315-4 Chapter 3, Section 3.5.3, Faulting, of the *CMRR-NF SEIS* provides information about fault locations in relation to the CMRR-NF location at TA-55. This includes three figures showing the locations of faults near LANL and the CMRR-NF. No surface faults were found at TA-55, and the zones of higher-density fracturing were found not to correlate to regions of surface faulting (Reneau et al. 1995; Gardner et al. 1998, 1999, 2008). Therefore, it is expected that the CMRR-NF would not be directly affected by surface faulting.

active faults close to the proposed CMRR-NF. The failure of DOE to characterize buried active faults close to the proposed CMRR-NF requires DOE to retract the DOE 2011 draft SEIS. In addition, the 2009 report by the LANL Seismic Hazards Geology Team (Lewis et al., 2009) described the insufficient knowledge of the southern extent of the Guaje Mountain Fault (GMF) toward the proposed CMRR-NF as follows: **315-3 cont'd**

> The southern extent and amount of displacement of the GMF are not well characterized (p. 257).
>
> **Conclusions. . .** The southern end of the GMF has not been mapped in detail, but its southern termination is likely to be similar to that of the Rendija Canyon fault (p. 268).

Comment by Gilkeson and Arends. *A southern termination of the GMF "similar to that of the Rendija Canyon Fault" would locate the GMF close to the proposed CMRR-NF. The above excerpt describes the requirement in the NRC 1997 SH Guidance Report for accurate maps that provide the following:* **315-5**

> "At a minimum, the location of fault sources must be identified in map view. Usually a fault map depicts the line of intersection of faults with the ground surface."

Comment by Gilkeson and Arends. *The fault map in the DOE 2011 draft SEIS does not provide accurate knowledge of the location of fault sources close to the proposed CMRR-NF because the LANL Seismic Hazards Geology Team describes the need for detailed field investigations to map the southern boundary of the GMF.*

NRC 1997 SH Guidance Report – Issue 2. **<u>Accurate knowledge of fault geometry is required</u>.** The NRC 1997 SH Guidance Report describes the requirement for accurate knowledge of the geometry of the faults as follows:

> The need to characterize the three-dimensional geometry of a source is greatest where the source to-site distance is small. For example, if a fault is less than 10 km from a site, the direction and amount of dip away from or toward the site can have a large impact on the source-to-site distance (p. 54).

However, the LANL 2007 PSHA Report describes the lack of knowledge of the fault geometry as follows on page 5-12: **315-6**

> Figure 5-7 shows views of our 3-D structural model for the PFS. These views were extracted from an interactive 3-D representation created by Claudia Lewis in Arcsine using digital elevation data to model the ground surface, digital fault traces to accurately represent complex geometries, and ***<u>assumed fault dips</u>*** [Emphasis Supplied] (which are within the ranges used in our seismic source characterization for the PFS, Figure 5-8). **<u>It is noteworthy that the fault dips are the most poorly constrained part of the model due to the lack of subsurface structural data</u>** [Emphasis Supplied].

In addition, the LANL report (Lewis et al., 2009) by the LANL Seismic Hazards Geology Team recognized an important deficiency in the LANL 2007 PSHA Report is the lack of

*Gilkeson and CCNS Additional Comments about DOE 2011 draft SEIS for CMRR-NF * July 5, 2011 * Page 7*

315-5 Lewis et al. (2009) states that the southern extent and amount of displacement on the Guaje Mountain fault are not well constrained. Detailed geologic mapping of the area between the mapped southern termination of the Guaje Mountain fault and the northern side of Los Alamos Canyon has not yet been undertaken. That said, studies have completed detailed geologic mapping of LANL from Los Alamos Canyon to the north to Pajarito Canyon to the south, and from the Pajarito fault escarpment to the west to TA-46 to the east (for example, Gardner et al. 1999; Lavine et al. 2003). These studies carefully looked for the presence or absence of surface faulting associated with the Rendija Canyon and Guaje Mountain faults within LANL property. Geologic mapping at LANL to identify surface faulting is summarized by Animation 1 in Lewis et al. (2009).

Lewis et al. (2009) shows that the Rendija Canyon fault trends southward to Los Alamos Canyon, then splays southwesterly into a broad zone of deformation in LANL's TA-3. Surface faulting from the Rendija Canyon fault was not identified due south of Los Alamos Canyon, including at TA-55. The surface expression of the Guaje Mountain fault is not visible south of Pueblo Canyon, including within LANL property.

Using the data presented in Lewis et al. (2009), as a comprehensive, peer-reviewed report and map of the Pajarito fault system, the following can be stated with respect to distances from the center of the proposed CMRR-NF:

- the nearest geologic structure with lateral continuity is associated with the Rendija Canyon fault, located approximately 3,300 feet (1,000 meters) west-northwest of the center of the proposed CMRR-NF. This geologic structure is located within the "horsetail" splay of the Rendija Canyon fault, in the western portion of TA-64, exhibits 3 feet (1 meter) of down-to-the-west displacement, and has a mapped length of approximately 100 feet (30 meters).
- the location at the north side of Los Alamos Canyon, where the Rendija Canyon fault changes its trend from southerly to southwesterly, is located approximately 6,250 feet (1,900 meters) north of the center of the proposed CMRR-NF.
- the mapped southern termination of the Guaje Mountain fault, north of Pueblo Canyon, within the Los Alamos townsite, is approximately 13,000 feet (3,960 meters) north-northeast of the center of the proposed CMRR-NF.

Commentor No. 315 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

knowledge of the fault geometry for the Pajarito Fault System (PFS) as follows on page 252:

> Despite the importance of understanding the geometry of the fault system and potential linkage among faults for purposes of seismic hazard analysis, a robust kinematic model of the [Pajarito] fault system is lacking.

Summary Comment by Gilkeson and Arends. *The DOE draft 2011 SEIS and the LANL 2007 PSHA Report do not provide the knowledge as required in the NRC 1997 SH Guidance Report for the locations of faults and the geometry of faults close to the proposed CMRR-NF. There is a requirement to retract the DOE 2011draft SEIS and perform the necessary field studies. These field studies should be conducted and reviewed by independent peer reviewers as required by the 2005 Office of Management and Budget.*

315-6 cont'd

NRC 1997 SH Guidance Report - Issue 3. Use of analog earthquake sites to determine the maximum Magnitude (M) of potential earthquakes in the PFS System. The NRC 1997 SH Guidance Report recommends the use of analog sites to determine the maximum earthquake magnitude (**M**) when there is insufficient knowledge of the dimensions of fault rupture. The above excerpts from Lewis et al., 2009 show that there is insufficient knowledge of fault rupture dimensions for the PFS and especially for the GMF in the immediate vicinity of the proposed CMRR-NF. The maximum magnitude **M** used as the design basis earthquake for the proposed CMRR-NF was incorrectly calculated as 7.27 (the reason the 7.27 maximum moment **M** is incorrect is described in Issue 1.A. in the June 28, 2011 public comments of Gilkeson and Arends). The importance to consider the maximum earthquakes for analogous historic earthquakes at other locations that are tectonically similar to the PFS is described in the NRC 1997 SH Guidance Report as follows:

> Other considerations in assessing maximum earthquakes for area sources are analogies to other sources. The source of interest may be tectonically similar to another source such that their maximum earthquakes are also deemed to be similar (p. 58).

From consideration of analog earthquakes, the design basis earthquake for the proposed CMRR-NF should have been at least maximum magnitude **M** 7.5 instead of the incorrect value of **M** 7.27. This is because the maximum magnitude **M** 7.5 for the analogous 1959 Hebgen Lake earthquake should have been used. The LANL 2007 PSHA Report described the 1959 Hebgen Lake earthquake as an analog for the PFS and the Valles Caldera as follows:

> Another example of a synchronous rupture that is a possible analog for the PFS is the **M** 7.3 1959 Hebgen Lake earthquake [actually **M** 7.5, see below] which involved multiple discrete faults and two subevents: a mb 6.3 event followed 5 seconds later by a mb 7.0 event (Doser, 1985). This is a good possible analog for the PFS because 1) it occurred in a region adjacent to a Quaternary caldera, as does the PFS; 2) it clearly involved multiple overlapping but distinct faults (rupture segments) with complex geometries, including opposing dips like the PFS; 3) it was dominantly extensional; and, 4) it had large displacements [23 feet], as is suggested for the PFS [Emphasis Supplied].

315-7

These data presented above, which are consistent with those provided in Chapter 3, Section 3.5, Geology and Soils, of the *CMRR-NF SEIS*, correspond to data used to calculate design-basis earthquake ground motions for the CMRR-NF.

It is important to note that precise locations of the strands of the Pajarito fault system, with respect to the CMRR-NF, are not needed for estimating the ground-shaking hazard at the site. The ground motion prediction models "flatten" out at short distances, less than a few kilometers for large magnitude earthquakes (M > 6.5), so the hazard is not sensitive to uncertainties in fault locations of hundreds of meters. Precise fault locations are needed for assessing the hazard from surface fault rupture, but the potential for surface faulting at the CMRR-NF is considered very low.

315-6 The comment indicates that site-specific data on the geometry and sense of slip of the Pajarito fault system are inadequate because studies have not been conducted. Dozens of mapping studies of the Pajarito fault system have been conducted (for example, Gardner and House 1987; Wong et al. 1995; Carter and Gardner 1995; McCalpin 1997; Lavine et al. 2003), including state-of-the-art, high-precision mapping in the vicinity of LANL. In addition, numerous paleoseismic trench investigations have been conducted at 17 sites over the past 20 years (for example, Gardner et al. 1990; Olig et al. 1996; Kelson et al. 1996; LANL 2007; McCalpin 1998, 1999, 2005). These studies clearly show that the Pajarito fault system is a series of normal slip faults that form the best studied fault system in the Rio Grande rift. Admittedly, some parts of the fault have not been as well studied as others; these tend to be those portions outside of LANL, especially where access issues are a problem (for example, the Santa Clara Canyon segment). Additional study of these areas would likely improve our understanding of the fault and could help reduce uncertainties in the inputs, but these studies are not a prerequisite to conducting a PSHA or determining design ground motions at LANL. The uncertainties in regards to fault geometry, rupture behavior, and sense of slip on the Pajarito fault system were fully recognized and addressed in the range of inputs to the PSHA. A range of fault dips was used (±15°), a component of oblique slip was considered in calculating slip rates, and two rupture models and various rupture scenarios were included in the analysis to address remaining uncertainties in the geometry and sense of slip of the Pajarito fault system.

In addition, several of the coauthors of the Lewis et al. (2009) study, including the lead author, were involved in developing the seismic source model of the

Commentor No. 315 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The 7.3 – 7.5 Richter magnitude of the Hebgen Lake earthquake is described as follows in the U.S. Geological Survey Fact Sheet 2005-3024 issued in 2005:

> The Hebgen earthquake of August 17, 1959 occurred at 11:37 p.m. Mountain Standard Time. The earthquake had a Richter magnitude of 7.3 – 7.5.

NRC 1997 SH Guidance Report - Issue 4. **Because of the record of increasing activity into the future for the youthful PFS, the NRC 1997 SH Guidance Report requires the addition of one-half earthquake magnitude unit M or one intensity unit to the design basis earthquake for the proposed CMRR-NF as follows**:

> In cases where the maximum historical earthquake has not been assessed to be equivalent to the maximum possible earthquake, past practice has included adding an increment of one-half earthquake magnitude unit or one intensity unit to the maximum historical earthquake (p. 57).

The NRC 1997 SH Guidance Report requires the design basis earthquake for the proposed CMRR-NF to be a minimum maximum moment **M** of 8 (7.5 (Hebgen Lake) plus .5 (NRC 1997 SH Guidance Report)) rather than the maximum moment of 7.27 that was used in the DOE 2011 draft SEIS. The fact that the youthful PFS is growing and increasing over time in the potential for more powerful earthquakes is described in the LANL 2007 PSHA Report as follows: 315-7 cont'd

> In the 1995 study, recurrence intervals were not used for most of the 26 rupture scenarios due to the lack of recurrence interval data. The weighted-mean recurrence interval was 32,000 years when they were used and the weighted-mean slip rate for most of the rupture scenarios was 0.182 mm/yr. In comparison, the weighted-mean recurrence for Rupture Model C, the strongly favored (weighted 0.85) model in this study is 8,400 years and the weighted-mean slip rate is 0.211 mm/yr (Figure 5-8). Sensitivity studies show that these higher rates have a significant impact on the hazard (Section 7.2.2) and so we know that increased rates on the PFS likely contributed measurably to the increase in hazard for this study, but we cannot specify exactly how much [Emphasis Supplied] (p. 9-6).
>
> Interestingly, the scaling factor needed to adjust segment slip rates in order to achieve preferred target recurrence intervals is 2.11 (see footnote 6 of Table 5-14), which is essentially the same factor between the long term slip rate (0.1 mm/yr) and the weighted mean for the slip rate distribution derived from the RGR [Rio Grande Rift] analysis (cf., slip rate branch for Rupture Model C on Figure 5-8). Thus, the moment balancing approach is implying that the late Quaternary rates are about twice as fast as the long-term Quaternary rates (and the Holocene rates are about 8 to 10 times faster than the Quaternary rates). We already knew this from the paleoseismic data, but it is reassuring to see that our moment-balanced rates for Rupture Model B are consistent with our slip rates assigned to Rupture Model C [Emphasis Supplied] (p. 5-20). 315-8

Summary Comment by Gilkeson and Arends. *The DOE 2011 draft SEIS did not follow the requirements in the NRC 1997 SH Guidance Report to use an appropriate analog historic earthquake for the maximum moment **M** and to add one-half magnitude* 315-7 cont'd

Pajarito fault system for the 2007 PSHA update. All of the data and analyses for the Pajarito fault system published in the Lewis et al. (2009) study were included or considered in the PSHA update. The first draft of the Lewis et al. paper was written in 2007 and it took 2 years to get through the review and publication process.

315-7 The claim that the maximum magnitudes were not correctly calculated in the 2007 PSHA, have no technical basis, or were underestimated, because they are less than magnitudes for historic analogue earthquakes (for example, 1959 Hebgen Lake and 1983 Borah Peak earthquakes), is not accurate.

Richter magnitudes (M_L) can differ from moment magnitudes (M_w), especially at large magnitudes. Therefore, to make a direct "apples to apples" comparison, the magnitude values should be compared using the same scale. All magnitudes used in the LANL PSHA were in terms of M_w, not M_L. Based on the latest geologic data, including those published in Lewis et al. (2009) and documented in the PSHA update (LANL 2007), expected maximum magnitudes for the various rupture scenarios of the Pajarito fault system range from M_w 6.5 to 7.3, and these were input as preferred values with a weight of 0.6 in the analysis. The expected magnitudes were calculated using well-established and widely accepted empirical relations (Wells and Coppersmith 1994). Results were checked and peer-reviewed by an internationally recognized Participatory Peer Review Panel during the PSHA update (LANL 2009). Additional uncertainties of ±0.3 moment magnitude (with a weight of 0.2 each) were included so that the M_w inputs into the PSHA were as large as 7.6, depending on the rupture scenario (LANL 2007). The estimated size of the 1959 Hebgen Lake earthquake is M_w 7.3, whereas the 1983 Borah Peak earthquake was smaller, at M_w 6.8 (Doser and Smith 1985). Thus, the range of maximum magnitudes used to calculate design ground motions for the CMRR-NF incorporates the magnitudes of historic earthquakes that might be considered analogues for rupture of the Pajarito fault system.

The statement in the 1997 SSHAC guidelines "in cases where the maximum historical earthquake has not been assessed to be equivalent to the maximum possible earthquake, past practice has included adding an increment of one-half magnitude unit or one intensity unit to the maximum historical earthquake" is for area sources, not active faults. This statement also refers to "past practice." Current practice for estimating the maximum magnitude for an area source is based on evaluating the maximum earthquake in analogue seismotectonic regions. For an active fault, SSHAC (1997) describes two general approaches:

315-7 cont'd

*unit for the design basis earthquake for the proposed CMRR-NF because the youthful PFS is growing in power. Accordingly, the NRC 1997 SH Guidance Report required that the design basis earthquake for the proposed CMRR-NF was a minimum maximum magnitude **M** of 8.0 instead of the incorrect maximum magnitude **M** of 7.27 that was used in the DOE 2011 draft SEIS. DOE is required to retract the DOE 2011 draft SEIS because is does not provide a safe and efficient design for the proposed CMRR-NF and does not analyze for a minimum maximum magnitude **M** 8.0 for the design basis earthquake.*

315-3 cont'd

Below are our questions from our review of the NRC 1997 Seismic Hazard Guidance Report 1 through 4. Please provide specific answer to our Questions NRC 1997 Seismic Hazard Guidance Report 1 through 4 in your Response to Comments for the DOE 2011 draft SEIS for the CMRR-NF. Please do not generalize or group the important issues raised in these additional comments by Gilkeson and CCNS.

Also, we add the same request not to generalize or group the June 28, 2011 comments of Robert H. Gilkeson, Registered Geologist, and Joni Arends, Concerned Citizens for Nuclear Safety (CCNS) about the DOE 2011 draft SEIS.

NRC 1997 Seismic Hazard Guidance Report Issue 1. The NRC 1997 SH Guidance Report recognizes the importance for the seismic hazard assessment for the proposed CMRR-NF to include locations of active buried faults. The best knowledge of active buried faults close to the location of the proposed CMRR-NF is the detailed field mapping of zones of intense fractures by LANL scientist Kenneth H. Wohletz (Wohletz, 2004). The zones of intense fractures close to the proposed CMRR-NF are displayed on Figure 3. The DOE 2011 draft SEIS did not consider the zones of intense fractures close to the proposed CMRR-NF as a seismic hazard from active buried faults. Accordingly, should DOE retract the 2011 draft SEIS? If not, why?

315-6 cont'd

NRC 1997 Seismic Hazard Guidance Report Issue 2. The NRC 1997 SH Guidance Report recognizes the need for accurate knowledge of the direction and angle of dip for the discrete faults in the PFS, especially for faults close to the proposed CMRR-NF. However, the LANL 2007 PSHA Report states, "It is noteworthy that the fault dips are the most poorly constrained part of the model due to the lack of subsurface structural data." In addition, the LANL Seismic Hazards Geology Team in Lewis et al., 2009 recognized that "The southern extent and amount of displacement of the GMF toward the CMRR-NF are not well characterized." Accordingly, should DOE retract the DOE 2011 draft SEIS? If not, why?

Further, the LANL Seismic Hazards Geology Team in Lewis et al., 2009 recognized the overall failure for knowledge of the direction and angle of dip of the entire network of faults in the PFS as follows:

> Despite the importance of understanding the geometry of the fault system and potential linkage among faults for purposes of seismic hazard analysis, a robust kinematic model of the [Pajarito] fault system is lacking.

*Gilkeson and CCNS Additional Comments about DOE 2011 draft SEIS for CMRR-NF * July 5, 2011 * Page 10*

constraints provided by historical seismicity and estimates of maximum rupture dimensions. Given the lack of significant historical seismicity on the Pajarito fault system, the latter approach has been used to estimate the maximum earthquake in addition to fault displacements from paleoseismic investigations.

315-8 There is no geologic or seismologic evidence that the rate of occurrence of surface-faulting earthquakes (magnitude > 6.5) is increasing along the Pajarito fault system. Paleoseismic investigations indicate that three large earthquakes ruptured along the Pajarito fault system during the Holocene period (past 11,000 years), suggesting that this recent activity may represent a temporal cluster in the long-term behavior of the fault (LANL 2007, Lewis et al. 2009). However, this possible pattern in the activity rate of the Pajarito fault system has been incorporated into the PSHA (LANL 2007). There is also no geologic or seismologic evidence that would suggest that the maximum potential earthquake along the Pajarito fault system is increasing in size. The maximum earthquake for the Pajarito fault system has been estimated for the PSHA based on observed fault displacements from past earthquakes and rupture dimensions of the potential fault rupture. Over the lifetime of the CMRR Facility and much longer, that is, thousands of years, the level of seismic hazard at the CMRR site is not expected to change because there are not expected to be changes in the maximum potential earthquake and activity rates of the Pajarito fault system. The general behavior of the Pajarito fault system is not expected to change over the time scale of the next century.

315-9 NNSA notes the commentor's position that the *CMRR-NF SEIS* is inadequate and that a full suite of reasonable alternatives should be evaluated. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information. Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, describes alternatives considered but dismissed from detailed analysis. These alternatives are: (1) alternatives locations outside LANL; (2) extensive upgrades to the existing CMR Building; and (3) moving capabilities to other LANL facilities. In addition, NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. This included options for moving CMR to another location. In the 2008 ROD for the *Complex Transformation SPEIS* (73 FR 77644) NNSA reaffirmed the decision to construct and operate the CMRR-NF at LANL. For the reasons described in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, these alternatives are not being revisited.

Commentor No. 315 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The record shows that DOE does not have the required knowledge of the geometry of faults in the PFS that is recognized as an important parameter for calculating the seismic hazard as required by the NRC 1997 SH Guidance Report. Accordingly, should DOE retract the DOE 2011 draft SEIS? If not, why? **315-6 cont'd**

NRC 1997 Seismic Hazard Guidance Report Issue 3. The NRC 1997 SH Guidance Report requirement for the maximum magnitude **M** earthquake for the proposed CMRR-NF should be from historic analogs. This is because there is too much uncertainty in the sparse data that was used to incorrectly calculate the maximum magnitude **M** of 7.27 in the LANL 2007 PSHA Report. The reasons the maximum magnitude is incorrectly calculated in the LANL 2007 PSHA Report are described in Issue1.A. in our June 28, 2011 public comments by Gilkeson and Arends.

The LANL 2007 PSHA Report identified the maximum moment **M** of 7.5 for the 1959 Hebgen Lake Earthquake as an analog for the PFS. The United States Geologic Survey http://earthquake.usgs.gov/learn/topics/richter.php reported a 7.5 magnitude earthquake is approximately seven (7) times more powerful for seismic hazard than a 7.27 earthquake. Accordingly, should DOE retract the DOE 2011 draft SEIS because the 1997 NRC Guidance for Seismic Hazard is not followed for the design of the proposed CMRR-NF? If not, why? **315-7 cont'd**

NRC 1997 Seismic Hazard Guidance Report Issue 4. The NRC 1997 SH Guidance Report recognizes the need to add one-half magnitude moment **M** to the design basis earthquake for the proposed CMRR-NF. This is required because the youthful PFS is increasing in power for more powerful earthquakes into the future at a rate that cannot be calculated with current knowledge. The pertinent excerpt from the NRC 1997 SH Guidance Report is below:

> In cases where the maximum historical earthquake has not been assessed to be equivalent to the maximum possible earthquake, past practice has included adding an increment of one-half magnitude unit or one intensity unit to the maximum historical earthquake (p. 57).

Accordingly, should DOE retract the DOE 2011 draft SEIS because the 1997 NRC Guidance for Seismic Hazard is not followed to add one-half magnitude moment **M** for the design of the proposed CMRR-NF? If not, why?

<u>Our Recommendations</u>:

The DOE 2011 draft SEIS does not meet the basic purposes of the NEPA. 40 CFR 1500 *et seq.* For example, the DOE 2011 draft SEIS does not provide reasonable alternatives for constructing and operating the proposed CMRR-NF, final design is not provided for the two construction options, and the final cost estimates have not been completed. For instance: **315-9**

> NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before

Regarding the final design of the project, the draft SEIS and PSHA are not intended to be used as design-level documents. The PSHA represents the best knowledge to date on the seismic hazard at LANL, with the uncertainties appropriately incorporated. The results of the PSHA and site-specific geotechnical reports referenced in the geology discussions in Chapter 3, Section 3.5, and Chapter 4, Section 4.5 (Kleinfelder 2007a, 2007b, 2010a, 2010b), have been included in the preliminary design of the CMRR-NF, which will be finalized subsequent to completion of the SEIS. Per DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets, final or detailed design cannot be started until the NEPA document (Final SEIS in this case) has been completed, so as not to prejudice the outcome, or restrict or narrow the range of alternatives to be considered.

Regarding the cost of the project, the cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 315 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail. 40 CFR §1500.1(b).

315-9 cont'd

NEPA also requires that "if a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion." 40 CFR §1502.9(a). Because the seismic issues impact each and every aspect of the proposal to construct and operate a CMRR-NF – and the fact that the DOE 2011 draft SEIS does not analyze for a minimum magnitude 8.0 earthquake, we urge DOE to retract the DOE 2011 draft SEIS. DOE must prepare and circulate a new revised draft environmental impact statement for public review and comment.

315-1 cont'd

Further, the Office of Management and Budget requires that for large projects, such as the proposed $6 billion CMRR-NF, that the documents be peer reviewed. "This new guidance is designed to realize the benefits of meaningful peer review of the most important science disseminated by the Federal Government." Final Information Quality Bulletin for Peer Review, 70 Fed. Reg. 2664 (2005), available at <http://www.whitehouse.gov/omb/memoranda/>.

315-2 cont'd

Thank you for your careful consideration of our comments.

Subject: Re: No Nuclear/plutonium bombs at Los Alomos!

I am very concerned with regard to the proposal to build new plutonium bombs at Los Alamos Lab. Too much risk in view of fires and earthquakes. *316-1*

Patricia O'Leary
PSOLeary@msn.com

316-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The commentor's earthquake concerns are addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Subject: Comments about Los Alamos Plutonium Pit Project

To whom it may concern!!!

We have enough bombs to explode the world hundreds of times over and they are all still viable and yet people propose we make more.

Are you lot crazy?

Introducing more plutonium and the consequent "toxic waste" from it into New Mexico is ludicrous and very unfunny *317-1*

Please pay attention to the health needs of NM residents!

Blessings and Peace,

Lasita Shalev

PLEASE SEND YOUR COMMENTS IN TO THIS GOV address .... NEPALASO@doeal.gov ____

317-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Commentor No. 318: Vic and Barby Ulmer

Sent: Monday, July 04, 2011 3:43 PM
To: NEPALASO@doeal.gov
Subject: Stop plans for Plutonium Bomb Plant

A plutonium bomb plant at Los Alamos is or at least ought to be unthinkable.

What with the 60 year drought predicted, the severe lack of water for human needs, the danger of fire made real with the current one ranging and the tremendous need for water for such a plant it makes NO SENSE whatsoever to build one.

Nor is this the step we should be taking politically, especially since we've signed a treaty and made a committment to scale down, not build up nuclear weapons.

Please don't allow this to happen.

318-1

Sincerely,

Vic and Barby Ulmer
Saratoga CA 95070

318-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

To: NEPALASO@doeal.gov
Subject: CMRR Nuclear Facility

AS a citizen on the U.S., in the light of Fukushima, of Desmond Tutu's call to honor the treaties of Nuclear Disarmament and the terrible fires that are sweeping through the region threatening the wellbeing of us all, I do not support CMRR The Nuclear Facility project in Los Alamos. The 6 billion dollars can be put to great use. *319-1*

Susan Osberg
susanosberg@mac.com
www.susanosberg.com

319-1 NNSA notes the commentor's opposition the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the Fukushima Daiichi Nuclear Power Plant, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Current operations at LANL do not violate any treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials, including vegetation, are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Regarding the commentor's statement about funding, decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 321: Richard Miller

From: Dick Miller [dick_miller@comcast.net]
Sent: Monday, July 04, 2011 6:24 PM
To: nepalaso@doeal.gov
Subject: Supplemental EIS for CMRR

Mr John Tegtmeler,

Pardon my slightly late response. I was a nuclear physicist before I retired in 1996. I worked primarily at SAIC for the DNA and participated in a number of projects involving LANL personnel. My basic work involved measuring the x-ray spectral output of nuclear devices at underground test sites at the Nuclear Test Site in Nevada, thus providing the DNA with information that they could use to estimate the effectiveness of nuclear rockets designed to be used to deter Soviet nuclear rockets from reaching our country, in the event of a Soviet nuclear attack.

321-1

I find the 20+ billion dollars to be spent to build a new CMRR at LANL so that new plutonium pits can be designed and built absurd, given that existing pits have been evaluated to last essentially indefinitely, so that there would be adequate time to build new pits at the first sign of the deterioration of present pits. And even then, what is the need for a new design for something with a very long life that hopefully and probably will never be used. What example does this set for the rest of the world as we on the other hand try to evolve into a nucler free world? The US and the Russians have more than adequate nuclear arsenals to defend ourselves if not the world. We have no need for an updated CMRR, let alone one built on a seismic fault line in an area prone to fires as presently now are burning near Los Alamos. I recognize that money should be spent to maintain scientists and engineers as myself with nuclear capabilities that might be required should our present nuclear capabilities and equipment deteriorate, but that is not an issue at present, Should it become an issue for whatever reason that I am currently unaware of, then there would be more than enough time to deal with this issue, given the speed with which LANL and Livermore were able to respond during WWII. The money to support our nuclear labs should be devoted to new technology to aid the evolving world, such as global warming and newer and safer energy producing resources, as well as health and information technology and other issues that hopefully will come about with government research funding.

Thank you for providing me the opportunity to express my views, however late they might arrive.

Richard Miller (PhD UC Berkeley, MBS MIT)

321-1 NNSA acknowledges the commentor's concerns regarding costs but notes that the estimated cost for the CMRR-NF is $3.7 billion to $5.9 billion (DOE 2011b). The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility.

Seismic issues are addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the

Commentor No. 321 (cont'd): Richard Miller

proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

To: NEPALASO@doeal.gov
Subject: CMRR SEIS

323-1

I am opposed to the construction of the CMRR as planned, and to the use of this SEIS to support the chosen design, for several reasons, but the main reason is that I do not believe the United States needs to manufacture more plutonium pits for new or "modernized" nuclear weapons. We have enough pits and we have enough weapons. I thought we were committed to eliminating these weapons in accord with Article 6 of the Nuclear Nonproliferation Treaty! Modernization of our weapons threatens to alarm Russia and inspire other nations to do the same, as I believe is already occurring amongst the nuclear weapons states.

This is insane. We already know that nuclear weapons in the hands of terrorists are a threat to our survival. The idea that making more or better weapons serves as an effective deterrent has been disproved.

Deterrence is an outdated theory that does not apply to the current geopolitical situation -- if it ever worked at all.

Since the CMRR is clearly intended to make more weapons possible, at terrific cost to the taxpayer, and with unacceptable seismic risk, and because it will use more of our precious resources, especially water, I urge you to declare the SEIS incomplete and unacceptable, cancel the project, and find more useful ways to spend $6 billion.

Thank you.

Stephanie Hiller
writer
Santa Fe, New Mexico

323-1 NNSA notes the commentor's opposition to the CMRR-NF project and pit production. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Seismic issues are addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. International Building Code so that the facilities remain safe in the event of a large earthquake.

Regarding funding priorities, decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 324: Benjamin Abbott

From: Benjamin Abbott [benjamin.abbott@gmail.com]
Sent: Tuesday, July 05, 2011 8:30 AM
To: NEPALASO@doeal.gov
Subject: Comments on CMRR-NF SEIS

Hello,

I'm emailing to express my opposition to the Chemistry and Metallurgy Research Replacement (CMRR) Project. Spending billions on new pit production is a slap in the face to everyone suffering in this country. It only be benefits the corporations involved; the rest of us have to pay and live with the risk of environmental contamination. The project can accomplish nothing positive. The last thing we need is more weapons of mass destruction. *324-1*

Sincerely,

Benjamin Abbott
UNM American Studies PhD Program

324-1 NNSA notes the commentor's opposition to the construction and operation of the CMRR Project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA acknowledges the commentor's concern about environmental contamination risk. Chapter 4 of the *CMRR-NF SEIS* provides the environmental impacts analysis, which evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area. The analysis indicates that the risk of environmental contamination is limited to extremely unlikely accident events.

Commentor No. 325: Joanne M. Roberts

From: Joanne Roberts [litlfut@comcast.net]
Sent: Monday, July 04, 2011 1:44 PM
To: NEPALASO@doeal.gov
Subject: Withdraw the Proposed Nuclear Facility of the Chemistry and Metallurgy Research Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL)

Hello,

I urge you to withdraw the draft Supplemental Environmental Impact Statement (draft SEIS) for the Proposed Nuclear Facility of the Chemistry and Metallurgy Research Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL)

The National Environmental Policy Act (NEPA) requires a federal agency to provide a range of alternatives. DOE has not provided viable and workable alternatives. *325-1*

The draft SEIS misrepresents the seismic hazard at the location of the proposed CMRR–Nuclear Facility is of great concern. *325-2*

The draft SEIS demonstrates that DOE will continue to waste water for manufacturing nuclear weapons; create more radioactive, hazardous and toxic waste; spew pollution into the air; and exceed its existing electric power needs. *325-3*

Please withdraw the draft EIS on this project.

There are other better alternatives.

Sincerely yours,

Joanne. M.Roberts
116 Fairview Ave. E. # 403
Seattle WA
98109

325-1 NNSA notes the commentor's opinion that the *CMRR-NF SEIS* does not provide a range of viable and workable alternatives. The SEIS was prepared in accordance with NEPA, as amended (42 U.S.C. 4321 et seq.), as well as CEQ regulations and DOE NEPA implementing procedures codified in 40 CFR Parts 1500–1508 and 10 CFR Part 1021, respectively. Chapter 1, Section 1.4, of the *CMRR-NF SEIS* identifies the three alternatives analyzed in the SEIS. These alternatives are addressed in more detail in Chapter 2, Section 2.6. Section 2.7 of the SEIS provides a discussion of alternatives that were considered and dismissed from detailed analysis. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

325-2 Seismic issues are addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. This section was updated for the *Final CMRR-NF SEIS*. Subsequent to the original proposal of the CMRR Facility and preparation of the *2003 CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve.

325-3 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water

Commentor No. 325 (cont'd): Joanne M. Roberts

Resources and Usage, of this CRD for more information on water resources at LANL.

Sufficient capacity exists at LANL or at offsite facilities to dispose of all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. As summarized in Chapter 2, Table 2-3, no air quality standards would be exceeded.

Electrical power impacts are addressed in Chapter 4, Section 4.2.3, 4.3.3, and 4.4.3, of the SEIS. Options for adding to or modifying the existing electrical distribution at LANL to support the requirements of the proposed CMRR-NF are analyzed in the SEIS (for example, adding an electrical substation in TA-50).

Commentor No. 326: Lisa Adkins

From: Lisa Adkins [annalisa.adkins@comcast.net]
Sent: Tuesday, July 05, 2011 9:29 PM
To: nepalaso@doeal.gov
Subject: In support of CMRR

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager
U.S. Department of Energy
National Nuclear Security Administration
Los Alamos Site Office
3747 West Jemez Road, TA-3, Building1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeier:

I have lived in Santa Fe, New Mexico for over 30 years. This email is in support for the construction of the Chemistry and Metallurgy Research Building Replacement (CMRR) Project and the "Preferred Alternative" as described in the draft Supplemental Environmental Impact Statement.

I believe the completion of such a project will provide a significant economic boost to Santa Fe, northern New Mexico and the Los Alamos National Laboratory, which is especially important to the long term health and vitality of New Mexico.

326-1

The existing Chemistry and Metallurgy Research (CMR) Building was built nearly 60 years ago and needs to be replaced with a modern facility meeting current design requirements. I, and many other Santa Feans, fully support the replacement facility and urge that its construction be started at the earliest possible opportunity.

Lisa Adkins
2631 Via Berrenda
Santa Fe, NM 87505

326-1 NNSA notes the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative and the Modified CMRR-NF Alternative would require a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 327: Ken Adkins

Subject: Santa Fe supports LANL and CMRR!

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager
U.S. Department of Energy
National Nuclear Security Administration
Los Alamos Site Office
3747 West Jemez Road, TA-3, Building1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeier:

I am a 20-year resident of Santa Fe, New Mexico. This email is in support for the construction of the Chemistry and Metallurgy Research Building Replacement (CMRR) Project and the "Preferred Alternative" as described in the draft Supplemental Environmental Impact Statement.

Completion of such a project will provide a significant economic boost to Santa Fe, northern New Mexico and the Los Alamos National Laboratory, which is especially important to the long term health and vitality of the state of New Mexico. ***327-1***

The existing Chemistry and Metallurgy Research (CMR) Building was built nearly 60 years ago and needs to be replaced with a modern facility meeting current design requirements. I, and many other Santa Feans, fully support the replacement facility and urge that its construction be started at the earliest possible opportunity.

Ken Adkins
2631 Via Berrenda
Santa Fe, NM 87505

327-1 NNSA notes the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative and the Modified CMRR-NF Alternative would require a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

328-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 329: Katherine Franger

June 21, 1011

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

Dear Mr. Tegtmeir:

I am writing to protest the proposed Chemistry and Metallurgy Research Replacement Project in Los Alamos.

CMRR would be built near a fault line, thus exposing this project to a disaster much worse than Fukushima or Chernobyl. The billions of dollars added t the original 2004 estimate apparently is supposed to address this, but no amount will prevent a huge disaster in the event of an earthquake in the area over 7 on the Richter Scale. *329-1*

The US already has more "Plutonium Pits" than could ever be used (God forbid). Increasing the production from 20 pits per year to 80+ per year is another way of using taxpayers' money for unnecessary projects. *329-2*

This foolish, unnecessary, and unbelievably costly project should be stopped and abandoned immediately. *329-1 cont'd*

Sincerely,

Katherine Franger
820 Sevely Drive
Mountain View, CA 94041

CC: Senator Dianne Feinstein
Senator Barbara Boxer

329-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMFF-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF. For more information, refer to Section 2.6, Seismic and Geologic Concerns, of this CRD.

Regarding an accident like that at the Fukushima Daiichi Nuclear Power Plant, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

329-2 A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2,

Commentor No. 329 (cont'd): Katherine Franger

Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 330: Mary vanderBerg Green

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, NNSA Los Alamos Site Office, 3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico, 87544 or fax: (505) 667-5948; or e-mail: NEPALASO@doeal.gov

This building was first designed in 2004 and the world has changed greatly since then a SEIS does not adequately assess the impacts of this proposal.
I request a complete and new EIS. 330-1

A request for an estimated $6B building at a time when FUKUshima has happened, and two US reactors are in the midst of floods while Los Alamos is burning in a forest fire at this very summer? is unacceptable and must not be taken on by the taxpayers of our nation. 330-2

Mary van der Berg Green
PO Box 1779, Taos, NM 87571
[redacted] - [redacted] - [redacted]

CMRR-NF Hearings:
Tues. May 24, 5 p.m. to 9 p.m., Holiday Inn Express, 60 Entrada Dr., Los Alamos
Wed. May 25, 5 p.m. to 9 p.m., Santa Claran Hotel, 464 N. Riverside Dr., Espanola
Thu. May 26, 5 p.m. to 9 p.m., Santa Fe Community College, Jemez Rooms, 6401 Richards Ave., Santa Fe
View or download SEIS document: http://www.nepa.energy.gov or http://www.nnsa.energy.gov/nepa/cmrrseis

330-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

330-2 NNSA notes that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could not happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

332-1

332-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 333: Renné Hardy

Jun 26 11 10:03a p.1

[redacted]

Attn: MR JOHN TEGTMEIR

I would like to submit the following comment

I AM IN OPPOSITION to PLUTONIUM PIT PRODUCTION AT LOS ALAMOS

1. Re EIS -
need an EIS not S-EIS
to study: seismic issues (May 2007 updated seismic eval) and unstable geological strata

333-1

2. Re Cleanup @ "Legacy Sites"
this cleanup should be addressed first

333-2

3. Exploration of other alternatives
1. NO ACTION
2. upgrading existing CMR bldg

333-3

Thank you! Rennie Hardy
124 E Bent St
Taos NM 87571

333-1 NNSA notes the commentor's opposition to pit production at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

333-2 In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to

Commentor No. 333 (cont'd): Renné Hardy

be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

333-3 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967). In response to public comments, additional information was added to Chapter 2, Section 2.7 of the *CMRR-NF SEIS*. Refer to Section 2.11, Alternatives Considered, of this CRD for additional information.

Commentor No. 334: Elana Sue St. Pierre
Healthy Water NOW ASAP

Healthy Water NOW ASAP
Elana Sue St. Pierre OTR/L
Santa Fe New Mexico 87505
6-21-11

Mr. John Tegtmeier, CMRR–NF
SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road,
TA–3 Building1410,
Los Alamos, New Mexico, 87544,

Respectfully, Earnestly, and Truthfully to the Powers that Be

I am writing as Spokes Woman for Healthy Water NOW ASAP a growing network of over 300 parents of children with developmental disabilities (often genetically related), pediatric therapists, early childhood interventionists, child advocates, midwifes, dulas, nurses, and physicians . We are speaking out for the voiceless children whose lives will hold all decision makers accountable in days yet to come regarding the nuclear bomb factory(Chemistry and Metallurgy Research and Replacement Nuclear Facility --CMRR) which is now being seriously questioned .

As humanity, as a world society, grows and our consciousness expands strategic rational for war and national defense must evolve to protect our human potential and to meet the true threats of our national security. In the days proceeding Aug and Sept 1945 when the first weapons of mass destruction were unleashed on helpless pregnant women and children, it was a war strategy that met the needs of the that Cold War Era. War and surrender was based on killing as many civilians as possible to force the governments fueling the war into submission. The massive massacre that the nuclear bombs created ended the war yet the nuclear fallout from these bombs continues to affect all our lives in deep invisible ways. In these early days of the nuclear age the effects of global contamination and health effects over generations of lives were not understood.

We now understand that nuclear fall out is carried in the soil which becomes our own nations contaminated food , it blows in the wind carried beyond all countries' boundaries, and it contaminates our living water which becomes waters within the womb birthing lives plagues by deformity, sickness and death through generations. Civilian deaths from the "little boy" and the" fat boy' (code names for these first nuclear weapons of mass destruction) continue today in Japan. For within the ovaries of the first surviving women exposed to the nculear bombs where the eggs of their grandchildren who today experience third generation genetic birth defects.

There is no old or new and improved nuclear bombs which can protect civilian populations , our sole/soul justification for our involvement in the Lybian War. Today the Kamikaze fighters have left their planes abandoning their cause....Japan now fights an internal nuclear catastrophe. Terrorism, the threat of this decade, is fought undercover of secret missions and all nuclear facilities have become potential targets with inadequate protections from terrorism attack. Hitler's bones have turned to dusts and the race to create bigger and better killing "Gadgets" no longer serves a propose of national defense but rather creates potential national disasters. Germany now leads the way away from the nuclear age transforming their nuclear foot prints into alternatives.

The nuclear foot prints of this nation's first weapon of mass destruction lies hidden in secret files,documents and the nuclear wasted buried in the canyons between Los Almos and the Rio Grande, our communities major source of water. Less than 100 yards from the intake of this *334-1*

334-1 NNSA notes the commentor's concerns about downstream and downwind contamination from LANL and the effects on human health. It is NNSA policy to conduct operations in a manner that ensures the protection of public health and safety and the environment through compliance with applicable Federal, state, and local laws and regulations, DOE Orders, and other requirements. LANL operations are subject to all of these requirements. Chapter 5 of the *CMRR-NF SEIS* describes the environmental laws and regulations that apply to the CMRR-NF operations.

Some LANL operations may result in the release of radioactive materials to the air through a stack or other forced air release point (called point sources). Limits or requirements for these emissions are set forth in the Clean Air Act, specifically the National Emissions Standards for Hazardous Air Pollutants for DOE facilities. Under these regulations, radioactive air emissions from LANL must be controlled to ensure that no member of the public receives an effective dose equivalent of 10 millirem per year.

Impacts on surface water can be caused by industrial outfalls, stormwater runoff, dredge and fill activities, or sediment transport. LANL has one sanitary outfall and 14 industrial outfalls; effluents from LANL facilities are discharged in accordance with a National Pollutant Discharge Elimination System permit that establishes limits on the volume and quality of the discharge. These outfalls are sampled weekly, monthly, or quarterly, as specified in the permit, to analyze effluents for compliance with permit levels. Over the past 5 years, LANL has maintained an average rate of compliance with industrial permit conditions of 99.5 percent. LANL also had a 93 percent compliance rate with National Pollutant Discharge Elimination System stormwater requirements at its permitted construction sites (LANL 2006a).

The Albuquerque water utility has monitored the Rio Grande by collecting and testing samples at various sites from the Heron Reservoir along the river to Albuquerque for metals, minerals, nutrients, organic substances, and radionuclides (City of Albuquerque 2006). The river water meets EPA drinking water standards for all of these substances (specifically, the levels of radionuclides are far below the EPA standards).

Regarding the Buckman well field, in 2006, LANL staff collected a groundwater sample from Buckman Well #1 as part of routine quarterly sampling that is conducted at three water-supply wells in the Buckman Well Field. This sampling

Commentor No. 334 (cont'd): Elana Sue St. Pierre
Healthy Water NOW ASAP

community's water supply lies traces of plutonium and radioactive heavy metal buried only three foot deep within the Buckman well field along the banks of the Rio Grande. Current radioactive clean up standards and methods for radioactive cleanup do not protect us. These silent yet deadly nuclear foot prints may be seeping into our life giving limited water resources . The air we breath and soil that grows our food radiates background contamination from these nuclear bombs, nuclear foot prints of the nuclear age threatening our national security, as well as, the immediate health and safety of this down wind/down stream community.

334-1 cont'd

We currently are in a sever drought. This proposed bomb factory would use over 326,000gallons of our water need for growing food and supporting lives. Where would the water needed for cooling a melt down or accident come from? Although we face the same Earthquake threats that Japan now faces we do not have a near by ocean to keep pumping water at an unsolvable catstrophe for indefinite periods of time.

334-2

The degrading current nuclear facility at LANL, situated on our active fault line, needs to be rendered inert and safe with full bio remediation of the site. Yet where is the research, technology and funding to do so? Degrading stock piles and contamination sites of deadly nuclear wastes threaten every state of our great nation and has spread across the face of our planet...all originating from here. LANL and DOE lack funding for research and development for alternative bio remediation of the nuclear contamination that originated here. When will our world's greatest scientists again gather here to find the true solutions that can transmute our nuclear foots prints one step at a time? The time can be NOW.

The nuclear age has served the purpose of teaching us that the true threat to national security can no longer be met by weapons of mass destruction . The true threats to our national security are now being caused by creations of our own making.....environmental disasters due to uncontrollable weather patterns set out of balance by our unbridled carbon foot prints and the earth quaking.... , shifting entire continental shelves where our nuclear foot prints lie buried within our ignorance and failure to move beyond the consciousness of nuclear war. The consciousness of mass destruction no longer serves our national security or defense strategies. The budget of 3 billions dollars for improving nuclear bombs can to be totally redirected toward a resurgence of nuclear research for life supporting bio remediation.

334-3

We intend that all funding for this bomb factory((Chemistry and Metallurgy Research and Replacement Nuclear Facility --CMRR) be redirected toward bio remediation of the growing nuclear contamination that already threatens us. We intend there be a re-evaluation that prevents any nuclear bomb factory (CMRR) from being created in this water scarce and seismographicly active region. A few years back the Pecos River flowed backwards due to an earthquake. The Valla Caldera was created when the planets largest mountain was blown to pieces from the Earth quaking. And we all quake to think that our world's best scientist would plan to store over 13,000lbs of plutonium in this unstable area. We ask that lessons form past mistakes move forward with greater insight in a new directions using the billions of dollars ear marked for this disastrous plan be re-directed for bio-remediasion and alternative energy research.

Respectfully, Earnestly,and Hopefully
Visioning a Nuclear Free Future for The Children
Healthy Water NOW ASAP
Spokes Woman :Elana Sue St. Pierre OTR/L
6-21-11

Elana Sue St Pierre OTR/L

is performed pursuant to a cooperative agreement with the City of Santa Fe. The samples were sent to an independent laboratory for radiochemistry analysis where it was reported that they detected plutonium-238 at a level about 3 percent of the DOE concentration guide for water ingestion. However, after recent reviews of legacy data by LANL staff and further discussions with the analytical laboratory, the laboratory has confirmed that computer analyses of the results were incorrect. The laboratory concluded that plutonium-238 was *not present* in the sample from Buckman Well #1. No further reports of plutonium detection have occurred since this occurrence in 2006 (LANL 2011e).

334-2 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

334-3 Regarding the commentor's statements about research, technology, and funding related to bioremediation, these subjects are not within the scope of the *CMRR-NF SEIS*. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 334 (cont'd): Elana Sue St. Pierre

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMFF-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF. The CMRR-NF would be designed, constructed and operated in accordance with applicable regulations and standards for environment, health, and nuclear safety (including seismic standards).

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect the workers and public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. The potential environmental impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10 of the *CMRR-NF SEIS*.

¿Que comentarios tiene usted sobre el Draft SEIS?

Good day.

Glad to hear your budget has been cut some, unfortunately the cleanup has been cut too.

335-1
I would prefer: (1) NO NEW BUILDING be built; (2) PRODUCTION HALTED; (3) ALL FUNDS GO TO CLEAN UP; (4) NO MORE WASTE BE ~~TRANS~~ MADE OR TRANSPORTED ON OUR HIGHWAYS.

PLEASE USE THE GREAT MINDS AT LOS ALAMOS TO HELP OUR PLANET WHICH IS OUR HOME.

335-2
CLIMATE CHANGE IS REAL AND MUCH MORE THREATENING THAN ANY TERRORIST THREATS. PLEASE HEED!

NOTE: Please do not include personal information (such as address or phone number) if you object to it being included in the SEIS; comments received are included in the SEIS in their entirety.
NOTA: Favor de excluir información personal (dirección o número de teléfono) que no desea aparezcan en el SEIS; todo comentario recibido es incluido en su totalidad en el SEIS.

PLEASE HAND THIS FORM IN OR MAIL BEFORE JUNE 28, 2011, to:
FAVOR DE ENTREGAR ESTA FORMA O ENVIARLA POR CORREO ANTES 28 DE JUNIO 2011 A:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager • U.S. Department of Energy
National Nuclear Security Administration • Los Alamos Site Office • 3747 West Jemez Road, TA-3, Building 1410
Los Alamos, New Mexico 87544

335-1 NNSA notes the commentor's opposition to the CMRR Project and production and the suggestion that funds be directed to cleanup. In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Each of the alternatives would result in the generation of radioactive waste. Sufficient capacity exists at LANL or at offsite facilities to dispose of all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. As summarized in Chapter 2, Table 2-3, transportation impacts from waste transport would be small, with no latent cancer fatalities or traffic accident fatalities expected.

335-2 Comment noted.

Commentor No. 336: Dimitra Doukas, Ph.D.

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667-5948); or e-mail : ***NEPALASO@doeal.gov***.

336-1

OF COURSE THE CMRR-NF PROJECT REQUIRES A FULL EIS, AND A REAL ONE, BASED ON A NEW, PROFESSIONAL STUDY, WITH NEW DATA COLLECTION BY QUALIFIED SCIENTISTS FROM ALL RELEVANT DISCIPLINES – AS MANY AS POSSIBLE BEING NM RESIDENTS. TOO OFTEN AN EIS IS A BUREAUCRATIC RECYCLING OF OLD DATA, A "PLACEBO" FOR A PUBLIC WHOSE CONCERNS ARE VIEWED AS GROUNDLESS. NEW MEXICANS' CONCERNS ABOUT THIS PROJECT ARE NOT GROUNDLESS.

336-2

AS THE NUCLEAR DISASTER IN JAPAN THIS SPRING SHOULD SHOW US – NUCLEAR FACILITIES MUST NOT BE SITED IN SEISMIC FAULT ZONES. NEW MEXICANS ARE ABSOLUTELY RIGHT TO RESIST THE SENTENCE THAT GREED AND NATURAL UNPREDICTABILITY HAVE PASSED ON THE JAPANESE PEOPLE. A SCIENTIFICALLY HONEST EIS HAS TO CONCLUDE THAT THE PROPOSED SITE CANNOT SUPPORT A NUCLEAR FACILITY AND THAT THIS PROJECT AS PROPOSED MUST NOT GO FORWARD. – DIMITRA DOUKAS, PH.D.

DIMITRA.DOUKAS@GMAIL.COM

Thur, May 26, 5 p.m. to 9 p.m., Santa Fe Community College, Jemez Rooms, 6401 Richards Ave, Santa Fe.
View or download SEIS document : http://www.nepa.energy.gov *or* http://www.nnsa.energy.gov/nepa/cmrrseis

336-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information. The *CMRR-NF SEIS* was prepared using the most current information about LANL and the CMRR project.

336-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground

Commentor No. 336 (cont'd): Dimitra Doukas, Ph.D.

motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

1. What comments do you have on the Draft SEIS?
¿Que comentarios tiene usted sobre el Draft SEIS?

We need a comprehensive EIS from the EPA, not this hurried SEIS prepared to combat the Los Alamos Study Group's suit. **337-1**

And of course, many of us in Taos who are 60 miles downwind from Los Alamos wish the scientists up there would turn their attention to renewable energy, and a way to safely extract nat. gas as well as medicinal treat this ie Parkinsons. We do not need more nuclear warhead projects!! Also put their brains on what to do with the nuclear waste at all of our plants. That would make sense!! **337-2**

Thank you!

I have attended meetings in Los Alamos, Taos, and also the Alb. lawsuit on this subject

Commentor No. 338: Virginia J. Miller

From: Virginia J Miller [vjmopus@cybermesa.com]
Sent: Tuesday, July 05, 2011 6:04 PM
To: NEPALASO@doeal.gov
Subject: No. 2 Comments on the draft SEIS for proposed CMRR-NF at LANL

John Tegtmeier, CMRR-NF
SEIS Document Manager
NNSA Los Alamos Site Office
Los Alamos, New Mexico

338-1

I just learned that there is a seventh key parameter that must be investigated at the CMRR-NF LANL site, in addition to the six I mentioned in my comments submitted last week. It is the shear velocity of the the reference rock, which is dacite. Field studies must be conducted, as also recommended several times by LANL scientists, but not carried out, in order to obtain accurate information of the seismic hazard. Plutonium particles are deadly.

It is utterly foolhardy to build an unnecessary plutonium facility in an earthquake zone not far from a volcano and in an area threatened by dangerous wildfires every few years due to serious drought conditions.

It is imperative that we divert funding for the CMRR-NF to the thorough cleanup of radioactive, toxic and hazardous wastes at LANL that will help protect our health and environment in northern New Mexico including the Rio Grande and our watersheds and the sacred sites of Pueblo people. Clean water is life. Thank you.

Virginia J. Miller
125 Calle Don Jose
Santa Fe NM 87501

338-1 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The 2007 and 2009 probabilistic seismic hazard analyses represent the best knowledge to date on the seismic hazard at LANL, with the uncertainties, such as the shear velocity in dacite, appropriately incorporated. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Chapter 3, Sections 3.5.1 and 3.5.5, and Appendix C have been revised to add information regarding volcanic hazards. The analysis of seismic events provides a conservative estimate of potential consequences that would be comparable to the impacts associated with volcanic events.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For

Commentor No. 338 (cont'd): Virginia J. Miller

the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 339: Jose A. Cisneros

From: Jose Cisneros [joseacisneros@aol.com]
Sent: Tuesday, July 05, 2011 10:03 PM
To: NEPALASO@doeal.gov
Subject: Draft CMRR-NF SEIS Comments

Mr. John Tegtmeir, CMRR-NF SEIS Document Manager
U/S> Department of Energy

National Nuclear Security Administration
Los Alamos Site Office
3747 West Jemez Road, TA-3 Building 1410
Los Alamos, New Mexico, 87544

Dear Mr. Tegtmeier,

As a retired career employee of the National Park Service, I have a long association with the Los Alamos National Laboratory beginning in 1973 when I worked in the Southwest Regional Office of the Park Service in Santa Fe. I later served as Superintendent of Bandelier National Monument in the late 1980's during which time I worked closely with our neighbors at the Laboratory. As you may know, Bandelier National Monument housed many of the employees of the Laboratory in its early years. That has become an important component of the Monument's administrative history and one of which we are proud of.

The Laboratory has served as an important component of the economy of New Mexico since its beginnings in addition to its work on the nuclear component of this country's defense mechanism. It is because of this partnership that I write to support the planned construction of the Chemistry and Metallurgy Research Building Replacement Project and its "Preferred Alternative" as described in the draft Supplemental EIS. After 50 years of use, the Chemistry and Metallurgy Research Building is due replacement and modernization. I applaud your efforts to proceed with its construction. *339-1*

Jose A. Cisneros
2611 Via Caballero Norte
Santa Fe, NM 87505

339-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

Commentor No. 340: Nona Lee Gregg

TO: Mr. John Tegtmeier, CMRR–NF
SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road
TA–3 Building1410
Los Alamos, New Mexico, 87544

As a member of impacted communities from the nuclear weapons industrial complex, I wish to express my opposition toward the proposed CMRR-NF SEIS (Chemical Metallurgy Research and Replacement Nuclear Facility, Supplemental Environmental Impact Statement) based on the following:

• A **new** environmental impact statement (EIS) needs to be created because the current supplemental EIS does not cover the changes in size, cost (4.5 billion and rising), and scope. *340-1*

•Environmental standards need to be held to **highest level** of nuclear safety regulations. *340-2*

• I am in **solidarity** with Santa Clara Pueblo's Tribal Resolution No. 08-16, which opposes the expansion of plutonium pit production at LANL (Los Alamos National Laboratory) and making that production capacity permanent through this complex. *340-3*

• The current SEIS **does not** adequately address the increased seismic dangers, unstable geological strata, storm runoff contamination, and fire risks that exist with the proposed location. *340-4*

• Expansion in proposed plans would only add to the 60+ years of legacy waste contamination in NM and should **not be allowed** until clean up is addressed in accordance with the 2005 consent order with the NMED (New Mexico Environmental Department). *340-5*

• Money spent on unusable nuclear weapons **does not** support or spur economic growth, but goes straight into corporate pockets, depriving local communities of federal funds. *340-6*

Additional Comments:

Printed Name: Nona Lee Gregg
Signature: Nona Lee Gregg Date: 5/26/11
Email:
Mailing Address: 3471 Cerrillos Rd #69, Santa Fe, NM 875

340-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

340-2 All proposed new DOE facilities are required to be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment.

340-3 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

340-4 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region

Commentor No. 340 (cont'd): Nona Lee Gregg

were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The *CMRR-NF SEIS* does address the potential for storm runoff. LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Storm Water Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. As described in the SEIS, there are plans for temporary and permanent detention ponds for the proper management of stormwater runoff.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 340 (cont'd): Nona Lee Gregg

340-5 Note that cleanup activities are not within the scope of the *CMRR-NF SEIS*. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

340-6 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. See Section 2.7, Economic Impacts, of this CRD for information on the economic impacts as evaluated in the *CMRR-NF SEIS*.

Commentor No. 341: Emily Koponen

To the Proposed CMRR comment June 16, 2001

#1) I support NO alternative which is to NOT build and to clean up the decrepid TA-55 that exists!

#2) I want the $180 Billion for "modernization" of nuclear sites to be spent on

all new funding

1. Education (Schools, teachers, libraries and materials and transportation)
2. Public Transportation
   Rapid transit trains
   bike paths
   ecological buses
   safe footpaths
3. Organic Agriculture
   no more use of pesticides
   clean fresh organic
   no more poison in food
4. Sustainable Alternative Energy
   water power
   solar + wind
   off grid support

NEEDS funding & away from All Nuclear coal + gas

341-1

341-1 NNSA acknowledges the commentor's position. Note that the estimated cost for the CMRRNF that is the subject of this SEIS is $3.7 billion to $5.9 billion (DOE 2011b). Cleanup of TA55 as suggested in the comment is not within the scope of the *CMRRNF SEIS*.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRRNF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. See Section 2.7, Economic Impacts, of this CRD for information on the economic impacts as evaluated in the *CMRRNF SEIS*.

Commentor No. 341 (cont'd): Emily Koponen

4) Alternative/Sustainable Energy
use of humanure for power
(No more flush toilets)

5) Health
Single payer health care
preventative medicine
away from Pharmaceuticals

6) Social Structures
all areas above w/meaningful work + good pay
youth research centers
trollies
gathering places ...

anon ...

The financial destruction robbery and poisoning could be so better spent!

Light to you!

Emily Koponen
Dixon N.M.
87527

Commentor No. 342: Gary Vogt

5065 Wolverton Drive
Florissant, MO 63033
June 16, 2011

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr Tegtmeier:

This is the time to do everything possible to eliminate all nuclear weapons from the face of the earth. Yet the proposed CMRR would expand the production of plutonium pits, the triggering devices for thermonuclear bombs.

This is a huge failure of morality, dangerous beyond belief and should be haulted at once! Instead of creating more of these triggers, the ones we now have should be destroyed, the plutonium mixed with large amounts of waste and the resulting material buried miles beneath the surface.

To spend anything on creating these triggers is obscene, and all the more so to spend billions at a time of budgetary crisis. Redirect necessary funds to the destruction of our stockpile and return the rest to the Treasury. Our leaders must halt the mad arms race against ourselves, and show the way to fortitude and confidence, not fear!

Since willingness to build these hellish devices shows an enormous disregard for human life, it is not surprising you care so little for American lives that you would build the CMRR in a seismic fault zone. Plutonomium is one of the most toxic substances known to science, and you risk its release with your foolhardy scheme. Once released it will be uncontainable and virtually everyone who is contaminated will die a horrible death.

342-1

Stop this horror now!

Gary Vogt

Gary Vogt

342-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMFF-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Dear Mr. Tegtmeir,

It is very alarming to read about the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos.

The current projected $5.86 billion cost in itself is something our nation cannot afford. The strong possiblities of disasters in the future due to a nearby (2/3 mile) fault line also indicate a project which needs to be canceled. There is also a strong possibility radioactive contamination from the lab contaminating Santa Fe's water supply. Again, the costs to our citizens in terms of money, safety, and health is too great to construct CMRR. 343-1

Please cancel.

Thank you ~~for~~ listening
Janice

Los Alamos, NM 87544

PLEASE DO NOT WRITE BELOW THIS LINE. SPACE RESERVED FOR U.S. POSTAL SERVICE

343-1 NNSA notes the commentor's opposition to the CMRR Project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Storm Water Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Storm Water Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment. All radioactive liquids would be transferred to RLWTF. At RLWTF, the liquids would be treated to meet discharge criteria and released through a permitted outfall or to a zero liquid discharge facility. Other liquids would be routed to the Sanitary Wastewater Systems Plant, where they would be treated prior to discharge through a permitted outfall.

1500 N 2nd St.
Aberdeen, SD 57401-1238
June 16, 2011

Greetings, Mr. John Tegtmeir,

I am writing to tell you of my sincere hope that the CMRR project be cancelled, and a study of LANL+ plutonium should be required, including existing & future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CRR must be determined. Thank you.

Sincerely,
Mary L. Geraets

344-1

344-1 NNSA notes the commentor's opposition to the CMRR project. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decision regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Commentor No. 345: Paul Helbling

June 15, 2011

Mr. John Tegtmeir

3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Fax: 505-667-5948

Dear Sir:

If the US government has 15,000 Plutonium pits already in storage and the ability to add 20 per year to this inventory, why does the government need a new Chemistry and Metallurgy Research Building (CMRR) to build 80 plus Plutonium pits per year?

Common sense, in my opinion, would suggest that a new CMRR is not needed.

Especially since, the new enemy facing the security of our country is our national debt. Please pray on this issue. Help our country balance our budget with sound finical decisions in order to control the national debt if not for us then our grandchildren and great grandchildren.

345-1

Our prayers are with you on this issue.

Paul Helbling

kandpinohio@embarqmail.com

345-1 NNSA notes the commentor's concern that the CMRR-NF may not be needed, and concerns about pit production and funding priorities. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 346: Rose Bernadette

6-16-11

Mr. John Tegtmeier

I am strongly concerned for our nations protection, peace and economic growth.

In relation to the CMRR project I am asking that this project be cancelled. There needs to be a study of LANL's plutonium + infrastructure should be required including existing + future capability needs + cost retaining + upgrading safety features at the existing CMR. Thank You Rose Bernadette

346-1

346-1 NNSA notes the commentor's opposition to the CMRR-NF project. NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Commentor No. 347: Pat Prunty

6/19/11

Mr Tegtmeier,

I am writing you to request that the CMRR project be canceled, a study of LANL's plutonium infrastructure be required, and a realistic cost study for maintaining and upgrading safety features at the existing CMR be determined.

347-1

I am very concerned about increasing our nuclear arsenal, the cost of building and maintaining nuclear weapons, and the long range effect they have on the land, people and our global image. My appeal comes from a need to support the position of America as a global leader in humanitarian issues. I feel we can be much more involved as peacemakers than we are.

Sincerely,
Pat Prunty, pbom

347-1 NNSA notes the commentor's opposition to the CMRR-NF project. NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the U.S.'s nuclear weapons stockpile can continue to be managed safely. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and

Commentor No. 347 (cont'd): Pat Prunty

to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

June 16, 2011

Dear Citizen:

I am writing in concern about the CMRR project.

It is my observation and research that says in conscience that the CMRR project should be cancelled.

We have examples in Japan, Hermoshima and Russia of the devastation of nuclear bombs.

Lets us not be so irresponsible as to repeat fatal acts of history.

348-1

Sincerely,

Angeline Walczyk

Angeline Walczyk

348-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The commentor's concern that an accident similar to that which occurred in Japan and Russia is addressed in Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 349: Doug Doran

JOHN,

PLEASE NOTE I'VE SENT MY ORIGINAL FORM TO THE PRESIDENT FIRST FOR HIS REVIEW AND (POSSIBLY COMMENT) I'VE ASKED THAT HE THEN SEND IT TO YOU

IN AN EFFORT TO COMPLY WITH YOUR SUBMISSION DATE OF JUNE 28TH I'VE SENT YOU THIS COPY OF MY COMMENTS WITH THE REQUEST THAT YOU ALLOW FOR POSSIBLE SLIGHT DELAY ON THE ARRIVAL OF THE ORIGINAL.

THANK YOU FOR YOUR UNDERSTANDING ON THIS

—Doug

1. What comments do you have on the Draft SEIS?
¿Que comentarios tiene usted sobre el Draft SEIS?

I PICKED UP THIS COMMENT FORM AT THE PUBLIC HEARING ON MAY 26th IN THE JEMEZ ROOM AT SANTA FE COMMUNITY COLLEGE AND IN THE DAYS SINCE THEN HAVE BEEN PONDERING OVER HOW TO BRIDGE THE CHASM BETWEEN MY TRUE POSITION ON THE OVERALL PROJECT AND THE LIMITED COMMENTARY SET UP IN QUESTION 1, ABOVE, TO DO SOLELY WITH THE DRAFT SEIS. ACCORDING TO THE RANGE IN QUESTION 1., AS I UNDERSTAND IT, YOU WOULD NOT BE REQUIRED TO ENTERTAIN MY COMMENTS IF THEY FELL OUTSIDE THE PARAMETERS OF THE DRAFT SEIS. IF THIS IS THE CASE, THEN IT LEAVES ME IN THE DIFFICULT POSITION OF TRYING TO SATISFY BOTH THE OVERALL CONCERNS I HAVE AND, I PRESUME, YOUR INTEREST IN MY COMMENTS TO DO WITH THE PART OF THE CONCERN CALLED THE DRAFT SEIS. IN OTHER WORDS TO EXPRESS MYSELF IN WORDS WHICH ANSWER QUESTION 1. BUT ALSO ALLOW FOR THE EXPANSION OF THOUGHT WHICH I BELIEVE MY TRUE POSITION MIGHT REQUIRE. THE WAY IT'S SET UP I'M ASKED TO LIMIT MY COMMENTS TO THE STRICTLY TECHNICAL DATA COMPILED AND MADE PUBLIC ON APRIL 22ND OF THIS YEAR. I MUST LOOK AT THINGS STRICTLY FROM THIS POINT OF VIEW OR RUN THE RISK OF BEING IGNORED BY THOSE CHARGED WITH REVIEWING MY COMMENTARY. SO, IT APPEARS, I MUST FIRST ASK MYSELF IF I'M CAPABLE OF ANSWERING QUESTION 1. BY PROVIDING YOU WITH MY COMMENTARY. THE ANSWER I COME UP WITH IS, I DON'T KNOW.

RHETORICALLY, I MUST WONDER IF THE SCOPE OF QUESTION 1

(CONT. OVER)

Commentor No. 349 (cont'd): Doug Doran

PAGE 2.

(CONT FROM REVERSE SIDE.)

WHICH REQUIRES ME TO RESTRICT MY INPUT BETRAYS A BIAS YOU MAY HOLD TO DO WITH THE SUBJECT OF THE DRAFT SEIS FOR THE NUCLEAR FACILITY PORTION OF THE CHEMICAL AND ME~~T~~ALLURGY RESEARCH BUILDING REPLACEMENT PROJECT AT LOS ALAMOS NATIONAL LABORATORY, LOS ALAMOS, NEW MEXICO? A BIAS WHICH WOULD OTHERWISE BE DIFFICULT IF NOT POSSIBLE TO DETECT? ON THE OTHER HAND, QUESTION ONE'S LIMITED SCOPE COULD IMPLY A DOUBT, OR DOUBTS, THE DESIGNERS THEMSELVES MAY HAVE AS TO THE VIABILITY OF THE OVERALL PROJECT? DOUBTS THEY'D BE LOATHE TO ADMIT TO ANYONE MOST ESPECIALLY THEMSELVES? DOUBTS, PERHAPS, ABOUT CONCERNS WHICH DON'T APPEAR WITHIN THE DRAFT SEIS BECAUSE THEY MUST BE SUPRESSED IN ORDER FOR THE PROJECT TO GO FORWARD?

SO IT COULD BE SAID THIS COMMENT FORM IS NOT SO MUCH TO DO WITH MY COMMENTS TO BE IN ACCORD WITH THE FORM'S GUIDELINE, BUT WITH COMMENTS I MUST SUPPRESS TO BE IN ACCORD WITH QUESTION 1. IN OTHER WORDS NOT THE COMMENTS I HAVE, BUT THE COMMENTS I'M REQUIRED TO NOT HAVE.

AGAIN, RHETORICALLY, WOULD RAISING DOUBTS AROUND THE ORIGINS OF QUESTION ONE BE PROVIDING COMMENTS I HAVE ON THE DRAFT SEIS? GRANTED, THEY MAY NOT BE IN AN ORTHODOX OR EXPECTED MANNER, BUT BY QUESTIONING POSSIBLE HIDDEN MOTIVES IMPLIED IN THE GUIDELINE OF THE FORM, WOULD THE COMMENTOR BE SAFE IN ASSUMING SUCH COMMENTS WOULD BE TAKEN INTO CONSIDERATION?

349-1 cont'd

IF SO, I THINK WE COULD LOOK AT THE DRAFT SEIS FROM A DIFFERENT PERSPECTIVE THAN MAY OR MAY NOT HAVE BEEN INTENDED BY DESIGNERS WHO MAY OR MAY NOT BE DARING TO HARBOR DOUBTS WHICH ARE DIRECTLY CONNECTED TO THE DRAFT SEIS BUT MAY OR MAY NOT FALL WITHIN THE BOUNDARIES OF QUESTION ONE.

A DIFFERENT PERSPECTIVE. ONE FROM WHICH DOUBTS AND BIAS DON'T NEED TO BE HIDDEN, BUT CAN BE LOOKED AT AND EXPLORED FOR ALL THEY'RE WORTH. A DIFFERENT PERSPECTIVE WHICH COULD WELL LEAD TO A FAR MORE COMPREHENSIVE DRAFT SEIS THAN THE ONE RELEASED ON APRIL 22ND.

I'M NOT SEEKING SPECIAL CONSIDERATION HERE. I'M ATTEMPTING TO BRIDGE A CHASM BETWEEN PERSPECTIVES, TO PERSUADE YOU THAT MINE IS AS VALID AS YOURS AND, THEREFORE, WORTH CONSIDERING.

THIS MUCH IS CERTAIN, I'M LESS THAN CONVINCED THAT THE DRAFT IS EQUALS NUCLEAR SECURITY. I ASSUME THAT'S ITS BOTTOM LINE

349-2

(CONT. ON PAGE 3.)

349-2 The purpose of a NEPA document, such as the *CMRR-NF SEIS*, is to "insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken" (40 CFR 1500.1(b)).

NNSA is fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*). See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 349 (cont'd): Doug Doran

(CONT. COMMENTS DRAFT EIS FROM PAGE 2.) PAGE 3.

PURPOSE, TO SATISFY LAY CONCERNS RELATED TO NUC-
LEAR SECURITY. IF MY ASSUMPTION ON THE PURPOSE
OF THE DRAFT IS CORRECT THEN THE DOCUMENT* SIMPLY
FAILS TO PASS MUSTER. ANYONE WITH A MEASURED OVER-
VIEW WOULD AGREE WITH ME ON THIS, I THINK.
AS IS SAID, THE DEVIL IS IN THE DETAILS AND IN THE
CASE OF THE DRAFT SEIS, THE DETAILS ARE QUESTIONS RAISED
WHICH REMAIN TO BE ANSWERED. IN ONE RESPECT WHAT WE
SEEM TO HAVE GOING ON HERE IS A RELUCTANT COLLAB-
ORATION UNDER THE AUSPICES OF NEPA BETWEEN
THE DESIGNERS AND THE TREE HUGGERS, IF I MAY BORROW
FROM THE VERNACULAR. NEITHER SIDE AGREES WITH THE
OTHER WHEN IT COMES TO THE MEANING OF THE TERM
'NUCLEAR SECURITY' BUT BOTH ARE REQUIRED BY LAW TO
WORK SOMETHING OUT. SO THERE'S A LOT OF BACK
SERIOUS CONCERNS HAVE BEEN
AND FORTH ON THE SUBJECT ~~AND WELL THERE SHOULD BE~~
RAISED TO DO WITH THE GEOLOGICAL STABILITY OF THE ~~???~~ BUILDING
~~CONSIDERING THE CONSEQUENCES OF A MISCALCULATION.~~
SITE. THE TREMENDOUS WEIGHT OF THE PROPOSED BUILDING ?
THIS LEADS ME TO COMMENT THAT THE VALUE OF THIS PRO-
CESS CANNOT BE OVERESTIMATED. ITS TRANSGENERA-
TIONAL, TRANSCULTURAL. IT IS PSYCHOLOGICAL. 349-2 cont'd

A., IF YOU'VE READ THIS FAR I SUPPOSE YOU CATCH MY
DRIFT AND, B. I COULD GO ON AND ON. AND THEN ON SOME
MORE FOR ANYONE LEFT IN THE ROOM. AND MAYBE SOMEDAY
IT WILL BE NECESSARY FOR ME TO DO THAT.
SO TO CLOSE, THE DRAFT SEIS WHICH IS THE SUBJECT
OF THIS BRIEF ELABORATION SHOULD BE WITHDRAWN BE-
CAUSE IT FALLS WOEFULLY AND IRREPAIRABLY SHY OF MEET-
ING WITH, NOT MY CRITERION (THOUGH IT DOESN'T) BUT WITH
ITS OWN CRITERION WHICH IS TO ESTABLISH BEYOND
ANY DOUBT A SENSE OF NUCLEAR SECURITY. AS MUCH
IS IMPLIED IN QUESTION 1 WHICH SOLICITS MY COM-
MENTS 349-3

NOW AS FAR AS I CAN TELL THERE'S NO LEGAL REQUIRE-
MENT FOR YOU TO PROVIDE ME WITH YOUR COMMENTS
ON MY COMMENTS. BUT IF YOU'RE INCLINED TO PLEASE
DON'T HESITATE FOR I'M ALSO AWARE OF NO REASON
YOU COULD NOT LEGALLY DO THAT. 349-1 cont'd

~~-END OF DOUG'S COMMENTS ON THE DRAFT SEIS~~
~~SANTA FE, N.M.~~ *STATEMENT (CONT.)

349-3 See the response to comment 349-2. In addition, it should be emphasized that the purpose and need is to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*).

Commentor No. 349 (cont'd): Doug Doran

PAGE. 4

~~CONT~~ VALID CONCERNS. OTHER SERIOUS QUESTIONS HAVE BEEN RAISED OVER THE VULNERABILITY OF THE ~~BUILDING~~ REPLACEMENT BUILDING TO ATTACK. THIS IS AN AREA OF CONCERN WHICH DEMANDS MUCH FURTHER CONSIDERATION THAN APPEARS IN THE DRAFT SEIS. THE OFFICIAL CALCULATIONS TO DO WITH THE PROBABILITY RATIO APPEAR TO BE DANGEROUSLY FLAWED IN THEIR ESTIMATION WHICH, GIVEN THE EXTREMELY HIGH VALUE OF THE TARGET TO AN ENEMY, COULD BE INTERPRETED AS A CHIP ON THE SHOULDER. ONE WOULD WONDER AS TO THE WISDOM OF SUCH WILD EYED BRAVADO. ANY SECURITY HERE? ~~HYSTERIA~~ 349-4

THEN WE HAVE THE ISSUE OF THE HUGE INCREASE IN THE AMOUNT OF WATER THE DRAFT SEIS ESTIMATES WILL BE NEEDED. I UNDERSTAND PLANS ARE BEING MADE TO PUMP WATER OFF THE DIVERSION PROJECT TO MEET THE DEMANDS OF THE PROJECT. TO MY KNOWLEDGE THIS IDEA WAS NEVER DISCUSSED DURING THE PLANNING PHASE OF THE RIVER DIVERSION. IF IT HAD BEEN THERE CAN BE LITTLE DOUBT IT WOULD HAVE BECOME A VERY SERIOUS ~~ISSUE~~ AND CONTROVERSIAL ISSUE. WHICH SHOULD BE ADDRESSED 349-5

ON THIS POINT WE COME TO ANOTHER POTENTIAL PROBLEM CONNECTED TO THE LARGE AMOUNTS OF WATER DESIGNED TO BE STORED INSIDE THE BUILDING TO BE USED IN CASE OF FIRE. THIS INDICATES THE POSSIBILITY OF ACCIDENTAL FIRE IS REAL. THE WATER IS THERE FOR SAFETY, AND THE WATER USED TO PUT OUT THE FIRE CANNOT BE RETURNED TO ITS STORAGE TANK AFTER IT'S BEEN USED TO PUT OUT THE FIRE. THE WATER DRAINS OFF INTO THE GROUND BELOW THE REPLACEMENT BUILDING FURTHER UNDERMINING THE ABILITY OF THE GROUND TO SUPPORT THE WEIGHT OF THE BUILDING. 349-6

SO IF THE DRAFT SEIS OVERLOOKS OR UNDERESTIMATES THE PROBLEMS RAISED BY THESE CONCERNS WHICH APPEAR ON THE HEARING RECORD IN MUCH GREATER DETAIL THAN I PROVIDE HERE, ONE MUST WONDER WHAT OTHER POTENTIAL PROBLEMS REMAIN YET TO BE CONSIDERED. ANY SECURITY HERE? I THINK NOT. IN FACT IT'S EASIER TO SAY THE OVERSIGHTS CONTAINED WITHIN THE DRAFT SEIS DO NOTHING BUT GENERATE INSECURITY WHICH OPENS THE DOOR TO STATES OF MIND LESS THAN SUITABLE TO MANAGE/CREATE PLUTONIUM SAFELY. <u>PERSONALLY I'M CONVINCED THE DESIGNERS ARE AWARE OF THIS TRUTH BUT ARE NOT OR PERCEIVE THEMSELVES NOT TO BE IN A POSITION TO OPENLY EXPRESS THIS.</u> THE DRAFT SEIS ALSO FAILS TO TAKE INTO CONSIDERATION THE EFFECTS SUCH THOUGHT SUPPRESSION HAS ON THE MIND SET OF THOSE CHARGED WITH MAKING SURE THE PROJECT MEETS WITH ITS GOAL OF PROVIDING NUCLEAR SECURITY. EVIDENCE OF THE EFFECTS OF SUCH THOUGHT SUPPRESSION ARE ALL AROUND US. ASKING BRILLIANT MINDS TO BREAK THEMSELVES TRYING TO FIT A SQUARE INTO A CIRCLE. IN FACT NUCLEAR SECURITY ITSELF IS NOTHING MORE THAN EVIDENCE OF AN ILLUSION. 349-7

AND THIS BRINGS US FACE TO FACE WITH MY TRUE POSITION ON THE OVERALL CONCERN WHICH, ACCORDING TO QUESTION 1, I'M REQUIRED NOT TO HAVE.

SO TO SUSTAIN THE ILLUSION WE MUST FIND WAYS TO SUPPRESS THE AFFECTS OF HAVING TO SUPPRESS CONCERNS THAT ARE SIMPLY TOO REAL FOR THE ILLUSION TO TOLERATE. AND NEPA CALLS FOR THE EXPRESSION OF SUPPRESSED THOUGHTS. NEPA REQUIRES THAT WE BE SANE. NEPA REQUIRES THAT WE NOT BECOME TRAPPED IN AN ILLUSION. NEPA EMPOWERS US TO SPEND 6 BILLION DOLLARS ON, SAY, RESTORING A RUINED WATERSHED* THROUGHOUT NORTHERN NEW MEXICO. THANKS DAVID, NEPA TURNS US ON. NEPA EQUALS SECURITY.

END OF COMMENTS.

*INSTEAD OF ON THE REPLACEMENT BUILDING.

349-4 Chapter 4, Section 4.2.10.3, Intentional Destructive Acts, of the *CMRR-NF SEIS* discusses scenarios such as terrorist attacks. These types of acts were analyzed as part of a classified appendix. Although the results of the analyses cannot be disclosed, the following general conclusion can be drawn: the potential consequences of intentional destructive acts are highly dependent on the distance to the site boundary and the size and proximity of the surrounding population; the closer and denser the surrounding population, the higher the consequences. In addition, it is generally easier and more cost-effective to protect new facilities because new security features can be incorporated into their design. In other words, the protective forces needed to defend new facilities may be smaller due to the inherent security features of a new facility. New facilities can, as a result of design features, better prevent attacks and reduce the impacts of such attacks.

349-5 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL. There are no plans to use water from the proposed San Juan/Chama transmountain diversion project for the CMRR-NF

349-6 The commentor is correct that the design of the Modified CMRR-NF includes tanks for fire suppression water. This is one of many prudent safety measures incorporated into the building design. Fires are not expected to occur, but the hazard must be anticipated and appropriately managed. If a fire were to occur in the CMRR-NF, the fire suppression water would be managed to ensure that it does not create additional hazards.

349-7 Comment Noted.

Commentor No. 350: Bob Walsh

July 5, 2011

Mr. John Tegtmeier
U.S. DOE/NNSA
Los Alamos Site Office

Los Alamos, New Mexico, 87544
by email to: nepalaso@doeal.gov

In a later dated June 2, 2011, I commented on the *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico,* DOE/EIS-0350-S1, April 2011 (Draft SEIS). The recent Las Conchas wildfire stimulated a few hours in further contemplation of Chapter C, Evaluation of Human Health Impacts from Facility Accidents. I now submit these supplementary comments and would appreciate their serious consideration by the National Nuclear Security Administration (NNSA). I look forward to the agency's comprehensive response.

This letter contains five supplementary comments on Chapter C. The first four comments address specific technical issues, specifically volcanism, wildfires, economic impact, and sources for parameters used in analyses. The final comment expands on my earlier request for independent technical review of the Draft SEIS.

<u>Supplementary Comment 1. Volcanism.</u>
Section C.3 states that the selection and evaluation of accidents was based on the Nonreactor SAR Preparation Guide. In that guide, Section 3.4 states, "External events … will be … analyzed … if frequency of occurrence is estimated to exceed 10^{-6}/yr conservatively calculated, or 10^{-7}/yr realistically calculated…. The analysis that substantiates frequency need only be referenced."

According to Wikipedia articles on "Valles Caldera" and "Jemez Mountains," there have been at least two major eruptions in the region within the last two million years, at least one of which is considered a "supervolcano," in a class with the Krakatoa event. Please include in the EIS an explanation of why the possibility of an eruption in the Jemez Mountains is omitted from the accident analysis. *350-1*

<u>Supplementary Comment 2. Wildfires.</u>
In Section C.3.3 of the Draft SEIS, it appears that the only fires considered are those that are ignited within the facility. Events of the last forty years show that the 10-year wildfire in the Jemez area is a very significant event. Prehistoric wildfires are more difficult to estimate than prehistoric volcanism. How bad is the 100-year wildfire, the 1000-year wildfire, the 10,000-year wildfire? *350-2*

350-1 DOE NEPA guidance for evaluation of accidents differs from DOE guidance for preparation of Documented Safety Analyses but still requires consideration of low-probability and potentially high-consequence events. The goals of the two processes are different. In DOE's current safety analysis process, the goal is to ensure that adequate controls are in place to protect the public from a range of accidents. For EISs, DOE NEPA guidance requires that EISs consider enough accidents to give both the public and the decisionmakers an understanding of the potential accident risks associated with the proposed action and the reasonable alternatives. In the case of the CMRR-NF and the CMR Building, the existing safety analyses systematically consider a wide range of potential hazards and then select accidents that would bound the potential impacts and identify controls that would prevent or mitigate those accidents. For natural phenomena-initiated accidents, severe seismic events are considered much more likely and threatening than a major volcanic event that would threaten the integrity of the CMRR Facility. The safety analyses consider the potential impacts of events such as seismic collapse with no controls to prevent release of radioactive materials, and then the effects of various controls, such as HEPA filters, in preventing those releases.

The accidents reported in the *CMRR-NF SEIS* are based on the extensive safety analyses that have been prepared for both the existing and proposed nuclear facilities. The accidents presented in the SEIS result in conservative estimates of the potential risk from each of the alternatives.

In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapter 3 and 4 (Sections 3.5.1 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). A volcanic eruption during the life of the CMRR-NF is an unlikely event. A variety of volcanic phenomena could occur as a result an eruption with a dispersion of a large ash cloud likely to affect a large area of the region. As discussed in Appendix C, such an event would have consequences that are represented by other accidents analyzed in the SEIS.

350-2 The Documented Safety Analyses upon which the accidents reported in the SEIS are based consider a wide range of accident initiators, including wildfires. Wildfires are expected events; however, except for the Cerro Grande Fire in 2000, the impact of wildfires on LANL facilities has been minimal. Even the Cerro

Commentor No. 350 (cont'd): Bob Walsh

What is the potential for a fire that completely surrounds the laboratory area, requiring evacuation of all personnel? Such a fire might have multiple ignitions, such as a major lightning storm with little rain, or an earthquake that downs multiple power lines, or deliberate action by an anti-nuclear psychopath.

Can the analysis be conservative without considering that an exceptionally large wildfire might result in a firestorm, or even a fire swirl? Consider the 1923 Great Kanto event.

350-2 cont'd

Supplementary Comment 3. Economic Impacts
It appears from a scan of Section C of the Draft SEIS that it does not mention economic impacts, such as the impact of a required evacuation of a neighboring community. If the considered accident scenarios would have no economic impact (other than would have resulted without the presence of LANL), that should be stated in the document.

350-3

Supplementary Comment 4. Sources for Parameters
I accepted an electronic copy in lieu of a printed copy of the Draft SEIS, expecting a 21st Century technology, including links to sources. Not only are such links absent, but Section C.4 presents the parameters used in the risk calculations without page citations and in most cases without any indication of the uncertainty in the parameter. Page C-5 lists more than one document as the source for a particular type of parameter; there is no indication of which source is linked to an individual parameter.

For example, the last paragraph of page C-6 states, "The released respirable fraction (airborne release fraction times respirable fraction) is estimated to be 0.00025 for metal ..." By providing this parameter with two significant digits, the uncertainty is implied to be on the order of 10%, which seems suspicious.

For airborne release fraction, as for respirable fraction, page C-5 lists three references: LANS 2011a, 2011b, and DOE 1994. Of these, only DOE 1994 shows a URL in the reference list. Today, that URL has timed out every time I attempted to access it; however, I was able to access it at:
http://www.orau.gov/ddsc/dose/doehandbook.pdf
Section 4.2.1.1.3 covers the situation of self-sustained oxidation of plutonium above the ignition temperature and indicates that there is great uncertainty. The final sentence suggests bounding values of 0.0005 and 0.5. Other sections cover other conditions with other bounding values. Section 4.2.1.1.4 considers a disturbed molten metal surface with high turbulence, with bounding values of 0.01 and 1.0.

It appears that the value given on page C-6 is based on Section 4.2.1.1.3. If so,
1. The value should be stated as 0.0003 to avoid implying small uncertainty.
2. It should be stated that this is a bounding value, not an estimate.

350-4

Grande fire did not impact the CMR Building or the TA-55 Plutonium Facility due to the design of the facility and lack of combustible vegetation near either facility.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in Appendix D of the 2008 *LANL SWEIS* (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are primarily constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials, including vegetation, are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Wildfires are considered a design-basis threat and the design and safety features for the proposed CMRR-NF would mitigate the propagation of the fire to the loading dock and the external building structure. The controls that would be present to mitigate fires following a design-basis earthquake would also provide adequate protection for other fire initiators, such as a wildfire and lightning-induced fire. In those cases, the structure provides the first and perhaps, most significant control in the line of defense for the nuclear material in the facility. The structure prevents a wildfire from entering the facility and provides protection against fires initiated by lightning. No additional controls are necessary beyond those identified in the design-basis earthquake. The safety controls include the requirement that the building exterior boundary walls and slabs be designed to maintain structural integrity during wildfires.

A specific analysis of wildfires was not reported in the *CMRR-NF SEIS* because much more severe fires could be initiated by other means, such as process events and earthquakes. These are reported in the SEIS. The discussion in the SEIS has been expanded to discuss the wildfire threat and why the threat to the facilities discussed in the SEIS alternatives is minimal.

350-3 The text in Appendix C of the *Final CMRR-NF SEIS* has been expanded to discuss some of the potential impacts on the community following a severe, beyond-design-basis earthquake. These impacts can be both societal and

Commentor No. 350 (cont'd): Bob Walsh

3. There should be justification for assuming this condition rather than "disturbed molten metal surface with high turbulence," which would increase the calculated risk by a factor of 40.

I am suspicious of other parameters presented in Section C.4, but am not adequately funded to track the sources down without proper citations to available sources. In fact, I am not funded at all.

350-4 cont'd

Supplementary Comment 5. Independent Technical Review
As noted in my previous comments, having discovered multiple oversights upon brief examination of only one section suggests that this document has not been subjected to rigorous independent review. Considering the expected public scrutiny, the quality of this Draft SEIS raises doubts about the capability of the NNSA to provide technical management. This has contributed to public concern that:

1. The operation of the facility will not be properly overseen; there are risks from mismanagement are not included in the Draft EIS.
2. This threat from mismanagement is greater than any threat in the current world political situation that could be mitigated by nuclear weapons.

The general public is neither technically qualified nor adequately funded to perform a comprehensive review. I therefore repeat my previous request for a rigorous review of this document by an independent professional organization. After that, please submit the corrected document for public comment.

350-5

Thank you for your consideration,

Bob Walsh
1553 Camino Amado
Santa Fe, NM 87505
(xxx) xxx-xxxx, walshb@cybermesa.com

economic due to potential disruptions associated with monitoring and cleanup of potentially contaminated lands.

350-4 As indicated in Appendix C, the *CMRR-NF SEIS* reports the results of extensive safety analyses performed for existing and proposed nuclear facilities at LANL. Each of the accident scenarios presented in the SEIS is supported by dozens to a hundred or more pages of analysis that supports the high-level results reported. These more-detailed analyses form the safety basis for the ongoing or proposed nuclear facility operations at LANL. For security reasons, these analyses are not available to the public but have undergone extensive review by DOE and NNSA. In addition, DNFSB, an independent government agency, reviewed the safety basis for both the existing and proposed nuclear facilities discussed in the SEIS.

The Documented Safety Analyses, upon which the accident impacts in the SEIS are based, follow the standard DOE guidance for their preparation. The accident analysis factors, such as material at risk, damage ratios, airborne release fractions, respirable fractions, and leak path factors, follow the standard DOE practice as demanded by the current safety practices for DOE facilities. As indicated in the SEIS, airborne release fractions and respirable fractions for both the safety analyses and the SEIS are based on the recommended bounding values reported in DOE Handbook 3010, *Airborne Release Fractions/Rates and Respirable Fractions for Nonreactor Nuclear Facilities*, available at: http://www.hss.doe.gov/nuclearsafety/ns/techstds/docs/handbook/hdbk301094_cn.pdf

The accidents presented in the SEIS bound the potential risk from each of the alternatives.

350-5 The Defense Nuclear Facilities Safety Board (DNFSB) is an independent organization within the executive branch chartered with the responsibility of providing recommendations and advice to the President and the Secretary of Energy regarding public health and safety issues at DOE defense nuclear facilities. In operation since in October 1989, DNFSB reviews and evaluates the content and implementation of health and safety standards, as well as other requirements, relating to the design, construction, operation, and decommissioning of DOE's defense nuclear facilities.

DNFSB has a full time, onsite representative at LANL whose responsibility is to provide an independent review of nuclear safety at LANL. This site representative prepares weekly reports on the status of safety activities at LANL and these reports are made public at http://www.dnfsb.gov/board-activities/reports/site-rep-weekly-reports. In addition, DNFSB prepares technical reports and recommendations. Safety at LANL nuclear facilities has been an area of intense oversight and review by DNFSB over the last decade and its issues and concerns have helped DOE and NNSA focus on safety issues such as the need for a replacement for the CMR Building and the need to ensure that LANL nuclear facilities can adequately protect the public even in a severe natural phenomena-initiated event, such as a severe earthquake. DNFSB reports and correspondence between DOE and DNFSB is public and is available at: http://www.dnfsb.gov/board-activities/reports.

As would be indicated by review of the DNFSB weekly reports, technical reports, recommendations, and other LANL-related DNFSB activities, the safety documents and safety processes for existing and proposed LANL nuclear facilities have undergone intense, detailed scrutiny. This level of independent review is comparable to the independent review provided by NRC for nuclear power plants.

Re: **Santa Clara Pueblo's Comments on *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory* (DOE/EIS-050-S1)**

Dear Mr. Tegtmeier:

Santa Clara Pueblo submits the following comments on the *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory* ("CMRR-NF DSEIS").

Although the CMRR-NF DSEIS states that the agency proposing the action is the National Nuclear Safety Administration ("NNSA"), because the NNSA is part of the U.S. Department of Energy ("DOE"), with which Santa Clara Pueblo enjoys a formal government-to-government relationship, we trust these comments will be respected as part of our government-to-government relationship with the DOE. As you know, that relationship is formalized not only in the DOE Order 144.1 (approved January 16, 2009) and the DOE American Indian and Alaska Native Tribal Government Policy ("DOE Indian Policy") but also more specifically through an Accord developed in 1992 directly between our Pueblo and the DOE which was restated and reaffirmed by both governments in 2006 ("2006 Accord").

As you may also know, Santa Clara Pueblo has gone on record in recent years objecting to any

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr. Santa Clara Pueblo

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 2

attempt by the DOE/NNSA to increase and make permanent plutonium pit production at Los Alamos National Laboratory ("LANL"). *See, e.g.*, Santa Clara Pueblo Tribal Council Resolution No. 08-16, *Supporting the Submission of Comments for Santa Clara Pueblo to the Department of Energy regarding the Complex Transformation Draft Supplemental Programmatic Environmental Impact Statement* (May 20, 2008). The Tribal Council has opposed expanding plutonium pit production at LANL when the impacts on the environment from sixty years of contamination at LANL still have not been adequately addressed. We thus are concerned about any "back door" attempt to increase pit production and address those concerns here in our comments on the CMRR-NF DSEIS.

First, however, we begin our comments with some background information regarding Santa Clara Pueblo and then follow with specific comments regarding the CMRR-NF DSEIS. While we appreciate the fact that the DOE and NNSA are finally acknowledging the considerable seismic risks that exist at LANL which would need to be taken into account in the design of a facility where special nuclear material would be handled and stored, we believe the analysis in the CMRR-NF DSEIS is incomplete and therefore fatally flawed. A revised draft supplemental environmental impact statement or an entirely new environmental impact statement should be issued with an opportunity for review and comment by the public and with proper government-to-government consultation with Santa Clara Pueblo.

Although our comments focus on very specific aspects of the National Environmental Policy Act ("NEPA") which we believe the NNSA has not properly followed, please bear in mind that this is no sterile regulatory matter for Santa Clara Pueblo. The Pajarito Plateau, where LANL is situated, contains many areas of traditional importance to the Santa Clara Tribal community. Environmental degradation of this place that is profoundly holy to the Santa Clara community affects the cultural survival of Santa Clara Pueblo.

I. Overview regarding Santa Clara Pueblo

Santa Clara Pueblo is a federally-recognized Indian tribe located in northern New Mexico, approximately twenty-five (25) miles northwest of the City of Santa Fe. Much of the City of Española, approximately one (1) mile to the west of our Tribal government offices, actually is located within the exterior boundaries of Santa Clara lands. While our Tribal offices are approximately eighteen (18) miles away from LANL, our closest border is actually only about five (5) miles from the current-day boundaries of LANL. In fact, early maps reveal that LANL once shared a boundary with Santa Clara Pueblo and that the area now located between LANL and Santa Clara was once referred to as "Area E." Our traditional lands include lands taken for the Manhattan Project.

While we always will emphasize the need for DOE to respect its government-to-government relationship with the Pueblo, Santa Clara Pueblo is not only a government in some bureaucratic

sense of the word. In the broader cultural sense, we are also an Indian community of people, a society unto ourselves numbering less than a few thousand, distinct from every other Indian community in our traditions. We have similarities with the other Pueblos in New Mexico, especially those who also speak our Tewa language, but we are a separate sovereign Indian nation, recognized as such over the past 400 years by three different sovereign governments – Spain, Mexico, and the United States of America. Tribal leaders at Santa Clara Pueblo still carry the canes presented to our ancestral leaders by the Spanish and Mexican governments, as well as a similar cane presented by President Abraham Lincoln after New Mexico was annexed by the United States. Tribal protection and management of our natural resources along our ancestral homelands in the Jemez Mountains, Pajarito Plateau, and Rio Grande Valley began many thousands of years ago, long before the Spanish, Mexican, or American periods of our history.

The modern-day boundaries of our Pueblo include over 53,000 acres of land. This acreage figure includes some of our traditional lands that we have fought to regain but does not encompass all of our aboriginal territory. Many of the various vegetative communities and the innumerable wildlife species they support have significant traditional and spiritual value to us as a people. The Pajarito Plateau contains many areas of cultural importance to our people and our cultural practices connected to these areas continue to this day.

II. The CMRR-NF DSEIS does not take into account new information since the Complex Transformation Supplemental Programmatic Environmental Impact Statement ("SPEIS") Record of Decision was issued, which skews the entire NEPA analysis

A. New information since the Record of Decision was issued for the Complex Transformation SPEIS affects the Purpose and Need for the CMRR-NF DSEIS

In the CMRR-NF DSEIS, the NNSA proposes to complete the Chemistry and Metallurgy Research Building Replacement ("CMRR") Project at LANL by constructing a new nuclear facility portion ("CMRR-NF") of the CMRR Project to provide the analytical chemistry and materials characterization capabilities currently or previously performed in the existing, but now aged, Chemistry and Metallurgy Research ("CMR") Building. NNSA completed an environmental impact statement for the CMRR Project in 2003 and received a Record of Decision ("ROD") in 2004 to build the CMRR-NF at LANL Technical Area ("T.A.") 55. However, as indicated in the CMRR-NF DSEIS, since 2004, safety and seismic concerns associated with the CMRR-NF have caused the NNSA to reevaluate the design for the CMRR-NF. *See* CMRR-NF DSEIS at iv.

NNSA has indicated that the "scope of operations remains the same as before," meaning the scope of operations for the CMRR-NF discussed in the current document remains the same as it

351-1

351-1 NNSA notes the commentor's objections about pit production at LANL and the adequacy of the SEIS. The need for the CMRR-NF is not connected to a specific level of operations. The CMRR-NF is not expanding capabilities that have historically been undertaken in the CMR Building; it is replacing the CMR Building capabilities because the CMR Building is not being operated to the full extent needed to meet DOE and NNSA operational requirements because of the need to comply with safety requirements. The CMRR-NF would be designed to meet all safety requirements necessary to undertake its mission.

As a result of comments received on the *Draft CMRR-NF SEIS*, Chapter 2, Section 2.7, Alternatives Considered but Dismissed, has been revised to describe alternatives that were considered but dismissed as not meeting NNSA's purpose and need. The alternative of distributing analytical chemistry and materials characterization capabilities among multiple facilities at LANL was considered, but not analyzed as a reasonable alternative. Because of the quantities of special nuclear material involved, to fully perform the AC, MC and plutonium research capabilities, facilities would need to be classified as Hazard Category 2 and Security Category 1. RLUOB was not intended as a nuclear-qualified space to handle Hazard Category 2 or 3 levels of nuclear material. Thus, NNSA would not operate the building as anything other than a radiological facility, which would significantly limit the total quantity of special nuclear materials that could be handled in the building. As a result, analytical chemistry and materials characterization operations requiring Hazard Category 2 and 3 work spaces could not be carried out in RLUOB. Using space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work. Use of other locations at LANL would introduce new hazards for which the facilities were not designed and would not conform to the objective of collocating plutonium operations near the TA-55 Plutonium Facility. Performing work at a location remote from the TA-55 Plutonium Facility would necessitate periodic road closures and heightened security to enable transport of materials between the facilities. In addition, other facilities would not have the available space, vaults, and engineered safety controls and requirements for this type of work. For more information on this issue refer to Section 2.11, Alternatives Considered, of this CRD.

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr. Santa Clara Pueblo

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 4

was in the 2004 ROD for the facility, and thus consequently this current draft supplemental environmental impact statement only addresses "structural aspects and not its purpose." *See id.* at v. Indeed, the NNSA is rather emphatic in the CMRR-NF DSEIS that "[t]he purpose and need for NNSA action has not changed since issuance of the 2003 CMRR EIS" and that the "NNSA is not planning to revisit either the need for the CMRR-NF or locating the facility at another site." *Id.* at S-8, S-14, and 1-9. The NNSA also emphasized in the CMRR-NF DSEIS that the "[p]it production does not take place at the [current] CMR Building and would not take place in any CMRR facility." *Id.* at S-5, 1-7, and 2-6.

For part of its rationale as to why the purpose of the CMRR-NF has not changed, the NNSA appears to rely on the Complex Transformation SPEIS ROD. *See id.* at S-2 and 1-3. The CMRR-NF DSEIS states that, in the ROD for the Complex Transformation SPEIS, "NNSA announced its decision" that the mission of "manufacturing and research and development involving plutonium" would remain at LANL and that, in the ROD, the NNSA had reaffirmed its decision to construct and operate the CMRR-NF at LANL. *See id.* at 1-19.

A closer look at the Complex Transformation SPEIS ROD, however, reveals that there is new information that has occurred since the issuance of that ROD which does not appear to be properly reflected in the CMRR-NF DSEIS.

While it is true that the Complex Transformation SPEIS ROD did decide that manufacturing and research and development involving plutonium would remain at LANL and that the CMRR-NF would be constructed at LANL to replace portions of the aging CMR facility, the Complex Transformation SPEIS ROD explains that:

> NNSA will continue design of a CMRR-NF that would support a *potential* annual production (in LANL's TA-55 facilities) of *20-80* pits. The design activities are sufficiently flexible to account for changing national security requirements that *could result from* a new Nuclear Posture Review, further changes to the size of stockpile, or future Federal budgets.

73 Fed. Reg. 77648 (Dec. 19, 2008) attached in Appendix A to CMRR-NF DSEIS (emphasis added).

In that ROD, however, the NNSA indicated it was "not making any new decisions regarding production capacity [beyond the authorized 20 plutonium pits per year] until completion of a new Nuclear Posture Review in 2009 or later." *Id.* As the CMRR-NF DSEIS acknowledges, a new Nuclear Posture Review was issued by the Obama Administration in April of 2010. *See* CMRR-NF at 1-4. What the CMRR-NF DSEIS does not appear to acknowledge, however, is that the new Nuclear Posture Review that was issued did *not* increase the annual production of plutonium pits from the 20 pits per year currently authorized in the ROD for the LANL Site

351-1 cont'd

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr. Santa Clara Pueblo

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 5

Wide Environmental Impact Statement. *See* 73 Fed. Reg. 33232 (July 10, 2009) attached in Appendix A to CMRR-NF DSEIS.

Thus, we have new information that has not been factored into the CMRR-NF DSEIS – namely, that there is no need to continue with an expansive design for the facility to accommodate support needs for more than 20 pits per year.[1] In other words, the purpose and need section for the CMRR-NF DSEIS must be amended to reflect this new information. *See* 40 C.F.R. §1502.9(c)(1)(ii)(indicating that agencies shall prepare a supplemental environmental impact statement when "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts").

B. <u>New information since the Record of Decision was issued for the Complex Transformation SPEIS affects the Range of Alternatives for the CMRR-NF DSEIS</u>

Of course, this new information (that, because of the 2010 Nuclear Posture Review, the design for the CMRR-NF need not be so expansive to support increased pit production capabilities as was stated in the 2008 Complex Transformation ROD) not only affects the purpose and need for the CMRR-NF, it also affects the range of reasonable alternatives that must be discussed in the CMRR-NF DSEIS. It is the purpose of an action which determines the universe of alternatives an agency must consider. *See id.* at §1502.13. While courts will defer to agency expertise, agency discretion in forming and evaluating alternatives is not unlimited. The agency still must exercise its discretion in a manner which is reasonable, especially taking into account the facts of the situation and the important goals of informed decision-making and protection of the environment found in NEPA. As the Council on Environmental Quality has emphasized in its NEPA regulations, the identification and evaluation of alternative ways of meeting the purpose and need of the proposed action is the "heart of the environmental impact statement" and the agency must "[r]igorously explore" all reasonable alternatives. *Id.* at § 1502.14.

Simply put, the CMRR-NF DSEIS does not present a reasonable range of alternatives in accordance with the mandates of NEPA. The NNSA readily admits that two out of the three alternatives it currently analyzes are unworkable, which automatically tilts the analysis in favor of the NNSA's preferred alternative. *See* CMRR-NF DEIS at 1-10 and 1-11 (stating that the No Action Alternative - to build the CMRR-NF as envisioned in the 2004 ROD – "could not satisfy

[1] The other two reasons given in the Complex Transformation SPEIS ROD to justify an expansive design for the CMRR-NF to support up to 80 pits per year are also equally specious. The size of stockpile will be reduced over time with the new START treaty and the trends are that Federal budgets, if anything, will be decreasing. Indeed, in recent weeks, the U.S. House Appropriations Committee reduced the amount of funding for early construction activities for the CMRR-NF by one hundred million dollars. *See* discussion in Section IV.B, *infra*.

351-1 cont'd

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr. Santa Clara Pueblo

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 6

current facility seismic and nuclear safety requirements" and therefore could not meet the purpose and need for NNSA to build the facility); *see also id.* at 1-10 and 1-13 (stating that the Continued Use of CMR Building Alternative would not meet the purpose and need for NNSA because use of the current building would have to be lessened over time due to safety concerns). Since the NNSA pronounces two of its current three alternatives as, essentially, being unsafe, this only leaves the NNSA's preferred alternative – which is to build the new CMRR-NF at T.A. 55 as originally planned but with beefed up design and construction modifications to address seismic and other safety concerns. *See id.* at 1-10.[2]

However, as discussed above, since there no longer appears to be any need for the expanded design of the CMRR-NF to provide a support function for the production of what was once contemplated to be 80 plutonium pits per year,[3] there are now other alternatives that need to be addressed and further analyzed by NNSA to meet the revised purpose and need (for design space to accommodate support for only 20 pits per year). One alternative, for instance, that appears to have been given short shrift in the analysis in the CMRR-NF DSEIS is the consolidation of CMR functions into the CMRR Project's first phase building, the newly-built Radiological Laboratory, Utility, and Office Building ("CMRR-Rad Lab"), in combination with upgrading the already existing T.A. 55 Plutonium Facility-4, which is LANL's existing pit production facility. The NNSA dismisses the ability to use the CMRR-Rad Lab because it was not built to be a "nuclear-qualified space." *See id.* at 1-20. With respect to the Plutonium Facility-4, however, the CMRR-NF DEIS simply indicates that:

> [u]sing space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work.

Id. at 2-28.

351-1 cont'd

[2] As discussed further in Section IV.B, *infra*, even the discussion of NNSA's preferred alternative is too incomplete as to meet the needs of NEPA.

[3] If there are other justifications for needing to design a CMRR-NF to support a potential annual production of 80 pits other than the Complex Transformation SPEIS ROD, those explanations are not readily apparent in the CMRR-NF DSEIS. To not provide such an explanation in a draft environmental impact statement in clear and concise terms that the public can easily ascertain renders the statement "so inadequate as to prevent meaningful analysis." 40 C.F.R. §1502.9(a); *see also* 40 C.F.R. §1500.2 (explaining the agencies shall, to the fullest extent possible, ensure that environmental impact statements are clear in order to assist the public and decisionmakers).

Response side of this page intentionally left blank.

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr. Santa Clara Pueblo

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 7

That analysis is woefully slim on substance and fails to meet the standards of NEPA to have federal agencies ensure, to the fullest extent possible, that environmental impact statements promote informed decision-making by public officials. *See* 40 C.F.R. § 1500.1(c). And, in any event, an upgraded Plutonium Facility-4 plus CMRR-Rad Lab alternative may need to be reexamined in light of the revised and updated "purpose and need" for the CMRR-NF DEIS.

We note that we continue to have concerns that the already existing Plutonium Facility-4 can be made safe enough to address seismic risks,[4] but we include this example to point out that there are a number of additional alternatives which may prove more reasonable than building a new costly facility and which must first be rigorously explored in order to comply with NEPA.

351-1 cont'd

III. NNSA must prepare a new, revised draft supplemental environmental impact statement or a whole new environmental impact statement and must consult with Santa Clara Pueblo before it is issued

There are two possible solutions for the NNSA to fix the NEPA flaws in its current CMRR-NF DSEIS. One is to issue a new, revised draft supplemental environmental impact statement:

> If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion.

40 C.F.R. §1502.9(a).

Here, of course, the portions needing updating and amending are the purpose and need and the range of alternatives analyzed.

The other solution is for the NNSA to actually issue a new environmental impact statement because enough has changed since 2004 that the analysis no longer falls into the category of simply needing supplementation. *See id.* at §1502.9(c).

In either event, when the updated, revised or new draft document is issued, government-to-government consultation with Santa Clara Pueblo regarding the revisions or additions must occur before the document is issued for additional public comment. *See* 2006 Accord at 3 ("DOE will consult with the Pueblo to assure that tribal rights, responsibilities, and concerns are addressed prior to the DOE taking action, making decisions, or implementing programs that may affect the Pueblo."). Moreover, no final supplemental environmental impact statement regarding the CMRR-NF should be issued without first consulting with Santa Clara Pueblo to ensure

351-2

[4] *See* Albuquerque Journal, "LANL's Earthquake Study 'A Big Deal'" (April 16, 2011)(discussing LANL's Seismic Analysis of Facilities and Evaluation of Risk (SAFER) Project citing potential for significant earthquake damage to the Plutonium Facility-4 structure).

351-2 NNSA does not agree that a revised *Draft CMRR-NF SEIS* or an entirely new EIS is needed to reach a decision about construction of the CMRR-NF. NNSA does, however, intend to continue to consult with Santa Clara Pueblo officials in accordance with the 2006 Accord. NNSA has determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the proposed construction changes for CMRR-NF. See Section 2.2, NEPA Process, of this CRD for more information. The alternatives considered in the *CMRR-NF SEIS* address options for the proposed construction changes. The purpose and need for the CMRR-NF are addressed in Chapter 1 of the *CMRR-NF SEIS* and in Section 2.4, CMR Mission, of this CRD. The need for the CMRF-NF is not connected to a specific level of operations. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility.

Page 8

compliance with the 2006 Accord and to ensure DOE has lived up to its commitment to "protect and promote" Tribal Trust resources in order try to avoid impacts to those resources. DOE Indian Policy at 3 (Section I). **351-2 cont'd**

IV. NNSA must consult with Santa Clara Pueblo about, and more fully address, additional concerns the Pueblo has with the CMRR-NF DSEIS

A. Transuranic and mixed waste management for a new CMRR-NF needs to be better addressed

Activities at a new CMRR-NF, as envisioned in the NNSA's preferred alternative for a modified design, would generate transuranic and mixed transuranic waste. The CMRR-NF DSEIS indicates those wastes would go to the Waste Isolation Pilot Plant ("WIPP"). CMRR-NF DSEIS at 4-58. However, the NNSA admits that disposal operations at WIPP are only currently approved through 2034 and that WIPP could meet its "statutory disposal limit before the end of the operational period of the Modified CMRR-NF." *Id.* To try to quell that concern, the CMRR-NF DSEIS simply states that "[i]f necessary, transuranic or mixed transuranic waste generated without a disposal pathway would be safely stored pending development of additional disposal capacity." *Id.* **351-3**

In other words, there is not necessarily a waste disposal pathway for the waste the NNSA is contemplating generating as part of the CMRR-NF. To continue to generate new transuranic waste, without a known disposal pathway, when LANL has yet to clean up the legacy waste it has generated, is highly irresponsible. The NNSA needs to explain to Santa Clara Pueblo how it intends to address this problem.

B. Seismic concerns, especially associated with the NNSA's preferred alternative for the CMRR-NF, need to be better addressed

The NNSA has been clear that a primary reason why this CMRR-NF DSEIS was issued was because the 2004 design of the CMRR-NF no longer would satisfy current DOE nuclear facility seismic and safety requirements. *See, e.g., id.* at S-17. Instead, the NNSA has advocated the inclusion of "certain construction enhancements and additional associated construction support activities" to ensure that a newly-designed CMRR-NF at T.A.55, as part of the NNSA's preferred alternative, would be safe. *Id.* The CMRR-NF DSEIS explains fairly clearly and concisely why new information on seismicity near T.A.55 caused the NNSA to redesign the facility, *see, e.g., id.* at 3-25, but does not seem to explain in any clear or concise way (as required by NEPA) why it still makes sense to build a facility of that type in that location given the concern expressed by NNSA about the seismicity of the location. This is especially important to do given LANL's recent "self-reporting" to the NNSA about the potential for **351-4**

351-3 NNSA intends to dispose transuranic waste from operations at RLUOB, the proposed CMRR-NF, and other LANL facilities at WIPP or a similar facility. The waste volumes projected over the 50-year life of the new facilities would require up to 12 percent of the current unsubscribed WIPP disposal capacity. Decisions about disposal of any significant quantities of transuranic waste, however, would be made within the context of the entire DOE complex. It was assumed for analysis in the *Waste Isolation Pilot Plant Disposal Phase Final Supplemental Impact Statement (WIPP SEIS II)* (DOE 1997) that transuranic waste would be received at WIPP over about a 35-year period, through approximately 2033. However, because the total quantity of transuranic waste that may be disposed at WIPP is statutorily established by the WIPP Land Withdrawal Act, the actual operational period for WIPP will depend on the volumes of transuranic waste received at WIPP from all DOE waste generators. Waste minimization efforts across the DOE complex would extend the WIPP operating period. If waste disposal capacity at WIPP is no longer available over the operating life of the CMRR-NF, then any transuranic waste generated at the CMRR-NF or elsewhere at LANL would be safely stored until additional disposal capacity becomes available. Because the issue of transuranic waste disposal affects several sites across the DOE complex, NNSA is confident that Congress would address any future need for additional transuranic waste disposal capacity in a timely manner.

351-4 NNSA does not agree that a revised *Draft CMRR-NF SEIS* or entirely new EIS is needed, and a decision on construction of the CMFF-NF need be delayed, pending the development of new seismic information. As addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD, DOE has been proactive in the assessment of the potential seismic hazards at LANL and the resulting design ground motions for the CMRR-NF reflect the best science and engineering available. As future studies are performed on the geology and seismology of LANL, there may be new information that becomes available that should be evaluated for potential impacts on the assessment of the seismic hazards.

All proposed new DOE facilities are required to be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment. DOE Order 420.1B, "Facility Safety," requires that nuclear or nonnuclear facilities be designed, constructed, and operated so that the public, the workers, and the environment are protected from the adverse impacts of natural phenomena hazards, including earthquakes. The order stipulates the natural

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr. Santa Clara Pueblo

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 9

earthquake damage for structures at T.A. 55. *See* news release, "Preliminary study assesses potential impact of seismic event at Los Alamos," at http://www.lanl.gov/news/releases/.

This is not an idle concern for Santa Clara Pueblo. As the CMRR-NF DSEIS acknowledges, the Pajarito Fault connects to a number of secondary faults -- the Santa Clara Canyon Fault, the Rendija Canyon Fault, the Guaje Mountain Faults, and the Sawyer Canyon Fault. *See* CMRR-NF DSEIS at 3-25. This fault system connects to Santa Clara Pueblo's landbase and, among other concerns, Santa Clara Pueblo remains deeply concerned that this fault system provides a means of transport for groundwater contamination to our lands.

In any event, it appears additional seismic investigations are still underway at LANL as part of the Seismic Analysis of Facilities and Evaluation of Risk (SAFER) Project and thus decisions about the CMRR-NF are premature. In fact, just a week or so ago, the U.S. House Appropriations Committee cited the need for the DOE to "first resolve major seismic issues with its design" of the CMRR-NF as a reason why that Committee reduced the amount of funding for early construction activities for CMRR-NF. *See* U.S House of Representatives Committee on Appropriations, *Report: Energy and Water Development Appropriations Bill, 2012*, at 131 (report can be accessed at: http://appropriations.house.gov/UploadedFiles/FY_2012_ENERGY_AND_WATER_FULL_COMMITTEE_REPORT.pdf.).

In fact, in the CMRR-NF DSEIS, the NNSA seems to admit that its analysis of construction methods for its preferred alternative is incomplete at best. The CMRR-NF DSEIS discusses two different construction methods for the NNSA's preferred Modified CMRR-NF. One option, the so-called Deep Construction Option, the NNSA indicates is "more mature, having undergone technical review by NNSA, NNSA's contractors, and the Defense Nuclear Facilities Safety Board." The other, the so-called Shallow Construction Option, NNSA admits has "more uncertainty" associated with it and still "needs to be subjected to the same level of technical review as the Deep Construction Option." CMRR-NF DSEIS at S-18; *see also id.* at 2-14. This analysis is hardly reassuring to those of us who live close to LANL (and who, as Santa Clara Pueblo people, will always reside on this land even after LANL is no longer needed) and who are deeply concerned about seismic risks and it hardly meets the requirement that NEPA help public officials make decisions that are based on understanding environmental consequences. 40 C.F.R.§1500.1(c).

If anything, the continued uncertainty regarding design and construction issues associated with the seismic activity at the NNSA's preferred location for the CMRR-NF underscores our request above that a new, revised, draft environmental impact statement or an entirely new environmental impact statement be issued for the CMRR-NF when this new information becomes available.

351-4 cont'd

phenomena hazards mitigation requirements for DOE facilities. DOE Standard 1020-2002, *Natural Phenomena Hazards Design and Evaluation Criteria for Department of Energy Facilities* (DOE 2002a), implements DOE Order 420.1B and provides criteria for the design of new structures, systems, and components to ensure that DOE facilities can safely withstand the effects of natural phenomena hazards.

The potential seismic hazards at LANL have been the subject of numerous studies performed in the past 30 years. Since the early 1990s, it has also been recognized that LANL is situated within and over the seismically active Pajarito fault system. The surface trace of the main Pajarito fault is the western boundary of LANL and dips underneath LANL, whereas subsidiary strands of the fault system, including the Rendija Canyon fault, extend into portions of LANL. The Pajarito fault system has been mapped in detail in the northern and western portions of LANL property, as well as in the vicinity of LANL.

In LANL seismic hazard evaluations issued in 1995, 2007, and 2009, a concerted effort was made to properly capture the uncertainties in input parameters. These analyses were reviewed and accepted by an external review panel, DOE, and DNFSB. Hence, it is expected that new information would not have a significant impact on the current assessment of the seismic hazard or design-basis earthquake ground motions for LANL. In addition, site-specific geotechnical investigations have been completed for both the Shallow Excavation Option and the Deep Excavation Option for construction of the CMRR-NF (Kleinfelder 2007a, 2007b, 2010a, 2010b). Therefore, there appears to be no compelling need to delay a decision on construction of the CMFF-NF pending the development of new seismic information.

Mr. Tegtmeier
Santa Clara Pueblo's Comments on the CMRR-NF DSEIS
June 24, 2011
Page 10

V. Conclusion

351-5 Santa Clara Pueblo reemphasizes here the DOE's and thus NNSA's duty, in accordance with our 2006 Accord and the DOE Indian Policy, to continue to consult with Santa Clara Pueblo on a government-to-government basis before any additional actions are taken or decisions made regarding this CMRR-NF DSEIS. It is our hope that the NNSA will live up to the words of our 2006 Accord by addressing the concerns Santa Clara Pueblo has expressed here in a manner that "recognizes and respects the continued existence of the Pueblo's values and culture in the exercise of its sovereignty."

Sincerely,

Walter Dasheno, Sr.
Governor

RESOLUTION NO. 2011 - 19

APPROVING THE SUBMISSION OF COMMENTS FOR SANTA CLARA PUEBLO TO THE DEPARTMENT OF ENERGY AND THE NATIONAL NUCLEAR SAFETY ADMINISTRATION REGARDING THE DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT FOR THE NUCLEAR FACILITY PORTION OF THE CHEMISTRY AND METALLURGY RESEARCH BUILDING REPLACEMENT PROJECT AT LOS ALAMOS NATIONAL LABORATORY

WHEREAS, Santa Clara Pueblo (the "Pueblo") is a sovereign Indian tribe, recognized as such by the United States Government, with the Pueblo's Tribal Council as its governing body, whose authority is defined by the Pueblo's Constitution and Bylaws approved on December 20, 1935; and,

WHEREAS, the Pueblo has maintained a recognized and formalized government-to-government relationship with the Department of Energy (the "DOE") as set forth first in 1992 and then in 2006 in the *Restatement of Accord between the Pueblo of Santa Clara, a Federally-Recognized Indian Tribe and the United States Department of Energy* (October 31, 2006); and,

WHEREAS, the National Nuclear Safety Administration ("NNSA") is an agency of the DOE; and

WHEREAS, the NNSA has issued a draft Supplemental Environmental Impact Statement (the "DSEIS") regarding the NNSA's proposal for an updated design of the Nuclear Facility portion of the Chemistry and Metallurgy Research Replacement ("CMRR") project (the "CMRR-NF"); and

WHEREAS, the Tribal Council has considerable concerns about the analysis provided in the CMRR-NF DSEIS; and,

Response side of this page intentionally left blank.

Commentor No. 351 (cont'd): Governor Walter Dasheno, Sr.
Santa Clara Pueblo

WHEREAS, after careful consideration, the Tribal Council is of the view that it is in the best interest of the Pueblo to submit the attached comments regarding the CMRR-NF DSEIS;

NOW THEREFORE BE IT RESOLVED that the Tribal Council hereby approves the attached comments regarding the CMRR-NF DSEIS.

BE IT FURTHER RESOLVED that the Tribal Council authorizes and directs the Governor to execute and submit the attached comments regarding the CMRR-NF DSEIS on behalf of the Pueblo.

CERTIFICATION

I, the undersigned, duly elected Governor of the Santa Clara Pueblo, do hereby certify that the Tribal Council, at a duly called meeting that was convened with proper notice and was held on the 24 day of June, 2011, at Santa Clara Pueblo, New Mexico, a quorum being present, approved the foregoing Resolution with 9 in favor, and 0 opposed, 1 abstaining, 2 being absent.

Governor Walter Dasheno, Sr.

ATTEST:

Secretary Francis Tafoya

Commentor No. 352: Yvonne Scott

May 23, 2011

Mr. John Tegtmeir
US DOE/NNSA
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

Dear Mr. Tegtmeir,

I am a citizen of New Mexico. I am a citizen of the United States of America. I am a citizen of this planet, a mother, grandmother, and a person of conscience.

I submit this letter in protest to the planned desecration of more New Mexican land to an unsafe and unsustainable addiction catalyzed by power hungry scientists to create more disasters such as we have witnessed in Russia, in Japan and in our own Three Mile Island. How many more meltdowns, or disasters will it take for all of you to wake up and realize that you have been mistaken about this demon unleashed 70 years ago in our own land? **352-1**

The current building for Chemistry and Metallurgy Research is now partially shut down because of radiation problems. Creating another for "pit production" not 2/3 of a mile from a geologic fault line is sheer madness. **352-2**

I ask that my remarks be entered in opposition to this proposed building.

Sincerely,

Yvonne Scott

Yvonne Scott
1810 Mesa Vista NE
Albuquerque, NM 87106

352-1 NNSA notes the commentor's concern regarding the occurrence of nuclear accidents. NNSA operates its nuclear facilities in accordance with Federal, state, and local laws and regulations that are designed to protect human health and the environment and prevent accidents. In addition, DOE has its own orders and directives to mitigate the possibility of an accident occurring and protect human health and the environment. DOE and NNSA perform safety analyses to predict how accidents might occur and the related possible impacts, designing mitigation measures to address these concerns.

352-2 NNSA has curtailed operations at the current CMR Building because of safety restrictions; some types of metallurgical chemistry work have been suspended because of these limitations. The proposed CMRR-NF would replace the CMR Building and would be designed to address the safety restrictions put in place at the CMR Building. Refer to Chapter 1, Section 1.2, Background, for more information regarding what operations at the CMR Building were curtailed.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMFF-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF.

Commentor No. 353: Al and Julie Sutherland

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667-5948); or e-mail : NEPALASO@doeal.gov

Deadline June 28, 2011

353-1 A new EIS is needed, as the old one (of 2004) is obsolete & inapplicable. The scope of the project has changed dramatically & the price tag has increased from $600 million to $6 billion! We do not need more nuclear weapons! Instead, clean up of legacy waste has ~~[illegible]~~ to happen for return to sanity. Our children deserve a future free from the terrorist threat that Los Alamos National Lab poses! We want our health back! Think of life-affirming alternatives to this technological ~~possible~~ destruction: Wind & solar energy are the harbingers of the future & sustainable to boot. Don't pollute! Reduce, reject this SEIS & ~~[illegible]~~, rejoice! with PEACE & LOVE, Al & Julie Sutherland

HC 81 Bx 9, Questa, 87556

CMRR-NF Hearings:
Mon, May 23, 5 to 9 p.m., Albuquerque Marriott, Salon F, 2101 Louisiana NE (Louisiana & I40) Albuquerque
Tues, May 24, 5 p.m. to 9 p.m., Holiday Inn Express, 60 Entrada Dr., Los Alamos
Wed, May 25, 5 p.m. to 9 p.m., Santa Claran Hotel, 464 N. Riverside Dr., Espanola
Thur, May 26, 5 p.m. to 9 p.m., Santa Fe Community College, Jemez Rooms, 6401 Richards Ave, Santa Fe
View or download SEIS document : http://www.nepa.energy.gov or http://www.nnsa.energy.gov/nepa/cmrrseis

353-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 354: Cliff J. Kirchmer

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir,

I am writing to you concerning the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico.

I am concerned that the project proposes to build a replacement of the existing CMRR building on a site near a geologic fault line. While the project design is for the building to withstand a grade 7 earthquake on the Richter scale, an analysis in May 2007 showed a potential increase in seismic ground motion and activity, and a more powerful earthquake is possible. The recent earthquake in Fukushima, Japan, was measured at grade 9, a hundred times more powerful than grade 7, and even one of the recent aftershocks in Fukushima was 7.1 on the Richter scale. If the building were struck by an earthquake greater than that for which it is designed, there might be a nuclear disaster like those that occurred in Fukushima or Chernobyl. ***354-1***

The current projected cost of the project ($5.86 billion) also concerns me, at a time when we have budget deficits and our national debt needs to be reduced. In FY2004, the original cost of the project was estimated to be $400-550 million. ***354-2***

The CMRR project should be canceled and a study of the Los Alamos National Laboratory (LANL) plutonium infrastructure should be done. This should include existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR should be determined. ***354-3***

Sincerely,

Cliff J. Kirchmer
921 Forrest Park Dr.
Fircrest, WA 98466-6808

354-1 NNSA notes the commentor's opposition to the CMRR-NF project. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

There are also fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

354-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

354-3 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Subject: Draft Environmental Impact Statement for a Proposed Plutonium Facility at,,Los Alamos

June 28, 2011

Los Alamos Fire is burning out of control and it is the most dangerous fire in all of the United States because of nuclear weapons labs. The highest alert possible concerns about 20,000 to 30,000 in 55 gallon barrels plutonium waste above ground under tents. Are we not insane to propose such a facility on top of a **volcanic mountain** surrounded by **forests**. *355-1*

DOE Must Withdraw the Draft Environmental Impact Statement for a Proposed Plutonium Facility at Los Alamos Because It Is Incomplete and Inaccurate

The "Modified CMRR-NF" Alternative has two options – the "Deep" Option and the "Shallow" Option. All environmental impacts of the Shallow Option are based upon assumptions that are not defensible at this time. As this supplemental EIS itself states, "The Shallow Construction Option needs to be subjected to the same level of technical review as the Deep Construction Option so the two options can be evaluated on the same basis." Most of the environmental impacts proposed in this supplemental EIS for the Shallow Option end up being the same or similar to the Deep Option impacts. This is only speculation at this time. The Draft SEIS for the CMRR-NF fails to offer and analyze realistic alternatives. *355-2*

The Costs of Trying to Build a Plutonium Pit Factory in a Geologically Unstable Area Are Just Too High

LANL is located between a rift valley (the Rio Grande in that area) and an inactive supervolcano (the Jemez Mountains) in an active seismic fault zone (the Pajarito Plateau). An updated seismic hazards analysis was published in May 2007. It showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the over $3 billion in cost estimate increases since 2008 are due to efforts to address the increased seismic hazards. DOE must analyze whether $6 billion is too high of a premium in order to build a new NF at this location. *355-3*

Volcanic Eruption Impacts Must Be Analyzed

The *Preliminary Volcanic Hazards Evaluation for Los Alamos National Laboratory Facilities and Operations Current State of Knowledge and Proposed Path Forward, September 2010* Report states, "The integration of available information on the volcanic history of the region surrounding [LANL] indicates that the Laboratory is at risk from volcanic hazards." *355-4*

All Impacts of NF Construction on the State Consent Order Must Be Analyzed

Cleanup of the existing mess must be the priority – not the proposed NF. DOE made a commitment to cleanup the legacy waste sites at LANL when it signed the Consent Order with the New Mexico Environment Department on March 1, 2005. The Order requires cleanup of certain sites by December 31, 2015. The analysis of the impacts of construction activities for the proposed NF must include those for the cleanup activities; including those at the nearby chemical dump, Material Disposal Area C. Precious taxpayer funds must be used to meet the cleanup obligations, not to build a shiny, new CMRR-NF. *355-5*

The Draft CMRR-Nuclear Facility SEIS Is Deficient and Must Be Withdrawn! *355-1 cont'd*

355-1 The waste storage domes in TA-54 are not the subject of the *CMRR-NF SEIS*. However, NNSA has taken actions to mitigate the risks of a wildfire on the domes. In 2000, the Cerro Grande fire burned a heavily forested canyon area to within about 0.75 miles (1.2 kilometers) of the waste storage domes, but none were burned and there were no radiological releases from the domes. The Las Conchas fire reached the southern border of LANL, but did not get within 2 miles (3.2 kilometers) of the domes. Additional fuel reduction has been conducted since the Cerro Grande fire, both to the vegetation surrounding TA-54 and within the domes themselves (for example, wooden pallets have been replaced with metal pallets), to further decrease the potential for a waste storage dome fire occurring as a result of a site wildfire. Furthermore, NNSA has an active program to remove the waste stored at Area G and ship it to WIPP for disposal.

NNSA notes the commentor's concern about constructing the CMRR-NF at LANL and request that the *Draft CMRR-NF SEIS* be withdrawn. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources). See the response to comment 355-4 regarding the risk of a volcanic eruption.

355-2 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. Alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, include both the Shallow Excavation Option and the Deep Excavation Option. Site-specific geotechnical investigations have been completed for the proposed CMRR-NF

Commentor No. 355 (cont'd): Marlene Perrotte

project site for both the Shallow Excavation Option and the Deep Excavation Option. Either option of the proposed CMRR-NF would be designed and constructed in accordance with recommendations provided in the geotechnical reports (Kleinfelder 2007a, 2007b, 2010a, 2010b). The human health and environmental impacts for both the Shallow and Deep Excavation Options have been analyzed to the same level in the *CMRR-NF SEIS*. The potential impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10, of the *CMRR-NF SEIS*. The Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

355-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMFF-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF.

355-4 NNSA agrees that volcanic eruption impacts should be analyzed and has made revisions. In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapter 3 and 4 (Sections 3.5.1 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). Based on the report, future planning will be performed to consider CMRR-NF structural requirements for ash-loading.

Commentor No. 355 (cont'd): Marlene Perrotte

355-5 The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on cleaning up (remediating) DOE sites across the country or LANL legacy waste cleanup. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 356: Tina S. Boradiansky, Esq.

Subject: Proposed Expansion of Plutonium Program at LANL

Gentlemen:

I have been a resident of New Mexico for 31 years and have seen two gigantic fires encroach into LANL property. At this time we are all holding our breath (Tuesday, June 28, 11).

356-1 I am writing in opposition to the proposed expanded plutonium program at LANL. It is simply too dangerous and in the wrong geography for such a program. There are many natural risks inherent to the location, from ongoing extreme fire risk in this desert area, to earthquakes and vulnerable power sources.

PLEASE stop this process of expansion. It ALREADY makes most of us residents nervous to live near the current level of exposure. This massive fire should be a timely warning. PLEASE do not expand.

Thank you,

Tina S. Boradiansky, Esq.
Post Office Box 6625
Santa Fe, NM 87502

356-1 NNSA notes the commentor's opposition to the CMRR-NF project. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the CMRR-NF SEIS, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 LANL SWEIS, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

357-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

The environmental impacts analysis in Chapter 4 of the *CMRR-NF SEIS* evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area. The potential impacts on environmental justice due to construction (except for the Continued Use of CMR Building Alternative) and operations are addressed in Sections 4.2.11, 4.3.11, and 4.4.11. These analyses show that the total minority, Native American, Hispanic, and low-income populations would not be subjected to disproportionately high and adverse impacts during implementation of any of the alternatives.

Commentor No. 360: Ruth Halcomb

From: Ruth Halcomb [ruthmmh@yahoo.com]
Sent: Saturday, June 25, 2011 3:59 PM
To: nepalaso@doeal.gov
Subject: New plutonium pit facility must be delayed if not stopped!

I am writing to voice my strong opposition to NNSA's new plutonium pit facility proposed at Los Alamos.

Manufacturing plutonium pits constitute a serious threat to the health and safety of those living downwind and downstream. Plutonium has been proven to be a potent carcinogen. The residue from the Alamos Lab has a severe health impact upon Native peoples and Hispanic New Mexicans. *360-1*

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. It is imperative that the implications of the seismic survey be taken seriously. *360-2*

The U.S. does not need 80 new plutonium pits per year. The cold war is over, use of nuclear weapons is unthinkable and peaceful uses of nuclear power are in question following the recent tragic situation in Japan. *360-3*

Ruth Halcomb
2921 Viaje Pavo Real
Santa Fe, NM 87505

360-1 NNSA notes the commentor's opposition to the CMRR-NF project, pit production, and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF.

The environmental impacts analysis in Chapter 4 of the *CMRR-NF SEIS* evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area. The potential impacts on environmental justice due to construction (except for the Continued Use of CMR Building Alternative) and operations are addressed in Sections 4.2.11, 4.3.11, and 4.4.11. These analyses show that the total minority, Native American, Hispanic, and low-income populations would not be subjected to disproportionately high and adverse impacts during implementation of any of the alternatives.

360-2 A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

360-3 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile

Commentor No. 360 (cont'd): Ruth Halcomb

stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 361: Karen Barton

From: Karen Barton [astrique@aol.com]
Sent: Sunday, June 26, 2011 2:42 PM
To: NEPALASO@doeal.gov
Subject: Stop New Nuclear Weapons Plant, Earthquake Zone by 6/28

Dear Department of Energy,

I'm concerned about the construction of the CMRR plutonium reprocessing and storage facility in New Mexico. It will store six tons of the most highly toxic substance on Earth, plutonium, at the government's facility. Second, the costs have ballooned by 1000%, from $600 million to $6 billion.

361-1 Finally, this facility can be used to reverse the program, from President Obama's pledge to end nuclear weapons, to produce as many as 80 nukes each year. This is going one step forward, 3 steps back, with plutonium—the most deadly, toxic substance in the world.

Sincerely,

Karen Barton
714 Old Lancaster Road
Bryn Mawr, PA 19010-3109

361-1 NNSA notes the commentor's concerns regarding storage of plutonium, costs, and purpose of the CMRR Project. The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect the workers and public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

Commentor No. 363: Maureen Wright

June 20, 2011

To John Tegtmeer
Los Alamos Lab
3747 W. Jemez Rd
Los Alamos NM 87544

Dear Mr. Tegtmeier,

363-1 Please know I oppose the construction of the nuclear facility designed to manufacture of new nuclear pits (plutonium pits) which is against National Environmental Policy Act and clearly against Article 6 of the Non Proliferation Treaty. In fact Los Alamos should have been closed at the time the Non Proliferation Treaty was ratified - Our present number of nuclear weapons are more than enough to disintegrate our known world - Should we add to our supply?

Sincerely,
Maureen Wright
2816 Kentucky St NE
Albuquerque NM 87110

363-1 NNSA notes the commentor's opposition to the proposed construction and operations of the CMRR-NF and to the production of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 364: Laura Woodford

Laura Woodford
821 Wilmore SE
Albuquerque, NM

6-19-11

Los Alamos National Laboratory
3747 W. Jemez Rd
Los Alamos, NM 87544
Attn John Tegtmeier, Document Mgr. (CMRR-NF SEIS)

Dear Mr. Tegtmeier,

364-1 I oppose any new facilities to construct or create nuclear cores or pits or associated manufacturing, such as the CMRR proposed currently. There are no alternatives offered in the draft proposal, which I feel is contrary & against the National Environmental Policy Act, as well as being an inappropriate course of action for many reasons. The Cold War is long over + the US would have appeared to be on a course towards disarmament, & what, Article 6 of the non proliferation treaty.

364-1 NNSA notes the commentor's opposition to the proposed construction and operations of the CMRR-NF and to the production of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS,* as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 364 (cont'd): Laura Woodford

There have been many
challenges to this kind
of manufacture, not the
least of which is: where
will the waste be stored? **364-2**

Can we really afford this?
Our economy is not in the
kind of shape to afford
such non-productive activity. **364-3**

We already have around 70
million bombs & one would
ask: why do we need this
much fire power? **364-1 cont'd**

New Mexico is actually
still considered an
earthquake zone in that
area. **364-4**

Please do not waste
our tax dollars for the
purpose of creating new
weapons & plutonium-cores
rather than other
positive and life affirming
activities. **364-3 cont'd**

Sincerely,
Laura Woodford.

364-2 As summarized in Section 2.5, Cleanup and Waste Management, of this CRD, the CMRR-NF and RLUOB would be designed, constructed, and operated to accommodate the projected waste volumes to be generated at the facilities. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. The impacts associated with transportation of radioactive and nonradioactive wastes to offsite treatment or storage facilities have been estimated for all alternatives (see Chapter 4, Sections 4.2.13, 4.3.13, and 4.4.13, of the *CMRR-NF SEIS*).

364-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

364-4 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the Draft CMRR-NF SEIS was prepared; however, it has subsequently been made available to the public and has been incorporated into the Final *CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve.

June 23, 2011

Dear Mr. Tegtmeir,

I am writing to register my comments against the CMRR Project. I urge cancellation of this project due to extreme safety concerns and dismay at its ballooning budget. I think this project is poorly thought out and has the potential to bring utter catastrophe to the region. *365-1*

Thank you in advance for hearing my concerns.

Sincerely,

James Miller

James Miller

365-1 NNSA notes the commentor's opposition to the proposed construction of the CMRR-NF and concerns about safety. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

Commentor No. 366: Katherine Michalak

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA–3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667–5948); or e-mail : **NEPALASO@doeal.gov**. Deadline June 28, 2011

Dear Mr. Tegtmeier,

366-1

The CMRR-NF at LANL recently came to my attention, and I'm very concerned about the potential consequences of this facility. As a lay person, I can't accurately estimate how high the impacts will be — the health hazards, the pollution, the interference with cleanup of existing waste at LANL — or whether the project is necessary and/or beneficial to our country. However, from the information I do have, this facility appears to be a questionable and risky undertaking on many fronts. From my understanding, the US already has sufficient plutonium pits, ~~so~~ and stockpiling nuclear weapons will do more harm than good in the current world climate.

366-2

I understand that financing this project does nothing economically for New Mexico outside of the already affluent Los Alamos county; as a taxpayer, I feel that this would be money squandered. I understand

366-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

366-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 366 (cont'd): Katherine Michalak

that the location for this facility ~~time~~ lies
between a Rift & a fault zone, making it
an even more environmentally risky under-
taking than nuclear facilities are to begin
with. **366-3**

From my perspective, it's absolutely
essential that

A) A new EIS in conducted; the SEIS
is far from sufficient **366-4**

B) The value of this Facility is thoroughly
questioned, and cancelation of the
project considered. **366-2 cont'd**

Thank you for considering my views.

Regards,

Katherine Michalak
PO Box 604 / 363 E Copper Ave
Crestone, CO 81131
[redacted]-[redacted]-[redacted]

366-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

366-4 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Commentor No. 367: Sister Joan Arnold

P.0. Box 109
Huntington, Indiana 46750-0109
June 27, 2011

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Rd
TA-3 Building 1410
Los Alamos, New Mexico 85744

Dear Mr. Tegtmeir:

I am writing to you about the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico. Since the Lab already has the ability to manufacture 20 "Plutonium Pits" a year, why is there any necessity to produce more?

I believe it is time to reduce nuclear weapons and not waste money on producing more "triggers" that are at the heart of every nuclear weapon. Furthermore, I learned that the Department of Energy has 15,000 pits stored at the Pentax Facility in Texas. Also, the projected budget for this project at Los Alamos is now $5.86 billion with a completion date of FY2023. This money could be better used for peaceful purposes. It would be foolhardy for anyone ever to use nuclear weapons! *367-1*

The worst part of all is that the proposed site for the new CMRR building is some two-thirds of a mile from a geologic-fault line. No doubt the more than $3 billion that has been added to cost-estimates since 2008 result from efforts to address the heightened seismic hazards in the area. In my view, the proposed CNRR project should be canceled immediately! *367-2*

Thank you for your consideration of my comments.

Sincerely,

Sister Joan Arnold

Sister Joan Arnold

367-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. The need for CMRR-NF is not connected to a specific level of operations. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

367-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 368: Kip Powell

Mr. John Tegtmeier 07/03/11

I am writing to express my complete opposition to the redesigned Chemical and Metallurgical Research Replacement Nuclear Facility. The danger of seismic damage is too great as is the potential for unpredictable wildfire behavior.

It seems that LANL escaped serious damage from the Las Conchas fire due to good preparation and safety planning as well as the extraordinary efforts of the firefighters. It also seems that a great deal of luck was in play. Had this fire occurred in April or May, the strong and persistent 30 - 50 mph winds might have caused a catastrophic outcome. **368-1**

This region has had the shadow of nuclear R&D and its associated toxic waste problems for 60 years. Nuclear weapons are not a deterrent to terrorist attacks nor are they useful as diplomatic leverage. The continued funding of federal nuclear weapons expansion and modernization makes a mockery of the nonproliferation treaty the U.S. has signed. **368-2**

My wife, our friends, and coworkers are weary and scared from this latest mess. We still have no idea how much toxic radiation was/is in the smoke. The data is only now starting to be posted on the internet. Have we been exposed for a week and will we only find out too late? **368-1 cont'd**

We love New Mexico and this area. We think it's time for LANL to be repurposed or shutdown and cleaned up, if that's even possible. 60 years is long enough. Research sustainable energy sources. The brain trust at LANL could completely change the course of modern man for the better. I am not alone in my concern and will seek to influence political decision makers as will many others in New Mexico and the U.S. **368-3**

Sincerely,

Kip Powell

Kip Powell
Espanola,NM

368-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. A summary of possible public health impacts resulting from the fire is included in Chapter 4, Section 4.6.1.3, of the 2008 *LANL SWEIS* (DOE 2008a). As indicated in this section, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air

Commentor No. 368 (cont'd): Kip Powell

during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself. This section of the *LANL SWEIS* also discusses the *Public Health Assessment* (ATSDR 2006), for which the Agency for Toxic Substances and Disease Registry (ATSDR) reviewed environmental monitoring data from 1980 to 2001 and concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future. The data considered in the ATSDR assessment included at least one full year of environmental monitoring results from the period following the Cerro Grande fire. Similar results would be expected from studies that will be done on the Los Conchas fire.

368-2 The President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

368-3 Comment noted.

Commentor No. 369: Susan McCarthy

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA–3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667–5948); or e-mail : ***NEPALASO@doeal.gov***.

Dear Mr. Tegtmeier,

I wish to draw your attention to the following drawbacks to the Draft CMRR-NF SEIS document:

1) The geological instability of Los Alamos makes it unsuitable for a plutonium pit facility; **369-1**

2) A new EIS rather than a Supplemental EIS is what is called for because greater seismic activity wasn't envisioned in 2004 as shown in the May 2007 updated analysis;

3) The cost of the new plutonium pit complex is too great; **369-2**

4) A real NO ACTION alternative should be included among the alternatives; **369-3**

5) Cleanup of the current radioactive mess will be neglected if the new facility is pursued; **369-4**

6) Capacity studies will show that DOE doesn't need 80 new plutonium pits per year. **369-5**

Sincerely
Susan McCarthy
TAOS, NM

View or download SEIS document : http://www.nepa.energy.gov *or* http://www.nnsa.energy.gov/nepa/cmrrseis

369-1 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Refer to Section 2.2, NEPA Process, of this CRD for more information.

369-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

369-3 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor

Commentor No. 369 (cont'd): Susan McCarthy

constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967). See Section 2.11, Alternatives Considered, of this CRD for more information.

369-4 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

369-5 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The need for the CMRR-NF is not connected to a specific level of operations. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office, 3747 West Jemez Road, TA–3 Building 1410, Los Alamos, New Mexico, 87544 or fax: (505) 667–5948); or e-mail : NEPALASO@doeal.gov. **Deadline June 28, 2011**

Dear Sir when i studied "facilitation" it involved brain storming and concensus Building. Apparently LANL's school on facilitation did not include these tools. Your facilitators were rude, arrogant, manipulative, power trippers and did not treat all people with respect. This and the more than $200 million hole @TA55 imply that the deal is done and none there is listening (as usual).

370-1

People want change and progress, it is a new century. The SNMR&D has been reworked, renamed and remarketed too many times. Old documents have been suplimented at least twice and are so misconfigured that they cannot fit into a coherent program, so we are given fragments and excuses, fast talk and slight of hand. A ananaysis is only as Good as the data it's based on, ie the Appendices. Need to update the data files!

Ms. Bonnie Bonneau
PO Box 351
El Prado, NM 87529

FROM

370-1 NNSA notes the commentor's opposition to the CMRR-NF project and concerns about the NEPA process. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA notes the commentor's concerns regarding how the facilitator mediated the public meeting. All public meetings were facilitated in the same manner, using commonly used methods. No disrespect was intended toward public participants. NNSA will take the lessons learned from these public interactions and consider how future meetings can be improved.

370-2 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including an option of not constructing the CMRR-NF at all. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for more information.

As discussed by the commentor, Appendix C of the *Final CMRR-NF SEIS* has been updated to include additional information on wildfires, volcanoes, and accidents such as the accident that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant. All of the references associated with this appendix will be available on the *CMRR-NF SEIS* website when the *Final CMRR-NF SEIS* is released to the public.

Chapter 4, Section 4.2.10.3, Intentional Destructive Acts, discusses scenarios such as terrorist attacks. These types of acts were analyzed as part of a classified appendix. Although the results of the analyses cannot be disclosed, the following general conclusion can be drawn: the potential consequences of intentional destructive acts are highly dependent on the distance to the site boundary and the size and proximity of the surrounding population; the closer and denser the surrounding population, the higher the consequences. In addition, it is generally easier and more cost-effective to protect new facilities because new security features can be incorporated into their design. In other words, the protective forces needed to defend new facilities may be smaller due to the inherent security features of a new facility. New facilities can, as a result of design features, better prevent security attacks and reduce the impacts of such attacks.

Commentor No. 370 (cont'd): Bonnie Bonneau

370-2 cont'd

You obviously have the revised edition (2) P 2 of 3
of Appendix C which includes evacuation plans,
terrorism, volcanic features, Fukushima and all
those great subjects you told folks in Taos
about. But these ~~sup~~ subjects are not
in the print version of the document, so
are they in the computer version or where?

370-3

Where did the local paper get the idea that
CMRR-NF was to be next door to old CMR Bldg?
Your visit to Taos was full of misinformation &
you admitted to enjoy deceiving folks. Ya'll are
quite stuck in your ways.

370-4

If the NEPA process applies to the doings
of LANL-NSSA, you will produce a complete
EIS of the Entire TA-55 Along with suggested
plans to cleanup / DID TA-55 in the next
phase of the mad plan to build bombs
atop the largest volcano on the continent.
You need a viable No-Action and Green
Action and peace Alternative, as well
as a less pyrophoric alternative.

370-5

Any excuse that NM is a sacrifice zone
is totally racist, immoral & illegal.
Plotting to bomb civilians is messed up too.

370-3 NNSA disagrees with the commentor's opinion that misinformation was provided at the public meetings. The information provided at the meeting in Taos accurately reflects the scope and status of the proposed project.

370-4 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. The 2008 *LANL SWEIS* analyzed site-wide activities.

Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967). A "green action and peace alternative" would not meet NNSA's stated purpose and need.

NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

370-5 NNSA does not consider any part of the country a "sacrifice zone." NNSA complies with all Federal, state and local laws and regulations when planning and conducting its activities to meet its mission as assigned by the President and Congress.

370-6 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building

Commentor No. 370 (cont'd): Bonnie Bonneau

p 3 of 3 -

370-6
It seems ill advised to dump cement into a geologic fault, but if this is indeed part of the plan, you must consider the possibility the fault might move and try it at somewhere else in an area far from dangers like plutonium. How far is TA55 from the fault under that excavated hole? How much weight will concrete add to the (light weight tuff) mesa? Can it dry and cure properly without air? How long and deep is the fault? Is it part of a drainage that comes out in a canyon? Cement is quite caustic. Don't faults collect water?

370-7
Usually EIS documents have response to public comments to show how issues are addressed and where. There were so many subjects raised in Espanola a few years back that were overlooked.

370-8
The subject of criticality with a 6.6 ton payload should provide a big bang, at least big enough to split the plates at the Rio Grande Rift. Somehow you need to quantify the possible global impact of such a scenario. Could a 9-11 airstrike jar the balance. The bombs are activated by a smaller explosion, it's a chain reaction. Accident, terrorist, act of God, natural phenomenon, power outages, evacuation plans, so much is missing, this document is inadequate for such an expensive error. Yours T, bonnie bonneau

location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The seismic mass (dead load plus live load) of the proposed building is 490 million pounds (220 million kilograms). The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option.

370-7 Chapter 1, Section 1.8 of the *Final CMRR-NF SEIS* summarizes the changes made in the SEIS since the *Draft CMRR-NF SEIS* was released to the public.

Commentor No. 370 (cont'd): Bonnie Bonneau

370-8 As described in Appendix C, even during the most severe accident, the amount of plutonium estimated to be released from the CMRR-NF would be small. The environmental consequences for human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

Appendix C describes the methodology used to determine the accidents evaluated in the *CMRR-NF SEIS*. Selection of these representative accidents considers a wide range of accidents produced by natural phenomena (e.g., earthquakes, volcanoes, tornados, high winds, floods, snow loads, wild fires) and those that are the result of the actions of man (e.g., spills, drops). The accidents selected for presentation in the *CMRR-NF SEIS* are those that provide a representative range of accidents. These impacts can be both societal and economic due to potential disruptions associated with monitoring and cleanup of potential contaminated lands.

Submit Questions or Comments about the Draft CMRR-NF SEIS to:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667-5948); or e-mail : ***NEPALASO@doeal.gov***. **Deadline June 28, 2011**

371-1
June 30, 2011 due to the Las Conchas fire, I hope you will accept this 2 day-delayed letter. 1st I am

371-2
requesting an EIS study to assure accurate & comprehensive details before building CMRR-NF The fact of spending Billions of dollars ($4.5 billion) on a geological fault line is unconscionable. We must deal with cleaning up Tech Waste and use of taxpayers' money for this before anything else!

371-3
We must rid our world of nuclear weapons and free our coming generations from this deadly liability! There are alternative to energy needs such solar, wind and water ~~and~~ hydraulics. Plutonium Kills and causes diseases of cancer & chronic fatigue It is a Killer. Let's use New Mexico taxpayers monies to establish greater health care & preventative medicine, create green jobs, grow industrial hemp which aerates the soil and produces the greatest biomass on the planet! Thank you.

taoshemp@newmex.com Ruth Fahrback [redacted]

371-1 In response to the Las Conchas fire, which affected the Los Alamos community, NNSA extended the public comment period to July 5, 2011. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

371-2 NNSA notes the commentor's concern regarding accurate and comprehensive details regarding the CMRR-NF. To address this, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA intends to continue to implement environmental restoration actions. NNSA does not consider environmental restoration to be optional and progress on implementing those actions is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

371-3 NNSA notes the commentor's opposition to the existence of nuclear weapons and nuclear power. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 371 (cont'd): Ruth Fahrback

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

Commentor No. 372: Marjorie S. Allen

to John Tegtmeier
Document Manager
Los Alamos National Labs
3747 Jemez Rd
Los Alamos 87544
Re: CMRR

June 20, 2011

Dear Mr. Tegtmeier,

372-1 I oppose any construction of The CMRR in Los Alamos. New Mexico is not and should not be a place that is used for antiquated concepts of defense made antiquated by the ratification of the Non-Proliferation treaty under article 6.

372-2 Furthermore, the environmental impact statement is clearly illegal by not offering truly viable alternatives including downsizing what we do now at Los Alamos. This violates the National Environmental Policy Act.

372-3 In addition ~~you are~~ the site proposed is at the headwater of the most viable water source in the state. My wish is that Los Alamos would act to protect our already impoverished state by not facilitating more nuclear poison being released into our environment for the benefit of monetary gain for a few. This is not in the interests of ~~Nuclear~~ National security.

Sincerely

Marjorie S. Allen
446 Alcazar NE
Albq. NM 87108

372-1 NNSA notes the commentor's opposition to the proposed construction and operation of the CMRR-NF and to the production of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

372-2 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

372-3 The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS. Water resources are addressed in Sections 4.2.6, 4.3.6, and 4.4.6 of the SEIS.

Commentor No. 373: Melissa Larson

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA–3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667–5948); or e-mail : NEPALASO@doeal.gov   Deadline June 28, 2011

NO THANKS. WE DON'T NEED MORE NUCLEAR WEAPONS OR NUCLEAR DANGER HERE IN NORTHERN NEW MEXICO. WE HAVE SEEN FUKISHIMA & WHAT HAPPENED THERE WHEN THE EARTH QUAKED. **373-1**

THE LAND AT LOS ALAMOS IS NOT STABLE ENOUGH TO SUPPORT THE WEIGHT OF THE CONCRETE THEY ARE PROPOSING LET ALONE WHAT WOULD HAPPEN IF 6.6 TONS OF PLUTONIUM IS RELEASED INTO THE ENVIRONMENT. **373-2**

WAR IS POLLUTING & NUCLEAR POWER IS POLLUTING, SO WE ENDANGER ALL LIFE FORMS WITH THIS TOXIC THREAT TO OUR ENVIRONS. **373-1 cont'd**

IT IS CRUCIAL THAT LOS ALAMOS NUCLEAR LABORATORY, CLEAN THE MESS IT HAS ALREADY CREATED. A FULL ENVIRONMENTAL IMPACT STATEMENT NEEDS TO BE PRODUCED TO ACCOUNT FOR THE COMPLETE VARIATION IN DESIGN ~~AND~~ ONLY IF THE PLAN IS FOR A SAFE NUCLEAR FACILITY, WHICH ENDANGERS NO LIFE AND IT ALSO CLEANS UP THE MESS IT HAS MADE. IF IT DOES NOT ALLOW ANY MORE NUCLEAR WASTE TO ACCUMULATE, THERE W/BE A CHANCE FOR SAFETY OR ANY LIFE TO CONTINUE. NOW STOP, CLEAN UP, AND BEFORE YOU BUILD ANY MORE, FIX WHAT HAS BEEN DONE. **373-3**

(see reverse) →

373-1 NNSA notes the commentor's opposition to nuclear weapons and nuclear power. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

373-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar

Commentor No. 373 (cont'd): Melissa Larson

373-4

PS. THE CURRENT FIRE MAY PUT A STOP TO THIS WHOLE NONSENSE, THOUGH I REALLY HOPE WE HAVE A CHANCE FOR SURVIVAL AFTER THAT. FORGET THE PLUTONIUM. LOOK INTO THORIUM FOR ELECTRIC GENERATION + STOP PUTTING TOXIC WASTE + PLUTONIUM ON OUR MOUNTAIN! THINK... GET SMART.

MELISSA LARSON
PO BOX 1057
Ranchos de Taos, NM 87557
575-751-9862

concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Under no circumstances would 6.6 tons of plutonium be released to the environment; as described in Appendix C, even during the most severe accident, the amount of plutonium estimated to be released from the CMRR-NF would be small. The environmental consequences on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

373-3 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

As summarized in Section 2.5, Cleanup and Waste Management, of this CRD, the CMRR-NF and RLUOB would be designed, constructed, and operated to accommodate the projected waste volumes to be generated at the facilities. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12.

373-4 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire

Commentor No. 373 (cont'd): Melissa Larson

LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Electrical power generation is outside the scope of the *CMRR-NF SEIS*.

Commentor No. 374: Laura Zwibovich

We Demand a complete EIS

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA–3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667–5948); or e-mail : ***NEPALASO@doeal.gov***.

Deadline June 28, 2011

As the FIRE rages & races out June 27, 2011
of control towards Los Alamos & we
suffocate w/ smoke & fear I write
to you demanding an immediate
end to this nuclear madness
that was hatched right there on that
hill. Nature is speaking to you w/
such uncompromising force that
surely you must get the message.
This is not the horror of Fukashima –
this is the horror in our back
yard – To continue on with your
CMRR Complex Project would be no less
than criminal insanity – Look into
your own hearts – into the eyes of your
children & their children – Do you want
the for profit nuclear destruction of life
on earth to be your legacy? Remember
the tragic death of your brother
nuclear scientist who jumped off the
Gorge Bridge after the disaster at
Fukashima. Do you think those 2 events
were unrelated? Life on earth & your
own souls hang in the balance. Stop Now!

374-1

374-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL, and the concerns of the Fukushima Daiichi Nuclear Power Plant accident. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

NNSA also notes the commentor's position that a new complete environmental impact statement is needed rather than an SEIS. NNSA determined that an SEIS is the appropriate level of analysis, because of CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

NOTA: Favor de excluir información personal (dirección o número de teléfono) que no desea aparezcan en el SEIS; todo comentario recibido es incluido en su totalidad en el SEIS.

PLEASE HAND THIS FORM IN OR MAIL BEFORE JUNE 28, 2011, to:
FAVOR DE ENTREGAR ESTA FORMA O ENVIARLA POR CORREO ANTES 28 DE JUNIO 2011 A:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager • U.S. Department of Energy
National Nuclear Security Administration • Los Alamos Site Office • 3747 West Jemez Road, TA-3, Building 1410
Los Alamos, New Mexico 87544

375-1 NNSA notes the commentor's opposition to the CMRR-NF project. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapter 3 and 4 (Sections 3.5.1 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). A volcanic eruption during the life of the CMRR-NF is an unlikely event. A variety of volcanic phenomena could occur as a result an eruption with a dispersion of a large ash cloud likely to affect a large area of the region. As discussed in Appendix C, such an event would have consequences that are represented by other accidents analyzed in the SEIS.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources). See the response to comment 355-4 regarding the risk of a volcanic eruption.

1. What comments do you have on the Draft SEIS?
¿Que comentarios tiene usted sobre el Draft SEIS?

(1) The Supplemental EIS is not sufficient to assess the impacts of the new design of CMRR-NF, plus new design with increased earthquake protection is not finished. ~~I~~ Want a new EIS written after new plan/design is complete. **376-1**

(2) Increasing cost to build CMRR complex is too high and ~~estimat~~ final costs will be higher, due to the area being geologically unsafe for this facility. DOE please analyze cost/benefits for this location. **376-2**

(3) Please clean up existing legacy waste sites first, spending money on new facility, NMED gave order to clean up Area G dump and others - not construct new site creating more pollution needing disposal. **376-3**

(4) DOE needs to conduct a "capacity study" to see if they can use the curreent facilities - Existing facilities have sufficed since 1999 with plutonium pit manufacturing limited to 20 per year - We don't need more. **376-4**

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager • U.S. Department of Energy
National Nuclear Security Administration • Los Alamos Site Office • 3747 West Jemez Road, TA-3, Building 1410
Los Alamos, New Mexico 87544

376-1 NNSA notes the commentor's request for a new EIS after the design is complete. NEPA documentation is performed while the design of a project is still underway in compliance with DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets. There is enough design information available to perform a NEPA analysis for the CMRR-NF project. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

376-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

376-3 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

376-4 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and

Commentor No. 376 (cont'd): Carrie Leven

materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 377: Barbara Silverman

To: Mr. John Tegtmeier, CMRR-NF
SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544
Re: CMRR-NF SEIS Comment
Date: June 24, 2011

Dear Mr. Tegtmeier:

I oppose the construction of the CMRR Nuclear Facility at the Los Alamos National (LANL) for the following reasons:

MORAL ISSUES

Nearly every major religious body has declared it immoral to not only use, but also to build and threaten to use weapons of mass destruction. Even if never used, the production and presence of nuclear weapons harms huge numbers of innocent civilians. Threats to use weapons of mass destruction tends to cause other nations to want to build their own out of fear. The more weapons out there, the more chances exist for terrorists to get ahold of them.

It is also immoral to cut services to the poor and disadvantaged populations in order to pay for weapons of mass destruction. In a declining economy and a world facing global warming, we have a moral obligation to use our resources for more urgent human needs.

377-1

Thank you for your consideration. I would like to receive only the summary of the final EIS, not the full report.

Barbara Silverman
120 Camino Matias
Santa Fe, NM 87501

377-1 NNSA acknowledges the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Funding decisions regarding major Federal programs (for example, health care and alternative sources of energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

378-1

As I sit here in Taos to write my sincerest request for a "No Action" Alternative in the SEIS for the CMRR Project, I watch enormous clouds of smoke coming from Las Conchas Fire too near Los Alamos. These smoke signals are sending a powerfully poignant message to WAKE UP! to the single most important issue of the 21st Century: CLIMATE CHANGE with its extreme weather conditions. As the Earth is still reeling, wobbling from the Fukushima Nuclear Power Plant disaster AND 2 nuclear reactors are being shut down in the massive Midwest flooding, Time's Up! Throw off the 20th Century Cold War mindset of the seductive power of nuclear energy/weapons technology. It's a DEAD END... and very expensive on all fronts. I implore you: Harness! every one of your brilliant BRAIN cells connecting to the heart of humanity and Become! the cutting edge of the necessary Green Technology for powering our homes, transportation, industries and cities. Put your energy into Green Restoration of our earth, air, and water, revitalizing our Planet from the contamination of toxic and radioactive wastes. More nuclear warheads from your pit production will not bring security and peace, rather increase proliferation and terrorism.
BE the HEROES of the 21st Century by mitigating Climate Change and Regreening our Planet. THANK YOU!

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager • U.S. Department of Energy
National Nuclear Security Administration • Los Alamos Site Office • 3747 West Jemez Road, TA-3, Building 1410
Los Alamos, New Mexico 87544

378-1 NNSA acknowledges the commentor's opposition to the construction and operation of a new CMRR Facility at LANL and the commentor's request for a "No Action" alternative. The No Action Alternative included in the *CMRR-NF SEIS* is to implement the decision made following preparation of the original *CMRR EIS* in 2003 (that is, to take no action that differs from the previous decision). Implementing a no action alternative, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Refer to Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967).

Funding decisions regarding major Federal programs (for example, health care and alternative sources of energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 379: Deborah Michalak

John Tegtmeier,
CMRR-NF SEIS Document Mngr
NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

June 22, 2010

Dear Mr. Tegtmeier,

379-1 I urge you to do everything in your power to enact an entirely new EIS for the CMRR-NF, rather than relying on the supplemental EIS. The building of nuclear facilities should never be taken lightly, even when there is political or economic incentive for their construction, and in this case, I find there to be very little of such incentive. I'm concerned that the necessity of this facility is marginal, and its primary purpose is commercial gain for the nuclear industry. Our country is built on capitalism, but I find it reprehensible to turn our backs on capitalism that puts our country's health safety and environmental resources on the line for the benefit of a few individuals—while paying for it out of taxpayers' pockets. In our current economic crisis, I feel that government money should be carefully placed in order to stimulate the most needy of our country's economies, not to give boons to already welll-off counties such as Los Alamos.

Thank you for considering my perspective.

Regards,

Deborah Michalak

379-1 NNSA notes the commentor's request for a new EIS. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 380: Charles R. Powell

Charles R. Powell
P.O. Box 20451
Albuquerque, NM 87154

June 20, 2011

John Tegtmeier
Los Alamos National Laboratory
3747 W. Jemez Rd
Los Alamos, NM 87544

Dear Mr. Tegtmeier:

I strongly oppose the construction of the CMRR. We do not need additional nuclear weapons. We already have more than enough. 380-1

There is no way such a facility is safe. Los Alamos sits on an earthquake fault. The location is at the headwaters of the Rio Grand. 380-2

380-1 NNSA acknowledges the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

380-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Stormwater Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Stormwater Pollution Prevention Plans includes a number of

Commentor No. 380 (cont'd): Charles R. Powell

Production of more pits for more weapons will result in more nuclear waste. There is already an existing mess that requires cleanup.

Expanding US capacity to build nuclear bombs could compromise US efforts for nonproliferation and nuclear arms Reduction.

380-1 cont'd

There has been no EIS for CMRR. The supplemental EIS is inadequate and should be withdrawn until a completely new EIS can be prepared.

380-3

Sincerely,
Charles R. Powell

temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment (see Chapter 4, Sections 4.2.6, 4.3.6, and 4.4.6 regarding impacts on water resources).

380-3 NNSA notes the commentor's support for the preparation of a new environmental impact statement. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action.

Commentor No. 381: Marilyn G. Hoff

June 27, 2001

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road, TA-3 Building 1410
Los Alamos, New Mexico, 87544

To Whom It May Concern:
Here are my comments on the CMRR-NF SEIS:

1. A Complete, New Environmental Impact Statement (EIS) is Needed, *Not* A Supplemental Environmental Impact Statement (SEIS). A SEIS cannot adequately assess the impacts of a completely redesigned CMRR-NF building for the processing of plutonium and nuclear materials at LANL. The original EIS of 2004, now supplemented by the SEIS, assessed a building designed to withstand only mild seismic events. As I write, LANL awaits a humungous fire which will surely in mere hours spread deadly pollution to where I live. Moreover LANL sits between the Rio Grande rift and the volcanic Jemez Mountains in a seismic fault zone. There have been predictions of a potential huge increase in seismic ground motion and activity. Given the instability of its building site, the most recent vastly fortified design for this building is still in flux. Uncertainty also clouds whether corners will be cut in the building's fire suppressant systems, made necessary by the extreme combustibility of plutonium. Not only is a SEIS inadequate to the new scope of the project, it is premature, because the building's design is not finalized. Only an EIS can adequately study the full impact of this much-altered building, and until the design is finalized, even an EIS would be premature. ***381-1***

2. The Costs of Trying to Build a Plutonium Pit Production Complex in a Geologically Unstable Area Are Just Too High. The total original estimate for the CMRR Complex Project, including the recently completed $363 million Radiological Laboratory Utility and Office Building (RLUOB), was around $600 million in 2004. The current estimate for the Nuclear Facility alone is $5.8 billion and rising. DOE must analyze whether this growing price tag is too high a premium to pay for a new Nuclear Facility (NF) in this questionable location. ***381-2***

3. The SEIS Must Study Whether the Unstable Geological Strata Can Support the Weight of the Redesigned Building. To address these increased seismic hazards, DOE is considering plans to excavate 225,000 cubic yards of earth under the proposed NF and fill the hole with concrete. DOE must question: Can the surrounding geology support all that concrete? Would a seismic event cause the concrete "slab" to sink or shift? The SEIS also suggests a "Shallow Option" (floating the building's foundation above the geologically unstable tephra layer), an option whose feasibility is unknown, needing the further study of a complete EIS. ***381-3 cont'd***

4. A New Nuclear Facility Will Detract from Cleanup of the Existing Mess. DOE made a commitment to clean up the legacy waste sites at LANL when it signed the Consent Order with the New Mexico Environment Department on March 1, 2005. The Order requires cleanup of certain sites by December 31, 2015, including the Area G dump site at Technical Area 54. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds for clean-up, not a new NF which will only add to the pollution. ***381-4***

5. New Alternatives Must Be Considered. DOE must develop more alternatives, including (a) a true "No Action" alternative of not building the Nuclear Facility; and (b) upgrading the existent old CMR building. The SEIS briefly considered and dismissed these alternatives as insufficient to "satisfy the entire range of DOE and NNSA mission support functions." The so-called "No ***381-5***

381-1 NNSA notes the commentor's support for the preparation of a new environmental impact statement. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. NEPA documentation is performed while the design of a project is still under way as required by DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets. There is enough design information available to perform a NEPA analysis for the CMRR-NF project.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 381 (cont'd): Marilyn G. Hoff

Action" alternative featured in the current SEIS is to build a new CMRR building as projected in 2003 (a design failing to meet new seismic standards). The other featured SEIS alternative is to continue operations at the old, unsafe CMR Building, without upgrades. Both "alternatives" are obviously undesirable and are therefore bogus. The only alternative presented to seem workable is the new, still evolving, exorbitant CMRR-NF design to be built on shaky ground. **381-5 cont'd**

6. The US does not need 80 new plutonium pits per year. DOE must conduct a "capacity study" to determine whether the existing facilities can be used instead of building the proposed NF, which would increase pit manufacturing capacity to at least 80 per year. Existing facilities have sufficed since 1999 when DOE limited plutonium pit manufacturing to 20 per year. Since US treaty obligations forbid both new nuclear designs and increased numbers of nuclear weapons in the US arsenal, the pits to be manufactured are touted as "stockpile stewardship" for maintaining existing nuclear weapons through replacement of old pits. However, a Jason study of aging plutonium argues against the need for pit replacement within the next hundred years. **381-6**

7. Boosting US capacity to build nuclear bombs could compromise US efforts for nuclear arms reduction, for the completion of non-proliferation treaties, and for persuading non-nuclear nations to abstain from acquiring their own nuclear weapons. President Obama's call for a "world free of nuclear weapons" rings hollow, as he also proposes a windfall to the nuclear industry to increase its nuclear weapons-making capacity. Will this double message increase worldwide distrust of US intentions and thus ratchet up the world's nuclear tensions? **8. Nuclear Weapons are Obsolete.** They do not increase national security. They did not prevent 9-11. They can't defend against terrorist attack. They can't be used against terrorists, who have no single country of residence. They haven't "deterred" the US from waging war. Making more and more US nuclear weapons could spur a new nuclear arms race, as other nations feel the need for their own nuclear arsenal to counteract a US build-up. Burgeoning bombs would spur nuclear proliferation and boost the chance of terrorists acquiring loose nukes, undeterred by US "nuclear deterrence" from using them. Investment in these genocidal weapons, never to be used in a sane world, is money down a sewer. High alert nukes can now be launched by one tiny mistake. Making more nuclear weapons brings the world closer to nuclear war. **381-7**

9. Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Los Alamos National Laboratory inherited the US pit manufacturing function from Rocky Flats in Colorado. Rocky Flats became so polluted and unsafe that it had to be shut down. Rocky Flats had repeated plutonium fires, two of which came perilously close to breaching containment and spreading vaporized plutonium to the environment and likely rendering Denver uninhabitable. Plutonium is a killer carcinogen. LANL's discharges disproportionately sicken Native peoples and Hispanic New Mexicans. **381-8**

10. Money spent on Unusable Nuclear Weapons Does Not Spur Economic Growth. It goes down the black hole of corporate pockets. Los Alamos, the richest county per capita in the US, does not need US budgetary charity, but it consumes a lion's share of federal funds coming to New Mexico. The rest of New Mexico, one of the nation's poorest states, cries out for the fulfillment of real human needs. Moneys for education, health care, green jobs, renewable energy, public transportation, all would keep circulating and get our economy growing again. **381-9**

Sincerely,

Marilyn G Hoff

Marilyn G.Hoff
PO Box 295, El Prado, NM 87529

NNSA is aware of the risks associated with the operation of its current and future facilities. These risks are mitigated through compliance with Federal, state, and local laws and regulations that protect the public and environment, and through process design and operational procedures. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program.

Shortcuts are not being taken with respect to the fire suppression system that would be installed at the proposed CMRR-NF. One of the reasons that the facility has grown substantially since 2003 is the placement of fire control water in the facility.

381-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

381-3 The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option. A draft slope stability analysis has been prepared that indicated that global slope stability is not an issue for the Deep Excavation Option (LANL 2011a: LANL site, 028). If the Deep Excavation Option were selected, as part of the ongoing design and evaluation process, studies would be completed to verify that all geotechnical stability issues had been addressed.

Commentor No. 381 (cont'd): Marilyn G. Hoff

381-4 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

381-5 The No Action Alternative included in the *CMRR–NF SEIS* is to construct and operate a new CMRR–NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR–NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR–NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR–NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR–NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

381- 6 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production),

Commentor No. 381 (cont'd): Marilyn G. Hoff

but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

381-7 President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

381-8 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives

Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

Commentor No. 381 (cont'd): Marilyn G. Hoff

381-9 Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 382: Margaret K. Burlingame

June 25, 2011

John Tegtmeier
SEIS Document Manager
3747 West Jemez Road
Los Alamos, NM 87544

Dear Mr. Tegtmeier:

I strongly oppose the construction of the CMRR Nuclear Facility at the Los Alamos National Laboratory. LANL sits on a windswept mountain top in a seismic area where wildfires and contaminated runoff continue to threaten the health of all who live downwind and downstream from LANL. Plutonium and other radionuclides were found in organic gardens downwind from Los Alamos after the 2000 Cerro Grande fire. There is evidence also of groundwater pollution from the Laboratory. Radionuclides have already been detected in the Rio Grande, the source of drinking water for many citizens living downstream from LANL. Plutonium has a half-life of 24,000 years. In addition to cancer, radioactive materials can cause serious birth defects. This disproportionately impacts minority populations, especially Native and Hispanic, making it an issue of environmental justice. *382-1*

The Department of Energy estimated that the maximum amount of water needed for constructionwould be 4.6 million gallons per year. However, an independent analysis figure was that 6.75 million gallons per year would be needed. The water would be used in mixing 225,000 cubic yards of concrete needed under the structure to meet safety requirements, i.e. seismic incidents. *382-2* The existing waste at LANL needs to be cleaned up before more radioactive or toxic waste is generated there. Taxpayer funds need to go first for cleanup instead of cutting domestic services to fund a $6 billion project which most U.S. citizens do not want to fund. Do you realize there are cynics in Santa Fe who contend that CMRR is not for the security of the population but for the prosperity of the munitions makers? *382-3*

Sincerely,

Margaret K. Burlingame

Margaret K. Burlingame
112 Camino Santiago

Santa Fe, NM 87501

P.S. There are not enough superlatives in the language to express my apologies for this vicious IBM machine. Be thankful I'm a librarian and not a physicist.
MKB

382-1 NNSA acknowledges the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials, including vegetation, are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

A summary of possible public health impacts resulting from the May 2000 Cerro Grande fire is included in Chapter 4, Section 4.6.1.3, Radionuclides and Chemicals in the Environment Around Los Alamos National Laboratory, of the 2008 *LANL SWEIS* (DOE 2008a). In summary, it was concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future as a result of the fire (ATSDR 2006).

Commentor No. 382 (cont'd): Margaret K. Burlingame

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Stormwater Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Stormwater Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment (see Chapter 4, Sections 4.2.6, 4.3.6, and 4.4.6 for impacts on water resources).

Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

382-2 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information.

382-3 Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are

Commentor No. 382 (cont'd): Margaret K. Burlingame

not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

To: [by email and certified mail]

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road, TA-3 Building 1410
Los Alamos, New Mexico, 87544
fax: (505) 667-5948
e-mail: NEPALASO@doeal.gov

Dear Mr. Tegtmeier:

383-1 Please include what is mostly my Oped, published June 23, 2011 in Taos News along with four other Oped's questioning LANL's actions, with a few additional comments, as my "official" comment (3 pages-1,070 words) into the SWEIS record. I was not allowed to present this orally when you visited Taos on June 8, 2011. I consider limiting the study of 'alternatives" to those which benefit Bechtel and involve ONLY increased supply solutions -there is not one reduced demand solution, nor is their an explanation for this exclusion as required by law- self-serving, contrary to the intent of NEPA and the purpose of an EIS statement, and very likely illegal.

******

The Department of Energy [DOE], and the sub-agency that manages the nuclear weapons program, the National Nuclear Security Administration [NNSA] seems more concerned with maintaining their high incomes and profits than with the interests of citizens. The vehicle for doing this is to swap sham law for good law.

With good laws we get not only full employment, but employment that is meaningful. One example of a good law is the National Environmental Protection Act [NEPA] that

1

383-1 NNSA acknowledges the commentor's op-ed, published June 23, 2011.

NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 383 (cont'd): Erich Kuerschner

requires that environmental impact statements (EIS) required of federal agencies must include alternatives to the proposed action. **The Council of Environmental Quality explicitly states that alternatives are the heart of an EIS** [Sec. 1502.14]. It says that agencies shall [**must**]:

(a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.

(b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.

(c) Include reasonable alternatives not within the jurisdiction of the lead agency.

(d) Include the alternative of no action.

My first experience with NEPA occurred in the summer of 1972, when I was asked to join the Skidmore, Owings, Merrill Environmental Study Group [SOM-ESG] to participate in preparing an EIS for the State of Oregon on addressing congestion in East Portland.

What the US Highway Department saw as insufficient capacity solved by more asphalt was defined by the SOM-ESG as one of inefficient use of commuter time. By looking at the problem broadly, including alternatives that decreased demand, the problem was NOT solved by building the extra twelve lanes anticipated by extrapolating present use into the future. A more cost effective solution was to reduce demand for roads by land use regulations that reduced trip time and distance by improving public transportation of buses and streetcars and, finally, by converting funds earmarked for interstate highway construction to a light rail system.

An example of a sham law is the Supplemental Environmental Impact Statement [SEIS] being scammed by LANL to avoid looking at alternatives to their vision of its proposed new Chemical & Metallurgy Research Replacement-Nuclear Facility [CMRR-NF] to avoid the transparent benefit-cost analysis actually mandated under NEPA.

383-2

The 2003 EIS process permitted a CMRR building whose stand alone price tag was perhaps $300 million. The fact that the current price has ballooned to upward of $6 billion is enough, BY ITSELF, to invalidate the original permit to build and MANDATE the study of alternatives, and a new EIS. With this twenty-fold DECREASE in the benefit-to-cost ratio, many of the previously rejected alternatives are now more appropriate. **The purpose of an EIS to ensure that an agency does not reject appropriate alternatives from the perspective of the public in pursuit of self interest.**

In addition to what I consider an illegal use of an SEIS, the Global Security Network reported that U.S. Armed Services Committee on May 12 passed an amendment sponsored by Doug Lamborn (R-Col) as part of the FY2012 Defense Authorization Bill

2

383-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 383 (cont'd): Erich Kuerschner

that "prohibits the administration from making any cuts to what Republican panel members dubbed the 'nuclear hedge force' until the CMRR site at the Los Alamos National Laboratory is operational. During the House committee debate, Democratsled by Strategic Forces subcommittee Ranking Member Loretta Sanchez (Calif) and Rick Larsen (Wash)–argued that the various strategic force amendments amounted to nothing more than a power grab by GOP members." *383-2 cont'd*

Town of Taos Mayor Darren Cordova has asked LANL to conduct a hearing in Taos, so that citizens will be able to have an opportunity to voice their concerns re security, health, economics, and values. LANL's John Tegtmeier has responded that there is money for a 'telling' but not for a hearing in Taos. Besides he claims that Taosenos either don't care, or are not important enough to matter. But I suspect that the reason for disallowing comments is to obfuscate, and confuse the public as to the legality of DOE/NNSA/LANL actions. *383-3*

As General Omar Bradley stated:

> *"We live in an age of nuclear giants and ethical infants, in a world that has achieved brilliance without wisdom, power without conscience. We have solved the mystery of the atom and forgotten the lessons of the Sermon on the Mount. We know more about war than we know about peace, more about dying than we know about living".*

Or in the words of late Stewart Udall :

> ***"There is nothing comparable in our history to the deceit and the lying that took place as a matter of official Government policy in order to protect [the nuclear arms] industry. Nothing was going to stop them and they were willing to kill our own people."***

I am truly sorry that NNSA/DOE/and LANL will not consider true alternatives, and continues its self serving policy leaving civil disobedience and litigation as the main avenues for resolving the issue of appropriate nuclear weapons solution for plutonium and stockpile management at Los Alamos, as alternatives to limiting solutions to those that serve a dual purpose of ALSO allowing a fast response to increased nuclear weapons production. Shame. *383-2 cont'd* It violates the intent of the very First United Nations Resolution, as well as Article VI of the Nuclear Non-Proliferation Treaty. *382-4*

The Best

Erich Kuerschner, Public Choice Economist
HCR 74 Box 24614
El Prado, NM 87529
[redacted] or [redacted] cell email: erichwwk@gmail.com

3

383-3 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

383-4 NNSA acknowledges the commentors' concerns about treaty compliance, international law, pit production, and the proliferation of nuclear weapons. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 384: Ann-Nicole Cain

Dear mr. John Tegtmeier, June 27, 11

I am writing to you on behalf of an organization of fish called - F.A.H.Q. also known as Fish Against Human Quarrels. The fish find it difficult to write due to their lack of dextrous digets so I volunteered to bring their messages to you & your organization.

384-1 The fish would like you to know that they prefer their water to be free of all radioactive materials They are sending this fish from the future as an example of what can happen to them if more radioactive materials are released from LANL into the Rio Grande.

384-2 They would like to remind you that LANL sits on a seismically active area & they feel it is very very unsafe to

384-1 NNSA notes the commentor's concerns regarding water quality, seismic and wildfire hazards, and general opposition to nuclear weapons.

LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Stormwater Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Stormwater Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment. All radioactive liquids would be transferred to RLWTF. At RLWTF, the liquids would be treated to meet discharge criteria and released through a permitted outfall or to a zero liquid discharge facility. Other liquids would be routed to the Sanitary Waste Water System, where they would be treated prior to discharge through a permitted outfall.

384-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

This SEIS does not address disposal of Greater-Than-Class C waste. Disposal of this waste is analyzed in another DOE NEPA document (DOE/EIS-0375-D).

Commentor No. 384 (cont'd): Ann-Nicole Cain

open a pit to store GTCC. Also they would like to remind you that wildfires are a real + active force in the area. There is not much worse than radioactive water except maybe radioactive air + ash from fires. Please make a real E.I.S. No Nukes are good nukes! "Zero nuclear activity in New Mexico + the world". - from the fish.

Thank You!
from F.A.H.Q.

You may use my personal info to enter this fish + comment into the public record.

Ann-Nicole Cain + the fish
6275 NDCBU
Taos, N.M. 87571 [redacted]

P.S. The fish would like more time for public comments

384-3

384-4

384-5

384-3 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

384-4 NNSA acknowledges that there is substantial opposition to nuclear weapons. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

384-5 In response to the Las Conchas fire, which affected the Los Alamos community, NNSA extended the public comment period to July 5, 2011. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

Los Alamos NM
87544

Dear Mr. Tegtmeier,

385-1 We oppose the construction of the CMRR nuclear facility. There are no alternatives offered in the draft Environmental Impact Statement, which goes against the national National Environmental Policy Act.

385-2 The proposed site of the CMRR building is in an earthquake zone.

385-3 The proposed CMRR building would be built at Los Alamos, one of the headwaters of the Rio Grande. There are already radionuclides in the Rio Grande which is now one of the sources of Albuquerque's

385-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

385-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

385-3 LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Stormwater Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Stormwater Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment (see Chapter 4, Sections 4.2.6, 4.3.6, and 4.4.6 for impacts on water resources).

385-4 NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a). It should be noted that plutonium aging is only one of the variables affecting nuclear weapon system reliability; other variables can control overall life expectancy of nuclear weapon systems.

Re: Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Mettallurgy Research Building Replacement Project at Los Alamos National Laboratory (SEIS CMRR) – Bandelier National Monument Comments

Dear Mr. Tegtmeier:

Bandelier National Monument, a unit of the National Park Service, Department of Interior, has been invited to comment on the Draft Supplemental Environmental Impact Statement for the above referenced CMRR project. Based on our review, we are concerned that the project may worsen safety conditions and the visitor experience at Tsankawi Unit on Highway 4 due to construction phase traffic impacts. We have summarized some concerns below, and by copy of this letter request a meeting at your earliest convenience to discuss these concerns with appropriate LASO staff. *386-1*

- Construction shipments will pass by the parking area serving Tsankawi Unit, and may result in short-and long-term construction traffic parking at the parking area. NPS does not manage the parking area and has limited ability to influence the presence of commercial vehicles there.
- Construction shipments – due to their size and slow braking capacity relative to automobiles and due to potential congestion at the Hwy 4/Truck Route intersection - may worsen traffic safety conditions for park visitors entering or exiting the Tsankawi Unit parking area. *386-2*
- Cumulative traffic increases may worsen traffic safety conditions for park visitors entering or exiting the Tsankawi Unit parking area, with special emphasis on the *386-3*

386-1 As requested, NNSA scheduled a meeting with the U.S. Department of Interior at Bandelier National Monument. Chapter 2, Section 2.6.2.1, of the *CMRR-NF SEIS* presents a discussion of construction activities associated with the Modified CMRR-NF. This discussion includes a description of the parking area that would be built in TA-72, along the south side of East Jemez Road. To minimize the potential for construction workers to use public parking areas, all craft workers would be required to board a bus to access the CMRR-NF construction site. The bus would only board at the designated craft worker parking lot planned for TA-72 along East Jemez Road. Equipment and material deliveries would be directed to arrive at the LANL vehicle inspection portal during off-peak hours to avoid peak traffic flows. This would minimize the need for suppliers to park their vehicles off the LANL site before passing through the vehicle inspection portal. For special deliveries that require large parking areas, arrangements would be made to ensure that parking areas would be located on the LANL site as close to the CMRR-NF construction site as possible.

386-2 Chapter 4, Sections 4.2.13, 4.3.13, and 4.4.13 of the *CMRR-NF SEIS* present the estimated impacts on transportation and traffic associated with the various alternatives. None of the proposed alternatives would result in a change to the level of service of roadways in the vicinity of LANL including SR-4, SR-501, and SR-502. Furthermore, the estimated impacts associated with transportation accidents under all alternatives would be small.

As indicated in the response to Comment 386-1, construction deliveries would be directed to arrive at LANL during off-peak traffic flows. The timing of deliveries as well as the relatively low number of daily deliveries would help minimize traffic congestion along Highway 4 and the entrance to the LANL vehicle inspection portal. Vehicles required to pass through the vehicle inspection portal would be provided with an access ramp that would enable them to wait in line for inspection without interfering with routine traffic flows. Also, the majority of delivery vehicles are expected to use the southbound lane of Highway 4, which would minimize traffic along the northbound lane, which is used by visitors entering or exiting the Tsankawi Unit.

386-3 Chapter 4, Sections 4.2.13, 4.3.13, and 4.4.13, of the *CMRR-NF SEIS* present the estimated impacts on transportation and traffic associated with the various alternatives. None of the proposed alternatives would result in a change to the level of service of roadways in the vicinity of LANL including SR-4, SR-501,

Commentor No. 386 (cont'd): D. Jason Lott, Superintendent U.S. Department of the Interior, National Park Service Bandelier National Monument

late afternoon, when construction workers are traveling home and visitation at the unit may still be relatively high. **386-3 cont'd**

- Vibration and noise from construction-related traffic may reduce the quality of the visitor experience at Tsankawi Unit. **386-4**

If you have any questions regarding these comments and to schedule a meeting as requested, please contact Barbara Judy, Chief of Resources at 505-672-3861 x 701 or Barbara_Judy@nps.gov.

Sincerely,

D. Jason Lott
Superintendent

TAKE PRIDE IN AMERICA

and SR-502. Furthermore, the estimated impacts associated with transportation accidents under all alternatives would be small.

The CMRR Project would mitigate traffic increases along Highway 4 by controlling the timing and parking location of workers and deliveries. Craft workers would arrive before peak morning traffic flows occur and would finish the day and leave the parking area on East Jemez Road before peak afternoon traffic flows occur. They would not contribute to the traffic flow during the day as they would be restricted to the CMRR-NF construction site. Craft worker traffic entering or leaving the parking area would be controlled by two traffic lights: one at the entrance to the parking lot and one at the intersection of East Jemez Road and Highway 4. These lights would help ensure that safe access to the Tsankawi Unit and Highway 4 would be maintained for persons entering and exiting the unit. Construction deliveries would also be restricted to off-peak traffic hours and would be provided an area to wait for inspection that minimizes impacts on routine traffic flows. Delivery vehicles would merge with westbound traffic after being inspected further minimizing impacts on routine traffic flows.

386-4 Chapter 4, Sections 4.2.4.3, 4.3.4.3, and 4.4.4.3 of the *CMRR-NF SEIS* present a discussion of noise impacts associated with construction of the CMRR-NF. Potential noise and vibration from CMRR-NF-related construction traffic would occur predominantly during off-peak traffic times and is not planned to occur on weekends. Construction activity under all alternatives is not expected to generate noise offsite that would be considered excessively intrusive. There would be a small increase in noise levels from construction employees' vehicles and material shipments; however, this increase would be temporary and would not be considered adverse when compared to preexisting conditions.

Commentor No. 387: Rhonda M. Smith, Chief
Office of Planning and Coordination
U.S. Environmental Protection Agency, Region 6

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 6
1445 Ross Avenue, Suite 1200
Dallas, TX 75202-2733

June 28, 2011

John Tegtmeier
EIS Document Manager
Los Alamos, Site Office
National Nuclear Security
Administration (NNSA)
U.S. Department of Energy
3747 West Jemez Road
Los Alamos, NM 87544

Dear Mr. Tegtmeier:

In accordance with our responsibilities under Section 309 of the Clean Air Act, the National Environmental Policy Act (NEPA), and the Council on Environmental Quality (CEQ) regulations for implementing NEPA, the U.S. Environmental Protection Agency (EPA) Region 6 office in Dallas, Texas, has completed its review of the Draft Supplemental Environmental Impact Statement (DSEIS) prepared by the National Nuclear Security Administration (NNSA), an agency within the United States Department of Energy (DOE), for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL) located at Los Alamos, New Mexico.

This DSEIS complements the environmental analysis contained within the Final EIS, and subsequent Record of Decision (ROD) published in February 2004, to replace the existing Chemistry and Metallurgy Research Building that was constructed in the early 1950's at the LANL. The replacement facility plan consists of constructing two new buildings. One of the buildings, the Radiological Laboratory/Utility/Office Building, has been constructed and is being outfitted with equipment and furniture. Enhanced safety requirements and updated information has prompted NNSA to re-evaluate the design concept of the second building to insure a more structurally sound design. The proposed Modified CMRR-Nuclear Facility (NF) portion design concept alternative will result in a more structurally sound building than that proposed in the earlier NEPA document. This building is being constructed on an existing and previously disturbed site within the existing LANL boundary. This modification has been addressed in this DSEIS.

EPA rates the Supplemental DEIS as "**EC-2**" i.e., EPA has "Environmental Concerns and Requests Additional Information in the Final Supplemental EIS (FSEIS)". Detailed comments are enclosed with this letter which more clearly identify our concerns and the informational needs requested for incorporation into the FSEIS.

EPA appreciates the opportunity to review the DSEIS. Please send our office two copies

Response side of this page intentionally left blank.

2

of the FSEIS when it is sent to the Office of Federal Activities, EPA (Mail Code 2252A), Ariel Rios Federal Building, 1200 Pennsylvania Ave, N.W., Washington, D.C. 20004. Our classification will be published on the EPA website, www.epa.gov, according to our responsibility under Section 309 of the CAA to inform the public of our views on the proposed Federal action. If you have any questions or concerns, please contact Michael Jansky of my staff at jansky.michael@epa.gov or 214-665-7451 for assistance.

Sincerely yours,

Rhonda Smith

Rhonda M. Smith, Chief
Office of Planning and
Coordination

Commentor No. 387 (cont'd): Rhonda M. Smith, Chief Office of Planning and Coordination U.S. Environmental Protection Agency, Region 6

Detailed Comments
for the
National Nuclear Security Administration (NNSA)
United States Department of Energy (DOE)
Draft Supplemental Environmental Impact Statement (DSEIS)
Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement (CMRR) Project
Los Alamos National Laboratory (LANL)
Los Alamos, New Mexico

The Draft Supplemental Environmental Impact Statement (DSEIS) for the National Nuclear Security Administration (NNSA) of the U.S. Department of Energy (DOE) was developed regarding the proposed construction of the nuclear facilities portion of the Chemistry and Metallurgy Research Building (CMR). The new facility will replace the outdated building that has been in use for 60 years, since it fails to meet current safety standards and building codes. The DSEIS makes clear that any impacts to the public resulting from the construction and operation (including potential accidents) of the CMR will be less than the potential dangers that exist by continuing to use the current facility.

Environmental Justice

The DSEIS analyzes impacts on populations within the 50-mile radius surrounding LANL as a whole, which includes eight counties and a population that is projected to be 545,000 by 2030. The demographic analysis should be more detailed in the interest of transparency and in order to present a more complete and accurate picture.

- The demographic data was limited to the average percentage of minority and low-income populations within the 50-mile radius of LANL, as well as the average percentages within the eight counties that comprise the 50-mile radius. The FSEIS should also provide a minority and low-income population analysis with a five, ten, and 20-mile radius. *387-1*
- It is obvious that those living closest to the facility will be more affected by normal operations or potential accidents at the facility than would those living farther away within the 50-mile radius.
- EPA guidance states, "Environmental effects are often realized in inverse proportion to the distance from the location or site of the proposed action (i.e., the closer the population is to the action, the greater the potential impacts). As a result, an effort should be made to correlate the demographic analysis to the area most likely to bear environmental effects." (*Final Guidance For Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses, April 1998)* *387-2*
- The total minority population of the 50-mile radius is projected to be 57% by 2030, compared with the State's 65% minority rate; however, by focusing on this 50-mile radius, the DSEIS somewhat distorts the picture because of the percentages of minority *387-3*

387-1 Chapter 3, Section 3.10, of the *CMRR-NF SEIS* was revised to provide additional analyses for minority and low-income populations at 5-, 10-, and 20-mile (8-, 16-, and 32-kilometer) radial distances as requested by the commentor.

387-2 Tables were added to Chapter 3, Section 3.10, of the *Final CMRR-NF SEIS* that display the composition of the population in the region of influence at radial distances of 5, 10, and 20 miles (8, 16, and 32 kilometers) for use in analyzing impacts specific to populations in close proximity to LANL. Additional analysis of the potential radiological impacts on nearby populations is presented in Chapter 4, Sections 4.3.11 and 4.4.11. The impacts on an average individual of the total minority population, the total Hispanic or Latino population, the American Indian population, and the low-income population; as well as the nonminority and non-low-income populations have been reported at each of these radial distances.

387-3 As discussed in the response to Comment 387-2, tables were added to Chapter 3, Section 3.10, of the *Final CMRR-NF SEIS* that display the composition of the region of influence at radial distances of 5, 10, and 20 miles (8, 16, and 32 kilometers). These tables show that the populations closest to LANL, within the 5- and 10-mile radial distances are predominantly nonminority and non-low-income residents.

387-4 Comment noted. Chapter 3, Section 3.10, of the *Final CMRR-NF SEIS* was revised to reflect changes to the population projections based on additional data available from the 2010 census.

387-5 Chapter 3, Figure 3-9, showed only minority populations surrounding LANL out to 50 miles and included percentages on the right axis of the graph. Tables were added to Section 3.10 of the *Final CMRR-NF SEIS* to clearly indicate the percentages of minorities residing within 5, 10, and 20 miles (8, 16, and 32 kilometers) of LANL in addition to the 50-mile analysis included in the draft SEIS. The graph was revised to include the total population, total minority, Hispanic, and American Indian populations.

387-6 As discussed in the response to Comment 387-5, tables were added to Chapter 3, Section 3.10, of the *Final CMRR-NF SEIS* to clearly indicate the percentages of minorities residing within 5, 10, and 20 miles (8, 16, and 32 kilometers) of LANL in addition to the 50-mile analysis included in the draft SEIS. The graph was revised to include the total population in addition to the minority populations and percentages are included on the right axis of the graph.

Commentor No. 387 (cont'd): Rhonda M. Smith, Chief Office of Planning and Coordination U.S. Environmental Protection Agency, Region 6

2

and low-income residents of many of the communities nearer LANL are higher than the averages of the 50-mile radius. **387-3 cont'd**

- Most of the population within the eight counties (74%) is concentrated in Sandoval and Santa Fe Counties, and they have 72% of the minority population of all the eight counties. Neither county, however exceeds the State's projected minority percentage of 65%, or the State's low-income percentage of 18.1%. **387-4**
- Figure 3-9, Minority Populations as a Function of Distance from Technical Area 3 and Technical Area 55 in 2030, depicts minorities and their distance from the facility. The graph is somewhat misleading because minorities are illustrated in an unclear manner and no percentages of minorities in those populations are shown. This could lead one to conclude that the percentage of minorities nearest the facility is low. The FSEIS should provide this information in a clear and concise manner accessible to the average person. **387-5**
- Figure 3-10, Minority Populations as a Function of Distance from Technical Area 55 in 2030, is also an effort to show minorities and proximity to the facility. It appears that at least 10,000 minority residents live within 15 miles of the facility, and those numbers rise precipitously after the10-mile point. No real data is provided about the minority residents living near LANL. However, outside of the towns of Los Alamos and White Rock, many residents are low-income Native Americans. The FSEIS should provide this information in a clear and concise manner accessible to the average person. **387-6**
- The FSEIS should provide a figure depicting the low-income status of residents and their distance from the facility. **387-7**

The health data provided was extensive, and included data from each of the eight potentially affected counties from 1999 to 2003 (after the Cerro Grande fire). The DSEIS states that cancer rates were lower than those of the U.S., and generally have been less than overall cancer rates of New Mexico. However, Los Alamos, Santa Fe, and Sandoval Counties did exceed the State's average of cancer rates.

- Los Alamos County, where LANL is located, exceeded the State's rates for melanoma, prostate cancer, female breast cancer, and thyroid cancer. Potential cancer risks should have been correlated with proximity of the residents to the facility, since risks to those who live greater than 50 miles of the facility will generally not be as high as the risks to those who live within a few miles of LANL. The FSEIS should provide this correlation. **387-8**

- Possible impacts to nearby Indian Tribes were not thoroughly examined. These individuals may already experience health problems (such as diabetes or high blood pressure) which would make them more susceptible to any radiological impacts. The FSEIS should provide a more detailed analysis of adverse impacts to Indians. **387-9**

The risk estimation data could have been presented in a manner more accessible to the general public. In describing the potential risk of developing one latent cancer fatality under various scenarios, the DSEIS did not consistently provide enough information. Frequently this **387-10**

387-7 Chapter 3, Figure 3-12, of the *Draft CMRR-NF SEIS* showed the number of low-income residents out to 50 miles (80 kilometers) from LANL. Tables were added to Section 3.10 in the *Final CMRR-NF SEIS* showing minority and low-income populations residing within 5, 10, and 20 miles (8, 16, and 32 kilometers) of LANL.

387-8 NNSA has researched these areas of concern and believes it would be inappropriate and not scientifically defensible to try to make the kind of correlation suggested by EPA. The data needed to correlate cancer rates with the proximity of the residents to LANL do not exist, so this cannot be done. Chapter 3, Section 3.11.4, of the *CMRR-NF SEIS* was revised to summarize the results of additional epidemiological studies performed for Los Alamos County and the State of New Mexico, and to clarify the results of an analysis performed for the *CMRR-NF SEIS* using data from the National Cancer Institute for the years 2003 through 2007. During that period, the overall cancer incidence and mortality rates for the state of New Mexico were below the national average, and the overall cancer mortality rate for Los Alamos County was less than that for the state. Total cancer incidence rates in Los Alamos, Santa Fe, and Sandoval Counties exceeded the state average, although the incidence rates in all four counties were below national averages. Although the current data indicate that Los Alamos County has higher cancer incidence rates than the state average for some cancers, including melanoma of the skin, prostate cancer, and female breast cancer, it also has lower cancer incidence rates for other cancers than the state or the Nation. As stated in Section 3.11.4, a study by the Agency for Toxic Substances and Disease Registry determined that there were no data to link environmental factors, other than naturally occurring ultraviolet light from the sun, with the observed incidence of any cancer in Los Alamos County and concluded that "Overall, cancer rates in the Los Alamos area are similar to cancer rates found in other communities. In some time periods, some cancers will occur more frequently and others less frequently than seen in reference populations. Often, the elevated rates are not statistically significant" (ATSDR 2006).

387-9 The activities associated with the alternatives evaluated in the *CMRR-NF SEIS* are expected to have very little impact on any members of the population, including members of minority groups. Additional comparison of radiological impacts on nearby populations was added to Chapter 4, Section 4.3.11, Environmental Justice, the *CMRR-NF SEIS*. The *CMRR-NF SEIS* follows the typical practice to evaluate dose to a representative receptor; the potential doses

Commentor No. 387 (cont'd): Rhonda M. Smith, Chief Office of Planning and Coordination U.S. Environmental Protection Agency, Region 6

3

information was well presented, as in this example, "... the estimated probability of this maximally exposed person developing a latent fatal cancer from radiation exposure associated with 1 year of LANL operations is about *1 in 3 million.*" Often, however, this risk estimation information was presented with mathematical formulas in a manner that the average person would not understand. The FSEIS should provide data and use language that is accessible to the average person. 387-10 cont'd

Tribal Concerns

The proposed project has the potential to affect several Indian Pueblos, including but not limited to effects on their governmental interests (such as emergency response to spills), natural resources (such as downstream pollution of streams and lakes from stormwater runoff, spills or transportation accidents) and their citizens. A significant amount of Indian country is located in the vicinity of LANL, and the San Ildefonso Pueblo borders LANL. The Pojoaque, Cochiti and Santa Clara Pueblos, Ohkay Owingeh Pueblo, Tesuque Pueblo, Jemez Pueblo, etc. are less than 30 miles away.

- The DSEIS does not adequately address potential effects upon Indian tribes, perhaps because the projected percentage of Native Americans within the 50-mile radius is 10%, while the percentage of Native Americans within all of New Mexico is 16%, but within certain areas, their percentages are high. The FSEIS should provide a more detailed analysis of adverse impacts to Native Americans. 387-11
- The FSEIS should provide more detailed maps depicting all tribal areas within the 50-mile radius. 387-12
- As detailed above, the proximity of many of the tribes to LANL and proposed transportation routes results in potentially significant adverse effects to Native Americans and tribal communities. As a federal agency, the DOE has a duty to consult with recognized Tribes whenever its actions may potentially impact those Tribes or tribal interests. 387-13
- The DOE should take immediate steps to initiate consultation with each of the potentially affected tribal governments on issues that may concern them, including but not limited to transportation, waste disposal, potential to pollute tribal waters, need for emergency response readiness, and other topics identified by the Tribes. As appropriate, the FSEIS should address topics of concern to tribes and these consultations should be documented.
- Special public outreach efforts should be undertaken to ensure that tribal members understand the proposed project and its implications. 387-14

The DSEIS states that the NNSA does arrange site visits with tribal representatives to solicit their concerns when a project is proposed. Normal procedures will be followed under the National Historic Preservation Act (NHPA), and the following tribes have been notified about the project and have been urged to comment on any concerns they may have:

from routine operations associated with the actions proposed in the *CMRR-NF SEIS* are shown to be very low such that additional analyses are not warranted. The *CMRR-NF SEIS* has added a reference to the analysis in the 2008 *LANL SWEIS* of the potential impacts on a subsistence consumer from LANL as a site and the impact of the proposed CMRR-NF on a subsistence consumer has been included in Chapter 4, Section 4.3.11, of the *Final CMRR-NF SEIS*. Note that the contributions of the facilities evaluated in the *CMRR-NF SEIS* would be very small contributions to the total dose. It should also be noted that detailed local tribal health information is not readily available to answer epidemiologic questions for nearby tribes.

387-10 NNSA agrees that the information should be easily understood by the average person. Thus, Chapter 4, Section 4.3.11, and Appendix B of the *CMRR-NF SEIS* were reviewed and the text revised to ensure that all of this risk estimation information is expressed in a manner that the average person can understand.

387-11 Appendix B, Section B.10, of the *CMRR-NF SEIS* has been revised to elaborate on the methodology used to project populations to the year 2030. The projected Native American population referred to by the commentor is a reflection of the low growth rates of the Native American population in this area. In comparison, the trends of other populations in the area, such as the Hispanic or Latino population, are projected to grow much faster than the Native American population. The activities associated with the alternatives evaluated in the *CMRR-NF SEIS* are expected to have very little impact on any members of the population, including Native Americans. Tables have been added to Chapter 3, Section 3.10, of the *CMRR-NF SEIS* to provide more information related to the percentage of Native Americans (and other populations) projected to be living within 5, 10, and 20 miles (8, 16, and 32 miles) of LANL in addition to the 50-mile analysis included in the draft SEIS. The impacts on Native Americans are not expected to be any different than the impacts on nonminority individuals and none of the impacts from normal operations of the proposed facility are expected to adversely affect minority or nonminority populations as discussed in the analyses presented in Chapter 4 of the final SEIS.

387-12 NNSA agrees. A figure has been added to Chapter 3, Section 3.10, of the *Final CMRR-NF SEIS* showing Pueblo and tribal areas within a 50-mile (80-kilometer) radius of LANL.

Commentor No. 387 (cont'd): Rhonda M. Smith, Chief Office of Planning and Coordination U.S. Environmental Protection Agency, Region 6

4

- Eight Northern Indian Pueblos Council,
- Mescalero Apache Tribe,
- Pueblo of Acoma,
- San Ildefonso Pueblo,
- Pojoaque Pueblo,
- Cochiti Pueblo,
- Santa Clara Pueblo, and
- Jemez Pueblo

However, the requirement to consult under the NHPA is separate and different from the broader duty to consult government-to-government that arises when federal agency actions may affect tribal interests. DOE should pursue consultation in a manner consistent with the Presidential Memo dated November 5, 2009, which states: "…The United States has a unique legal and political relationship with Indian tribal governments, established through and confirmed by the Constitution of the United States, treaties, statutes, executive orders, and judicial decisions. In recognition of that special relationship, pursuant to Executive Order 13175 of November 6, 2000, executive departments and agencies (agencies) are charged with engaging in regular and meaningful consultation and collaboration with tribal officials in the development of Federal policies that have tribal implications, and are responsible for strengthening the government-to-government relationship between the United States and Indian tribes."

387-14 cont'd

387-13 As previously indicated, analyses presented in Chapter 4 of the SEIS demonstrate that impacts from routine operations of the proposed CMRR-NF are not expected to adversely affect either minority or nonminority populations. Chapter 4, Section 4.3.13.1, Table 4-37, presents the annual risk from transportation or radioactive materials by route segment, for the Modified CMRR-NF Alternative. As indicated in this table, the risks from transportation are very low along the entire route, including the LANL-to-Pojoaque segment that traverses San Ildefonso tribal lands.

387-14 NNSA has undertaken public outreach efforts to ensure that tribal members understand the project and its implications. NNSA meets frequently with governors and others representing the Pueblos and tribes near LANL. In addition, DOE visited the San Ildefonso Pueblo during the public comment period to discuss the *Draft CMRR-NF SEIS*.

Chapter 5, Section 5.7, of the *CMRR-NF SEIS* has been revised to more fully explain the interactions between NNSA and the neighboring pueblos. There is a LANL Cultural Resources Management Plan (LANL 2006b) that guides the interactions with potentially affected pueblos and tribes with respect to the requirements of the National Historic Preservation Act.

Commentor No. 388: Pax Christi-Phoenix

Pax Christi-Phoenix

June 15, 2011

Mr. John Tegtmeir
U. S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir,

We, the members of Pax Christi-Phoenix, are concerned about the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico.

It is our understanding that the CMRR was designed to replace the existing Chemistry and Metallurgy Research Building and serve as the site where they would manufacture "Plutonium Pits", the fissile "triggers" capable of nuclear capability that initiate the destruction of modern thermonuclear weapons. The Lab already has the ability to produce 20 pits a year at the CMR building, but if they move ahead and build the new CMRR, they will have the ability to produce 80+ a year.

The original cost of the project was $400-550 million with the completion date this year. The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and lists a completion date of FY 2023 - this is more than ten times the original forecast. Who knows what the final cost would be if they are given the green light on this unneeded and dangerous project? *388-1*

The worst part is that the proposed site for the new CMRR building is only 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007, showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of *388-2*

388-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF, concerns regarding the cost of constructing the CMRR-NF, and position regarding plutonium pit production levels. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

388-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic

Commentor No. 388 (cont'd): Pax Christi-Phoenix

adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great.

With this in mind, it appears we could be looking at our own nuclear disaster much worse than Fukushima or Chernobyl. Supposedly, the new CMRR building will be able to withstand an earthquake of 7 on the Richter scale, but Japan has already had an aftershock from their recent earthquake measuring 7.1.

388-2 cont'd

In addition, none of this takes into account whether the nuclear weapons work presently done at LANL and our other nuclear weapons facilities violates the Nuclear Non-Proliferation Treaty.

388-3

We the members of Pax Christi-Phoenix advocate that the CMRR project be canceled and that a new study of LANL's plutonium infrastructure be undertaken which will include existing and future capability needs, and provide a realistic cost for maintaining and upgrading safety features at the existing CMR.

388-4

We look forward to your response.

Peace and Much Good,

Dan Petzmeyer
Ruth C. Zemek
Daniel Wazgowa
Suye Carey
Betty Bitham
John
Margaret Wolfaa
Tom Donovan
Jean Ajamie
Margaret McChesney

hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA acknowledges the commentor's concern that accidents similar to those that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant and in 1986 at Chernobyl could happen at LANL. There are fundamental differences between the functioning of nuclear reactors and activities at LANL. The types of radiological accidents that occurred at the Fukushima Daiichi Nuclear Power Plant and Chernobyl require a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

388-3 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

388-4 NNSA has already undertaken a more extensive evaluation than the requested evaluation of LANL's plutonium infrastructure. In 2008, NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b). NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility

Commentor No. 388 (cont'd): Pax Christi-Phoenix

at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely.

Commentor No. 389: John W. Zemblidge

John W. Zemblidge

Mr. John Tegtmeir
U. S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir,

I am writing about the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico.

It is my understanding that the CMRR was designed to replace the existing Chemistry and Metallurgy Research Building and serve as the site where they would manufacture "Plutonium Pits", the fissile "triggers" capable of nuclear capability that initiate the destruction of modern thermonuclear weapons. The Lab already has the ability to produce 20 pits a year at the CMR building, but if they move ahead and build the new CMRR, they will have the ability to produce 80+ a year.

The original cost of the project was $400-550 million with the completion date this year. The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and lists a completion date of FY 2023 - this is more than ten times the original forecast. Who knows what the final cost would be if they are given the green light on this unneeded and dangerous project?

389-1

The worst part is that the proposed site for the new CMRR building is only 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007, showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened

389-2

389-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF, concerns regarding the cost of constructing the CMRR-NF, and position regarding plutonium pit production levels. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

389-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic

Commentor No. 389 (cont'd): John W. Zemblidge

seismic hazards. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great.

With this in mind, it appears we could be looking at our own nuclear disaster much worse than Fukushima or Chernobyl. Supposedly, the new CMRR building will be able to withstand an earthquake of 7 on the Richter scale, but Japan has already had an aftershock from their recent earthquake measuring 7.1. **389-2 cont'd**

In addition, none of this takes into account whether the nuclear weapons work presently done at LANL and our other nuclear weapons facilities violates the Nuclear Non-Proliferation Treaty. **389-3**

Mr. Tegtmeir, I feel it is imperative that the CMRR project be cancelled and that a new study of LANL's plutonium infrastructure be undertaken which will include existing and future capability needs, and provide a realistic cost for maintaining and upgrading safety features at the existing CMR. **389-4**

I look forward to your response.

Peace and Much Good,

John W. Zemblidge
2722 East Purdue Avenue
Phoenix, AZ 85028-4720

hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA acknowledges the commentor's concern that accidents similar to those that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant and in 1986 at Chernobyl could happen at LANL. There are fundamental differences between the functioning of nuclear reactors and activities at LANL. The types of radiological accidents that occurred at the Fukushima Daiichi Nuclear Power Plant and Chernobyl require a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

389-3 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

389-4 NNSA has already undertaken a more extensive evaluation than the requested evaluation of LANL's plutonium infrastructure. 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely.

Commentor No. 390: Anonymous

June 25, 2011

Hello,

I'd like to leave a comment about the Metallurgy lab at Los Alamos. I am a concerned citizen, a long-time northern New Mexico resident, and I am definitely encouraging you to not build this facility. Okay?

It's time for us to move in a different direction in this country and on this planet. Six billion dollars is a lot of money and we could apply that money and help ourselves with renewable energy and not moving in a way of weapons and weapons research and plutonium pit manufacturing. Alright?

So it's time guys. Let's move our energy and our funds in a different direction. Please do not continue to poison the earth and its residence with plutonium pit factories that are unnecessary.

Thank you so much. Have a great day.

Anonymous

390-1

390-1: NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

Funding decisions regarding major Federal programs (for example, renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 391: Ellen Amba Caldwell and David Caldwell

Subject: CMRR Nuclear Facility

I wholeheartedly OPPOSE the building of the CMRR Nuclear Facility in New Mexico or anywhere. This complex will quadruple LANL's plutonium production from 20 pits per year to 80 pits per year. All of this will be used in making bombs to blow up places, people and animals, if such opportunities do arise. WE are supposed to be decreasing our nuclear supply of weapons, not increasing it. *391-1*

In a 2007 site–wide seismic report LANL issued a warning that there was not enough information on the seismic properties of the reference rock. There is not enough information to determine seismic safety of the old buildings and the new proposed facility.

The April 2011 LANL released a memo that describes why the soft option is not safe to prevent the proposed building from collapse into the underlying layer: compression of the layer of soft volcanic ash by the heavy building; seismic shaking from an earthquake; and liquefaction of the volcanic ash because of water leaks. Scott also talked about the deep alternative that would involve digging out the entire soft layer and then pour concrete and build on top of that but it is a much more expensive option. "The government has not done enough seismic analysis, they do not know if there is no fault line at the proposed site. They're designing it with an earthquake of maximum 7 Richter scale. They do not know what would happen if an earthquake of larger magnitude hits. They need to do more research and find all the faults". *391-2*

I am in agreement with this and think it should not be built and jeopordise us further.

On December 13, 2010 online issue of the Proceedings of the National Academy of Sciences, the University of Arizona scientists published a major study that concludes that the American West maybe entering a prolonged 60–year drought. The CMRR project would require approximately 16 million gallons of water each year for its operation. Let's not waste our precious water for this. *391-3*

Sincerely, Ellen AMba Caldwell

David Caldwell

391-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

391-2 There is no "soft option" under consideration by NNSA for construction of the CMRR-NF. The cost difference between the two options that are considered in the SEIS is one of the factors that NNSA will consider in making its decision on the project. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMFF-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

391-3 Based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Sent from my iPod

392-1 NNSA notes the commentor's opposition to the construction of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMRR Mission, of this CRD for more information.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 393: John Storbeck

From: Rusty Storbeck [rustys@cybermesa.com]
Sent: Wednesday, July 06, 2011 3:25 PM
To: NEPALASO@doeal.gov

I sincerely hope that the Las Conchas fire has caused DOE to re-think making Los Alamos the new center of plutonium pit production. We dodged a bullet this time, but we may not be able to next time. Mother Nature has a way of showing us that She is much more powerful than any design-basis plan humans come up with. *393-1*

Climate change is real. The drought this part of the country is in, is real. *393-2*

John Storbeck
Santa Fe

393-1 NNSA notes the commentor's concerns regarding the possible impact of wildfires and climate change. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

393-2 NNSA acknowledges the commentor's concerns that climate change may increase the frequency of wildfires and decrease the availability of water. In response to public comments, Chapter 3, Section 3.4.4, of the *Final CMRR-NF SEIS* has been revised to include a description of the types of environmental changes that could occur in the southwestern United States due to climate change. A discussion of potential impacts that could result at LANL from climate change and that addresses water usage has been added to Chapter 4, Section 4.1.

As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. LANL approaches sustainability on a site-wide basis, knowing that new facilities will require the use of limited resources. New projects such as the proposed CMRR-NF are constructed in a manner that improve the efficiency of energy and water use site wide. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

To: nepalaso@doeal.gov
Subject: Urgent that you reconsider!

I understand that you are considering building near a geologic fault line. I am asking that you reconsider and do NOT build there. The costs of adding this enormous new facility to LANL's weapon manufacturing complex in a geologically unstable area are just too great. Please cancel this project immediately. Thank you. *395-1*

Mary Smith, 3512 Michigan Ave, Elmira NY 14903-1107

395-1 NNSA notes the commentor's opposition to construction and operation of the CMRR-NF regarding cost. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 396: Sheila A. Cooper

SHEILA A. COOPER
P.O. BOX 312
ALCALDE, NEW MEXICO 87511

July 8, 2011

Mr. John Tegtmeier, CMRR-NF-SEIS Document Manager
Los Alamos National Laboratory
Los Alamos, New Mexico

Dear Mr. Tegtmeier:

I respectfully submit the following comments regarding the CMRR SEIS. I acknowledge and apologize for any inconvenience caused by the fact that my comments are submitted past the posted time deadline. I am asking for consideration due to complications regarding the Las Conchas fire.

I am a concerned citizen and have lived downwind of LANL in the traditional community of La Villita for 20 years. I am a former state of New Mexico Statistical Research Director, a former military officer and was a departmental representative on New Mexico Governor Jerry Apodaca's Cabinet Taskforce on the Waste Isolation Pilot Project (WIPP) in addition to being a lifelong New Mexican.

I am writing to express concerns regarding the adequacy and accuracy of the SEIS in particular the risk assessment analysis contained in Chapter 3 AFFECTED ENVIRONMENT and Chapter 4 ENVIRONMENTAL EFFECTS. My concerns are both general and specific in nature.

GENERAL CONCERNS

I am generally concerned with the assumptions and methodological parameters underlying the statistical analysis. For example, the analysis of health and radiation risks consider a one time exposure risk only using an average annual individual dose based on past release and exposure data. There is no analysis of cumulative effect or magnitude of potential exposure in relation to risk. The current analysis appears to consider only normal operating exposure risk with no consideration of accidental release exposure. Additionally, examining health effects within a 50 mile radius implicitly assumes equal risk at any time for every individual anywhere within that area without considering or controlling for the issues of greater risk at greater proximity, differing prevailing weather conditions, geophysical conditions, extreme weather conditions, or other extreme events such as earthquake or wildfire. It also implicitly assumes that an individual or individuals 1 foot further than the 50 mile radius never have any risk. While these assumptions simplify the analysis, they reduce the validity and reliability that results. *396-1*

396-1 The techniques, assumptions, methods, and parameters used for the human health analysis are the standard practices of the safety professionals of the industry. They have undergone detailed review both within the community and by independent groups, including the DNFSB and the NRC. The general modeling and analysis assumptions used for both the radiological impacts of normal emissions from the CMRR, which are extremely small, and for very severe accidents including earthquakes so severe that the building fails, are also typical parameters used in EISs or SEISs, and safety analyses around the country for both the DOE and the NRC.

Radiological releases from the facilities with any of the alternatives are extremely small and controlled. Releases of plutonium would be through filters and managed such that the releases are very small. As reported in the EIS, the estimated dose to the maximally exposed offsite individual is a very small percentage (less than 0.1 percent) of natural background radiation. The population as a whole receives much smaller doses. Since the releases are so low, the corresponding exposures are very low and largely insensitive to modeling assumptions. With releases this small, the use of more elaborate modeling techniques, even if they were available, would still calculate very small impacts and would not add additional insight regarding risk.

Appendix C of the *CMRR-NF SEIS* details the accident analysis that was performed for this SEIS. Using sophisticated models, severe accidents such as earthquakes and fires were analyzed using site specific meteorology and population distributions. The population information is based on the latest 2010 census data and includes detailed data on residents throughout a 50-mile (80-kilometer) radius around LANL. This information includes detailed information on minority and low-income populations residing within this region of influence. Where these populations reside is included in the modeling, so, the SEIS is able to project whether these populations would be subjected to disproportionate adverse risks.

Commentor No. 396 (cont'd): Sheila A. Cooper

Portions of 7 counties are included within the 50 mile radius area of analysis used for some variables. Los Alamos County is included in its entirety. Most population, demographic, economic and health data are aggregated and available for analysis with the county as the unit of analysis. The exception is in case of major metropolitan areas, none of which is entirely within the 50 mile radius. In rural or frontier counties these data, especially health statistics, are frequently only collected by county. To use these data to analyze effects on small portions of rural counties or a small portion of a major metropolitan area requires much extrapolation of data, which significantly increases the likelihood of error. Additionally more extrapolation leads to less confidence in the data. I find no figures establishing the range of confidence in the risk assessments reported within the SEIS. Further, racial, ethnic, and low income, underprivileged populations tend to aggregate in specific localized neighborhoods rather than distribute normally across an entire geographic area making extrapolation of countywide distributions even more specious. **396-1 cont'd**

The analysis of potential radiological effects uses the Genii Version 1 and Version 2 computer models. In 2001, the EPA Science Advisory Board reviewed GENII Version 2. The 10 member Science Advisory Board included a representative from LANL and another from the Lovelace Respiratory Research Institute in Albuquerque. The board raised a number of issues about the utility, validity and reliability of this model, including the fact that it had never been tested. Perhaps the most significant criticism of GENII v2 in relation to CMMR is that the dispersion modeling it produces are limited to open, flat terrain, a condition which most definitely does not describe Los Alamos. I find no evidence that the issues raised by the board have ever been addressed or corrected. **396-2**

SPECIFIC CONCERNS

CHAPTER 3 AFFECTED ENVIRONMENT

Population Estimates
The Los Alamos County website states "about 190,000 people live within 40 miles of Los Alamos". The analysis within the SEIS uses a 50 mile radius and reports the estimated population at risk in 2009 was 332,272. The difference in these figures suggests, at a minimum, that approximately 42% of the analyzed population at risk is located at the farthest distance from any exposure. Expanding the area of the population at risk has the effect of minimizing total exposure risk and significantly minimizing risk to those in closest proximity.

FIGURE 3-8 This figure appears to project a population at risk within the Santa Fe County ROI in excess of 200,000 in 2030. The actual 2010 population of all of Santa Fe County according to the US Census Bureau is 144,170. A 38.7% increase over 20 years or 19.35% per decade would be required to attain the projected population in all of Santa Fe County in 2030. However, the population increase from 2000 to 2010 was 11.5%. Thus, the population projection for the Santa Fe County ROI seems excessively optimistic and has the effect of underestimating individual risk. No explanation of the **396-3**

396-2 The impacts from normal operations are evaluated in the SEIS using the industry standard code developed by the EPA for just these purposes, the code GENII. This code is routinely used by the EPA for confirmation that releases from nuclear facilities meet the requirements of the Clean Air Act. The code is also used by the DOE and NRC for estimation of the potential doses to individuals and the general population from controlled, normal releases from nuclear facilities. Many reviews of this code have occurred over its several decades of continuous use and refinement. These reviews have found that the code provides conservative results, i.e., it overestimates the potential consequences.

The model allows consideration of both the distance and direction to target individuals and populations and makes use of site-specific meteorology. The model accommodates scenarios involving chronic releases to air from ground level and/or elevated sources. Exposure pathways include direct exposure from surface sources (soil) and air (semi-infinite cloud and finite cloud geometries) as well as inhalation and ingestion.

The GENII code was developed over a period of several years; the development incorporated several rounds of review of all portions of the code. As mentioned by the commentor, the EPA Science Advisory Board was asked in 2001 to review an early "beta test" version of Version 2 of the code and its initial draft users' manual. The suggestions of the EPA Science Advisory Board were incorporated in the ongoing development of the code. With regard to the concern expressed by the commentor that the model is limited with regard to modeling terrain such as that surrounding LANL, this may be correct but the results of the modeling for the proposed CMRR-NF are extremely low as discussed in the response to comment 396-1; are considered to be conservative; and provide NNSA with a reasonable basis upon which to compare the alternatives under consideration.

396-3 The population of the area within 50 miles (80 kilometers) of LANL provided in the *Draft CMRR-NF SEIS*, about 332,000, was based on census data collected from 2005 through 2009. The commentor compares this estimate to a Los Alamos County estimate of 190,000 within 40 miles (63 kilometers) of Los Alamos. This difference could be tied to the fact that most of Albuquerque is more than 40 miles (63 kilometers from Los Alamos and Albuquerque is the largest city in New Mexico. The standard 50 miles (80 kilometers) region of influence used to estimate potential human health impacts from radioactive releases in the *Draft CMRR-NF SEIS*, has been modified in the *Final CMRR-NF SEIS*. Additional radial distances of 5, 10, and 20 miles (8, 16, and 32

Commentor No. 396 (cont'd): Sheila A. Cooper

projection method is given. However it is likely that all population projections within the SEIS are similarly inflated. **396-3 cont'd**

A risk estimator of 1 latent cancer fatality per 1,667 person-rem dose is used to calculate the risk for exposure to 1 year of CMMR operations. This is essentially a one time risk exposure analysis. There is no analysis of cumulative effect over multiple years or decades. Cumulative effect is significant and needs to be considered because many Los Alamos residents live their entire working career in Los Alamos. Further, a majority of residents in significantly impacted downwind communities are multi-generational families with tenure longer than LANL has existed. Many of these family members live their entire lives with continual exposure. **396-4**

3.11.44 HEALTH EFFECTS STUDIES

This section reports National Cancer Institute Five Year Incidence and Mortality figures. It also quotes a study by the Agency for Toxic Substance and Disease Registry which concludes "overall cancer rates in the Los Alamos area are similar to cancer rates in other communities" without specifying how this conclusion was reached, what data was studied or how it was analyzed. TABLE 3-17 shows the five year rate of cancers for the country, state and 4 counties. However, the risk assessment purports to address risk in Los Alamos County and portions of 7 other counties. Failure to maintain consistency in the area studied throughout all risk assessment analysis is a questionable practice and raises issues of credibility.

Additionally, the data cited report all cases. Age related differences are not addressed. This is a significant omission and another way of excluding cumulative effect. As an example, National Cancer Institute 5 Year Cancer Incidence and Mortality data from 2003-2007 for Non-Hodgkins Lymphoma for Los Alamos County occurred at a rate somewhat higher than the national and state rate. However, if the rate for both sexes over 65 years of age, presumably after prolonged exposure, is studied, the national rate is 87.8/100,000; the New Mexico rate is 77.3/100,000 and the Los Alamos County rate is 141.3/100,000, nearly double the state rate. The rate in Los Alamos County for both sexes over age 50 is also significantly higher than either the National or State rates. This pattern also exists for other types of cancer. At a minimum, these data indicate the need for cumulative exposure analysis, not merely one time or average annual exposure calculations, to adequately and accurately assess risk. **396-5**

Chapter 4 Environmental Consequences

Table 4-28 Annual Collective Dose to Population within 50 mile radius of Radiological emissions during normal operations. These doses were calculated using GENII version 1 in the EIS. In the SEIS revised population figures and GENII version 2 were used to produce the dosage data. As the EPA Scientific Advisory Board determined in 2001, the revised GENII Version 2 is a simplistic computer model and its application to the geophysical environment of the Los Alamos area is especially questionable. Among the comments and recommendations of the Scientific Advisory Board are the following: **396-2 cont'd**

kilometers) were analyzed to estimate the potential impacts to residents in close proximity to LANL (see Chapter 3, Section 3.10).

Language has been added to section B.10 to elaborate on the methodology used to develop the population projections in this SEIS. Many of the subpopulations in the area surrounding LANL have a tendency to experience widely different growth rates. To avoid under- or over-counting populations, separate projections were made for individual subpopulations within each county of the potentially affected region that reflect the trends of that population specific to that area. The projections were made using data from the US Census Bureau's 1990, 2000, and 2010 Decennial Census. The projections used in the *Draft CMRR-NF SEIS* relied upon data from the 2005-2009 American Community Survey 5-Year Estimates because data from the 2010 census was unavailable at that time. A linear extrapolation was made using the preexisting census data to estimate populations at future points in time. The commentor is correct in the assertion that Santa Fe County experienced an 11.5 percent increase between 2000 and 2010; however, that county has also experienced a 45.7 percent increase between 1990 and 2010. The 20-year trend provides a more appropriate timeframe for comparison to a 20-year projection than can be established by a 10-year period.

Regarding the calculation of individual radiological risk, the increase in the estimated population included in the *CMRR-NF SEIS* results in a higher population dose and does not result in a lower individual risk. The estimated radiological releases were modeled for the entire population based on where they reside within the region of influence. In general, the higher the population, the higher the population dose with the closest residents to the site receiving a higher percentage of the dose. The average individual risk is calculated by dividing the total population dose by the total population. The average individual dose would not change if the total population was lower as suggested by the commentor because such a change in total population would result in a lower population dose assuming the population distribution remained the same. The results of this modeling for the various radial distances from LANL, included in the *Final CMRR-NF SEIS*, are shown in Chapter 4, Section 4.3.11.

396-4 The risk estimator used in the SEIS is based on the risk estimator set by the Interagency Steering Committee on Radiation Standards in 2002. This risk estimator reflects the lifetime dose from all pathways that an exposed individual and the population as a whole might receive from a year's worth of radiological releases from the CMRR-NF or the CMR Building. The commentor is correct

Commentor No. 396 (cont'd): Sheila A. Cooper

1. "More up to date algorithms are found in other computer models, especially those developed by the American Meteorological Society."

2. "It should be noted that in GENII v2 current dispersion modeling capabilities are limited to open, flat terrain."

3. "The straight line Gaussian and Langragian puff models were designed for "well-behaved" pollution transport from chimney stacks and do not apply to more critical scenarios involving fires, explosions and accidental or terrorist aerial releases of contaminants.... Under such conditions, the physics and chemistry of the problem require the use of more sophisticated, physically based models."

4. " The number of particle sized classes allowed in the system needs to be expanded as particle size is a very important parameter in governing deposition patterns during transport as well as deposition in the human respiratory tract. The sites of deposition in the respiratory tract in turn influence both the subsequent deposition of the inhaled material in the body and the doses received by the various body organs and tissues. Atmospheric transfer modeling in GENII v2 only accommodates 1 particle size."

5. "Failure to capture proper physical reality in risk assessment and policy management will be increasingly serious."

6. "In order to properly assess risk of radiological contamination and releases a site specific model is preferred"

7. "All the simplifying assumptions used in GENIIv2 may be justifiable for use in a screening tool that is not intended for detailed site specific analysis."

8. "Recommended Changes to GENII v2:

a. In all cases, recommended parameterized models should be tested thorough verification, calibration and if possible validation of some or all of its components.

b. A major deficiency in GENIIv2 appears to be in the water transport model. GENII v2 DOES NOT have a groundwater transport model.

c. The terrestrial transport model is also very simple.

d. GENIIv2 may also be inadequate in terms of the air transport model. Further development of near field and far field analysis is needed.

e. GENIIv2 does not incorporate meteorological data to allow for wind field analysis."

396-2 cont'd

CONCLUSIONS"

The CMRR SEIS , especially Chapters 3 and 4, is inadequate to properly assess potential risk. The population projections used to determine potential population at risk are overly optimistic. The ROI is not consistent throughout all variables. The health effects studies

that these estimates represent annual risks from the projected radiological releases. However, these risks are still a very small fraction of the annual risk associated with natural background radiation for individuals living near LANL. For example, as discussed in Chapter 4, Section 4.3.10.1, the projected dose to the average individual from Modified CMRR-NF operations would be less than 1/1000 of a percent of natural background radiation, annually.

396-5 The purpose of Table 3-19 in Chapter 3 of the *CMRR-NF SEIS* was not to provide a detailed comparison of all 22 cancers listed in the National Cancer Institute data base across any given number of counties across New Mexico or the United States. The intent, rather, was to provide a snapshot of the rates for representative cancers for the United States, the State of New Mexico, and Los Alamos and its three surrounding counties. The data that is presented indicates, for example, that cancer rates for prostate, thyroid and female breast cancers in Los Alamos County, are larger than average rates for the United States and New Mexico, but cancer rates for lung and bronchus, colon and rectum, stomach, and some other cancers are smaller than average rates for the United States and New Mexico. If the table was expanded to include additional New Mexico counties such as Bernalillo, Taos, and Mora Counties, NNSA expects the comparative cancer rates among the counties would again be variable: for some cancers the cancer rates would be larger than those seen in Los Alamos County and for other cancers the rates would be smaller.

The expansion of the table to consider age-related effects would not provide additional information that would assist NNSA in making a decision about constructing and operating the CMRR-NF. The National Cancer Institute data provides no information about the myriad of factors that may influence cancer incidence. It may be noted, however, that similar to that illustrated in Table 3-19 for persons across all ages and sexes, a review of National Cancer Institute data for the same 5 years and types of cancers addressed in Table 3-19 for all persons aged 65 years and older indicates wide comparative variations in cancer rates (see http://statecancerprofiles.cancer.gov/index.html). For example, the incidence rates for all cancers and both sexes is smaller for Los Alamos County than for Sandoval County and the United States average rate, but larger than the New Mexico average rate. The average cancer rates for Los Alamos County are larger than United States average rates for breast cancer, non-hodgkins lymphoma, and prostate cancer, but smaller than United States average rates for cancer of the brain and other nervous system, lung and bronchus, colon and rectum, stomach, leukemia, melanoma of the skin, ovary, and thyroid.

Commentor No. 396 (cont'd): Sheila A. Cooper

are superficial and do not include cumulative effects of contamination. The release data only consider past releases during normal operations and do not include potential accidental releases during extreme events. Some of the computer models used for analysis have not been tested and have been found to be simplistic, incomplete, invalid and unreliable for conditions at LANL. These models cannot perform a site specific analysis.

For these reasons, I strongly oppose the proposed expansion of CMRR until a comprehensive EIS is performed using site-specific computer models and analysis that conforms to rigorous research standards. ***396-1 cont'd***

I appreciate your consideration of these comments.

Sincerely,

SHEILA A. COOPER

The complete citation for the cited Agency for Toxic Substance and Disease Registry reference (ATSDR 2006) can be found in Chapter 7 of the *CMRR-NF SEIS* and at http://nnsa.energy.gov/nepa/cmrrseis.

Commentor No. 397: CK

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA–3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667–5948); or e-mail : **NEPALASO@doeal.gov**.

397-1

Right now the absolute global disaster at Fukushima shows the folly of pursuing any thing nuclear. Especially weapons. Obviously the New Mexican community is opposed to this madness. Yes madness. The United States does not need more nuclear weapons. Our infrastructure is crumbling and you want to spend money on more & more bombs. Pathetic. What part of NO do you not understand? This is proposed for right in my backyard AND I DON'T WANT IT. I AM UNALTERABLY OPPOSED.

397-2

This is sheer madness. How dare you even propose this utter nonsense. I lived near Rocky Flats and once was enough. To try to "sell" this ~~idea~~ by the idea of adding "jobs" is ludicrous. Just shame on you. Put this money and energy toward renewable energy. The last thing the world & the United States needs, is more nuclear weapons. They don't make us safer. They aren't wanted. They aren't needed. Stop this madness.

CMRR-NF Hearings:
Tues, May 24, 5 p.m. to 9 p.m., Holiday Inn Express, 60 Entrada Dr., Los Alamos.
Wed, May 25, 5 p.m. to 9 p.m., Santa Claran Hotel, 464 N. Riverside Dr., Espanola.
Thur, May 26, 5 p.m. to 9 p.m., Santa Fe Community College, Jemez Rooms, 6401 Richards Ave, Santa Fe.
View or download SEIS document : http://www.nepa.energy.gov *or* http://www.nnsa.energy.gov/nepa/cmrrseis

397-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMRR Mission, of this CRD for more information.

Regarding the Fukushima Daiichi Nuclear Power Plant, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

397-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the CMRR-NF SEIS. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 398: Bob Trujillo

Mr. John Tegtmeier

I listened to the radio last night. A preacher had one emphatic message which he preached with unchangeable love. America is doomed unless we take a good look at what we are doing.

I graduated from U.C. Berkeley in Feb 1965. My education is Electrical Engineer. My specialization is Feedback Control System. The professor who taught me this was Robert M. Saunders who later became the Dean of Engineering at the University of California Campus at Santa Cruz.

A feedback system can go into runaway mode or slew itself into being null and void by a zero control signal. Both types of signals mean the end of a system.

Do we really need the proposed LANL Bomb Factory? 398-1

As a Scientist educated at U.C. Berkeley I have a library of Chemistry and Metallurgy that I think needs to be used by the Research Replacement Project at Los Alamos

398-1 NNSA notes the commentor's question about the need for the CMRR-NF project. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility.

Commentor No. 398 (cont'd): Bob Trujillo

National Laboratory (LANL).

Since the Department of Energy (DOE) held a public meeting about the Draft environmental impact statement for the proposed #6 Billion Nuclear Facility which is part of the Chemistry and Metallurgy Research Replacement Project at LANL I only became aware of their request for comments prior to the June 23th due date.

398-2 Please allow me entrance into this comment submission procedure even though I am not meeting the due date in regards to Draft CMRR-NF SEIS.

At U.C. Berkeley I studied Nuclear Physics in my studies in Electrical Engineering.

Since then in my own individual library I have acquired and reviewed the same series of Science that I was taught at U.C. Berkeley with one important up date on my past.

398-2 NNSA considered all comments received after the end of the public comment period in preparing this *Final CMRR-NF SEIS*.

Commentor No. 398 (cont'd): Bob Trujillo

Every book that I read changes the concept of the word weight to mass.

Instead of study of Atomic Weight in the Periodic Table of the elements we study Atomic Mass.

By this change being omni present in all books taught at all levels of education from Kindergarden to Post Graduate studies uniformily in Science Weight is not considered real.

Therefore as we study mass in we must proceed further into this dead-end street to formulate F=ma, Work = Force x Distance, E=mc², and power = Work/Time or Energy/Time and thus is derived by the United States of America a DOE

Such a DOE is based upon the reality of the existence of Energy which has set aside its validity the moment Science opted to study Mass rather than Weight

An example of this is Soil Science

Response side of this page intentionally left blank.

Commentor No. 398 (cont'd): Bob Trujillo

A common garden hose produces pressure governed by W/L^2 ie a weight per unit of exiting area in which the water flows.

No mass is involved yet the hose separates the earth into 1) clay of formula $H_2O + H_2O + Al_2O_3 + 2SiO_2$, 2) silt of typical formula $Na_2O + FeO$, 3) Sand of aggregated formula $Al_2O_3 + 2SiO_2$ & 4) pebbles then little rocks etc.

This separation is by weight. It is linear. It is invariable. Not so in the book of Soil Science. The Soil Triangle shows Clay, Silt and Sand arrayed as a Triangle with each being a % of Soil Composition. This thinking is not in alignment with Science.

Another example of separation by weight is the use of filter paper and cellulose powder in Chromatography. In one direction weighted migrating compounds separate out. By changing the migration path by 90° the weighted migrating compounds even metals further separate out.

Response side of this page intentionally left blank.

Commentor No. 398 (cont'd): Bob Trujillo

Then there is the concept of Light. All of Science considers light to be a wavelength (L) divided by a time (T) ie L/T

Never is it taught that this light is separated from Mass M. Rather the Standard thinking is that light is separated from Weight W.

By these two concepts of W & L/T we obtain WL/T which is called production.

At the Livermore Lawrence Radiation Laboratory my U.C. Berkeley Engineering student friends worked by counting radioactive emission trails in a Wilson Cloud Globe Chamber. Each particle that they counted were in a subatomic trajectory governed by weight W x velocity L/T which they saw as light.

By moving this incorrectly into Force = mass x acceleration man through incorrect research has made possible the making of Nuclear Weapons that can

Response side of this page intentionally left blank.

Commentor No. 398 (cont'd): Bob Trujillo

literally burn down the forest above Los Alamos, New Mexico

I happen to meet two cross country Trail bicycle riders, the day before that forest fire started.

Their comment to me is that they bicycle 150 to 200 miles per day. Imagine that in the run between Abiquiu and Cuba through very rugged high country that these two very tired individuals set up a camp fire to cook food.

Due to an immediate need to get on their bicycles and keep tracking the Trail that they left the fire unattended. Thus the old addage that one careless match can burn down a whole forest became real. The Forest started burning the very next day.

This is what Mass, Force, Work, Energy and Power really mean. No one on earth today needs for LANL to do more research and replacement on a proposed LANL Bomb Factory

398-1 cont'd

Response side of this page intentionally left blank.

Commentor No. 398 (cont'd): Bob Trujillo

Rather I need you to visit Me at
Abiquiu New Mexico in order to
begin an exact and very difficult
review of chemistry & Metallurgy
as I see it per the information that
I own in my library of books that
the computer has made nominally
null and void i.e. all of them
are Discarded

We may possible Discard Earth
& then America will be doomed for
certain or we can open up to
sensible review and re-invent
ourselves.

I have done this to me. My
name is Jesus Christ Electrical
Engineer & Feedback Control
System Specialist.

Looking forward to your kind
communication with me. Write me
at Bob Trujillo P.O. Box Abiquiu
New Mexico or stop by and visit. From
where I live it looks like Los Alamos is
burning up. Kind of like the aftereffect of Nuclear War.
J.C.

Response side of this page intentionally left blank.

Commentor No. 398 (cont'd): Bob Trujillo

Mr. Tegtmeier

An example of the books I have marked Discard is Valence Theory which considers the foundation of Atomic Theory based upon Newtons classical equation F=ma which the book prints cannot be derived but is founded on experiment. The book goes on to print that the laws of Quantum Mechanics likewise are derived in the same light, the final test is that Quantum Mechanics Solution Equations agree with experiment.

By being marked Discard and thrown in the Trash Can per librarian decision of discarded out dated books we as the Community of Concerned Scientist have to go to the computer which with error in computers error out every single time.

I do not use the computer. At U.C. Berkeley I studied the Diode Diodes are doped. Two doping Diodes back to back make a transistor A series of integrated transistors make transistor-transistor logic & this gives us doped digital. Dope is prohibited by Law.

Response side of this page intentionally left blank.

Commentor No. 398 (cont'd): Bob Trujillo

So when 200 or more of the most extensive type of Scientific books get discarded by a deputy Librarian addicted to control by an instrument that cannot see, hear, feel, taste or touch as we people do I think that is equivalent to Idol Worship.

I have the books. Each and every one of them can only be read by an educated person. People who do not have Scientific education cannot read such, because they have no background training to do so.

So I suggest that we become University Readers & go to the books to validate any other system that we are today using especially the Computer.

What do you think. Best J.C.

Subject: comment form/hearing in Taos
Attachments: townrequestforhearingcMRRseis.pdf

Hello Mr. Tegtmeier,

Thank you for the deadline extention on the CMRR-NF SEIS and for the additional hearing in Albuquerque.

We still want a hearing in Taos as we will also be affected by this decision. We are downwind of LANL. Attached is the letter of request from our Mayor.

Also, I still cannot find a comment form available to the public on any of the websites. Please send me a copy by e-mail attachment. Thank you.

Jeanne Green 575-751-4130

399-1

399-1 Comment noted. The letter from Mayor Cordova is included as Comment No. 5 of this CRD.

After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

Mr. Tegtmeier:

The Town of Taos is in receipt of a form letter from your office, dated April 21, 2011, wherein it informs the reader that your office will be holding three public hearings on May 24, 25, and 26, in Los Alamos, Española, and Santa Fe (respectively). The purpose of these hearings is to discuss the findings of the environmental impact analysis contained within the Draft CMRR SEIS.

Given that the Town of Taos, as a representative agency of its citizens, considers the greater Taos community as an interested party, we respectfully request that a formal hearing, similar to those afforded to other communities in the affected region, be held within the Town of Taos. There is a considerable number of citizens in our area that have taken positions of interest on this matter, so much so that the Town Council took a similar position regarding its view of the SEIS pertaining to the Nuclear Facility portion of the CMRR Project by passing Town of Taos *Resolution 11-03* on January 25, 2011. In support of this request for a formal hearing in Taos, the Town is willing to provide the meeting space necessary to accommodate such a hearing.

We ask that your office seriously consider our request and hope you will grant said request as soon as possible to allow for adequate notification to our public. Please feel free to contact me or the Town Manager, Daniel Miera, directly at (575) 751-2003 should you have any questions or wish to discuss this request in more detail. Thank you.

399-1 cont'd

Commentor No. 800: Johnnie S. Martinez, Jr.

Chemistry and Metallurgy Research Replacement Project
Supplemental Environmental Impact Statement comment – May 24, 2011

Johnnie S. Martinez, Jr.
P. O. Box 581
Velarde, NM 87582

I am a 61-year resident of northern New Mexico and a 36-year employee of the Los Alamos National Laboratory. I'm also a father and a grandfather who is concerned about the safety and security of his family.

I support the Chemistry and Metallurgy Research Replacement (CMRR) Project, and I have several reasons for doing so that I'd like to share this evening:

National security

- I believe very strongly in the value of nuclear weapons as deterrents to all-out global warfare. As Dr. Norris Bradbury, a former director of the Laboratory, so aptly stated "The purpose of nuclear weapons is not to use them but to force people to find other means to solve their differences." I'm proud to be part of an institution that has helped make those fine words a reality.
- I am personally convinced that the science and technology underpinning this nation's nuclear deterrence capability must be maintained and should in fact be strengthened to address new challenges posed by terrorism and the proliferation of nuclear materials.
- The CMRR facility is designed to address these national security needs, and I therefore support its construction and operation as a safe and effective resource for doing so.

800-1

Environment

- The existing CMR building is old; in fact, it's almost as old as I am, and I believe its continued operation poses a much greater potential threat to the environment than does the proposed CMRR facility.
- I've had the opportunity to attend briefings and tours of the CMRR's sister facility, the Radiological Laboratory Utility Office Building, and I've come to the conviction that environmental safety is a key element of plans for the CMRR facility's construction and will be a fundamental element of its operation.

800-2

Economy

- Northern New Mexico was selected in 1943 as the site of the Manhattan Project because of its isolated location. Northern New Mexico is still relatively isolated, and many of us remain dependent on LANL as an economic resource.
- The CMRR project will present employment and procurement opportunities in northern New Mexico that would otherwise be difficult or nearly impossible to find in today's economic environment.

800-3

Thank you for this opportunity to share my thoughts.

800-1 NNSA notes the commentor's support for the proposed CMRR-NF project. All proposed new facilities would be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment. DOE Order 420.1B (DOE 2005) requires that nuclear or nonnuclear facilities be designed, constructed, and operated so that the public, the workers, and the environment are protected from the adverse impacts of natural phenomena hazards, including earthquakes. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for a description of some of the recommendations regarding enhancement of the CMRR-NF to address issues related to nearby seismic faults.

800-2 Chapter 1, Section 1.2 summarizes the operational and safety concerns related to the CMR Building. The proposed CMRR-NF would be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment.

800-3 The socioeconomics sections of the CMRR-NF SEIS present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9).

Commentor No. 801: Scott Kovac, Operations and Research Director Nuclear Watch New Mexico

May 5, 2011

Mr. John Tegtmeier
CMRR-NF SEIS Document Manger
USDOE, NNSA
Los Alamos Site Office
3747 West Jemez Rd.
Los Alamos, NM 87544

Via e-mail to NEPALASO@doeal.gov <mailto:NEPALASO@doeal.gov>

Dear Mr. Tegtmeier:

We, the undersigned, respectfully request that three additional public hearings be held and the comment period be extended by 75 days for the draft Chemistry and Metallurgy Research Replacement Project-Nuclear Facility Supplemental Environmental Impact Statement (draft CMRR-NF SEIS). Thus, our request is that comments on the draft CMRR-NF SEIS be due on August 26, 2011.

Additional public hearings should be held in Albuquerque, Taos, and Washington, DC. There is substantial interest in the CMRR-NF both in New Mexico and nationally. About 40 percent of New Mexico's population lives in the Albuquerque area, which is downstream from LANL, and it is not reasonable for people to have to travel to Santa Fe as the closest location to attend a public hearing. People in Taos are downwind of LANL and it is not reasonable for people to have to travel to Española as the closest location to attend a public hearing. Both Santa Fe and Española are approximately 60 miles from Albuquerque and Taos, respectively.

Additionally, because of the billions of dollars needed for the project, funding for the nuclear weapons complex and the CMRR–NF in particular has been a central focus of a significant national debate. The CMRR-NF SEIS indicates that the CMRR-NF is intended to support "manufacturing, development, and surveillance of nuclear weapons pits." Because its "need for action" is related to nuclear weapons production and because of the enormous resources required, the CMRR-NF has national implications. As a result, it is appropriate that policy makers and experts who debated funding for the CMRR-NF be given a chance to speak in a Washington, DC hearing.

Given the importance of the CMRR-NF and the substantial public interest, we believe that there will be substantial numbers of people interested in providing public comment at all of the hearings. Thus, the additional hearings are necessary so that those interested may provide public comments at reasonable times and locations, and may each have ample time to provide public comment. This will enhance the public participation process under the National Environmental Policy Act (NEPA), which we know is a common goal.

801-1

801-1 On April 29, 2011, NNSA published a notice in the *Federal Register* (76 FR 24018) announcing the availability of the *Draft CMRR-NF SEIS*, the duration of the comment period, the location and timing of public hearings, and the various methods for submitting comments. NNSA's implementation of public participation activities for review of the *Draft CMRR-NF SEIS* was consistent with past practices for other NEPA documents prepared for LANL. NNSA announced a 45-day comment period to provide sufficient time for interested parties to schedule their review of the *Draft CMRR-NF SEIS* around other commitments. In response to requests for additional review time, the comment period was extended by 15 days to a total review time of 60 days (76 FR 28222). NNSA believes this allows a sufficient period of time to provide comments on the *Draft CMRR-NF SEIS*. The Las Conchas wildfire affected many in the immediate vicinity of LANL. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*. Other NNSA EIS processes were delayed to respond to concerns regarding multiple NEPA public involvement opportunities (for example, the Sandia SWEIS scoping meetings and the BSL-3 Draft EIS public review period).

As with previous LANL NEPA documents, the public hearings were held at regional venues near LANL (Los Alamos, Española, and Santa Fe). In response to requests for additional public hearings, NNSA also held a fourth public hearing in Albuquerque (76 FR 28222). NNSA decided to hold an informational meeting in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period. DOE determined that holding a public hearing in Washington, D.C., is not appropriate for the *CMRR-NF SEIS* because construction of the CMRR-NF is specific to LANL missions.

Commentor No. 801 (cont'd): Scott Kovac, Operations and Research Director, Nuclear Watch New Mexico

We believe this requested time extension is merited because:

1. The proposed scale of the CMRR-NF SEIS has grown dramatically, with the addition of a second modified construction alternative – the "Shallow Excavation Option." Further, the Project has seriously grown in complexity in order to address seismic issues, with, for example, added related subprojects, such as the concrete batch plant and the pouring of a 250,000 yd^3 foundation of a lean concrete basemat to mitigate concerns about increased seismic risks. Because the CMRR-NF SEIS provides no preferred construction option at this time, research and technical review to prepare informed comments will have to be performed on multiple construction options.

2. The "Extensive Upgrades to the Existing CMR Building" (CMR Alternative 2) was removed as an alternative in the draft CMRR-NF SEIS from the alternatives provided in the October 1, 2010, Notice of Intent. Those members of the public who believe this to be the best alternative will still have to do research and technical review for this important omission. It will require even more work from the public because the baseline impacts have not been provided by NNSA.

3. Further, the CMRR-NF is not scheduled to be completed any earlier than FY 2022. Given all this, a 75-day extension, which we argue is the right thing to do, is inconsequential compared to the Project's increased scope and long schedule. Consequently, we think that granting the extension places no significant burden on NNSA, while not granting the extension would place a significant burden on the public.

4. Public scoping hearings are currently scheduled to be held May 24, 25, and 26, which will provide the public with an opportunity to interact with NNSA personnel, ask questions, discuss concerns, and likely become better informed. Then unfortunately the proposed comment period would end just 18 days later. We believe that is not sufficient time for the general public to research, prepare and submit informed comments on the draft CMRR-NF SEIS after having the benefit of interacting with NNSA officials.

5. Another Department of Energy (DOE) NEPA process involving the Lab is being held concurrently with the scoping comment period for the CMRR-NF SEIS. This is the draft Greater Than Class C EIS (GTCC EIS), which provides a 120-day comment period (the same as we are requesting for the draft CMRR-NF SEIS) with comments due on June 27 – a mere two weeks after the CMRR-NF comments are due. This limited timeframe places an undue hardship on NGOs and the public who are providing DOE with informed public comments about both important matters at LANL. A 75-day extension would make the comments on the draft due August 26, which is a reasonable time after the draft GTCC EIS comments are due.

801-2

CMRR-NF SEIS Additional Public Hearings
And Comment Period Extension Request
May 5, 2011 2

801-2 NNSA does not believe there is reason to extend the review time. The cited scale of the project has little bearing on the time required to review the *Draft CMRR-NF SEIS*. The addition of a construction option is a minor variation to the Modified CMRR-NF Alternative that does not affect the overall performance of the facility. Elimination of detailed analysis of an alternative to upgrade the existing CMR Building also does not warrant additional review time. The scheduled construction completion date of 2020 included in the *CMRR-NF SEIS* also does not bear on the time required to review the SEIS. Holding public hearings in the middle of the comment period is generally considered to be desirable in that it gives commentors some time to review the document prior to the hearings and time after the hearings to prepare comments. NNSA extended the comment period to 60 days, ending on June 28, 2011, which provided commentors with 15 additional days. As noted in response to Comment 801-1, other DOE NEPA activities were rescheduled in response to public concerns regarding multiple NEPA public involvement opportunities.

Commentor No. 801 (cont'd): Scott Kovac, Operations and Research Director, Nuclear Watch New Mexico

In sum, given the national interest and importance of the Project, at least three additional public hearings are necessary; the growth in project size, construction options and complexity, and the overlapping conflict with the draft GTCC EIS NEPA process, make it absolutely necessary for NNSA to grant a 75-day extension for draft CMRR-NF SEIS comment period.

Please do not hesitate to contact us through our email addresses below should you have any questions or comments. We look forward to your reply at your earliest convenience.

Sincerely,
Scott Kovac, Operations Director

To: NEPALASO@doeal.gov
Subject: Support of Construction for LANL's CMRR Facility

Dear Mr. Tegtmeier,

I would like to take this opportunity to express my support for construction of the Chemistry and Metallurgy Replacement Project (CMRR) at Los Alamos National Laboratory. I am an employee of Jack B. Henderson Construction Company (JBH). Our company has performed work at LANL for a couple of decades, opening an office on Trinity Drive in 1996.

Currently we are serving as General Contractor for the RLUOB Ventilation and Piping projects adjacent to the proposed CMRR nuclear facility. Please count me as a supporter of the continued development of this effort and facility. Not only will this project provide hundreds of construction and engineering jobs, bolstering the Northern New Mexico economy, it will serve a critical need in support of our Nation's energy and national security goals.

A-1

Thank you,

The Employees of Jack B. Henderson Const. Co.
Albuquerque, New Mexico

A-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF.

The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market for the proposed alternatives (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would employ a construction workforce for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (both direct and indirect) is relatively small in comparison to the total labor force in the four-county ROI. However, NNSA recognizes the opinion stated by a number of commentors during the public comment period that the creation of any construction jobs during the current economic climate would have a positive effect on the construction industry in northern New Mexico. See Section 2.7, Economic Impacts, of this CRD for more information.

Campaign B

A friend of mine passed along a report about your new developments at the Los Alamos National Laboratory. I am incredibly upset by this proposed new project. **B-1**

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. **B-2**

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. **B-3**

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. **B-4**

B-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

B-2 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the Pajarito and Rendija fault systems. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, these faults do not extend to the proposed construction location.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

B-3 NNSA notes that as indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials

Campaign B (cont'd)

characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Refer to Section 2.4, CMR Mission, of this CRD for more information. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

B-4 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

Campaign C

The new plans for a CMRR Nuclear Facility at the Los Alamos Lab are alarming. As a citizen who is concerned about nuclear proliferation and national security, here are a number of reasons why I oppose this project: ***C-1***

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. ***C-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***C-3***

The United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limit implemented by DOE in 1999 should suffice. ***C-4***

C-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF, and concerns about proliferation of nuclear weapons and national security. See Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

C-2 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazards analyses of the LANL region (LANL 2007, 2009). The updated seismic hazards analyses provided a better understanding of the ground motion and seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a sizable earthquake event without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

C-3 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

C-4 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in

Campaign C (cont'd)

December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Campaign D

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. As a citizen who is concerned about nuclear proliferation and national security, here are a number of reasons why I oppose the proposed CMRR Nuclear Facility: **D-1**

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. **D-2**

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. **D-3**

Expanding the United States' nuclear weapons production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere. **D-4**

D-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF, and concerns about proliferation of nuclear weapons and national security. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

D-2 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the Pajarito and Rendija fault systems. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, these faults do not extend to the proposed construction location.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign D (cont'd)

D-3 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

D-4 NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

... popula... surrou... LANL t... ophic risks this ... ility would pose.

Even without a natural disaster, manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. In fact, construction and operation of the CMRR-NF will interfere with efforts to clean up existing pollution at LANL.

The current cost estimate for the CMRR is $5.8 billion. That price tag emphasizes that the US simply does not need new plutonium pits. Furthermore, new "replacement" components, including plutonium pits that could be heavily modified from originally tested designs should be avoided because their use would inherently undermine confidence in the extensively tested reliable stockpile. *D1-1*

Expanding the United States' nuclear weapons production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere.

Beatrice Brailsford

Snake River Alliance

D1-1 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

As previously indicated, Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, states that pit production would not occur in the CMRR-NF. The President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile, which would be accomplished in part by activities that would be conducted at the proposed CMRR-NF, including analytical chemistry, materials characterization, and plutonium research.

Campaign E

I was just recently told about your new plutonium facility at the Los Alamos National Laboratory. Here are several reasons I believe it is not in the interest of any U.S. citizen to have this facility built: ***E-1***

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. ***E-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***E-3***

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. ***E-4***

E-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

E-2 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports the work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible

Campaign E (cont'd)

to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

E-3 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

E-4 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the Pajarito and Rendija fault systems. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, these faults do not extend to the proposed construction location.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological

Campaign E (cont'd)

material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign F

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have listed a number of different reasons why this plan would be harmful and costly: ***F-1***

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. ***F-2***

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. ***F-3***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***F-4***

F-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

F-2 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the

Campaign F (cont'd)

Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

F-3 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

F-4 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional

Campaign F (cont'd)

detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Individuals submitting "Campaign F" with additional comments

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have listed a number of different reasons why this plan would be harmful and costly:

At a time when the US and Russia are reducing their stockpiles of nuclear weapons, it is crazy to be expanding the capacity to produce up to 80 warheads a year. We need to not expand our capacity to contaminate the earth with more radioactive and toxic materials from a building in a seismic zone. ***F1-1***

Susan Gordon

F1-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

See response to Comment F-4 regarding seismic concerns.

Campaign G

The NNSA's plan to construct new plutonium pits at the Los Alamos Labs is a bad idea. I have listed a number of different reasons why this plan would be harmful and costly: ***G-1***

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. ***G-2***

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. ***G-3***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***G-4***

G-1 NNSA acknowledges the commentor's objections to new plutonium pits at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

G-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the Federal Register on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the

Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

G-3 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

G-4 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional

Campaign G (cont'd)

detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign G (cont'd)

Individuals submitting "Campaign G" with additional comments

With the fire now threatening Los Alamos, it becomes even more obvious that constructing new plutonium pits there is a terrible idea.

The costs to build a plutonium pit production complex are too high. The United States government simply can't afford this.

G1-1

Karen Turner

G1-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

See response to Comment G-2 regarding costs.

Campaign H

The NNSA is doing ecological harm by constructing a new nuclear storage and development facility at the Los Alamos National Laboratory. Here are several reasons I believe it is not in the interest of any U.S. citizen to have this facility built: ***H-1***

The United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limit implemented by DOE in 1999 should suffice. ***H-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***H-3***

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. ***H-4***

H-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The potential environmental impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10, of the *CMRR-NF SEIS*. Refer to Chapter 4, Section 4.2.7, 4.3.7, and 4.4.7 of the *CMRR–NF SEIS* for specific analyses of possible impacts on LANL ecological resources.

H-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

H-3 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

H-4 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Campaign H (cont'd)

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign I

I was just recently told about your possible new plutonium facility at the Los Alamos National Laboratory. I am very upset by this new project

The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include “taking no action” as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. ***I-1***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab’s discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***I-2***

Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth. ***I-3***

I-1 NNSA acknowledges the commentor’s concerns about construction and operation of the CMRR NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, “no build” alternative, however, would not satisfy NNSA’s stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

I-2 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL’s pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Campaign I (cont'd)

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

I-3 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth.

Certainly the tragedy being played out in Japan right now has lessons for us. Please ensure that we do not follow a path that would lead future generations to face what the Japanese are now facing. Nuclear power is not safe, despite what we are told. *I1-1*

Rita Schwarzenberger

I1-1 NNSA acknowledges the commentor's opposition to nuclear power and concern about the effects of more accidents similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant. The use of nuclear power is not within the scope of the *CMRR-NF SEIS*. NNSA notes, however, that there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Campaign J

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have summarized some of my concerns below. ***J-1***

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. ***J-2***

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. ***J-3***

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. ***J-4***

J-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

J-2 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue

Campaign J (cont'd)

to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

J-3 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

J-4 NNSA notes that as indicated in Chapter 2, Section 2.4, of the CMRR-NF SEIS, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the Federal Register on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original CMRR EIS and the current *CMRR-NF SEIS*

Campaign J (cont'd)

(see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Campaign K

I have recently been informed of a new plutonium development and handling facility being built at the Los Alamos National Laboratory. I am incredibly concerned by this project and feel the need to inform you of the various dangers of this project. A few of many are listed below. ***K-1***

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. ***K-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***K-3***

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. ***K-4***

K-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR-NF.

K-2 NNSA notes that as indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Refer to Section 2.4, CMR Mission, of this CRD for more information. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the

Campaign K (cont'd)

Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

K-3 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

K-4 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made

Campaign K (cont'd)

available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign K

Individuals submitting "Campaign K" with additional comments

Here in Boulder citizens are struggling to force the DOE to really clean up Rocky Flats. We have found Pu in the dust along the eastern boundary. With a raging wildfire surging toward the lab and the town, surely you must be rethinking the wisdom of building this project.ju

Please don't make the people of New Mexico be at greater risk than they already are by creating a new Rocky Flats.

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start.

Judith Mohling

K1-1

K1-1 NNSA acknowledges the commentor's concern regarding the potential for wildfires in the vicinity of LANL to release hazardous materials to the environment. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Refer to website http://www.lm.doe.gov/lead/sits/w/rocky-flats/rocky.htm for information about the Rocky Flats site.

Campaign L

I would like to voice my dissent concerning the NNSA's new plutonium pit facility being proposed at Los Alamos. ***L-1***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***L-2***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***L-3***

The United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limit implemented by DOE in 1999 should suffice. ***L-4***

L-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

L-2 NNSA notes that as indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

L-3 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that

Campaign L (cont'd)

are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

L-4 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Campaign L

Individuals submitting "Campaign L" with additional comments

As I watch the Conchas fire from my home in Santa Fe, and listen to the predictable reassurances from the Lab about the security of their nuclear materials I am again beset by the fear and resentment of the presence of this grotesque boondoggle that is the atomic weapons industry.

L1-1 It is past time to redefine the mission of the labs to the research and development of new energy technologies whose potential failures do not threaten the lives and health of the planet. Relying on the infallibility of human action when dealing with the most toxic materials offers no comfort, and the reassurances of officials with vested economic interests ring hollow.

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans.

James Chase

L1-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Campaign M

I was just recently told about your new plutonium facility at the Los Alamos National Laboratory. As a citizen who is concerned with nuclear proliferation and national security, here are a number of reasons why I am concerned: ***M-1***

Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth. ***M-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***M-3***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***M-4***

M-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR-NF, proliferation of nuclear weapons, and national security. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

M-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

M-3 As indicated in Chapter 2, Section 2.4, of the CMRR-NF SEIS, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

M-4 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no

Campaign M (cont'd)

evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign M

Individuals submitting "Campaign M" with additional comments

As a [illegible] nuclear [illegible] and national security, here are a number of reasons why I am concerned about your new plutonium facility at the Los Alamos National Laboratory:

Money spent on the CMRR facility should instead be spent on the clean-up of the many tons of waste still at the LANL site. Without a DOE infusion of at least $400,000,000, LANL will not meet the consent order timeline for the removal of the waste. Building nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth. *M1-1*

Pamela Gilchrist

M1-1 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Campaign M

Individuals submitting "Campaign M" with additional comments

...am. Plutonium is a very potent carcinogen... Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. Cancer rates are elevated due to normal emissions. In 2000 the Cerroi Grande Fire caused widespread contamination. Dust from my house tested too high with Strontium 90. This year I got cancer myself. Now we have a wild fire burning that could dwarf the Cerro Grande. Los Alamos has dry forests on three sides. It is insane to do nuclear production at this facility. And all the waste already there needs to be removed. This should be a matter of national security, and needs to be done before an EIS is considered. **M2-1**

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is also underway at Los Alamos Lab and the results will impact the design of the building. And we have yet to see what this fire brings us...all of northern NM may need to evacuate, but of course indigenous and poor farmers and families won't. It is an abomination that we bear this local threat from our own government facility. War is obsolete. We need all our resources **M2-1 cont'd**

Jean Nichols

M2-1 A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. A summary of possible public health impacts resulting from the fire is included in Chapter 4, Section 4.6.1.3, of the 2008 *LANL SWEIS* (DOE 2008a). As indicated in this section, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself. This section of the *LANL SWEIS* also discusses the *Public Health Assessment* (ATSDR 2006), for which the Agency for Toxic Substances and Disease Registry (ATSDR) reviewed environmental monitoring data from 1980 to 2001 and concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future. The data considered in the ATSDR assessment included at least one full year of environmental monitoring results from the period following the Cerro Grande fire.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 LANL SWEIS, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

LANL manages its wastes through an extensive and well-documented waste management program to ensure proper storage and disposal of its wastes in accordance with applicable environmental regulations and nuclear safety standards. As necessary, cleanup of previously disposed wastes and disposal areas is addressed in accordance with the Consent Order. See Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Campaign N

The National Nuclear Security Administration's plan to make a space for building new plutonium pits in Los Alamos is a terrible idea. I have listed a few different reasons I think this needs to be stopped. ***N-1***

Expanding the United States' nuclear weapons production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere. ***N-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***N-3***

The Alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. ***N-4***

N-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

N-2 NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

N-3 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

N-4 The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the *2003 CMRR EIS* and selected in the associated 2004 ROD and the *2008 Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and

Campaign N (cont'd)

materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

Campaign O

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have listed a few different reasons I think the CMRR-NF needs to be stopped. *O-1*

The United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limit implemented by DOE in 1999 should suffice. *O-2*

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. *O-3*

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. *O-4*

O-1 NNSA acknowledges the commentor's opposition to the construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

O-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

O-3 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

O-4 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that

Campaign O (cont'd)

are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign O

Individuals submitting "Campaign O" with additional comments

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have listed a few different reasons I think the CMRR-NF needs to be stopped.

First, let's take notice of the threat again of wildfires. We really need to consider that there are circumstances that we will not be able to predict, there for we will never be guaranteed 100% accident free facilities. *O1-1*

The United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limit implemented by DOE in 1999 should suffice.

Jill Franklin

O1-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 LANL SWEIS, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. The accident analysis presented in Appendix C of the *CMRR-NF SEIS* considered a representative set of severe accidents, including those initiated by earthquakes and fire. See Chapter 4, Section 4.2.10.2, Facility Accidents, and Appendix C, "Evaluation of Human Health Impacts from Facility Accidents," of the *CMRR-NF SEIS* for more information.

Campaign P

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory for a CMRR Nuclear Facility. I am incredibly upset by this new project for a variety of reasons. ***P-1***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***P-2***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***P-3***

Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material. ***P-4***

P-1 NNSA acknowledges the commentor's concern about construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

P-2 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Campaign P (cont'd)

P-3 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

P-4 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

Campaign Q

I recently heard about the proposed new plutonium facility at the Los Alamos National Laboratory, and I have a few concerns. **Q-1**

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. **Q-2**

The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. **Q-3**

Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth. **Q-4**

Q-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR–NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Q-2 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR–NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR–NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Q-3 The No Action Alternative included in the *CMRR–NF SEIS* is to construct and operate a new CMRR–NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR–NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR–NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR–NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR–NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

Campaign Q (cont'd)

Q-4 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR–NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Campaign Q

Individuals submitting "Campaign Q" with additional comments

I have concerns about the proposed work at LANL, especially in light of the current fire.

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

Aline Brandauer

Q1-1

Q1-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the CMRR-NF SEIS, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 LANL SWEIS, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Campaign Q

Individuals submitting "Campaign Q" with additional comments

I am here in NM right now, witness to the fire encroaching Los Alamos this is insane to create more disaster threats for our communities here.

I can not allow this to go forward and all of us here now after experiencing two fires in that area will be doing all that we can to block this from happening!

A new nuclear facility will detract from cleanup of the already existing mess! The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

Kathy Sipowicz

Q2-1

Q2-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the CMRR-NF SEIS, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 LANL SWEIS, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Campaign R

As an American citizen, I would like to voice my dissent concerning the NNSA's new plutonium pit facility being built in Los Alamos. *R-1*

The Alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. *R-2*

The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start. *R-3*

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. *R-4*

R-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

R-2 The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

R-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the CMRR-NF SEIS, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement

Campaign R (cont'd)

for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644).

Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

R-4 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Campaign S

The CMRR Nuclear Facility proposed at Los Alamos Laboratory is dangerous environmentally and physically. As a voting citizen who worries about the next generation of Americans, I feel obligated to voice my discontent. ***S-1***

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. ***S-2***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***S-3***

Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material. ***S-4***

S-1 NNSA acknowledges the commentor's concern about construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

S-2 As indicated in Chapter 2, Section 2.4, of the CMRR-NF SEIS, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the CMRR-NF SEIS present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

S-3 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the

Campaign S (cont'd)

CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS,* as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

S-4 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

Campaign S

Individuals submitting "Campaign S" with additional comments

OBVIOUSLY during this crisis with the fire blazing in Los Alamos at the moment, the CMRR Nuclear Facility proposed at Los Alamos Laboratory is dangerous environmentally and physically. As a voting citizen who worries about the next generation of Americans, I feel obligated to voice my discontent and deep concern for the safety and health concerns that we are facing currently with this fire. ***S1-1***

Manufacturing plutonium pits is a dangerous, inhumane and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. This building of nuclear weapons could backfire on the purpose of them being built and harm it's own country's people!

Pyara Ingersoll

S1-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Campaign T

I was just recently told about your new plutonium facility at the Los Alamos National Laboratory. I have listed a few different reasons I think this needs to be stopped. ***T-1***

Expanding the United States' nuclear weapons production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere. ***T-2***

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. ***T-3***

The Alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. ***T-4***

T-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

T-2 President Obama has stated a long-term goal of a world free of nuclear weapons, but also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

T-3 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

T-4 The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive

Campaign T (cont'd)

upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, Section 2.11, Alternatives Considered, of this CRD for additional information.

Campaign T

Individuals submitting "Campaign T" with additional comments

Spending $6 billion on a huge increase in plutonium production at this time of economic peril for so many in the U.S. is wasteful and dangerous. The U.S. is so strapped that many believe its debt ceiling must be raised; how can this expense be justified at this time?

President Obama has stated a goal of a world free of nuclear weapons. Increasing plutonium production only exacerbates the fear of other countries, which will want to react in kind, potentially accelerating an international arms race. With the building of a new plutonium pit facility, the US could possibly spur nuclear weapons development elsewhere. *T1-1*

Martha Eichler

T1-1 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions on Federal programs and projects at LANL are made by Congress and the President. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF, nor does plutonium production occur at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons and Nuclear Technology and Section 2.4, CMR Mission, of this CRD for more information.

Campaign T

Individuals submitting "Campaign T" with additional comments

I was just recently told about your new plutonium facility at the Los Alamos National Laboratory. I couldn't believe what I was hearing: the U.S. increasing their nuclear bomb-making capacity? After touting a vision for global nuclear disarmament? Why would be spending money, time, and resources building a facility that would manufacture nuclear weapons parts? I am utterly opposed to the construction and operation of this facility for its intended purpose. Here are a few different reasons I think this needs to be stopped: ***T2-1***

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

Lisa Young

T2-1 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Campaign T

Individuals submitting "Campaign T" with additional comments

I was j... ...lutonium ... Los Alamos National Laboratory.

In light of the knowledge we have from Fukushima nuclear power plant meltdown, I think this is a terribly stupid and irresponsible project. *T3-1*

As a public health professional, I know that this is a ticking time bomb. You will kill people with radioactive particles in water and the air. You know it and I know it. Plutonium is a toxic choice. *T3-2*

I have listed a few different reasons I think this needs to be stopped.

Expanding the United States' nuclear weapons production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere. You are open to terrorist attacks, too.

Audrey Keesing

T3-1 NNSA acknowledges the commentor's concern that accidents similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of nuclear reactors and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

T3-2 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Campaign U

The new development at the Los Alamos National Laboratory for plutonium pits is not in the best interest of our country. As a voting citizen, I feel as though there are a number of reasons to not complete this facility. *U-1*

Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material. *U-2*

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. *U-3*

The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. *U-4*

U-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

U-2 NNSA notes that as indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

U-3 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

U-4 The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so.

Campaign U (cont'd)

This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, Section 2.11, Alternatives Considered, of this CRD for additional information.

Especially in the wake of fires currently raging at its edge, the new development at the Los Alamos National Laboratory for plutonium pits is not in the best interest of our country. As a voting citizen, I feel as though there are a number of reasons to not complete this facility. ***U1-1***

Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material.

Don Eichelberger

U1-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Campaign V

Dear Department of Energy,

I'm concerned about the construction of the CMRR plutonium reprocessing and storage facility in New Mexico. It will store six tons of the most highly toxic substance on Earth, plutonium, at the government's facility. ***V-1*** Second, the costs have ballooned by 1000%, from $600 million to $6 billion. ***V-2***

Finally, this facility can be used to reverse the program, from President Obama's pledge to end nuclear weapons, to produce as many as 80 nukes each year. This is going one step forward, 3 steps back, with plutonium—the most deadly, toxic substance in the world. ***V-3***

V-1 NNSA notes the commentor's concern about the construction of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

V-2 The cost to build and operate the proposed *CMRR-NF* is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

V-3 President Obama stated that the goal of a world free of nuclear weapons would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF, nor does plutonium production occur at LANL. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Dear Department of Energy,

With the fire raging at the Lab's boundary, it is necessary to look at air and water contamination at the Lab as a result of the fire's long term impacts. *V1-1*

I'm concerned about the construction of the CMRR plutonium reprocessing and storage facility in New Mexico. It will store six tons of the most highly toxic substance on Earth, plutonium, at the government's facility. Second, the costs have ballooned by 1000%, from $600 million to $6 billion.

Finally, this facility can be used to reverse the program, from President Obama's pledge to end nuclear weapons, to produce as many as 80 nukes each year. This is going one step forward, 3 steps back, with plutonium—the most deadly, toxic substance in the world.

Susan Gordon

V1-1 A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. A summary of possible public health impacts resulting from the fire is included in Chapter 4, Section 4.6.1.3, of the *2008 LANL SWEIS* (DOE 2008a). As indicated in this section, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself. This section of the LANL SWEIS also discusses the Public Health Assessment (ATSDR 2006), for which the Agency for Toxic Substances and Disease Registry (ATSDR) reviewed environmental monitoring data from 1980 to 2001 and concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future. The data considered in the ATSDR assessment included at least one full year of environmental monitoring results from the period following the Cerro Grande.

Campaign V

Individuals submitting "Campaign V" with additional comments

Dear Department of Energy,

I'm concerned about the construction on an earthquake fault line of the CMRR plutonium reprocessing and storage facility in New Mexico. We have recently seen how natural disasters can affect nuclear power plants, etc. in the case of Japan and the tsunami. *V2-1*

In addition, the CMRR plutonium reprocessing and storage facility will store six tons of the most highly toxic substance on Earth, plutonium, at the government's facility. Second, the costs have ballooned by 1000%, from $600 million to $6 billion.

Amy Bush

V2-1 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazards analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). The updated seismic hazards analyses provided a better understanding of the ground motion and seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a sizable earthquake event without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA notes the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Campaign W

The draft SEIS is inadequate and technically indefensible for analysis of the risks of constructing and operating the proposed CMRR–Nuclear Facility with a capacity of quadrupling the current production of 20 plutonium triggers for nuclear weapons to up to 80 per year. I respectfully request that the DOE withdraw the draft CMRR–NF SEIS. ***W-1***

The National Environmental Policy Act (NEPA) requires a federal agency to provide a range of alternatives. DOE has not provided viable and workable alternatives. The "Modified CMRR–NF" alternative would allow construction with enhancements to address the growing number of seismic issues. There are two construction options: the "Deep Construction Option" and an inadequately analyzed "Shallow Construction Option," which do not meet NEPA requirements. Assumptions were made for key parameters in the analyses of the Shallow Option. The draft SEIS fails to offer and analyze realistic alternatives and therefore must be withdrawn. ***W-2***

The draft SEIS misrepresents the seismic hazard at the location of the proposed CMRR–Nuclear Facility. Intensive research by Robert H. Gilkeson, Registered Geologist, discovered that the draft SEIS misrepresents the possible ground motions by a large amount, omits important seismic information about the potential of active faulting close to the proposed site, and makes assumptions because the necessary field investigations have not been done.

There are seven key parameters that must be investigated in order to characterize the seismic hazard. They are the fault locations; the fault geometry; the direction of the slip on the faults; the maximum magnitude of an earthquake; the rate at which earthquakes reoccur on the faults; kappa, which is a key parameter for ground motions at specific LANL sites; and the shear velocity of the reference rock, which is dacite. In order to obtain this information, field studies must be conducted. ***W-3***

LANL scientists recommended these studies in three key seismic reports written in 1995, 2007 and 2009. But the recommended studies were not done. As a result, assumed values for the seven key parameters were inserted into computer programs to estimate the seismic hazard for the design of the proposed Nuclear Facility.

W-1 NNSA acknowledges the commentor's request to withdraw the *CMRR-NF SEIS* because it does not include an evaluation of increasing the pit production capacity. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

W-2 Regarding the commentor's assertion that the *CMRR-NF SEIS* fails to offer and analyze realistic alternatives, CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare an SEIS when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA prepared the *CMRR-NF SEIS* specifically to address the changes in construction of the CMRR-NF based on additional seismic information. See Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for more information.

W-3 NNSA disagrees with the commentor's assertion that the *Draft CMRR-NF SEIS* misrepresents the seismic hazard for the proposed CMRR-NF and therefore needs to be withdrawn and field studies completed before a new NEPA document could be submitted to the public. In particular, the seismic information included in Chapter 3, Sections 3.5.1.3 and 3.5.1.4, of the *CMRR-NF SEIS* only summarize the very detailed and extensive seismic information that has been compiled for LANL. These sections draw heavily from the 2007 and 2009 PSHAs (LANL 2007, 2009), which were prepared by experts in seismic analysis using the ground motion prediction models as specified by NRC guidelines developed by the Senior Seismic Hazard Analysis Committee, "Recommendations for Probabilistic Seismic Hazards Analysis – Guidance on Uncertainty and the Use of

Campaign W (cont'd)

Further, both surface–rupturing synchronous and simultaneous earthquakes have occurred along the Pajarito Fault System. For these types of earthquakes, multiple synchronous earthquakes produce a greater seismic hazard than the simultaneous earthquakes. But the draft SEIS states the contrary that simultaneous ground–rupturing earthquakes produce a greater seismic risk. ***W-4***

These errors will ultimately result in the underestimation of the seismic hazard risk and the impacts to public health and the environment from releases from the proposed Nuclear Facility. The LANL scientists recommended that comprehensive field studies must be done to gather the necessary information about the seismic hazard. The comprehensive field studies must be done before a new EIS is submitted for public review and comment. ***W-5***

The draft SEIS demonstrates that DOE will continue to waste water for manufacturing nuclear weapons; create more radioactive, hazardous and toxic waste; spew pollution into the air; and exceed its existing electric power needs. ***W-6***

Further, I am in solidarity with Santa Clara Pueblo Tribal Resolution No. 08–16 in which the Pueblo opposes the expansion of plutonium pit production at LANL and making that production capacity permanent. ***W-7***

Experts" (NUREG/CR-6372; NRC 1997), and established methodology. These reports were reviewed and accepted by an external review panel, DOE, and DNFSB. Section 3.5 had been revised to more fully describe the seismic studies and seismic risk for the CMRR-NF.

The commentor cites seven key parameters: fault locations; fault geometry; direction of the slip on the faults; maximum magnitude of an earthquake; rate at which earthquakes reoccur on the faults; kappa; and shear velocity of the reference rock. While the 2007 PSHA study acknowledges that additional data in these areas would provide a more complete understanding of the seismic hazard at LANL, there was sufficient information to complete the study. The uncertainties associated with these areas has been adequately captured and bounded by the results of the study.

DOE has been proactive in the assessment of the potential seismic hazards at LANL and the resulting design ground motions for the CMRR-NF reflect the best science and engineering available to date. That said, as future studies are performed on the geology and seismology of LANL, there may be new information that becomes available that should be evaluated for potential impacts on the assessment of the seismic hazards. In the 2007 and 2009 LANL seismic hazard evaluations, which updated a 1995 evaluation, a concerted effort was made to properly capture the uncertainties in input parameters and, hence, it is anticipated that new information will not have a significant impact on the current assessment of the seismic hazard or design-basis earthquake ground motions for LANL.

In addition to the assessment of seismic hazards at the CMRR-NF site, site-specific geotechnical investigations have been completed for both the Shallow Excavation Option and the Deep Excavation Option. A geotechnical report prepared for the Shallow Excavation Option provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy, which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation (Kleinfelder 2007a). The report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter)). The proposed CMRR-NF would be designed and constructed in accordance with geotechnical

Campaign W (cont'd)

recommendations provided in the geotechnical report (Kleinfelder 2007a). Similarly, the Deep Excavation Option would be completed in accordance with recommendations resulting from the geotechnical reports (Kleinfelder 2010a, 2010b). See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

W-4 While the *CMRR-NF SEIS* does not discuss the difference in seismic risk between multiple synchronous earthquakes and simultaneous ground-rupturing earthquakes, the *CMRR-NF SEIS* accident analysis is based on information in the 2007 and 2009 PSHAs (LANL 2007 and 2009), which do address this issue. The 2007 PSHA included both simultaneous and synchronous earthquake rupture models in calculating design ground motions for TA-55. Simultaneous ruptures were slightly favored in the model with a weight of 0.6 because this is the standard model used in PSHA practice, and displacement data for the Pajarito fault system suggest this type of rupture occurred in the past. However, synchronous ruptures were also included in the analysis with a weight of 0.4 (LANL 2007).

The commentor appears to mistake earthquake magnitudes with hazard in that the PSHA did not calculate higher hazard for the simultaneous rupture model, but it did estimate slightly higher maximum magnitudes for the simultaneous rupture model. Preferred maximum magnitudes for both simultaneous and synchronous ruptures were estimated using the same general approach. It is somewhat counterintuitive that the slightly bigger simultaneous earthquake can result in a lower ground motion hazard, but the two synchronous earthquakes result in higher ground motions for nearby sites, particularly when the site is located between the rupturing fault segments, because energy is coming from two sources. Calculations were performed using techniques that meet SSHAC (NRC 1997) and DOE guidelines, and were reviewed and accepted by an external review panel, DOE, and DNFSB.

W-5 See the response to comment W-3.

W-6 NNSA has evaluated the environmental consequences of the proposed alternatives for construction and operation of the CMRR-NF. Chapter 3 of the *CMRR-NF SEIS* describes the affected environment and Chapter 4 describes the environmental consequences, for each resource area, of the proposed alternatives.

Campaign W (cont'd)

NNSA takes its resource stewardship and conservation responsibilities seriously and continues to work with Los Alamos County to implement water conservation measures. Chapter 3, Section 3.3.4, of the *CMRR-NF SEIS* describes current water use and the water utility infrastructure for LANL and the Los Alamos region. DOE is now a county water customer; as such, DOE is billed and pays for the water it uses in accordance with a water service contract. For water-use planning purposes, DOE has established a target ceiling quantity for water use equal to the water rights it still owns (542 million gallons [2,050 million liters] per year). In 2010, LANL used 412 million gallons (1,600 million liters) of water or about 76 percent of LANL's target ceiling quantity.

Water usage estimates related to the proposed CMRR-NF are included in Chapter 4, Sections 4.2.3 and 4.3.3. As discussed in these sections, the proposed CMRR-NF is expected to use up to about 5 million gallons (19 million liters) of water per year to support construction of the CMRR-NF. If built, the CMRR-NF combined with RLUOB would use up to 16 million gallons (61 million liters) of water per year to support facility operations. LANL water usage, including the proposed Modified CMRR-NF and RLUOB, is expected to remain within the Laboratory's water rights. See Section 2.10, Water Resources and Usage, of this CRD for more information.

Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives evaluated in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. As summarized in Chapter 2, Table 2–4, no air quality standards would be exceeded.

Electrical power impacts are addressed in Chapter 4, Section 4.2.3, 4.3.3, and 4.4.3, of the SEIS. As discussed in Chapters 2 and 4, options for adding to or modifying the existing electrical distribution infrastructure at LANL to support the requirements of the proposed CMRR-NF are analyzed in the SEIS (for example, adding an electrical substation to TA-50).

W-7 Comment noted. See response to comment W-1 regarding pit production levels.

... al Polic... ...A) requires a federal agency to provide a range of alternatives. DOE has provided two alternatives: A "Deep Construction Option" and an inadequately analyzed "Shallow Construction Option," which do not meet NEPA requirements. And these alternatives stack the deck in favor of the Deep Option because the necessary work has not been done to present the public health and environmental impacts from the Shallow Option. ***W1-1***

* **The draft SEIS misrepresents the seismic hazard at the proposed location of the Nuclear Facility.** For example, the 2007 Probabilistic Seismic Hazard Analysis reports a vertical peak ground acceleration (PGA) of 0.6 g, but the draft SEIS reports the vertical PGA at 0.3 g. In addition for multiple surface-rupturing earthquakes, synchronous earthquakes produce a greater seismic hazard than multiple simultaneous earthquakes. But the draft SEIS **states the contrary** that simultaneous ground-rupturing earthquakes produce a greater seismic risk. ***W1-2***

Joe Hempfling

W1-1 The concerns expressed by the commentor about the Shallow Excavation Option not being evaluated as thoroughly as the Deep Excavation Option appear to refer to statements in Chapter 2, Section 2.6.2.1, of the *Draft CMRR-NF SEIS* indicating that there was more uncertainty in the design of the Shallow Excavation Option because that design had not reached the same level of maturity as the Deep Excavation Option. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option. Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002a). As indicated in the *CMRR-NF SEIS*, the Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

W1-2 Based on an apparent typographical error in the 2007 PSHA Executive Summary, the vertical peak ground acceleration for the CMRR-NF was incorrectly cited as 0.3 *g* instead of 0.6 *g* in the SEIS. This error has been corrected. This

Campaign W

Individuals submitting "Campaign W" with additional comments

typographical error in the Executive Summary of the PSHA is not reflective of information presented elsewhere in the PSHA and was not used in the design of the proposed Modified CMRR-NF.

Campaign W

Individuals submitting "Campaign W" with additional comments

I am opposing the proposed CMRR-Nuclear Facility because I believe it will have grave ecological and human health implications for my home state—local indigenous population from the Santa Clara, San Ildefonso, Cochiti and other pueblos that surround the lab, and to my own health where I live in Santa Fe. The project will also have great negative impacts on the birds, fish and animals that make their home in this desert environment. *W2-1*

The draft SEIS must be withdrawn as it does not take into account both the seismic risks as well as the climate change impacts predicted for the American southwest. *W2-2*

Subhankar Banerjee

W2-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF and concerns about potential ecological and human health impacts in New Mexico, in particular for those who live as close to LANL as Santa Fe and Native American populations in the vicinity of LANL. The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. The potential environmental impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10, of the *CMRR-NF SEIS*. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives, while Section 4.2.7, 4.3.7, and 4.4.7 address the possible impacts on ecological resources.. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

W2-2 NNSA acknowledges the commentor's concerns that climate change may increase the frequency and intensity of wildfires and decrease the availability of water. NNSA disagrees with the commentor's assertion that the *Draft CMRR-NF SEIS* needs to be withdrawn because it does not account for seismic risks and the effects of climate change in the American Southwest. Chapter 3, Section 3.4.4, of the *CMRR-NF SEIS* has been revised to include a description of the types of environmental changes that could occur in the southwestern United States due to climate change. A discussion of potential impacts that could result at LANL from climate change and that addresses water usage has been added to Chapter 4, Section 4.1. See the response to Comment W-3 regarding seismic concerns.

...gy Researc...
Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL)

Dear Mr. Tegtmeier:

I am writing today to register my opposition to the proposed CMRR facility at Los Alamos, NM. **W3-1**

The draft SEIS is inadequate and technically indefensible for analysis of the risks of constructing and operating the proposed CMRR–Nuclear Facility with a capacity of quadrupling the current production of 20 plutonium triggers for nuclear weapons to up to 80 per year. I respectfully request that the DOE withdraw the draft CMRR–NF SEIS.

...oppose the expansion of plutonium pit production at LANL and making that production capacity permanent.

The world already has enough plutonium to annhilate every country on the face of the map, and all of the life that lives on the lands, and most if not all life in the waters of our Earth. To what real purpose is production of another facility to create plutonium buttons for weapons, please? It is time we stop this insane dash to the ultimate finish line! **W3-1 cont'd**

Morgana Washington

W3-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMMR-NF and to proliferation of nuclear weapons. President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

See the response to Comment W-1 regarding pit or "plutonium button" production.

Campaign W

Individuals submitting "Campaign W" with additional comments

I am appalled that the US Government is going to spend $$$BILLIONS to build a new plutonium facility at Los Alamos. This is a waste of US Taxpayer money and a security threat which we do not want. There MUST be better ways to waste US Taxpayer money and to increase the already staggering US Federal Debt. The rationale for this plutonium facility was concocted many years ago using outdated concepts of national security. Since that time we have learned that every ounce of plutonium manufactured in the world is a threat to world security and that all efforts must be made to stop production of plutonium and other dangerous nuclear materials. *W4-1*

The proposed facility is even more disturbing given that it will be located in a more populated area subject to more recent discoveries of seismic activity and subject to very destructive wildfires which have proved to be almost impossible to control. *W4-2*

The draft SEIS is inadequate and technically indefensible for analysis of the risks of constructing and operating the proposed CMRR–Nuclear Facility with a capacity of quadrupling the current production of 20 plutonium triggers for nuclear weapons to up to 80 per year. I respectfully request that the DOE withdraw the draft CMRR–NF SEIS.

George MacArthur Henke

W4-1 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. The cost to build and operate the proposed CMRR-NF is also not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA acknowledges the commentor's concerns regarding national security. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

W4-2 NNSA acknowledges the commentor's concerns regarding seismic issues and the potential impacts of wildfires at LANL. Seismic issues have been addressed in the response to Comment W-3. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

Campaign X

Mr. John Tegtmeier, CMRR-NF SEIS Document Manger, USDOE, NNSA, Los Alamos Site Office, 3747 West Jemez Rd., Los Alamos, NM 87544

1. A Complete, New Environmental Impact Statement is Needed, Not A Supplemental Environmental Impact Statement. The original Environmental Impact Statement in 2004 assessed a building designed to withstand only mild seismic events. A 2007 updated seismic hazards analysis showed a potential huge increase in seismic ground motion and activity. Los Alamos National Lab sits between the Rio Grande rift and the volcanic Jemez Mountains in a seismic fault zone. Only a full Environmental Impact Statement can adequately study the full consequences of increased possibility seismic events might have on the proposed bomb plant. ***X-1***
   - A new business case is needed. Decisions made in 2004 EIS are outdated. Choice of NF is based on 2007 costs before NF ballooned to $6B.
   - The wrong Question is being asked. Should be - What is the most efficient way to take care of NNSA's stockpile needs? Not - What size and where shall the NF be built?
2. Real Alternatives Must Be Considered in the Supplemental Environmental Impact Statement. DOE must develop and consider new alternatives, including a true "No Action" alternative--not building the Nuclear Facility; and upgrading the existing plutonium production building. ***X-2***
   - Two of the Alternatives given in this draft are so bad that they cannot really be considered alternatives
   - The current "No Action" Alternative is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 CMRR EIS. But based on new information learned since 2004, the 2004 CMRR-NF would not meet seismic standards to safely conduct mission work. "Therefore, the 2004 CMRR-NF would not be constructed". (Pg. S-8)
   - So this is not really an alternative.
   - The Continued Use of CMR Building Alternative In this current EIS states: Do not construct a replacement facility to house the capabilities planned for the CMRR-NF, but continue to perform operations in the CMR Building at TA-3, with normal

X-1 NNSA notes the commentor's statements that a new environmental impact statement is required, and not an SEIS. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazards analyses of the LANL region (LANL 2007). The analyses were updated again in 2009 (LANL 2009). These updated seismic hazards analyses provided a better understanding of the ground motion and seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a sizable earthquake event without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely.

X–2 As described in Chapter 2, Section 2.6, of the 2003 *CMRR EIS*, a number of alternatives were considered and dismissed from detailed study. These include removing the CMR capabilities from LANL, alternative LANL sites for the CMR capability, and upgrading the existing CMR Building. NNSA did not revisit these decisions in the *CMRR-NF SEIS*. These and other alternatives considered, and dismissed are addressed in detail in Chapter 2, Section 2.7 of the *CMRR-NF–SEIS*. In addition, the 2008 *Final Complex Transformation SPEIS* evaluated options for relocating the CMR functions to other DOE facilities, including

Campaign X (cont'd)

maintenance and component replacements at the level needed to sustain operations for as long as feasible. Certain operations would be restricted. Administrative and radiological laboratory operations would take place in RLUOB at TA-55.

But this alternative does not completely satisfy NNSA's stated purpose and need to carry out operations at a level to satisfy the entire range of DOE and NNSA mission support functions. (Pg. S-19)

- So this is not really an alternative, either.
- That leaves only the Modified CMRR-NF Alternative as the only real alternative. Under the Modified CMRR-NF Alternative, which is NNSA's Preferred Alternative, NNSA would construct the new CMRR-NF at TA-55 next to the already constructed RLUOB, with certain construction enhancements and additional associated construction support activities.
- Obviously, two of the alternatives are unworkable, which stacks the deck in favor of the preferred alternative.

X-2 cont'd

3. This draft SEIS should be withdrawn until the details of the Seismic Risks are better understood.
   - The cost-saving Shallow Option, in which the foundation would be constructed in a geologic layer above a poorly welded tuff layer, is not a mature concept, and it is not yet known if this option is safe. The draft SEIS fails to accurately analyze how impacts to the environment from this option may be different.
   - There are more new seismic investigations currently underway at the Lab. This draft SEIS must be withdrawn and rewritten after the results of these new investigations are known. Proceeding with design before seismic risks are better known will only repeat the process that led to the need for this Supplemental EIS.

X-3

4. A New Nuclear Facility Will Detract from Cleanup of the Existing Mess. DOE made a commitment to clean up the legacy waste at Los Alamos Lab by 2015.

   Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant, which will only add to the pollution.

X-4

NNSS, the Pantex Plant, the Savannah River Site, and the Y-12 Security Complex (DOE 2008b). In the ROD for the *Complex Transformation SPEIS* (73 FR 77644) NNSA decided to construct and operate the CMRR-NF at LANL. DOE is not revisiting these decisions in the *CMRR-NF SEIS*.

The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

X-3 NNSA notes the commentor's position that the SEIS should be withdrawn. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations,

Campaign X (cont'd)

- Materials Disposal Area C (MDA C), a large chemical waste dump, is located in the middle of the proposed construction support areas.

  Large pore gas contaminant plumes exist under areas where construction offices and warehouses are planned. Cleanup at MDA C must be completed before any new construction.

X-4 cont'd

5. The Costs to Build a Plutonium Pit Production Complex Are Just Too High. The total original estimate for constructing the new nuclear weapons complex at Los Alamos National Laboratory was approximately $600 million in 2004. The current estimate is $5.8 billion. DOE must analyze whether this growing price tag is too high and examine simply upgrading the existing facilities to address seismic concerns and worker safety would cost less.

X-5

6. The US does not need 80 new plutonium pits per year. DOE must conduct a "capacity study" to determine whether the existing facilities can be used instead of building the proposed NF, which would increase pit-manufacturing capacity to at least 80 per year. Existing facilities have sufficed since 1999 when DOE limited plutonium pit manufacturing to 20 per year.

   - So what are these needed new or expanded capabilities, if indeed we are seeking a future world free of nuclear weapons? If these needs exist, NNSA must explain why plutonium pit production must be expanded? If expanded production is not needed, then why is the CMRR-Nuclear Facility needed?

X-6

Just as new seismic information has forced a re-evaluation of the construction, new cost information must force a re-evaluation of the cost.

X-5 cont'd

The No-build alternative that was offered in the scoping must be reconsidered.

- Do not construct a replacement facility to house the capabilities planned for the CMRR-NF. Continue to perform analytical chemistry, material characterization, and actinide research and development activities in the CMR Building, making the extensive facility upgrades needed to sustain CMR programmatic operations for another 20 to 30 years.

X-2 cont'd

no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

X-4 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

As stated in Chapter 4, Section 4.3.12, Waste Management and Pollution Prevention, of the *Draft CMRR-NF SEIS*, There are known potential release sites located within the affected technical areas (for example, Material Disposal Area C in TA-50), and the potential for contact with contaminated soil or other media

Campaign X (cont'd)

would be appropriately considered throughout the construction process. Proper precautions would be taken as needed to minimize the potential disturbance of potential release sites. As needed, actions such as appropriate documentation and contaminant removal would be taken by LANL Environmental Restoration staff in accordance with the 2005 Consent Order and other applicable requirements.

As discussed in Chapter 2, Section 2.6.2.1, the activities included in TA-50 in the proposed action would involve use of the parking lot that was developed during construction of RLUOB, and the construction of a small stormwater detention pond and possible construction of an electrical substation across Pajarito Road from Material Disposal Area C. Also, there is the potential for temporary power to be run through TA-50 alongside Pajarito Road, but outside of Material Disposal Area C. None of these activities would infringe upon Material Disposal Area C and no excavation would take place that could affect the area down slope from Material Disposal Area C.

X-5 As stated in the response to Comment X-1, the cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Also, as discussed in the response to Comment X-2, NNSA considered upgrading the existing CMR Building and determined that it could not fulfill the stated purpose and need.

X-6 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Individuals submitting "Campaign X" with additional comments

Simply put, CMRR is a huge new plutonium facility for expanded nuclear weapons production.

CMRR's first phase, the 185,000 square-feet "Radiological Laboratory, Utility and Office Building" (RULOB or "Rad Lab"), was completed in September 2009, costing $400 million (including equipment), but will not handle large quantities of "special nuclear materials," like plutonium. For that purpose, the CMRR's final phase is the proposed "Nuclear Facility." The Nuclear Facility (NF) will provide crucial "materials characterization" and "analytical chemistry" in direct support of plutonium pit production. If built, the Nuclear Facility wi ll be located next door to Plutonium Facility-4 (PF-4), LANL's existing pit production facility, and the two will be physically linked to each other via underground tunnel. The NF will also supply PF-4 and LANL's plutonium complex with a vault to store up to six metric tons of plutonium. As such the NF will be the keystone to an expanded plutonium complex at LANL capable of quadrupling the current production capability of 20 pits per year to up to 80. Design of the Nuclear Facility has already cost nearly a half billion dollars and is still only ~50% complete. Because of the recognition of greater seismic risks and a proposed 50% increase in size, NNSA was compelled by citizen pressure to prepare a supplemental EIS, which was released on April 22. ***X1-1***

The public comment period will be open through June 28, 2011. You may use this form to submit comments to the Document Manager automatically via email.

1. A Complete, New Environmental Impact Statement is Needed, Not A Supplemental Environmental Impact Statement. The original Environmental Impact Statement in 2004 assessed a building

Juliet Carpenter

X1-1 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. As indicated in Chapter 1, Section 1.3, of the *CMRRNF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRRNF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

See the response to Comment X-6 regarding pit production levels.

Campaign X

NM c

By way of introduction, I would like to point out that Earth Day (April 22) was quite an ironic date to release the SEIS for the CMRR-NF. Plutonium is perhaps the most hazardous substance human beings have ever created. Plutonium's forever hazard (Pu-239, for example, has a hazardous persistence of 240,000 years) in even microscopic quantities (a small speck in the human lung will initiative cancer), as well as the peril represented by the continued and prolonged presence of nuclear weaponry, put the Earth and all living things in peril. X5-1

1. A Complete, New E... Impact Statement is Needed. Not A

should ...itted, new ones should not ...icated.

In closing, I must point out another piece of ironic timing. The deadline for public comments on this SEIS on June 28th is the third day of a very dangerous wildfire threatening Los Alamos National Lab, the Las Conchas Fire. It is, of course, a sobering reminder of the May 2000 2000 Cerro Grande Fire. Given these two potentially catastrophic fires, how can LANL considering even more plutonium activities on site?! LANL should be cleaned up, not built up! As Citizens Concerned for Nuclear Safety (CCNS) warned just yesterday, "Our main concern is that the Las Conchas fire is about 3 1/2 miles from Area G, the dumpsite that has been in operation since the late 1950s/early 1960s. There are 20,000 to 30,000 55‐gallons drums of plutonium contaminated waste (containing solvents, chemicals and toxic materials) sitting in fabric tents above ground. These drums are destined for WIPP." The priority at LANL should be clean up, not build of new facilities such as the CMRR and its NF. X5-2

How can LANL consider storage and processing of 6 tons or more of ultra-hazardous plutonium in an area so demonstrably at risk of fire, not to mention seismic activity?

Finally, to drive home the risks of such fires, I am providing to you a link, http://www.beyondnuclear.org/nuclear-weapons/2011/6/27/los-alamos-nuclear-weapons-lab-threatened-by-wildfire.html, which shows an image of the smoke plume -- visible from outer space, and photographed by satellite -- covering several states downwind, very likely contaminated with radioactive contamination from LANL's Cerro Grande fire in 2000. Such risks are unacceptable. Please do not build the CMRR-NF.

Kevin Kamps

X5-1 Comment noted.

X5-2 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

The waste storage domes in TA-54 are not the subject of the *CMRR-NF SEIS*. However, NNSA has taken actions to mitigate the risks of a wildfire on the domes. In 2000, the Cerro Grande fire burned a heavily forested canyon area to within about 0.75 miles (1.2 kilometers) of the waste storage domes, but none were burned and there were no radiological releases from the domes. The Las Conchas fire reached the southern border of LANL, but did not get within 2 miles (3.2 kilometers) of the domes. Additional fuel reduction has been conducted since the Cerro Grande fire, both of the vegetation surrounding the TA-54 area and within the domes themselves (for example, wooden pallets have been replaced with metal pallets), to further decrease the potential for a waste storage dome fire occurring as a result of a site wildfire. Furthermore, the stored transuranic waste referred in the comment is being recovered and shipped to WIPP for disposal, thus, further reducing wildfire risks as the shipments continue.

A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. A summary of possible public health impacts resulting from the fire is included in Chapter 4, Section 4.6.1.3, of the 2008 *LANL SWEIS* (DOE 2008a). As indicated in this section, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk

Campaign X

Individuals submitting "Campaign X" with additional comments

over the risk from the fire itself. This section of the *LANL SWEIS* also discusses the *Public Health Assessment* (ATSDR 2006), for which the Agency for Toxic Substances and Disease Registry (ATSDR) reviewed environmental monitoring data from 1980 to 2001 and concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future. The data considered in the ATSDR assessment included at least one full year of environmental monitoring results from the period following the Cerro Grande fire.

Campaign Y

To: Mr. John Tegtmeier, CMRR-NF
SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544
Re: CMRR-NF SEIS Comment
Date: June 24, 2011

Dear Mr. Tegtmeier:

Y-1

I oppose the construction of the CMRR Nuclear Facility at the Los Alamos National (LANL) for the following reasons:

ENVIRONMENTAL ISSUES

The Nuclear Facility is designed to have the capacity to prepare plutonium for up to 80 new pits (triggers for nuclear weapons) per year. It would store six metric tons (about 13,200 pounds) of plutonium, a very potent carcinogen.

Y-2

LANL sits on a windswept mountain top, in a seismic area, where wildfires and contaminated run-off continue to threaten the health of all who live downwind and downstream from LANL. Plutonium and other radionuclides were found in organic gardens downwind from Los Alamos after the 2000 Cerro Grande fire. There is increasing evidence of groundwater pollution from the Lab, with more "expected over a period of decades to centuries as more of the contaminant inventory reaches the water table," according to a 2005 LANL report. Radionuclides have been detected in the Rio Grande, the source of drinking water for many citizens living downstream from the Lab.

Y-1 cont'd

Plutonium has a half-life of 24,000 years (meaning it is half as potent by then). So any pollution will continue for many, many thousands of years. In addition to cancer, radioactive materials can cause serious birth defects. This disproportionately impacts New Mexico's minority populations, especially Native and Hispanic, making it an issue of environmental injustice.

Y-3

The Department of Energy (DOE) estimates that the maximum amount of water needed for construction would be 4.6 million gallons per year. However, an independent analysis figured that 6.75 million gallons of water would be used in mixing 225,000 cubic yards of concrete planned under the structure to meet safety requirements due to potential seismic hazards (and we are not convinced that will protect against a major earthquake). Another 3.9 million gallons of water would be needed for the additional 130,000 cubic yards of structural concrete.

For each year of operation after construction, DOE estimates that the Nuclear Facility would use 16 million gallons per year. We live in a dry semi-desert climate getting ever more dry with global warming, and we cannot afford to waste such a huge amount of water. Better not to put a nuclear facility in an earthquake prone zone.

Y-4

Taos citizens, along with Senator Udall and Representative Lujan, requested a hearing for public

Y-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF, position regarding plutonium pit production levels and concern regarding the hazards of plutonium. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

Y-2 A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. A summary of possible public health impacts resulting from the fire is included in Chapter 4, Section 4.6.1.3, of the 2008 *LANL SWEIS* (DOE 2008a). As indicated in this section, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air

Campaign Y (cont'd)

comment in their town so they wouldn't have to travel through the canyon to get to a hearing in other locales, but the National Nuclear Security Administration told Sen. Udall that the NNSA expected no safety consequences for Taos from operating the CMRR Nuclear Facility. Yet the smoke carrying plutonium and other radionuclides reached Taos during the 2000 Cerro Grande Fire at LANL. And they received smoke from the current Wallow Fire in AZ 200 miles away. **Y-4 cont'd**

Producing more plutonium pits will create more waste. We already have 700,000 metric tons of depleted uranium waste from weapons production. Depleted uranium has a half-life of 4.5 billion years. So far, there is no viable plan for storing this waste. Because LANL did not keep good records in the early years of operation, an unknown amount of tons of radioactive waste is stored in Area G at LANL, and tritium is releasing into the air. Our environment and our health cannot tolerate any more radioactive waste.

The existing waste at LANL needs to be cleaned up before any new radioactive or toxic waste is generated there. DOE made a commitment to clean up certain legacy waste sites at LANL by 2016 when it signed the Consent Order with the New Mexico Environment Dept. on March 1, 2005. Yet the House Appropriations Committee has recommended cutting the cleanup budget for LANL by $175 million (almost half of the request to meet the need). Taxpayer funds needs to go first for cleanup, instead of cutting domestic services to fund a $6 billion project when most U.S. citizens don't want to fund any more nuclear weapons. **Y-5**

SEISMIC HAZARDS

The Los Alamos National Lab (LANL) is situated over a 29-mile-long fault system, where several faults converge. The original 2004 Environmental Impact Statement for the CMRR Nuclear Facility responded to a possible mild cosmic event. But a 2007 study calculated a 50 percent increase in the potential seismic risk across the LANL site. As a result of a new study mapping earthquake danger in the area, the Defense Nuclear Facilities Safety Board, in a unanimous decision, reported that there is a 5% chance of a big earthquake during the 50-year lifetime of the proposed Nuclear Facility, and that the potential fatal public doses from a plutonium release during earthquake-induced fires have been estimated to exceed DOE guidelines by more than 100-fold.

Registered geologist Robert H. Gilkeson reported "The new knowledge of the latent earthquake danger at the location of Los Alamos NM is evidence that the Department of Energy has made a mistake to select LANL as the nation's primary plutonium facility for nuclear weapons." **Y-6**

Instead of accepting the fact that a nuclear facility should not be built in a dangerous seismic zone, LANL is attempting to make the facility strong enough to withstand a strong earthquake by proposing to excavate 225,000 cubic yards of earth and fill the hole with concrete. The huge concrete slab would still be situated over poorly welded tuff, and I am not convinced that the slab would not shift during a major earthquake. Concerns about earthquake safety need to be worked out before costly construction begins.

SAFETY AND SECURITY

IN 2004 nuclear operations at Los Alamos were suspended for six months due to grave safety concerns, and yet long-standing safety issues remain unresolved.

during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself. This section of the *LANL SWEIS* also discusses the *Public Health Assessment* (ATSDR 2006), for which the Agency for Toxic Substances and Disease Registry (ATSDR) reviewed environmental monitoring data from 1980 to 2001 and concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future. The data considered in the ATSDR assessment included at least one full year of environmental monitoring results from the period following the Cerro Grande fire.

The Albuquerque water utility has monitored the Rio Grande by collecting and testing samples at various sites from the Heron Reservoir along the river to Albuquerque for metals, minerals, nutrients, organic substances, and radionuclides (City of Albuquerque 2006). The river water meets EPA drinking water standards for all of these substances (specifically, the levels of radionuclides are far below the EPA standards).

Y-3 NNSA takes its resource stewardship and conservation responsibilities seriously and continues to work with Los Alamos County to implement water conservation measures. Chapter 3, Section 3.3.4, of the *CMRR-NF SEIS* describes current water use and the water utility infrastructure for LANL and the Los Alamos region. For water-use planning purposes, DOE has established a target ceiling quantity for water use equal to the water rights it still owns (542 million gallons [2,050 million liters] per year). In 2010, LANL used 412 million gallons (1,600 million liters) of water or about 76 percent of LANL's target ceiling quantity.

Water usage estimates related to the proposed CMRR-NF are included in Chapter 4, Sections 4.2.3 and 4.3.3. As discussed in these sections, the proposed CMRR-NF is expected to use up to about 5 million gallons (19 million liters) of water per year to support construction of the CMRR-NF. If built, the CMRR-NF combined with RLUOB would use up to 16 million gallons (61 million liters) of water per year to support facility operations. LANL water usage, including the proposed Modified CMRR-NF and RLUOB, is expected to remain within the Laboratory's water rights. See Section 2.10, Water Resources and Usage, of this CRD for more information.

Y-4 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos

Campaign Y (cont'd)

One example: the Institute for Energy and Environmental Research has found that about 300 kilograms of plutonium (enough to make 60 bombs) is missing from LANL's nuclear materials records. **Y-7**

Former Pennsylvania State Police Commissioner Glenn Walp was hired to investigate lapsed security after 9/11. Walp uncovered the theft or loss of over $3 million in taxpayer property, including nearly 400 computers that potentially housed nuclear secrets. In his recent book Implosion at Los Alamos, Walp describes a lax security culture of corruption, crime, coverups and whistleblower retaliation, where the Lab's "image" is more important than safety or security. **Y-8**

And now, in order to cut costs, Los Alamos is considering the elimination of some of the facility's fire suppression systems and ventilation equipment intended to prevent plutonium from leaking in the event of an earthquake and fire! **Y-9**

The Los Alamos National Lab cannot be trusted to safely and securely handle six metric tons of plutonium.

MORE PITS ARE NOT NEEDED

The Chemistry and Metallurgy Research Replacement (CMRR) Nuclear Facility is designed to have the capacity to produce up to 80 new plutonium pits per year. Some LANL officials claim that the Nuclear Facility will not really produce the pits -- so why have the capacity to do so? **Y-1 cont'd**

When Senator Bingaman legislatively required an independent expert study on the aging of plutonium pits, the 2006 JASON study concluded that the thousands of existing pits not only don't deteriorate with age, but actually improve with age, up to 85-100 years. The oldest existing pits are less than 30 years old, so they will remain stable for at least another 55-70 years, and newer ones even longer. We obviously don't need any more.

That makes us suspect that the new pits are really for new-design weapons. The DOE wants to "modernize" the nuclear weapons complex, including developing smaller and more powerful nuclear weapons. Congress denied funding for the Reliable Replacement Warhead, so now LANL is working on other designs, and one is a design that is 30 times more powerful than the one dropped on Hiroshima. Why do we need a bomb more powerful than Hiroshima? What we have is already more than sufficient. Most U.S. citizens have higher priorities for our tax dollars. **Y-10**

TREATIES AND PROLIFERATION

The United States signed the Nuclear Non-Proliferation Treaty (NPT) in 1968. Article VI of the NPT commits the signers to work toward nuclear disarmament. We are violating the treaty when we produce more nuclear weapons.

Violating treaties violates our own Constitution. Article 6 states that all Treaties made "shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby."

The CMRR Nuclear Facility sends the message to the rest of the world that the United States is not serious when we talk about nonproliferation and arms reduction. If we produce more weapons, how can we convince other nations to disarm? They are more likely to feel the need to **Y-11**

is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period. See response to Comment Y-2 for information regarding the Cerro Grande wildfire.

Y-5 The depleted uranium mentioned by the commentor is not stored at LANL and is not within the scope of the *CMRR-NF SEIS*. Cleanup of Material Disposal Area G is being performed in accordance with the Consent Order. NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Radioactive waste generated by construction and operation of the proposed CMRR-NF would be managed through the LANL waste management program, as described in Chapter 3, Section 3.12.4.1, Solid Radioactive Waste Management. Low-level and mixed low-level radioactive waste would be disposed of off site at either the Nevada National Security Site or the commercial facility in Clive, Utah. Transuranic waste would be disposed of at the Waste Isolation Pilot Plant in New Mexico. Impacts associated with management and transport of these wastes are evaluated in the waste management and transportation sections of Chapter 4.

Y-6 Chapter 3, Section 3.5, of the *CMRR-NF SEIS* describes the geologic setting of LANL, and was revised in the *Final CMRR-NF SEIS* to improve the discussions

Campaign Y (cont'd)

build their own nuclear arsenal, thus increasing international nuclear tensions.

The Los Alamos Lab has tremendous expertise that could be used to work for nonproliferation, securing the dangerous materials around the world, and cleaning up contaminated sites. **Y-11 cont'd**

ECONOMY AND JOBS

The estimated cost of the CMRR Nuclear Facility has ballooned from its original $300 million in 2003 to possibly $5.8 billion now, almost 20 times more, and the project's federal managers have acknowledged that they have no firm idea about the final price tag. Final estimated costs costs won't be known until the design is completed in 2015, and are listed as "to be determined." These costs do not include decontamination and cleanup in the future. How much higher will it go? Construction should not begin until Congress knows the full cost and approves of it. **Y-12**

Much of this increase is due to the new discoveries that the seismic hazard risks are greater than reported earlier. It may be cost-prohibitive to make the Nuclear Facility fully safe from an strong earthquake. Rather than spending enormous amounts of money to deal with a possible catastrophic earthquake, it would be better not to build there at all. **Y-6 cont'd**

The few supporters of the Nuclear Facility who spoke at the hearings claimed that the construction will add jobs to New Mexicans. But those jobs are temporary, and only for a few hundred workers. After the facility is built, almost all the workers will be transferred from other buildings. Even the Environmental Impact Statement admits that the socioeconomic impact on New Mexico is minimal. **Y-13**

The total cost of nuclear weapons complex across the country is estimated to be $180 billion over the next ten years. This is just too high in our failing economy. Money spent on unusable nuclear weapons do not spur economic growth. Rather than cutting domestic services to the poorest and most disadvantaged in our society in order to balance the federal budget, the $6 billion (and growing) could be used to create jobs for education, health care, mass transit, affordable housing, renewable energy, bridge upgrades, and better food distribution. **Y-12 cont'd**

NEW EIS

The original 2003 CMRR Environmental Impact Statement (EIS) was based on the 1996 Seismic Analysis. The current draft Supplemental EIS (SEIS) was conducted to deal with the more dangerous seismic issues revealed in 2007. But now, 5 years later, new seismic analyses are being conducted indicating even more serious potential consequences. So the 2003 EIS and the Supplemental EIS are outdated and should be withdrawn and a new full EIS written only after the results of the new current seismic investigations are known. **Y-6 cont'd**

There are discrepancies between the 2003 EIS and the Supplemental EIS -- for example, the figures regarding amount of water needed. The SEIS was drafted in a rush to meet desired timelines, and consequently is woefully inadequate. **Y-14**

I am concerned about the 225,000 cubic yards of soil to be evacuated. The soil needs to be analyzed for radioactive, toxic and hazardous materials that could impact the workers and environment. A plan for disposing of this potentially harmful soil needs to be outlined in the **Y-15**

of faulting and seismic hazards. Section 3.5 of the *Final CMRR–NF SEIS* summarizes the very detailed and extensive seismic information that has been compiled for LANL. This section draws heavily from the 2007 and 2009 PSHAs (LANL 2007, 2009), which were prepared by experts in seismic analysis using the ground motion prediction models as specified by NRC guidelines developed by the Senior Seismic Hazard Analysis Committee, "Recommendations for Probabilistic Seismic Hazards Analysis – Guidance on Uncertainty and the Use of Experts" (NUREG/CR-6372; NRC 1997), and established methodology. These PSHAs were reviewed and accepted by an external review panel, DOE, and DNFSB.

As indicated in Chapter 3, Section 3.5.3, of the *CMRR-NF SEIS*, the location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

DOE has been proactive in the assessment of the potential seismic hazards at LANL and the resulting design ground motions for the CMRR-NF reflect the best science and engineering available. That said, as future studies are performed on the geology and seismology of LANL, new information may become available. In the 2007 and 2009 LANL seismic hazard evaluations, which updated an analysis issued in 1995, a concerted effort was made to properly capture the uncertainties in input parameters and, hence, it is anticipated that new information will not have a significant impact on the current assessment of the seismic hazard or design-basis earthquake ground motions for LANL. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

In addition to the assessment of seismic hazards at the CMRR-NF site, site-specific geotechnical investigations have been completed for both the Shallow Excavation Option and the Deep Excavation Option. A geotechnical report prepared for the Shallow Excavation Option provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy,

Campaign Y (cont'd)

new EIS.

Y-15 cont'd

The need for more plutonium pits needs to be re-evaluated, given the long life expectancy of existing pits. The need for a hugely expensive new building needs to be re-evaluated, analyzing the possibility of doing research on existing pits in upgraded existing facilities.

Y-10 cont'd

ALTERNATIVES

The current draft Supplemental EIS lists only 3 alternatives -- two of which are totally unreasonable because of the increased seismic risk, leaving only the current plan which is unacceptable to most of the citizens who spoke at the hearings. There are other more acceptable alternatives that the new EIS needs to consider.

Some reasonable alternatives: upgrading existing facilities; building a much smaller nuclear facility for research; building just a vault to store plutonium; consolidating the research in the newly built Rad Lab and PF-4; diversify LANL's mission to move away from nuclear weapons research and production; and use LANL expertise to work on nonproliferation, renewable energy sources, and responding to global warming. Each realistic alternative which the public has suggested needs to be addressed in a new IES.

Y-16

MORAL ISSUES

Nearly every major religious body has declared it immoral to not only use, but also to build and threaten to use weapons of mass destruction. Even if never used, the production and presence of nuclear weapons harms huge numbers of innocents civilians. Threats to use weapons of mass destruction tends to cause other nations to want to build their own out of fear. The more weapons out there, the more chances exist for terrorists to get ahold of them.

It is also immoral to cut services to the poor and disadvantaged populations in order to pay for weapons of mass destruction. In a declining economy and a world facing global warming, we have a moral obligation to use our resources for more urgent human needs.

Y-17

Thank you for your consideration. I would like to receive only the summary of the final EIS, not the full report.

which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation (Kleinfelder 2007a). The report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]). The proposed CMRR-NF would be designed and constructed in accordance with geotechnical recommendations provided in the geotechnical report (Kleinfelder 2007a). Similarly, the Deep Excavation Option would be completed in accordance with recommendations resulting from the geotechnical reports (Kleinfelder 2010a, 2010b).

The potential impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10, of the *CMRR-NF SEIS*. Whichever alternative or option is selected, the CMRR-NF will meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b).

Y-7 LANL materials control and accountability procedures are conducted in compliance with DOE orders. In a letter to the president of the Institute for Energy and Environmental Research dated February 28, 2006, the NNSA Administrator replied to at-that-time allegations of a plutonium accounting discrepancy at LANL (NNSA 2006b). This apparent discrepancy resulted from the use of different tracking and reporting procedures by site security and waste management organizations. Comparison of the information contained in the two systems cannot be used to draw conclusions about the control and accountability of special nuclear material.

Y-8 Comment noted.

Y-9 As indicated in the response to comment Y-6, the CMRR-NF will meet the design standards for a PC-3 facility, which means that design considerations for structures, systems, and components for which failure to perform their

Campaign Y (cont'd)

safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials must be designed to withstand design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002a). This requirement would extend to both the fire suppression and ventilation systems for the CMRR-NF. As described in Chapter 2, Section 2.6.2, the footprint of the Modified CMRR-NF is larger than that of the 2004 CMRR-NF due to space required for engineered safety systems and equipment, such as an increase in the size and quantity of heating, ventilation, and air conditioning ductwork, addition of safety-class fire suppression equipment, plus the associated electrical equipment. In addition, the lowest building floor or level would be devoted to the fire suppression water storage tanks, other facility support equipment, and maintenance areas. Inclusion of a dedicated water source for fire protection within the building assists in meeting nuclear safety and design requirements.

The commenter may be referring to a February 8, 2011, letter from DNFSB to Thomas P. D'Agostino, Administrator, NNSA, which referenced a December 20, 2010, letter from LANL to NNSA proposing certain changes to the CMRR project and design (DNFSB 2011a). NNSA responded in a February 28, 2011, letter to Peter S. Winokur, Chairman, DNFSB, indicating that NNSA was analyzing the LANL proposal, and would share its analysis with, and solicit input from, DNFSB before reaching a conclusion. LANL was instructed not to proceed with any design changes until NNSA provides additional direction (NNSA 2011).

Y-10 NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a).

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any

Campaign Y (cont'd)

particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644). Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Y-11 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Y-12 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer

Campaign Y (cont'd)

to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Y-13 The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county ROI. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Y-14 Changes in the design for the CMRR Facility proposed in 2003 and the current, more mature design that could affect environmental impacts are the reason that this SEIS to the *CMRR EIS* has been prepared. Absent these differences, there would be no reason to supplement the *CMRR EIS.* The *CMRR-NF SEIS* reflects changes in the proposed alternatives and new information that has been developed since the *CMRR EIS* was issued. In particular, the design of the proposed CMRR-NF has changed substantially from the original design to address seismic issues. It is the changes resulting from seismic requirements that caused NNSA to decide that an SEIS should be prepared. An example of these changes is the difference in water usage cited by the commentor. The estimate of water usage for the Modified CMRR-NF reflects a more mature design and is considered to be more accurate than the estimate included in the 2003 *CMRR EIS*.

Y-15 At the time RLUOB was being constructed, the adjacent area proposed for the CMRR-NF was also excavated to a depth of about 30 feet (9.1 meters) in support of site geologic characterization and seismic mapping. No contamination was found in the area. Chapter 4, Section 4.3.12, of the *CMRR-NF SEIS* indicates that surveys have been conducted to identify potential release sites, and that no unidentified or unexpected soil contamination or buried media have been encountered. Should any unexpected contaminants be encountered during excavation at the proposed CMRR-NF site or other locations that would be

Campaign Y (cont'd)

disturbed in support of construction activities, appropriate documentation and contaminant removal would be undertaken by LANL Environmental Restoration staff in accordance with the Consent Order and other applicable requirements. Construction personnel would be protected through appropriate training, monitoring, and management controls; and storage and disposal of such materials would be in accordance with applicable requirements at permitted facilities.

Y-16 The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

Y-17 Comment noted.

Campaign Z

As a member of impacted communities from the nuclear weapons industrial complex, I wish to express my opposition toward the proposed CMRR-NF SEIS (Chemical Metallurgy Research and Replacement Nuclear Facility, Supplemental Environmental Impact Statement) based on the following: *Z-1*

- A **new** environmental impact statement (EIS) needs to be created because the current supplemental EIS does not cover the changes in size, cost (4.5 billion and rising), and scope. *Z-2*
- Environmental standards need to be held to **highest level** of nuclear safety regulations. *Z-3*
- I am in **solidarity** with Santa Clara Pueblo's Tribal Resolution No. 08-16, which opposes the expansion of plutonium pit production at LANL (Los Alamos National Laboratory) and making that production capacity permanent through this complex. *Z-4*
- The current SEIS **does not** adequately address the increased seismic dangers, unstable geological strata, storm runoff contamination, and fire risks that exist with the proposed location. *Z-5*
- Expansion in proposed plans would only add to the 60+ years of legacy waste contamination in NM and should **not be allowed** until clean up is addressed in accordance with the 2005 consent order with the NMED (New Mexico Environmental Department). *Z-6*
- Money spent on unusable nuclear weapons **does not** support or spur economic growth, but goes straight into corporate pockets, depriving local communities of federal funds. *Z-7*

Z-1 NNSA acknowledges the commentor's opposition to construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Z-2 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action to address changes in construction of the CMRR-NF based on additional seismic information. The increased size of the proposed CMRR-NF is due primarily to addressing seismic concerns; the scope of activities to be performed in the CMRR-NF has not changed since the *CMRR-EIS*. All of the changes made in the design, siting, and construction of the proposed CMRR-NF from the originally proposed CMRR Facility analyzed in the *CMRR EIS* are evaluated in the *CMRR-NF SEIS*.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Z-3 The CMFF-NF will be designed and operated in accordance with applicable laws and regulations. Chapter 5, "Applicable Laws, Regulations, and Other Requirements," of the *CMRR-NF SEIS*, provides the regulatory basis for design and operation of the CMRR-NF.

Z-4 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Campaign Z (cont'd)

Z-5 The *CMRR-NF SEIS* addresses each of the identified subjects in detail:

Seismic concerns, including unstable geologic strata:

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazards analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). The updated seismic hazards analyses provided a better understanding of the ground motion and seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a sizable earthquake event without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Storm runoff contamination:

LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Stormwater Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Stormwater Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative (see Chapter 4, Section 4.3.6 of the Final CMRR-NF SEIS).

Campaign Z (cont'd)

Fire risks:

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Z-6 NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Z-7 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Campaign Z (cont'd)

• Money spent on unusable nuclear weapons does not support or spur economic growth, but goes straight into corporate pockets, depriving local communities of federal funds.

Additional Comments:

I strongly disagree with this problem that they want to bring plutonium to N.M. the waist will harm our soil and our air for many years! I hope and pray that they change there decision to bring waist to N.M.

Z1-1

Patrick Baldonado

Z1-1 NNSA notes that no radioactive waste would be brought into New Mexico as a result of actions proposed and evaluated in the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of construction and operation of the CMRR-NF, a facility that would replace the existing CMR Building, and in which analytical chemistry, materials characterization, and plutonium research in support of stockpile stewardship and other LANL efforts would be conducted.

Radioactive waste types that would be generated at the CMRR-NF include low-level radioactive waste, mixed low-level radioactive waste, and transuranic waste. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. Transuranic waste would be disposed of at WIPP or a similar facility. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Campaign AA

The following comments were identified upon reviewing approximately 4,500 submittals. The response to each comment is on the right of the page.

1. The United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limited implemented by DOE in 1999 should suffice.

2. A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

3. The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building.

AA-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

AA-2 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

AA-3 NNSA notes the commentor's position that the SEIS is premature. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the *2003 CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site specific geotechnical evaluations of the proposed CMRR-NF construction site were

Campaign AA (cont'd)

4. The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility.
5. Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans.
6. Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth.

performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

AA-4 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the *2003 CMRR EIS* (69 FR 6967). Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

AA-5 The dangers of plutonium have been recognized since its first large scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

Campaign AA (cont'd)

7. Expanding the United States' nuclear production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere.

8. The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design.

9. Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material.

10. The CMRR Nuclear Facility proposed at Los Alamos Laboratory is dangerous environmentally and physically.

AA-6 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

AA-7 NNSA acknowledges that there is substantial opposition to nuclear weapons and that President Obama has stated a long term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

AA-8 Refer to the response to Comment AA-3.

AA-9 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

AA-10 The CMRR-NF would be designed, constructed, and operated in accordance with applicable regulations and standards for environment, health, and nuclear safety, including seismic standards (see Chapter 5 of the CMRR-NF SEIS). The potential environmental impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10, of the *CMRR-NF SEIS*.

Campaign AA (cont'd)

11. The costs to build a plutonium pit production complex are too high. The Department of Energy should consider other options, such as upgrading old facilities for safety, rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start.

AA-11 As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the Final *Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the Federal Register on December 19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original CMRR EIS and the current CMRR-NF SEIS (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced Section 2.7 of the *CMRR-NF SEIS*. Section 2.7

Campaign AA (cont'd)

12. The NNSA is doing ecological harm by constructing a new nuclear storage and development facility at the Los Alamos National Laboratory.

13. The new plans for a CMRR Nuclear Facility at the Los Alamos Lab are alarming.

14. The National Nuclear Security Administration's plan to make a space for building new plutonium pits in Los Alamos is a terrible idea and not in the best interest of our country.

15. Nuclear weapons and nuclear power are generally bad industries and should be ended.

of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

AA-12 As discussed in the response to Comment AA-10, the CMRR-NF would be designed, constructed, and operated in accordance with applicable regulations and standards for environment, health, and nuclear safety, including seismic standards. The potential environmental impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 of the CMRR–NF SEIS, with possible impacts on ecological resources specifically analyzed in Sections 4.2.7, 4.3.7, and 4.4.7.

AA-13 NNSA acknowledges the commentor's concern about constructing and operating the CMRR-NF.

AA-14 See response to Comment AA-11.

AA-15 NNSA notes the commentor's opposition to nuclear energy and nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Campaign AA (cont'd)

16. More plutonium pits and nuclear weapons, and more plutonium in general, are not needed.

17. NNSA should not construct and operate the CMRR-NF.

18. NNSA does not have enough information to address seismic concerns.

19. NNSA must learn from prior accidents that have occurred in the nuclear industry, such as what has happened at Chernobyl, Russia, and Fukushima, Japan. These facilities were thought to be safe. The risks are too high; it is a matter of not if, but when, such accidents will occur.

AA-16 NNSA notes the commentor's opposition to the production of plutonium pits and nuclear weapons, and to the existence of plutonium. DOE/NNSA has not produced plutonium since 1988 and has no plans to produce additional plutonium. Refer to the response to Comment AA-1 regarding pit production levels.

AA-17 NNSA acknowledges the commentor's opposition to constructing and operating the CMRR-NF. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort.

AA-18 See response to Comment AA-3.

AA-19 NNSA acknowledges the commentor's concern that an accident similar to those that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant and in 1986 at Chernobyl could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The types of radiological accidents that occurred at the Fukushima Daiichi Nuclear Power Plant and Chernobyl require a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Campaign AA (cont'd)

20. Plutonium is dangerous and threatens to pollute air, water, and agricultural lands, and endanger the health and safety of people who live downwind. LANL has been polluting the Rio Grande for years with its toxic runoff. People of Sante Fe have to drink polluted water because of the discharges from LANL, and LANL should not be adding more pollutants to air and water resources for the people down wind and down river. Commentors are concerned about the impacts spreading as far as Texas.

AA-20 The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

The Albuquerque water utility has monitored the Rio Grande by collecting and testing samples at various sites from the Heron Reservoir along the river to Albuquerque for metals, minerals, nutrients, organic substances, and radionuclides (City of Albuquerque 2006). The river water meets EPA drinking water standards for all of these substances (specifically, the levels of radionuclides are far below the EPA standards).

Campaign AA (cont'd)

21. The question was asked about how much compensation has been made to LANL workers and their families due to their premature deaths.

AA-21 The Federal government has a number of programs related to the health of former government workers. More information on these programs can be found at the following websites. http://www.hss.energy.gov/healthsafety/fwsp/formerworkermed; http://www.dol.gov/owcp/energy/index.htm; and http://www.cdc.gov/niosh/ocas/ocassec.html.

Campaign AA (cont'd)

22. The wildfires have come too close to LANL. New Mexico is experiencing its worst drought ever recorded with forest fires in several areas.

23. NNSA facilities are susceptible to terrorists. Nuclear facilities do not have proper security. It is not wise to have plutonium sitting around.

AA-22 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 LANL SWEIS, Appendix D (DOE 2008a). The CMR Building and the TA 55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are largely constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to directly affect the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

AA-23 DOE gives high priority to the safety and security of all its facilities and to plutonium accountability. Security, theft, and potential acts of sabotage are integral considerations in the designs and operating procedures for new and existing DOE nuclear facilities. DOE considers these threats to be real and uses an established safeguards and security process to assess facility vulnerabilities to various threats, including those from intentional destructive acts such as terrorism.

Campaign AA (cont'd)

24. No one has designed a long-term safe storage facility for nuclear waste. WIPP is full. Nuclear waste cannot be disposed of safely.

25. The valuable resources at LANL should be addressing environmentally safe technologies and research.

26. Nuclear accidents can have disastrous consequences for the public.

27. No one calculates the nearly infinite costs of housing nuclear materials indefinitely or how to safely care for this material for its dangerous lifespan.

28. The production of plutonium pits, in today's tight economy, needs more study.

AA-24 Radioactive waste types that would be generated at the CMRR-NF include low level radioactive waste, mixed low level radioactive waste, and transuranic waste. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. Transuranic waste would be disposed of at WIPP or a similar facility. Because the total quantity of transuranic waste that may be disposed of at WIPP is statutorily established, and the operating period for WIPP will depend on the volumes of waste that may be disposed of at WIPP, WIPP may meet its statutory disposal limit before the end of the operational period for the proposed CMRR-NF. If necessary, transuranic waste generated without a disposal pathway would be safely stored pending development of additional disposal capacity. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information. High level radioactive waste and used (spent) nuclear fuel would not be generated at the CMRR-NF and are outside the scope of the *CMRR-NF SEIS*.

Radioactive waste disposal facilities must meet Federal requirements regarding their ability to contain waste safely and not impact human health and the environment. Performance studies are performed to determine the suitability of the site and to optimize the facility design and operations to safely contain the waste. Facilities also must undergo environmental monitoring and report the results.

AA-25 LANL is an active research facility. Research areas currently under way at LANL include environmental technology, renewable energy, global climate change, antiterrorism and nonproliferation, and biological and biomedical research.

AA-26 Appendix C of the *CMRR-NF SEIS* describes the methodology and assumptions, accident selection process, and selected accident scenarios and their consequences and risks. While accidents at nuclear facilities can have large consequences, the risks can be managed and mitigated with proper design, construction, and operation. Refer to Section 2.8, Nuclear Accidents, of this CRD for additional information.

AA-27 DOE and NNSA are concerned about the long term process and costs associated with housing and safely storing plutonium from nuclear weapons. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Campaign AA (cont'd)

29. NNSA should not go ahead with a cost over-run, dangerous, and eco-damaging project such as the CMRR-NF. A more reasonable approach needs to be found. The poor and elderly are being stripped of their benefits to create this project. The quality of life of citizens needs to be improved.

30. Nuclear facility designs do not take into account the changing weather patterns. NNSA needs to heed the warnings of storms that are stronger than ever imagined.

31. The CMRR-NF building will be too heavy seismically.

AA-28 As discussed in the response to Comment AA-1, a decision on pit production is not within the scope of the *CMRR-NF SEIS*.

AA-29 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

AA-30 Nuclear facilities at LANL undergo an extensive safety evaluation and approval process that ensures that they can be operated safely. This process is mandated by Federal law. The details of the process are also codified and ensure that accident planning includes planning for rare events, including severe seismic and other natural phenomena, such as severe weather and flooding (see Appendix C of the *CMRR-NF SEIS* on facility accidents). Chapter 3, Section 3.4.4, of the *CMRR-NF SEIS* has been revised to include a description of the types of environmental changes that could occur in the southwestern United States due to climate change.

AA-31 A geotechnical report prepared for the Shallow Excavation Option provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy, which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation (Kleinfelder 2007a). The report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]). The proposed CMRR-NF would be designed and constructed in accordance with geotechnical recommendations provided in the geotechnical reports (Kleinfelder 2007a 2007b). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (44 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option. A draft slope stability analysis has been prepared that indicated that global slope stability is not an issue for the Deep Excavation

Campaign AA (cont'd)

32. The CMRR-NF project will not increase jobs for people of New Mexico.
33. There is too much plutonium.
34. Nuclear facilities are accident prone. There is no planning for rare seismic and other events.
35. The CMRR-NF building is being built on a fault line.

Option (LANL 2011a: LANL site, 028). If the Deep Excavation Option were selected, as part of the ongoing design and evaluation process, studies would be completed to verify that all geotechnical stability issues had been addressed.

AA-32 The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four county region of influence. However, NNSA recognizes the opinion stated by a number of commentors during the public comment period that the creation of any construction jobs during the current economic climate would have a positive effect on the construction industry in northern New Mexico.

AA-33 As addressed in the response to Comment AA-16, DOE/NNSA has not produced plutonium since 1988 and has no plans to produce additional plutonium. In fact, DOE/NNSA has plans to permanently disposition 34 metric tons of surplus plutonium, and as described in the July 19, 2010, Notice of Intent (75 FR 41850), is planning to permanently disposition approximately 13 metric tons of additional surplus plutonium. See http://nnsa.energy.gov/nepa/spdsupplementaleis for more information on NNSA's program for surplus plutonium disposition.

AA-34 Refer to the response to Comment AA-30.

AA-35 Refer to the response to Comment AA-3.

Campaign AA (cont'd)

36. What are the current cancer rates in the LANL area? We believe our daughter died from radioactively-contaminated well water in Santa Fe, New Mexico.

37. More nuclear weapons go against the START treaty.

38. The Cerro Grande fire in 2000 sent smoke to the northeast for probably a month. Is it a coincidence I was diagnosed with bladder cancer the following year? When the trees burned that had grown in the canyons surrounding Los Alamos it was discovered that these were places where barrels of waste from Los Alamos work done long ago had been tossed off the rim. We had to wonder what was in the particles that caused the coughing and two weeks of red eyes.

AA-36 Chapter 3, Section 3.11.4, Health Effects Study, of the *CMRR-NF SEIS* provides a summary of a number of epidemiological studies that have been conducted in the LANL area, as well as a summary of cancer incidence and mortality figures for the Los Alamos Region as derived from data from the National Cancer Institute. Table 3 19 in Section 3.11.4 summarizes cancer rates from 2003 through 2007 for Santa Fe County. Although it is not possible to draw any conclusion about the cause of any particular cancers, the data indicate that Santa Fe cancer rates are higher than the U.S. and state averages for some types of cancers and lower for others.

AA-37 Current operations at LANL do not violate the Treaty on the Non Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would operations that would be performed in the proposed CMRR-NF. The United States is reducing its nuclear weapon stockpile, but also needs to maintain the existing stockpile. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

AA-38 A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. As noted in Chapter 4, Section 4.6.1.3, of the 2008 LANL SWEIS (DOE 2008a), an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself.

Campaign AA (cont'd)

39. Disposition of plutonium waste from the CMRR needs further analysis, including if there are plans to ship the materials to the Savannah River Site. Will plutonium waste to WIPP meet the "spent fuel standard" in disposing of plutonium? This standard was established in DOE's deliberations on what to do when disposing of surplus weapons plutonium, but disposal in WIPP of such plutonium affirms that the spent fuel standard is null and void. Please confirm, or not, that the spent fuel standard is no longer the standard being applied.

40. There are concerns that issues flagged by DNFSB have not been adequately addressed.

AA-39 Refer to the response to comment AA-24. No shipments of radioactive waste are planned from the CMRR-NF to the Savannah River Site. The potential shipment of plutonium –bearing waste from the Savannah River Site to WIPP is the subject of another DOE SEIS. Refer to http://nnsa.energy.gov/nepa/spdsupplementaleis, for more information.

AA-40 For many years NNSA has worked with DNFSB regarding identification and resolution of possible safety issues pertaining to the CMR Building, the CMRR Project, and other nuclear facilities at LANL. For example, DNFSB has reviewed DOE seismic hazard evaluations for LANL (see Section 2.6, Seismic and Geologic Concerns, of this CRD) and NNSA has worked with DNFSB to resolve questions about the design of safety class systems at the CMRR-NF (LANL 2009). In 2009 and in accordance with the 2009 Defense Authorization Act, LANL received a certification of design closure from DNFSB pertaining to the CMRR Project, addressing seismic as well as engineering and design and safety control issues; the certification freed the release of allocated funding for continuation of the project.

The commentor may be referring to a February 8, 2011, letter from DNFSB to Thomas P. D'Agostino, Administrator, NNSA, which referenced a December 20, 2010, letter from LANL to NNSA proposing certain changes to the CMRR project and design (DNFSB 2011a). NNSA responded in a February 28, 2011, letter to Peter S. Winokur, Chairman, DNFSB, indicating that NNSA was analyzing the LANL proposal, and would share its analysis with, and solicit input from, DNFSB before reaching a conclusion. LANL was instructed not to proceed with any design changes until NNSA provides additional direction (NNSA 2011).

Petition 1

The following petition was signed by 607 individuals. The response is on the right of the page.

CLEAN UP! DON'T BUILD UP! NO MORE HARM FROM NUCLEAR WEAPONS!

We, the undersigned, demand our elected officials to STOP ALL funding for nuclear weapons, which violates the Nuclear Non-Proliferation Treaty that was ratified by the U.S. Senate, and to invest in the total cleanup of ALL nuclear facilities and dumping grounds and provide compensation to those harmed by such activities. We can no longer put future generations at risk because of the mistakes that we are making now and made in the past beginning with the Manhattan Project in 1943.

The *Final CMRR-NF SEIS*, including this Comment Response Document, has been distributed to a number of elected officials in the U.S. Senate and the U.S. House of Representatives. A list of recipients is included in Chapter 9 of the SEIS.

CLEAN UP! DON'T BUILD UP! NO MORE HARM FROM NUCLEAR WEAPONS!

We, the undersigned, demand our elected officials to STOP ALL funding for nuclear weapons, which violates the Nuclear Non-Proliferation Treaty that was ratified by the U.S. Senate, and to invest in the total cleanup of ALL nuclear facilities and dumping grounds and provide compensation to those harmed by such activities. We can no longer put future generations at risk because of the mistakes that we are making now and made in the past beginning with the Manhattan Project in 1943.

CLEAN UP! DON'T BUILD UP! NO MORE HARM FROM NUCLEAR WEAPONS!

We, the undersigned, demand our elected officials to STOP ALL funding for nuclear weapons, which violates the Nuclear Non-Proliferation Treaty that was ratified by the U.S. Senate, and to invest in the total cleanup of ALL nuclear facilities and dumping grounds and provide compensation to those harmed by such activities. We can no longer put future generations at risk because of the mistakes that we are making now and made in the past beginning with the Manhattan Project in 1943.

Individuals submitting this petition:

CLEAN UP! DON'T BUILD UP! NO MORE HARM FROM NUCLEAR WEAPONS!

We, the undersigned, demand our elected officials to STOP ALL funding for nuclear weapons, which violates the Nuclear Non-Proliferation Treaty that was ratified by the U.S. Senate, and to invest in the total cleanup of ALL nuclear facilities and dumping grounds and provide compensation to those harmed by such activities. We can no longer put future generations at risk because of the mistakes that we are making now and made in the past beginning with the Manhattan Project in 1943.

CLEAN UP! DON'T BUILD UP! NO MORE HARM FROM NUCLEAR WEAPONS!

We, the undersigned, demand our elected officials to STOP ALL funding for nuclear weapons, which violates the Nuclear Non-Proliferation Treaty that was ratified by the U.S. Senate, and to invest in the total cleanup of ALL nuclear facilities and dumping grounds and provide compensation to those harmed by such activities. We can no longer put future generations at risk because of the mistakes that we are making now and made in the past beginning with the Manhattan Project in 1943.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

(5:30 p.m.)

MR. MacALLISTER: Good evening. My name is Bruce MacAllister. Welcome. This is the first public hearing for the Draft Supplemental Environmental Impact Statement for the Los Alamos National Laboratory Chemistry Metallurgy Research Replacement building, the nuclear facility portion. Pardon me, I've grown up in Colorado, and we often say nuclear. So if I stumble, you'll know that I know better.

My name is Bruce MacAllister. I'm the senior principal at a firm called Business Excellence Solutions. This firm and myself do community meeting facilitations. We're all conflict resolution specialists and organizational excellence consultants. We work with a variety of organizations, large and small, to resolve conflict, and to help optimize efficiencies in those organizations.

It's my pleasure to welcome you here tonight. My role for the meeting tonight will be to be your facilitator and moderator, insofar as I will be conducting the flow of the meeting.

I'm going to go through carefully some ground rules. And typically I work a little more

Response side of this page intentionally left blank.

informally on the ground rules, but because we're doing four officially recorded meetings, it's important that the ground rules are consistent meeting to meeting.

So I will work through these with you, so that the understandings for tonight, the expectations and understandings for tonight's meeting are clear to you all.

And remember, if you care to speak at tonight's meeting, at the mike for recording now, please fill in a card at the registration table, and we will be taking those comments in order once received after we hear from any elected officials, and I'll go through that in more detail in just a minute.

The order of the meeting will be, I'll go through the ground rules. We're going to have a brief presentation by Mr. Tegtmeier, who's the public document manager for the program. Then we will have comments through the duration of the meeting.

The comments initially will be limited to five minutes a person; however, if you feel like you need to make another comment, if there's sufficient time after we cycle through the first round of comments, you are more than welcome to make another

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

4

comment.

Let me remind you that there are a variety of options available to you for completing or providing comments on the program. There are computer stations in the back corner there. There's a kiosk of facilities for taking your comments electronically. You can fax comments. The fax number will be available. There's a poster that describes all of the different ways that you can make your comments. And there's a second court reporter back there for verbal comments.

So there's a multitude of ways that you can get your comments in the official record, besides speaking here at the mike.

We will be first asking for comments from federal elected officials, followed by state, county, municipal, and tribal governments, in that order. And then we will be taking your comments based on the order in which you registered.

Based on the number of participants here tonight, it looks like we will be able to allot for the initial round of comments five minutes per comment. So I will be giving you a little bit of a heads-up at about 30 seconds towards the end of your comment, and then I'll ask you to yield the mike at

Response side of this page intentionally left blank.

the conclusion of your five minutes, if you need the full five minutes.

Again, I've mentioned the poster session. Folks will continue to be available back there.

The focus of the hearing tonight is to receive comments. That it's not to engage in debate with one another. It is not to engage in debate with subject matter experts. We are here to answer technical questions, not to justify national policy or to defend decisions that are made at higher levels in the nation, either by Congress or by senior administration officials.

So, I would ask you, if at all possible, to keep your comments focused. You are certainly free to make any comments you wish, but the comments that are most useful for us tonight will be focused on the Environmental Impact Statement for the facility, as I mentioned.

Any discussions that go on in the back of the room with the subject matter experts are not a matter of the official record. The official record will either involve the comments that were received at the kiosk, or they are comments that were received at the mike.

If we run out of time tonight, for any

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

6

reason, there are three other meetings scheduled. There is a handout in the poster area that describes the meeting locations, one in Espanola, one in Santa Fe, and one in Los Alamos.

And the comment session -- the comment period for this Supplemental Environmental Impact Statement runs through June 28th. So, there is ample time to make those comments.

As far as actually conducting our conduct in the meeting tonight, a couple of ground rules, please wait until I invite you to the mike. I will be inviting one person and letting another person know that they're next, so that they can be prepared to come up, so we have minimal lag time between the comments.

And because we're transcribing these comments, it's very important that the audience remain civil and quiet, so that we can get the comment recorded. One comment at a time without interruption, please. Please identify yourself before speaking. Please abide by the time limits. If we start getting close to your time, I will ask you to yield the mike, and if we have time, I will -- we will make accommodation for you to make a second statement.

Response side of this page intentionally left blank.

And as a final reminder, please, let's remember that this is a public hearing, that what we're here to do is model civil dialogue. We're here to model interpersonal civility and mutual respect. And in that vein, let's keep our language appropriate for a publicly-recorded meeting.

And, finally, let's make sure that our cell phones and anything else that might make intrusive noise while others are commenting are silenced.

And without further ado, I'd like to introduce the document manager for the project, John Tegtmeier.

MR. JOHN TEGTMEIER: Good evening. Welcome everyone, and I appreciate everyone's attendance. This is very important to us, these public hearings, and the entire process for receiving comments on the draft document, important role.

In one of the -- the two areas that is my prime responsibility as document manager; number one, is to manage the preparation of the document, and meet all of NEPA requirements and procedural requirements required by law. But I believe my most important is to encourage and facilitate public interaction in the process. And for that, I really appreciate everyone coming this evening. And I take

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

that second role very seriously in fulfilling my duties.

I wanted to give just a very brief background of the NEPA history, the National Environmental Policy Act history on this project, and then talk a little bit about what you might see in the document, and then lead you to the end of the comment period.

Back in 2003, we did an Environmental Impact Statement for this facility, the CMRR facility. That was issued in November of 2003.

In early 2004, the NNSA issued a record of decision that decided upon, based on the environmental assessment, environmental analysis of the various alternatives, they selected a preferred alternative, which is a two-building concept at TA-55, and that's adjacent to the current facility.

So the first building is actually completed. There's some information on the posters back there. That's the radiological laboratory facility office building, that's being outfitted right now. So these people will be moving into the facility very shortly. And the second building is currently in design.

And Bruce mentioned to us the nuclear

Response side of this page intentionally left blank.

facility portions. That will be the second building.

Since the time that we prepared the Environmental Impact Statement and the Department issued the record decision, we did some additional geological mapping at the site, and there's some photographs on the poster down there, at the poster sessions, where they basically looked at fracture mapping in the exposed face of the tuff there at the side.

They also did bore hole drilling, and they determined the presence of a layer that's at some depth beneath the proposed facility location.

In addition to that, they did an update to the seismic study of the conditions at Los Alamos National Laboratory, specific in there to TA55 where the plutonium facility's located, and Technical Area 3, the main technical area of the laboratory. And that resulted in an increase in the horizontal ground motions and vertical ground motions associated with earthquakes at various return periods.

So, that was new information available to the designers and to the Department, and as part of the NEPA process is to periodically review new information that's available. And based on that, the Laboratory prepared a supplement analysis and

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

10

submitted that to our office, at Los Alamos Site Office in the middle of the summer.

And, in part, based on that, the NNSA decided to go ahead and prepare a Supplemental Environmental Impact Statement for the project. And that decision was made, like I said, in the late summer.

So we set up a series of scoping meetings. We had two scoping meetings; one in Los Alamos, one in Pojoaque, in early October of last year.

The Notice of Intent to prepare the Supplemental EIS was issued in the Federal Register on October 1st. So, the comment period extended through the middle of November. We got some very good scoping input.

So, the document that is before us now, the Draft Supplemental EIS, is a culmination of the work since essentially October 1, and that's reflected in the document.

Now, as part of the analysis -- we had to look at some new analyses. There's some new requirements to look at various things, like greenhouse gas emissions from various operations, both construction and operations of the facilities. And we also had to do an intentional destructive act

11

analysis, potential consequences of a terrorist attack, or something of that nature.

And also wanted to do a specific transportation analysis of the demolition waste from the existing chemistry-metallurgy replacement, I mean, CMR research Building at Los Alamos.

And we also updated analyses in areas of -- obviously, the construction impacts, because to meet the new requirements for seismic and geological features at the site, we had to beef up the structural strength, and do some other nuclear safety type enhancements to the design.

We've also updated the operations impacts, not only for the proposed project, but since we're going to be in the CMR Building for a longer period of time, we also updated the environmental impacts of operations of that facility, as well as the RLUOB facility, which is complete, and will be in operation shortly.

We also updated the accident analyses for both the existing CMR Building and the new proposed facility.

And we also updated the human health impacts due to operations.

There were some changes in the way the

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

12

modeling is done. And we also incorporated the stuff we could, the latest census data. That isn't all in yet, but we took the information most current at the time.

Now, the alternatives that we have currently in the draft EIS is to construct and operate the nuclear facility portion as we selected 2004 record of discussion.

So, that's in our no-action alternative, in the context of we would not change past decisions made in NEPA. So that's why it's the no-action alternative.

We also looked at the modified CMRR Nuclear Facility alternative. And that was originally started with just one construction option, and that was the deep excavation option, which would involve going down into that layer of volcanic tuff that was not structurally as strong as we believed it needed to be. But in the course of looking into that further, we also identified a shallow excavation option. It would be the same facility located on the same footprint, but raised higher up in the geologic strata, so as to not require the digging out and refilling that additional excavation with clean concrete.

Response side of this page intentionally left blank.

Then the last alternative is the continued use of the CMR Building alternative, which is basically a no construction option alternative. And we would continue to perform the limited capabilities in the existing building for as long as we could without major upgrades.

So those are all action alternatives and the no-action alternative.

We posted the Draft Supplemental EIS on our NNSA web page on April 22nd of this year. And that was followed a week later by the EPA publishing and giving a Notice of Availability of the draft document to give public comment on April 29.

And at that time, the comment period was a 45-day comment period. And subsequent to, that based on some requests, the NNSA decided to extend that comment period by 15 days, and that decision was made on May 6th, and that information was posted and distributed to various media, and now the public comment period that Bruce mentioned, up to June 28th. So I encourage all of the individuals who wish to comment, to participate in the process and prepare these comments by that time frame.

Bruce mentioned the other meetings that we will have following tonight's public hearing.

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

Although more to come on that, we will have a meeting at Los Alamos tomorrow evening at the Holiday Inn Express. As you're coming into town, you follow the drive right off the main hill road -- off the main hill road.

We will have a public hearing in Espanola on Wednesday the 25th at the Santa Claran Hotel in Espanola. And on Friday -- Thursday, I mean, we will have the public hearing in Santa Fe at the community college there south of town. And it will be the same format, and we will have the same time. We'll start at 4:45 with the doors open, poster session 5:00 to 5:30, and then we'll start comments at 5:35, and run through 9:00 p.m., at that time.

And as Bruce mentioned, also, we have various ways to present -- provide comments on the draft documents. So I encourage any number of those ways. Feel free to comment multiple times. We will be taking comments through June 28th.

So I appreciate you-all being here, and I'd like to get started with the main part of our process, and ask Bruce to get started, and we'll start taking your public comments.

Thank you very much.

MR. MacALLISTER: A couple of late-breaking

Response side of this page intentionally left blank.

announcements, folks. Based on the number of people that ultimately have signed up to make comments, we have -- we're required to reduce our initial round to comment, the time frame for that, to three minutes.

So, we will go through these as quickly as we can, and hopefully we'll have time for additional comments after that.

So, I'll try to be as efficient as I can with that.

Also, I've been asked to let people know that the video that's being made in the center of the room right now is not being done by the Department of Energy or the National Nuclear Safety Administration.

So, if anybody objects to having their image videoed while they're making their comment, kindly just bring that up with the videographer, and we will work that out.

Without further ado, I'm going to take the names in the order that I've been given them, based on your registration. And I'm going to call out two names; the first name will be our first speaker, the second name is the person to be ready to speak next.

First we have Ray M. Baca. And Scott Kovac will be in the chute to be speaking next.

And Mr. Baca, you can use this mike or that

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

mike. You ready?

MR. RAY M. BACA: Good evening. My name is Ray Baca. I am the Executive Director for the New Mexico Building Trades Council.

In that capacity, I represent all of the construction labor unions here in the state of New Mexico. This includes approximately 800 construction and maintenance workers that are currently employed there at the Laboratory. These are family-sustaining well-paying jobs that unfortunately otherwise would not be available anywhere else in northern New Mexico. They are very few and far between.

For those of you who are not aware, the construction industry in New Mexico is in a very blighted state currently, as it is in most of the country. The unemployment rate for construction workers has fully doubled, and in many cases triple that of the average unemployed New Mexican.

It is not uncommon to see unemployment rates of 25 to 28 percent in many of the crafts that we represent.

Obviously, if this facility comes to be, if and when it comes to be, this should be a tremendous boost not only to the construction industry of

401-1

401-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

17

New Mexico, but more importantly to the many construction families in New Mexico who are in dire straits.

We respectfully urge the Lab to begin this project sooner than later. Thank you.

MR. MacALLISTER: Mr. Kovac, followed by Robert Press.

MR. SCOTT KOVAC: Thank you. My name is Scott Kovac with Nuclear Watch of New Mexico in Santa Fe.

First off, I would -- I'm having a problem with this format tonight. I would prefer to see a presentation given along with your explanation. Very complicated issue. You have the posters. Those could be a PowerPoint presentation. Yes, the subject matter experts, it would be nice to get them on record.

Thank you. (Applause.)

Okay. On to my comments. I will -- first off, I request that this EIS -- this Supplemental EIS be withdrawn, and that true alternatives are analyzed.

The alternatives we're given, two out of the three are not really alternatives. To build the existing -- I mean, alternative number one, the

401-1 cont'd

402-1 Comment noted.

402-2 Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and not proceed with the CMRR-NF, such an alternative is not consistent with meeting NNSA's mission need nor does it reflect the status quo at LANL. The No Action Alternative in this *CMRR-NF SEIS* is based on the decision announced in the 2004 ROD for the original *CMRR EIS*. This is consistent with CEQ recommendations that, for proposed changes to an ongoing activity, "no action" can mean continuing with present plans (51 FR 15618). NNSA determined that a supplement to the *2003 CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in design and construction of the CMRR-NF and has addressed alternatives consistent with previous analyses and decisions. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. NNSA estimates that the total project cost of CMRR Project construction activities would be between $3.7 billion and $5.9 billion (DOE 2011b).

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

18

no-action alternative is to, you know, build the 2003-2004 version of the nuclear facility, which at this stage cannot be done, because of the seismic issues. So, that's not really an alternative.

The other alternative is to continue using the existing -- you know, the existing CMR facility without upgrading it. And that's not really an alternative, either.

So you've eliminated two alternatives, and you're down to one alternative and, you know, we're not here tonight to just decide if it's a deep facility or shallow facility.

I also think we should analyze the -- take a hard look at the costs of the facility. A lot of the issues -- a lot of the previous decisions were based on costs back in 2003-2004, before the seismic issues were known -- the increased seismic issues were known.

It was -- at that point it was decided that it would be cheaper to build a new building than to upgrade the existing old building, and I'm not sure that's true any more. Upgrading the existing CMR building was an option in the scoping comments, and for some reason it got removed, and we would like to see that back as an alternative.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

Thank you. And I will submit formal comments also. Thank you. (Applause.)

MR. MacALLISTER: Thank you. Robert Press followed by Don Hancock.

MR. PRESS: I will be brief. Recently the United States and Russia agreed to reduce the number of nuclear warheads. And here we are with a proposal from the Department of Energy and LANL suggesting that we build a new building, build new pits for nuclear weapons. Does the word hypocrisy mean anything to you? It does to me.

What I thought about doing when I came here was to set up an employment agency outside, because it seems to me when we come to these hearings the question is about jobs. Never mind that the jobs are a threat to the citizens of the United States. Never mind that the Department of Energy is supposed to be a protective agency for the people of the United States. But when we want to build something new and create more jobs, as the gentleman earlier said, then we vote for building more bombs.

Japan just went through a serious problem. Three Mile Island was a serious problem. Russia had its own serious problem. But do we pay attention to any of those? No. We do not live in a democracy any

403-1 NNSA notes the commentor's opposition to pit production and nuclear weapons. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

As stated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, the purpose of the proposed CMRR-NF is to provide analytical chemistry and materials characterization capabilities in support of NNSA and LANL missions. The *CMRR-NF SEIS* presents the environmental impacts of construction and operation of the facility; one area of environmental impacts is socioeconomics, including jobs.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

more. We are controlled by corporate America, and the people who work at these agencies are employed by corporate America. If they want other jobs, I would be happy to help them find jobs. We need other scientists to look for peaceful ways of bringing safety to the United States and the rest of the world. But we ignore that.

403-1 cont'd

I have been to many of these hearings. And at most hearings, the majority of the people who are giving evidence, are not listened to. And I am sure tonight that what I have said will not be listened to.

403-2

So, I am not going to waste my time. And I hope other people will join me as I walk out.

Thank you. (Applause.)

MR. MacALLISTER: Don Hancock, followed by Dave McCoy.

MR. DON HANCOCK: Good evening. I'm Don Hancock from Southwest Research and Information Center, a 40-year-old organization based in Albuquerque.

We've looked at dozens of Environmental Impact Statements over the last 40 years, and this one is one of the worst, most obviously illegal ones that we have ever looked at, and I've seen some

403-2 NNSA considers every comment received by U.S. mail, email, toll-free telephone or fax line, or at the public hearings. Consistent with the purpose and intent of NEPA and the implementing regulations, public comments assist NNSA in determining the scope of the analysis to be included in a NEPA document and in improving the analysis and range of alternatives evaluated. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

pretty bad documents.

One of the things that's interesting, though, is that this document that was referred to, this is the 2003 Environmental Impact Statement on this project, the preferred alternative in this document and, in fact, the option that was chosen in the Department of Energy Record of Decision, is now rejected as being inadequate, inappropriate, because it doesn't meet the seismic hazard problems.

Well, that's pretty amazing, the Department of Energy itself has said, this Environmental Impact Statement that it did is legally inadequate.

When you have a legally inadequate document, what should you do? The Department of Energy has two reasonable choices.

One, the preferred one, would be to say, well, we guess we shouldn't build this nuclear facility at all. That would be what the preferred alternative would be.

The other alternative would be to go back and start over with a legally adequate Environmental Impact Statement. They've chosen not to do that, either, but to take an illegal, inadequate document, and say, we can supplement it. With what? With a one-alternative proposal. The one alternative is to

404-1

404-1 The *CMRR EIS* was not legally inadequate. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. The *CMRR-NF SEIS* is an SEIS to specifically address changes in the design of the CMRR-NF based on additional seismic information and safety requirements. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

22

build a shiny, new nuclear bomb plant, and dig a 58-foot hole to put the shiny bomb plant on top.

Or the other alternative is to dig a 130-foot hole in the ground, fill half of it up with cement, and put the shiny bomb plant on top of it.

Those are not what are called all of the reasonable alternatives. The Council on Environmental Quality Regulations that govern these procedures say that the heart -- their word, the heart of an Environmental Impact Statement is discussion of all reasonable alternatives.

So this new document has no heart. It has no heart from a legal standpoint, and it has no heart from a lot of other standpoints.

What about the other reasonable alternatives? The alternative of not building it? No, that -- can't consider that, because that wouldn't fulfill our purpose and mission.

What about the alternative of using the existing plutonium facility? That's rejected in one sentence, quote, "It would interfere with performing work currently being conducted there, and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work."

That's not -- that one sentence is not what

404-1 cont'd

and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.11, Alternatives Considered, of this CRD for additional information.

Response side of this page intentionally left blank.

you call a rigorous analysis of all of the alternatives. So they haven't done that.

There are other alternatives that I could go into, and actually Mr. Snyder encouraged me before the hearing started tonight, to go into detail about the other reasonable alternatives that should be included, but I've now been told that I only have three minutes, so that clearly, we are getting mixed messages here. On the one hand we want to hear what the analysis of the reasonable alternatives should be. And on the other hand we're told, oh, by the way, you really don't have time to do that.

404-1 cont'd

MR. MacALLISTER: Well, actually, your time is up.

MR. DON HANCOCK: Well, I understand, but there's another thing that needs to be said about how DOE can't be bothered with talking about the reasonable alternatives. DOE's own regulations say that they have to notice 15 days in advance.

MR. MacALLISTER: Sir, your time is up, I'm going to have to ask you to give up the mike.

SPEAKER FROM THE FLOOR: Let him speak, let him speak.

(Speakers from the Floor were talking at the same time, and could not be reported.)

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

MR. DON HANCOCK: This is a good example -- this is a good example of the Department of Energy not wanting to hear people's comments.

MR. MacALLISTER: My apologies. We set out the ground rules. I've asked you to abide by the ground rules.

SPEAKER FROM THE FLOOR: You set them up. We didn't set them up.

(Speakers from the floor were talking at the same time, and could not be reported.)

MR. MacALLISTER: We have many other people waiting, and the intention is to let everybody speak.

SPEAKER FROM THE FLOOR: (Speaking at the same time as Mr. MacAllister.) (Inaudible.) Willing to give up for that?

OTHER SPEAKERS FROM THE FLOOR: I am.

I will give him my time.

MR. MacALLISTER: If somebody -- if the next person I call chooses to yield, that will be -- I will give him another three minutes, that's fine, but Dave McCoy is in the cue.

SPEAKER FROM THE FLOOR: No, everybody should take their own time.

MR. MacALLISTER: And Dennis Holloway is next.

Response side of this page intentionally left blank.

MR. DAVE McCOY: I agree with Mr. Hancock. My name is David McCoy. I am the Director for Citizen Action. I agree with Mr. Hancock about the phantom alternatives that are being presented here.

Additionally, the use of National Security protocol is being used to trump the NEPA. This is a very inadequate SEIS.

The only reason it was issued at the time it was issued is because there was a lawsuit against the lack of a new EIS being in effect.

The SEIS fails to examine reasonable alternatives to the proposed CMRR.

The preferred alternative of building is not technically or financially feasible through the completely unsafe geological location that's been chosen.

Moving or not constructing at all must be an alternative for consideration.

405-1

The uncertainties associated with building either the shallow or the deep excavations of the CMRR, as proposed in the SEIS, are insurmountable.

Let's take a look at some of the information that's missing about this site geologically.

There's no determination of a kappa from a

405-1 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the *2003 CMRR EIS* (69 FR 6967). See Section 2.11, Alternatives Considered, of this CRD for more information.

405-2 NNSA notes the commentor's concerns and technical comments regarding seismic issues related to the Draft CMRR-NF SEIS. In addition to the following responses, refer to Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information. Chapter 3, Section 3.5, Geology and Soils, of the CMRR-NF SEIS has been revised to improve the discussion of faulting and seismic hazards at LANL.

The comment indicates that site-specific seismic data are inadequate because studies have not been conducted. Dozens of mapping studies of the Pajarito fault system have been conducted (for example, Gardner and House 1987; Wong et al. 2005; Carter and Gardner 1995; McCalpin 1997; Lavine et al. 2003), including state-of-the-art, high-precision mapping in the vicinity of LANL. In addition, numerous paleoseismic trench investigations have been conducted at 17 sites over the past 20 years (for example, Gardner et al. 1990; Olig et al. 1996; Kelson et al. 1996; McCalpin 1998, 1999, 2007; LANL 2007). These studies clearly show that the Pajarito fault system is a series of normal slip faults that form the best studied fault system in the Rio Grande rift. Admittedly, some parts of the fault have not been as well studied as others; these tend to be those portions outside of LANL, especially where

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

26

network of seismometers.

An analysis of high potential ground shaking due to amplification of seismic waves by the near surface soils or at the near surface soils, which is commonly referred to as site amplification, is completely missing. Mapping of faults beneath LANL, and the relationship to regional tectonics is missing.

Information that should warn against the use of this site is that the potential for compression of the weak, soft volcanic ash beneath the heavy CMRR, and the potential subsidence over the long-term, the so-called raft that is supposed to float, may sink.

The potential is there for hydro collapse due to wetting. The added weight to the CMRR from the use of water, supplying this water within the building for fire suppression, and for cooling plutonium, has not been presented.

The slope instability, which can cause excessive movement is not really being considered.

The increased seismic shaking due to the soft volcanic ash and building response is not really set forward.

We can't do an adequate risk analysis,

405-2 cont'd

405-3

access issues are a problem (for example, the Santa Clara Canyon segment). Additional study of these areas would likely improve our understanding of the fault and could help reduce uncertainties in the inputs, but these studies are not a prerequisite to conducting a PSHA or determining design ground motions at LANL. The uncertainties in regards to fault geometry, rupture behavior, and sense of slip on the Pajarito fault system were fully recognized and addressed in the range of inputs to the PSHA. A range of fault dips was used (±15°), a component of oblique slip was considered in calculating slip rates, and two rupture models and various rupture scenarios were included in the analysis to address remaining uncertainties in the geometry and sense of slip of the Pajarito fault system. All of the data and analyses for the Pajarito fault system published in the Lewis et al. (2009) study were included or considered in the PSHA update.

The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option. A draft slope stability analysis has been prepared and determined that indicated that global slope stability is not an issue for the Deep Excavation Option (LANL 2011a: LANL site, 028). If the Deep Excavation Option were selected, as part of the ongoing design and evaluation process, studies would be completed to verify that all geotechnical stability issues had been addressed.

405-3 Chapter 4, Section 4.2.10.2, and 4.3.10.2, and Appendix C of the *CMRR-NF SEIS* present the accident analysis for the CMRR-NF. NNSA evaluates a range of potential accidents and their impacts. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

because they don't have the data in place to do a risk analysis, and yet they're trying to tell the public that this is safe. The accident that can happen there, is supposedly a spill of plutonium.

Listen, the accident that can happen is an explosion or a fire out there with plutonium, and the loss of Colorado and most of Santa Fe, and most of New Mexico. Let's quit kidding ourselves. This --

MR. MacALLISTER: Your time is up.

MR. McCOY: Yeah, I know.

This EIS talks about -- well, we are going to incorporate the lessons of Fukushima. The lesson of Fukushima is don't build nuclear reactors and nuclear facilities in unsafe geological locations.

405-3 cont'd

MR. MacALLISTER: Dennis Holloway, followed by Joan Brown.

MR. DENNIS HOLLOWAY: I'm an architect in the state of New Mexico. I was licensed as an architect in 1970, and this is ridiculous. What's going to happen to this state if this plant goes in? I can tell you that all architects have to take earthquake exams to be licensed in certain states like California. New Mexico doesn't require that, even though we have so many earthquakes.

But just to let you know, I have studied it

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

28

carefully. It's part of my training. And I'm here to tell you that this EIS, all the statements about seismic issues -- baloney. And don't trust it. We need to get an expert analysis of that seismic site before any more nuclear facilities are built in that death factory. (Applause.)

MR. MacALLISTER: Joan Brown, followed by Marlene Perrotte.

SISTER JOAN BROWN: Good evening, my name is Joan Brown. I'm a Franciscan sister and I work in several different ecology and faith organizations throughout the state. I have been to numerous of these hearings. I keep coming, and nothing seems to change. There's no real alternative, and I second the voice that our voices are not heard. I'm not a technical expert, but I am a citizen, and I work in these issues all the time. I am appalled that we are continuing to go forth with this without a realistic EIS. I'm appalled that we are spending $4.5 million on such a facility when we have a $14 trillion debt in this nation, when we are cutting education funds, we are cutting health care funds, we don't have any money for true energy alternatives like solar, wind, and others that we haven't even thought of. I'm appalled we would even stand to continue to put up

406-1

407-1

406-1 Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

407-1 NNSA notes the commentor's concerns. CEQ and DOE NEPA regulations and implementing procedures require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively), to address the changes in construction of the CMRR-NF based on additional seismic information.

Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.2, NEPA Process, and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

with this.

I think a better alternative for the investigation of this would be to call some of these very intelligent credible citizen experts and sit down and talk with them instead of whoever the, quote, experts are that have been being relied upon.

But ultimately, this is a deep moral and spiritual issue. And I believe that we have lost and are losing our soul in this nation bit by bit, more and more. That we would build such a facility on a vulnerable piece of land seismically that would threaten our water in the state, which we already are in a drought and we are in severe concerns about, shows that we have no care, concern, for the current populations, the people, or the future children and people of not only this nation, but of other countries, as well.

We are risking all of this and all of this money, and yet we fail to consider climate change, which is affecting millions, billions, of people on this planet. It's truly a waste of money.

I do, in closing, have an alternative that I would like to propose. And I propose this even though some of you might think it's very simplistic, and there's not enough time to explain it in great

Response side of this page intentionally left blank.

depth, but my alternative is on the other side of what really is propelling this particular project, and that's the $14.5 billion of these dollar bills, but on the other side it says, "In God we trust." I would propose that an alternative be not in a simplistic manner but in a truly deep, spiritual, moral and ethical way to look at what does it mean to really trust in God and our own creative possibilities, intelligence, as individuals and as collective people in this state, and propose other alternatives. In God we trust. And I'm giving this as my alternative for documentation.

MR. MacALLISTER: Thank you. Marlene, followed by Camy Condon.

MS. MARLENE PERROTTE: We have been asked to model civil dialogue, which means be submissive to the military, to the corporate/military/industrial complex. The greatest threat that we have, says the Pentagon, is climate change. Nuclear weapons are obsolete. How do we confront DOE and DOD with the mixture of the corporate/military money? What happened to governing power by the people, of the people, and for the people? It seems also that this process is obsolete.

We must understand that when we make

Response side of this page intentionally left blank.

decisions that are going to affect millions and the future of our planet, when we're talking about uncertainty and we have no data on the risk, we must understand we need to use the precautionary principle. We must find out and we must ask, "Prove to me that the Clean Water Act will not be violated. Prove to me that the Clean Air Act will not be violated. Prove to me that nuclear weapons should be on that seismic mountain. Prove to me all the things that you are saying, that this is not going to happen."

I think we must understand that we have been entrusted with the sovereign resources of this world. Are we going to put our trust in this bombplex when our budget is being balanced on the backs of teachers, Medicare and Medicaid people and people that are senior citizens in Social Security? Isn't that something, to come to a point when we prefer putting our trust in nuclear weapons rather than the humanity of this planet and the earth community. Thank you. (Applause.)

MR. MacALLISTER: Camy Condon, followed by Bastia Miller.

MS. CAMY CONDON: Good afternoon. My name is Camy Condon, a long-time resident of New Mexico,

408-1

408-2

408-1 As part of the NEPA Process, an EIS must consider whether actions described under its alternatives would threaten a violation of Federal, state, or local law or requirement imposed for the protection of the environment (40 CFR 1508.27) or require a permit, license, or other entitlement (40 CFR 1502.25). NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF and to conduct its operations in a manner that ensures the protection of public health, safety, and the environment through compliance with all applicable Federal and state laws, regulations, directives, and other requirements (including the Clean Water Act and Clean Air Act). Refer to Chapter 5 of the *CMRR-NF SEIS* for more information. Also, refer to Appendix C of the SEIS for risk analysis.

408-2 Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.2, NEPA Process, and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

and a lover of every part of nature here. I also work a little bit in Japan, where I have published 15 books, was a journalist, and I'm doing volunteer work with micro credit banking in northeastern Brazil because I'm on Social Security and I can volunteer in another place.

409-1

But I'm right now here to be strongly against this project. I will only say one reason. I agree with many other points that have been made, but I want to say only one comment about the seismic hazards. Right now I have my son, Michael, and my granddaughter, and the mom of the family living in Tokyo. My son works there as a manager for a Japanese company, one of the largest, most profitable telephone companies in Tokyo, Japan, and my granddaughter, age 1, is now receiving low-level radiation from the Fukushima plant. I speak Japanese and ever since the tsunami, the earthquake, and the tsunami, I been watching online all of the daily reports from the NHK Broadcasting, Japanese corporation reports from the beginning until now.

409-1 cont'd

I am horrified to think that my granddaughter might come back to my house in New Mexico, escaping radiation in Japan, and find radiation hazards here in New Mexico, more of them, even more.

409-1 NNSA notes the commentor's objection to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF of this CRD for more information.

There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information. Chapter 4 of the *CMRR-NF SEIS* analyzes the radiological impacts associated with operations at the proposed CMRR-NF. The radiological hazards would be small. See Chapter 3, Section 3.4.3, regarding current radiological emissions at LANL.

I know very little about the geology of the Pajarito Plateau, except I do know that there are faults there and that the current building is above one of the faults, and that is a new building, according to the gentleman who informed me earlier, down the road, the plans for that down the road from this seismic fault. I don't think that's down the road far enough, and because of the unsafe location, the reality that we will hopefully not ever need any of these weapons, I don't want my own tax money used for this purpose. I strongly object to this project, and thank you for letting us testify.

409-1 cont'd

MR. MacALLISTER: Thank you. Bastia Miller, followed by Marcus Page.

MS. BASTIA MILLER: My name is Bastia Miller. I'm on the board of Concerned Citizens for Nuclear Safety in Santa Fe. I want to start by saying how disconcerting it is to have our time for speaking abruptly changed from five minutes to three minutes. Some speakers are excellent extemporaneous speakers, and I have my things written down, and so it has really inhibited my ability to present in a reasonable way, to go back through and figure out how to make three minutes out of my five minutes, and I think that that kind of abrupt shift in the ground

410-1 NNSA notes the commentor's concern with the format of the Albuquerque public hearing. Public hearings were formatted to allow enough time for all commentors to be heard. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Regarding the commentor's statements about climate change and earthquakes, the *CMRR-NF SEIS* has been revised to address seismic risks and the effects of climate change in the American Southwest. Seismic risks were addressed in the *Draft CMRR-NF SEIS*. However, Chapter 3, Sections 3.5 of the *CMRR-NF SEIS* has been revised to more fully describe the faulting and seismic hazards at LANL. Chapter 3, Section 3.4.4 of the SEIS has been revised to include a description of the types of environmental changes that could occur in the southwestern United States due to climate change. A discussion of potential impacts that could result at LANL from climate change, has been added to Chapter 4, Section 4.1.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

34

rules discourages the public from coming forward.

I want to register my observation that the proposed CMRR building has a limited rationale in the sense that it does not seem to have been adapted to the changing circumstances of our world. First I'm thinking of climate change, which means we can no longer trust our risk measurements. The land is responding with earthquakes. The water is responding with tsunamis. The weather is going to extremes of hot and cold, and tornadoes bring destruction. It's hard to gain a footing under those circumstances.

410-1 cont'd

There are other critical reasons for taking a true look at possible alternatives to the proposed CMRR, but the nuclear industry seems to be intent on building itself up without reviewing the big picture. One way is that our human institutions are flawed. The profit motive has come to play a bigger and bigger role in determining our goals. We move away from science at its best when government institutions are privatized.

Another flaw is that regulators are unable consistently to hold themselves to the standards that are separate, in terms of public interest, from the people who are being regulated.

I have to move along, because I have this

Response side of this page intentionally left blank.

35

sense of impending abrupt termination.

The next point concerns nuclear waste. Los Alamos has a long history of carelessness in handling nuclear waste, promises for cleanup that are not carried out, and of priorities that put cleanup in the last place. With the recent settlement under the Clean Water Act, they have another opportunity to show good faith, and for that I would like to be grateful, but rationally, I still hold a wait-and-see attitude. I grew up in Missouri, the "Show Me" state.

410-2

My last point has to do with the economy of the surrounding communities. These communities have borne heavy consequences --

MR. MacALLISTER: Thirty seconds. You're fine.

MS. BASTIA MILLER: -- for being in the neighborhood of Los Alamos. The health effects for people who have worked at the lab are severe. People have suffered the consequences of contamination because of Cerro Grande fire. The traditional ways of life are being curtailed and eliminated.

410-3

I want to conclude with this quotation from Octavio Paz. He says, "The idea of a single civilization for everyone implicit in the cult of

410-2 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Chapter 2, Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

410-3 Chapter 3, Section 3.11.4, Health Effects Studies, of the *CMRR-NF SEIS* provides a summary of a number of epidemiological studies that have been conducted in the LANL area, as well as a summary of cancer incidence and mortality figures for the Los Alamos Region as derived from data from the National Cancer Institute. During the period 2003 through 2007, the annual cancer death rate for Los Alamos County was smaller than that for the state of New Mexico as a whole, and for the entire United States. The cancer incidence rates, however, of melanoma of the skin, prostate cancer, thyroid cancer, and female breast cancer were elevated in Los Alamos County with respect to state averages, while cancers of the lung, colon, and rectum occurred at rates below the state averages. Refer also to Chapter 3, Section 3.11.3, Industrial Safety, of the *CMRR-NF SEIS*.

A summary of possible public health impacts resulting from the May 2000 Cerro Grande fire is included in Chapter 4, Section 4.6.1.3, Radionuclides and Chemicals in the Environment Around Los Alamos National Laboratory, of the 2008 *LANL SWEIS* (DOE 2008a). In summary, it was concluded that no harmful exposures due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future as a result of the fire (ATSDR 2006).

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

36

progress and technique impoverishes and mutilates us. Every view of the world that becomes extinct, every culture that disappears diminishes a possibility of life."

These are just some of the concerns I have. I'd like to encourage the Department of Energy to take a deeper look, a step back from simply continuing to do more of the same. Thank you very much.

MR. MacALLISTER: Thank you. Marcus Page, followed by Benjamin Abbott.

MR. MARCUS PAGE: Moo. I am the cash cow. I am so happy to receive all this money in foolishness. But I'm not the cash cow, I was just dressed as the cash cow. My name is Marcus, with Trinity Nuclear Abolitionists, and I'm opposed to the system of feeding the cash cow because the nuclear complex was not meant to be a jobs program for scientists and for the working class folks that build the factories. And that's what it has become, and I'm sorry about that, because I do agree with all the antinuclear and nuclear abolitionist statements that have been made before me tonight, so I don't want to repeat it. I just want to echo it. I wish you could play it back on a tape so you could hear it.

411-1

411-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Thank you all for what you have said tonight, especially Sister Joan Brown on the spiritual level. So I'm inviting all of you to come pray with Trinity Nuclear Abolitionists on Father's Day, which is also Holy Trinity Sunday. It's June 19th, and then Monday morning, June 20th. Thanks again for all the antinuclear and nuclear abolition statements. They are true. And thanks for the technical statements from our watchdog groups.

Back to cash cow mode. Feed me more money to destroy the planet. Moo. I am a fool. I am Los Alamos. I am the Department of Energy.

(Applause.)

MR. MacALLISTER: Benjamin Abbott, followed by Janet Greenwald.

MR. BENJAMIN ABBOTT: I have a process question. Why is it necessary for you to stand next to the speakers?

SPEAKER FROM THE FLOOR: It's kind of threatening, intimidating.

MR. MacALLISTER: It's for the speakers. There is a yellow card that is a 30-second warning, and there's a red card, so I don't have to stand here unless people don't respect the process.

MR. BENJAMIN ABBOTT: I'm going to be

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

38

pretty brief. My name is Benjamin Abbott. I'm a grad student at UNM. Like Marcus, I want to thank everyone else who has spoken and echo a lot of their concerns. But what I want to emphasize is the fact that the project is not going to build anything useful. I mean, it's absolutely important to have jobs and money in northern New Mexico, in this state. I think we should just take the money and do something useful with it, because currently, plutonium pits are not going to help anyone. It would be much better for the entire species if you just paid the people to do absolutely nothing. That would be vastly superior. You pay them to party, basically. But as dangerous as a wild party is, it's not as dangerous as this facility, according to all the testimony we've had today. *412-1*

So that's what I want to emphasize, that there's no reason for any of this. We should take the money and do something useful with it. There are so many things that need to be done, there are so many people suffering, people not having a good standard of living, there's education systems going downhill, the energy system in this country needs to be complete, and transportation needs to be completely revamped. The money can be spent on so

412-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

many good things, so this project should be opposed for whatever reasoning, anything you can do to stop it and put the money into somewhere good should be done. Thank you. (Applause.)

MR. MacALLISTER: Janet Greenwald, followed by John Lockridge.

MS. JANET GREENWALD: Well, I think what I have to say probably relates mostly to risk. I moved to New Mexico when I was in my early 20s, and bought a farm downwind from Los Alamos. If I had known that Los Alamos was there, I might not have done that. My family lives there still. So once I found out Los Alamos was there, and started to begin to understand nukes and what they were all about and what Los Alamos was about, I joined CARD and came down to Albuquerque and worked in the office a day a week. CARD paid my bus fair, I think, for a number of years. And I became known as an antinuclear activist in the north and around Albuquerque, and for some reason people at Los Alamos, because I never passed on what they said, would sometimes call me and talk to me about what they were experiencing up there. I would work at the office late at night, so these calls would always happen late at night.

The first one was from a woman who had just

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

lost her husband at Los Alamos. She said he was a high administrator. She said that he had died from cancer. She said a lot of people she knew were dying of cancer. She told me that the little stream that ran through her backyard, her beautiful backyard, was contaminated. I asked her if she would come forward and talk about these things, and she said if she came forward, that her family at Los Alamos would be ostracized. And so no, she was not going to come forward.

Then some years later, I received a call from a friend of mine about our friend Tyler, who lived at Los Alamos. Tyler had discovered a brain cancer cluster up at Los Alamos, and my friend called me to tell me that his house had been burned down, and that he and his family would be moving out of New Mexico.

So then years later, I'm working late in my office again, and I get a call from a nuclear scientist. Well, he wasn't -- let's see how to state. His training was -- it was not a physicist. I don't want to go into it any more, but it was the night of the Cerro Grande fire, and he called me up because he said there was a bunker at Los Alamos and that there were prototypes of nuclear bombs in that

Response side of this page intentionally left blank.

bunker, and he was terrified that the fire was going to reach the bunker, and he said if it did, we would all be gone. So he started out very upset, and then I talked to him for about an hour, and he gradually got less upset, and then he began to back pedal and say, "No, it will be fine, it will be all right."

So now I no longer work late in my office. I'm in my mid-60s, and if there are calls coming in from people at Los Alamos who are upset by one thing or another, they just get an answering machine. So for me, building another bomb building at Los Alamos -- it just seems like insanity, just insanity. And who is the enemy? Who is the enemy? Maybe it's like the poet said. Maybe we found out that it was ourselves. Thank you.

413-1

MR. MacALLISTER: John Lockridge followed by Flora Barrett.

MR. JOHN LOCKRIDGE: My name is John Lockridge. Thank you for the opportunity to speak here. I wish we would get 100 percent of our time instead of 60 percent or 40 percent reduction. It seems fairly extreme.

Anyway, to get on with it, since we don't have much time, there has been a lot said about the EIS itself. I think the EIS is really almost

414-1

e-mail: info@litsupport.com

413-1 NNSA notes the commentor's opposition to this project. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

414-1 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

42

secondary to the real problem of violation of a nuclear treaty that we have. We have this nuclear nonproliferation treaty that we are signatory to here in the United States, and we are supposed to honor what we sign, I believe. I don't believe that's being done in this case. A lot of people -- some of the DOE people may say -- and some others, too -- that this is really just replacement of existing pits. But I don't know, and I don't know that as a citizen of New Mexico I'll ever find out unless we work for DOE. The truth of the matter, I believe there are probably going to be some enhancements to the pits, probably in the name of safety or something like that. But they won't be the same pits. They won't be just replacement pits for the ones that are already in existence. We already have thousands of bombs that are lying around the country, about 2000 or more here, I believe, at Kirtland.

Another thing that has been mentioned before, but I think is important to restate, is that the environmental threat is extreme. At least a couple of people, I believe, have mentioned the seismic problems. But not only that, there is already contamination up at Los Alamos from poorly maintained pits. They don't have accurate records.

414-1 cont'd

414-2

414-2 A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Please refer to Section 2.4, CMR Mission, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

There's pits down here at Kirtland Air Force Base, Los Alamos, I guess, actually -- or not Los Alamos. But Sandia Labs. Not really the Air Force base, I guess. But we've already seen how our government does not maintain safety issues for us that should be maintained. We are supposed to be protecting the people of the country, not destroying the people of the country, and I think we're just introducing more and more threats to our population by allowing this to happen. So I think just on the basis of the treaty that it seems to me that we're violating, we should not even consider having an EIS. We should consider ending the project.

414-1 cont'd

And at that, since I don't know how much time more I may have, I'm just going to end it there. Thank you for the time. (Applause.)

MR. MacALLISTER: Flora Barrett, followed by number 16. I don't have a name.

MS. FLORA BARRETT: Yes, my name is Flora Barrett, and I am speaking for myself. I heard earlier a mention that nuclear weapons are obsolete. That is my message. And so I'm going to say it again, because I have had planned all along to say nuclear weapons are obsolete. Why would we build more nuclear weapons when we can't use them? Why are

415-1

415-1 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

44

we going to put money into something that can never be used? We have said all along that we can't use these weapons. So why would we build more of them?

So shut down that plant. Don't put any money in it. Close it completely, and let's talk about how we can build sustainable nuclear and -- sustainable energy, solar, wind, and bio uses of energy. To me, it doesn't make any sense to build something you're never going to use. We can't use it. There's no way we can put nuclear weapons out there in the world. So close down whatever is there of the CMRR and do not ever open it again.

415-1 cont'd

(Applause.)

MR. MacALLISTER: Thank you, ma'am. The person who signed in as number 16. I don't have a name. Thank you, followed by Lilly Rendt.

NUMBER 16: Also no pictures, and I don't want the film on, so you don't have my release of confidentiality and my release of information to do that.

I'm just going to give the basics of what came up for me. I was born in Los Alamos, and I know the big difference between Bechtel. Bechtel's a corporation. It is not the old days of University of California and the quaintness of University of

416-1

416-1 DOE and NNSA continue to provide oversight of LANL as in the past. The managing and operating contract for LANL was openly competed in 2005 for the first time in the 63-year history of the LANL site. Through 2005, the University of California had been the sole managing and operation contractor for the LANL site since its creation in 1943. The new managing and operating contractor, Los Alamos National Security, LLC, began managing LANL in June 2006. The selection of a new managing and operating contractor did not change the DOE and NNSA work performed at LANL.

Chicago where the scientists were coming in and they made $45,000 for the year. These Bechtel guys are coming in with gigantic salaries of $100,000 and above. They're not living in the little government houses that are falling apart that were built in the 1950s. They're in the great big houses near the golf course.

416-1 cont'd

I think that because of this, we've lost our ethics, we've lost our morality, and we're not thinking of legacy and future generations.

The other thought I have, that I had, was: Why risk it? Why risk it? And what I have seen in the transition of how quaint Los Alamos used to be, it's easy for Bechtel to come in, make big money off of this and then split.

And then the other thing I was thinking of, the downwinders were never paid off for the cancers that they're still dealing with. The government made promises to the downwinders, and those monies never occurred for those people with thyroid and brain and lung, et cetera, cancers.

This idea that we've got to make jobs, build jobs off of nuclear, those construction companies and those unions can make money off of peace. They don't need a nuclear plant to have a job

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

from it.

And then the other thought I had was, I thought I'd take it from a psychosocial point of view. Why should we trust these people? I would like alcohol and substance abuse testing and psychological testing done of these new age scientists that have come in. I want them tested. (Applause.) Yeah, and when I look at the neighbors that I have had in Los Alamos, I definitely want them alcohol and substance abuse tested. Okay, just a thought.

But the bottom line is: Why risk it? Why risk it? (Applause.)

MR. MacALLISTER: Lilly Rendt, followed by Susan Rodriguez.

MS. LILLY RENDT: I'm always amused at these meetings because I go a long way back. I go back to the '50s, when they were putting the Cullen Foundation under New York City and underneath Columbia University, and everybody was so afraid that Columbia University would blow up, and they did have a few accidents there. They were just starting.

But I was going to this gal who said we ought to give them an education. Yes, here's a book called "Complexity." And it talks about putting all

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

your facts into the computer before you make a decision. And frankly, I think things that were put into computer to decide upon in New Mexico had to be very, very scarce. In other words, there weren't very many factors that were considered, and when the people here talk about some of the things that have happened and some of the ways of our state, I don't think you people know what you're doing, because this is a very special state.

I just read a book about Alaska, about the gates of Alaska, and I think that might be a good place to put it. Let's make an effort to have them change the whole venue up to Alaska and then the Alaskans who are shooting wolves anyway might have some interest in it. They want all the money, so if money is the big issue, let's give it to them. I mean, we've been a poor state for many, many years, and I really don't mind.

But some people want to build things and then not use them. And what would be the use of nuclear energy at this point? We're trying to work for world peace, not world war. And if we are, then we ought to think carefully that we don't want to be the center and, you know -- we don't want to be the ones that are bombed.

417-1

417-1 NNSA notes the commentor's opposition to nuclear facilities. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons and Nuclear Technology, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

48

Let's build these things somewhere on the Nordic Sea where it can't do any harm to anyone. There's no one up there. This man walked for miles and miles with his two dogs and he didn't meet any people, and his food drop didn't come down, and he met some grizzly bears. He looked so pathetic, the grizzly bears left him alone.

So let's see if we can somehow, somehow -- I don't know how exactly -- maybe through complexity theory, where we really put all the factors into play, or maybe -- well, all I know is, Japan made a big mistake. They built on a small island and they were hurt. And we are not a large state. Even though we do have some mountains, for heaven's sake, let's keep those nuclear facilities out of our state. (Applause.)

MR. MacALLISTER: Susan Rodriguez followed by Sarah Rodriguez.

MS. SUSAN RODRIGUEZ: I'm going to go over some of these points, because I agree with all of them, and to start with the first one I think that's important, a new nuclear facility will detract from the cleanup of the existing mess. So DOE made a commitment to clean up the legacy waste at LANL when it signed the consent order with the New Mexico

418-1

418-1 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF.

Funding decisions regarding major Federal programs (for example, education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

49

Environment Department on March 1, 2005. The order requires cleanup of certain sites by December 31, 2015, including the area G dump site at Technical Area 54. Construction activities for a new nuclear facility will interfere with these cleanup activities. DOE must devote taxpayer funds for cleanup, not a new NF, which will only add to the pollution.

Then I'll skip to another point about these pits, 80 pits. DOE must conduct a capacity study to determine whether the existing facilities can be used instead of building the proposed NF, which would increase pit manufacturing to at least 80 pits a year. Now, I have the number 20 and it says here existing facilities have sufficed since 1999, when DOE limited plutonium pit manufacturing to 20, and I thought that was a lot, but to go up to 80 is absolutely crazy. Since the US treaty obligations forbid both new nuclear designs and increased numbers of nuclear weapons in the US arsenal, pits to be manufactured are touted as stockpiled stewardship, which I have heard for the past 20 years here, for maintaining existing nuclear weapons through replacement of old pits. There's something called the Jason study, however, of aging plutonium that

418-1 cont'd

e-mail: info@litsupport.com

418-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Regarding the commentor's request for a capacity study, the proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years.

NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a). It should be noted that plutonium aging is only one of the variables affecting nuclear weapon system reliability; other variables can control overall life expectancy of nuclear weapon systems.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

argues against the need for pit replacement within the next 100 years.

The manufacturing of these pits is dangerous and the pollution is a threat to the health and safety of those living downwind and downstream, so that's us here in Albuquerque.

418-2 cont'd

Los Alamos National Laboratories inherited the US pit manufacturing from Rocky Flats, which was one of my points. Rocky Flats -- you should Google that one. We inherited that one, Rocky Flats, in Colorado, just north of Denver, was a place where they produced these pits and they made such a mess of it that the FBI had to come down and close them down because they were about to poison the drinking water of Denver.

Now, that is just news, guys. You know, this is just -- and so now we have CCNS that has looked into the Buckman well and they have found plutonium and all the other stuff that -- I'm not a nuclear person -- so it's all this stuff that you don't want in your drinking water, and here in Albuquerque we have not yet had -- the Albuquerque Water Utility Authority has not seen fit to even try to test that. You can't test for this enough because it will go through. It's so small, you have to test

418-3

418-3 There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if he decision is made to construct the CMRR-NF. A monitoring program is conducted at LANL (described in the *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, for more information on cleanup of past contamination.

In 2006, LANL collected a groundwater sample from Buckman Well #1 as part of routine quarterly sampling that is conducted by NNSA at three water-supply wells in the Buckman Well Field. This sampling is performed pursuant to a cooperative agreement with the City of Santa Fe. The samples were sent to an independent laboratory for radiochemistry analysis where it was reported that they detected plutonium-238 at a level about 3 percent of the DOE concentration guide for water ingestion. However, after recent reviews of legacy data by NNSA and further discussions with the analytical laboratory, the laboratory has confirmed that computer analyses of the results were incorrect. The laboratory concluded that plutonium-238 was *not present* in the sample from Buckman Well #1. No further detections of plutonium have occurred since 2006 (LANL 2011e).

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

for this much, and you don't even want to breathe in any of that plutonium. It's deadly. The money spent on unusable nuclear weapons is nuts for economic growth.

418-3 cont'd

This is the last point, but I think the Republicans ought to pay attention to this. It goes down the black hole of corporate pockets. Los Alamos, the richest county per capita in the United States, does not need US budgetary charity, but it consumes the lion's share of federal funds coming to New Mexico. The rest of New Mexico, one of the nation's poorest states, cries out for the fulfillment of real human needs. Money for education, health care, green jobs, renewable energy, public transportation, would all keep circulating and get our money growing again -- get our economy growing again. Thank you. Let's put some sanity into this. (Applause.)

418-4

MR. MacALLISTER: Sarah Rodriguez, followed by Manuel Pino.

MS. SARAH RODRIGUEZ: My name is Sarah. I am currently a chemistry major and a dual Spanish major at the University of New Mexico. I'm only 22. Be these plutonium pits will hurt my generation and the one after that. I have known my friends -- I

419-1

418-4 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

419-1 NNSA notes the commentor's opposition to plutonium pits. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

have had some friends who have died of cancer who are my age. I do not want anybody to have that feeling of loss. Thank you. (Applause.)

MR. MacALLISTER: Manuel Pino, followed by Joni Arends.

MR. MANUEL PINO: (In Navajo.) My name is Manuel Pino, from Acoma Pueblo. My entire life I grew up in what is known as the Grants mineral belt. The Grants mineral belt is one of the largest ore-producing areas in the world. This 50-year legacy of the nuclear industry in our backyard has caused nothing but pain and suffering for Laguna, Acoma, and Navajo people in Cibola and McKinley Counties, extending into the Navajo Nation in Arizona.

It does not surprise me, standing here as an indigenous man, that the United States Government is again breaking another treaty, the nuclear proliferation treaty. The United States Government has broken over 500 to this day. In this 50-year legacy, we have experienced the Jackpile Mine, the largest open pit uranium mine in the world. The Homestake Mill, consistently from the mid-1950s through the 1980s, one of the largest mill producers in the world. We have experienced the Church Rock

420-1

420-1 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

spill, 15 miles east of Gallup, considered along with Three Mile Island as the worst nuclear accident in the United States. Japan and Canada are currently proposing a mine and mill north of our sacred mountain, Mt. Taylor, which recently received a traditional cultural property designation by the State Historic Preservation Office of New Mexico that was challenged by the mining industry and pro-nuclear populations in Cibola County, and the TCP designation was reversed.

I know that in close proximity to Los Alamos we have numerous sacred sites that are sacred to San Ildefonso, Santa Clara, Ohkay Owingeh, Tesuque, and numerous others of our sister pueblos in the north. And you know, I have learned historically that many of these impacts to the pueblos were after-the-fact realization. And again, I want to make sure that there is full consultation of pueblo people in those northern pueblos, that they have free prior and informed consent in this decision-making process, as we were denied that in the Grants mineral belt in many of these historical contamination legacies. We have cancer clusters in our community, both of working and nonworking populations today. You go to my people and ask them if they want any

420-2

420-2 DOE and NNSA are aware of and comply with Presidential Executive Order 13175, which requires all Federal agencies to engage in consultation and coordination with Native American tribal governments on matters of mutual concern. Chapter 5, Section 5.7.1.3, of the *CMRR-NF SEIS* has been revised to describe the specific interactions with the tribal governments in New Mexico's seven northern counties concerning the CMRR Project and the SEIS.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

54

form of nuclear energy.

You know, it's hard for us to conceive as indigenous peoples, when we were studying the Jackpile Mine, that of the 24 million tons of ore, over 90 percent of that went to one source, the Department of Defense, to make weapons of mass destruction. When we tell our elders that this big hole in their front yard was going for that purpose, they were appalled. They were blown away.

We have lived with the contamination of the nuclear industry not only in the Grants mineral belt, but if you go to western Shoshoni land in Nevada, they were the most bombed nation in the world before the aboveground testing was banned. If you go to northern Saskatchewan today, where Dineh and Cree people live, you'll find the most intense mined and milled area of North America. We are sick and tired of disproportionately providing unsafe energy to this country, and we want it to stop. (Applause.)

MR. MacALLISTER: Joan Arends, followed by M. J. Mahan.

MS. JONI ARENDS: Good evening. My name is Joni Arends. I'm with Concerned Citizens for Nuclear Safety. I would like to talk about the need for a public hearing exactly the same as this in the Taos

421-1

421-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

community. Mayor Darren Cordova asked for a hearing. He was denied, but offered a briefing. Sixty people in the Taos region signed a petition in support of the mayor's request. Thirty nongovernmental organizations and four individuals signed a separate letter asking for hearing in Taos. And one of the justifications for the request was because that community was in the plume of the Cerro Grande fire for weeks and the plume was orange.

So I would like to renew that request for a hearing just like this, where people could make public comments, where they can hear one another, the same type of hearing as here in Albuquerque, as will be held in Los Alamos tomorrow night, in Espanola on Wednesday night, and in Santa Fe on Thursday night. There's plenty of time between now and the end of the comment period on June 28th for a public hearing in the Taos community. Thank you. (Applause.)

421-1 cont'd

MR. MacALLISTER: M. J. Mahan, followed by David Bacon.

MS. M.J. MAHAN: I'd like to yield to Mr. Hancock, if he's still here.

MR. MacALLISTER: Thank you, ma'am. Is Mr. Hancock?

MR. HANCOCK: I'm glad to speak. I'd like

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

56

to let the other people go ahead, and I'll speak at the end, if necessary. If you have something to say, feel free to say it.

MS. M.J. MAHAN: Okay. Well, I was very anxious to hear some positive suggestions. I'm very much against building more bombs. I have been way up in the Arctic Circle, where you could look over and see where the Russians were doing their atomic work and their pollution, and it frightens the life out of me. I went up in the Gutenhurten (phonetic) in Norway. There's plenty up there.

More and more, it becomes obvious that we are one world, and what we do in one place affects everything else. I was here in New Mexico as a child, long before the '50s. We moved out, got transferred. My dad got transferred out in 1942. My great grandmother was here. She was principal of First Ward School.

I came back here from New Orleans. I don't have much. I had a wonderful life as a teacher, and I loved it in Catholic schools. But I didn't get much money, and all I had was my little home in New Orleans, my home for 25 years, and I thought with the hurricanes coming, with the threat to one of the largest ports in the United States, I thought, well,

422-1

422-1 NNSA notes the commentor's opposition to nuclear weapons production. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology for more information.

I'm going to go back home to my querencia, the land where my family came from seven generations ago.

So I came back. Little did I know that I was sitting right on top of Sandia Labs. And we know that because people finally wouldn't be quiet, they have finally listened to us, and they're drilling more wells, and we know that the pollution is spreading, spreading, spreading.

So it's a very sad thing. New Mexico's a wonderful place. I grew up here. My mom and dad would sing the song, "Oh, fair New Mexico, we love, we love you so." They met at UNM in the 1920s, late '20s.

So anyway, I do hope that a solution can be found. I'm glad that people are at least letting us speak. I wish they would listen. That's my hope, that they will listen, and that we will get our land back, our beautiful New Mexico. Thank you.

422-1

(Applause.)

MR. MacALLISTER: David Bacon.

MR. DAVID BACON: I come to these events to talk to, you know, my fellow human beings. I was at a committee that Senator Bingaman chaired three weeks ago in Santa Fe. He's the head of Energy and Natural Resources, and he was presented with the data on

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

58

what's going to happen to the Colorado and Rio Grande river basins due to climate change. And it was serious data that he had received, you know. We're just starting to crash and burn when it comes to our own river basins. River flows will diminish, snow pack will diminish, storms will get heavier but less frequent. He came out of that meeting shaken, and Paula Garcia, the head of the acequia association, said in the paper the next day she was shocked at what she heard.

Now, that $6 billion that we're going to throw away or the DOE is going to throw away -- well, $6 billion and counting that they're going to throw away -- would translate into 10,000 jobs at $30 an hour over ten years. We know what we need to do. DOE doesn't know anything. TEPCO didn't know anything. BP didn't know anything. The Army Corps of Engineers didn't know anything. Nature always wins. It always wins. We might as well get used to that and start planning for the future that we know is coming, rather than pretending that we can build these things and that we know what will happen.

Fukushima. The damage occurred during the earthquake, not the tsunami. They know that now. And they know that the level of the meltdown

423-1

423-1 NNSA notes the commentor's concern about climate change and the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, environmental restoration and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Please refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Regarding the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

astonished those so-called experts in Fukushima. What we have to do -- and it was clear in the testimony to Senator Bingaman -- we have to begin restoration of our watersheds. We have to begin restoration of our grasslands. We have to begin the massive deployment of nonwater-consumptive clean energy that doesn't create any waste. We have to put people to work. To do this, we have to create healthy soils, we have to create healthy river systems, we have to create health in our own natural resources again.

This isn't rocket science, fortunately. With just this money, we could begin a serious endeavor to at least stave off what we know is going to be happening to our river basins. I would hope that we can begin now to focus on this, and to completely pull money out of DOE and Los Alamos. We should not spend another dime up there.

We now know how to restore -- a lot of people who are outside the sort of traditional scientific community know how to restore grasslands, river sheds, and so forth, watersheds. We know how to do it. We should be putting all our money into these people, into the small communities in the rural areas, into the damaged forests and the damaged

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

watersheds that have been damaged because we've pushed our energy to the limit. We push everything to the limit. We have to back off. We have to start working with nature. We know that, and we ought to get on with it, and I don't think we can change the focus of DOE, but we can create an entirely new restorative scientific and civil community and begin to save the planet. Thank you. (Applause.)

423-1 cont'd

MR. MacALLISTER: Has everybody who completed a registration form had a chance to speak? Has anybody not had a chance to speak who completed one?

Okay. How many people who are still present are interested in making another comment? Three? Okay. We have time. And I'd also like to remind you again that you have unlimited time and unlimited numbers of opportunities to submit comments through the other venues in the back corner, and venues like the mail, phone, and fax. So tonight is not by any means your only opportunity. In addition, we have the other three meetings.

Sir, is there a question?

SPEAKER FROM THE FLOOR: Yes. How can your calculations for the facility site be correct when you can't even calculate that there was plenty of

Response side of this page intentionally left blank.

time for five-minute presentations rather than three-minute presentations? It's now 7:00, and this is supposed to run until 9:00. That's two more hours. You know? That's a pretty poor calculation on your part, and a lot of interruption of a lot of people that wanted to say something in a cohesive, coherent manner. So you have insulted this audience by your ineffectual and improper rule-making.

MR. MacALLISTER: Thank you, sir, for the comment. And just for the record, two points. I apologize if anybody did feel intimidated by my standing here. The intention was to facilitate everybody being able to turn through -- it wasn't available to me at the outset how many people may still be registering and coming through, so I was intent on making sure that everybody had a chance to at least make their comment.

Secondly, I can't speak to the calculation. I take the number that I'm told as the facilitator. So at this point, I would like to start the second round, and invite people in the order that they raised their hand to come and speak. Ma'am?

NUMBER 16: The other thing that DOE doesn't get is that people don't trust you. There's no trust built, and trust is earned, so that when

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

62

you're speaking, you know, Bechtel babble, people don't trust you. You broke trust. There's no reason for anybody to trust any of you.

MR. MacALLISTER: Okay. The comment -- since it wasn't on the mic, I'm not sure it was picked up. But the comment was that there is no reason to trust us, that the calculations broke trust; is that it?

NUMBER 16: No, just in general. People have no reason to trust you.

MR. MacALLISTER: Understood. Okay. So other people who would like to approach the mic and make a comment, please raise your hand, and I'll call you in the order of your hand raised.

Sir, in the yellow shirt.

MR. DENNIS HOLLOWAY: Just one more comment from an architect. You know, Fukushima is on all of our minds right now. If it isn't, it should be. And you should be reading online what actually is going on, because there's a news blackout. Tokyo people are being very, very highly radiated right now, and we're not hearing it on our news. I want to say that, you know, when Fukushima was built, I'm sure that jobs were the big issue in those counties, weren't they? They convinced the counties that

406-2

406-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF* they're going to get lots of work. But you know, the difference between that and what we're talking about here, which is potential job creation, is that people know what a nuclear reactor is and how it works. We don't know what's going to be done inside that building, because it's a security problem, and we're not going to be told. So why should we do carte blanche and say on an earthquake fault and volcanic area that this kind of a very sensitive processing facility should be built on a 50-foot hole with concrete it in, or a 100-foot hole with concrete in it?

I don't care. As an architect, this is total psycho babble. There's no sense to it structurally, and everybody in this room who I don't see again -- we should talk and we should try to find a way to get an analysis of that whole idea because that's the weak point here. There is no structural rational basis for implementing this kind of sensitive process.

MR. MacALLISTER: Thank you, sir. Who would like to speak next? Ma'am.

MS. M.J. MAHAN: Thank you. One of the big issues I feel is the job issue. And there are so many different ways to create jobs that are positive,

SEIS was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geological Concerns, of this CRD for more information.

422-2 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, agriculture and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

64

instead of putting all our money into something that is going to -- I mean, it's a war issue. I mean, why do we want to put all of our funds into something that is only a war implement? I just can't see it. I feel like if we were to put that money, like these people said, into agriculture -- although agriculture, I think we put so much housing into New Mexico now, I don't know if we can ever have agriculture again, the way we had it.

422-2 cont'd

And this is one of the things I felt was a device. Years ago, there was so much empty land, and you could look for miles. And now when you go from here to Santa Fe, you see nothing but buildings and, you know, different structures, casinos, mister from Acoma there. You know, it has changed. And I always said we were not the largest state. I grew up in Minnesota. And there are 10,000 lakes in Minnesota. The water will never deplete there.

But I had a vision one time of how about transporting water to places where it's needed? California did it. And they brought plenty of water from up north down into southern California. And they have beautiful aquifers there. And this is one thing we could do. And there are all sorts of dreams that I have. But one of them is not blowing up

Response side of this page intentionally left blank.

things.

Somehow something has happened to New Mexico. We never thought that way years ago. I came here in 1966. My husband died in Vietnam, and I had to be the full support of my three children and myself. New Mexico gave me a house to live in, gave me a good job, I was a teacher for 30 years here, 53 altogether. And you know, I count my blessings. But I don't want them ruined. I do not want New Mexico ruined by a nuclear explosion or anything to do with it.

You know, frankly, I don't think you people know what you're doing. I have heard not one word from you people about -- or haven't seen any charts like I see over at the Cesar Chavez place when Kirtland gives a demonstration. You haven't given one iota of information of what you really want to do. You only give it in the papers and the journalists mess it up anyway. They don't know what they're saying. I'm sorry, but that is the truth. Sometimes I look at them and, you know, I really feel sorry for the mentality of the news reports on this. And you know, if we had some booklets or something -- but you brought nothing, and yet you expect us to welcome you with open arms, and I'm not sure I want

422-3

422-3 NNSA notes the comment about information on the *CMRR-NF SEIS.* In addition to the *Draft CMRR-NF SEIS*, NNSA distributed a Summary document that presents an overview of the alternatives and the impacts of each alternative. At the hearings, participants could review posters on the NEPA process and the alternatives and speak to NNSA staff and technical experts who were available to answer questions. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

that kind of bienvenidos aqui.

MR. MacALLISTER: Sir, you had your hand up. Is there somebody else who would like to -- you will be next, sir.

MR. CARRILLO RODRIGUEZ BEJERANO: One of the points of -- my name is Carrillo Rodriguez Bejerano, and I'm a 22-year resident of the state of New Mexico, if that helps you. One of the points that this particular society such as ours that we are told -- developed society -- is the fact that we think that we are rational in several of the things that we do. Just tonight, just a simple point, we were not even able to calculate how much time we actually had available for comments. This is just a very simple proof of -- how shall I put it -- how ignorant we are of everything that we are trying to do.

Now, to me, the question of this nuclear weapons is a total -- it just has no logic whatsoever. It has no logic for one particular point to begin with. If we were ever going to go into a war with another nation that also had nuclear weapons, we would all be in real serious trouble. It would be not a question of, "Oh, we're just going to wait another 50 years and all this Agent Orange will

Response side of this page intentionally left blank.

dissipate into the vegetation or whatever we bombed over there in Vietnam," or, "Well, you know, we didn't find weapons of mass destruction there in Iraq, but they were there indeed. That's why we thought they would be there," and so on and so forth.

But in the case of a nuclear war, we don't get it. We would all reap that particular good thing of having these devices that are capable of destroying humanity many times over. So to me, that is not logical.

Secondly, it is not logical either that we expect all this money, billions and billions, as the gentleman just said, counting on something that we could not possibly use, while at the same time we are arguing that senior citizens should give up some of their particular hard-earned rights to having Medicare and also Medicaid, although not necessarily for seniors, but the Medicare and the Social Security that was fought by those who came behind us, simply because we don't have enough money, but we do have enough money, we think we have enough money, to spend billions of dollars on that particular foolish enterprise in Los Alamos. Build more nuclear weapons. What for? Whom are we going to attack with these things? Are we going to be able to defend

424-1

424-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, medicare and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

68

ourselves if someone throws a nuclear weapon at us? Of course we will. And we will throw a nuclear weapon at them. To what effect? We would all perish. So we could then say, "Oh, well, that place was after all safe. That particular fault, well, what does it matter anymore?"

No, it's not just putting it in somewhere else. It's not just saying, "Oh, well, I don't want it here in the state of New Mexico." I don't want it anywhere in the world. The world is a beautiful place. There's not just our state. It's the entire planet, which is a beautiful place. We should simply not have it. Yes, there's no foundation for this thing. Structurally speaking, this is stupidity at the highest degree, and it's very costly. Thank you. (Applause.)

424-2

BOB: My name is Bob and I have been coming to these hearings for about 30 years. What's that definition of insanity? If you keep doing the same thing over and over again and you expect different results? It's not happening, you know? And I have been sitting back there listening to people talk and trying to figure out, what is it going to take to really stop these people? And the only thing that I can see that's going to stop them is the same thing

425-1

424-2 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

425-1 NNSA acknowledges that there is substantial opposition to the CMRR-NF project. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

that happened in Tunisia and the same thing that happened in Egypt. People are going to have to stand up to the powers that be in this country and say, "We're not going to take it anymore. We're not going to do it anymore. We're mad as hell, that you're spending the money that we give you to kill us. We're tired of it."

And I don't understand where all the young people are, you know. All the people -- I mean, I just don't understand. Do they not care? Is our educational system so screwed up that they can't even see what's in their own self's best interest? You know? I don't understand. Are we so propagandized by the TV and the media that people don't understand what's at stake? I guess people aren't going to be in the street until we can't drink the water anymore and we can't breathe the air, but it will be too late then, you know. It will be too late. (Applause.)

MR. MacALLISTER: Mr. Hancock, and is there somebody else who wants to speak after Mr. Hancock? Pam and Sarah.

MR. DON HANCOCK: So let's get some numbers out so that we, the guinea pigs in Albuquerque, can help John and Roger and the rest of the folks at the forthcoming hearings.

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

70

These hearings were noticed for public comment between 5:45 and 9:00. At five minutes apiece, that means 39 people can speak. Nobody needs to be cut off. So tonight, the first round, there were 23 people who spoke. So there was no reason at all to cut off the comments.

Those of us who have been at many hearings had said to Roger and other people in advance. "Give people five minutes. Some people will take them. A lot of people will not take all of the five minutes."

So the rule of thumb that I would argue you should use for the forthcoming hearings, unless you have 45 people or more signed up, give them five minutes. You'll still be through on time. So that's one number that you need to think about.

Another number that you need to think about are your own regulations. The Department of Energy's own regulations say that notice for any public hearing has to be provided 15 days in advance. Unfortunately, the Department of Energy can't count to 15 in this case, because this Albuquerque hearing was not noticed 15 days in advance. The card that I received in the mail from John arrived to me on May 19th. Four days. Not 15 days. Four days before the hearing. The legal Federal Register notice for this

404-2

404-2 The length of time given to commentors to speak at public hearings was estimated based on the anticipated number of commentors. At the Albuquerque meeting, in the end, less people spoke than were anticipated. Refer to Section 2.2, NEPA Process, of this CRD for more information.

DOE regulations state that "DOE shall hold at least one public hearing on DOE draft EISs. Such public hearings shall be announced at least 15 days in advance. The announcement shall identify the subject of the draft EIS and include the location, date, and time of the public hearings" (10 CFR 1021.313(b)). NNSA published a Notice of Availability for the *Draft CMRR-NF SEIS* in the *Federal Register* on April 29, 2011 (76 FR 24018). That notice stated that the public review and comment period would continue until June 13, 2011, and announced public hearings to be held in Los Alamos, Espanola, and Santa Fe on May 24, 25, and 26, respectively. On May 16, 2011, NNSA published a *Federal Register* notice (78 FR 28222) to extend the comment period 15 days and to add a hearing in Albuquerque. While the *Federal Register* notice appeared a week before the Albuquerque public hearing, a notice of the Albuquerque public hearing was published in the *Albuquerque Journal* on May 8 and 19, 2011, meeting the requirement for a 15-day advance notice.

All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

71

hearing was May 16th, last Monday. That's seven days, not 15 days before the event.

So once again, this is another example, and I'm going to go into a couple of more. I have already mentioned the fact of how illegal the document is. This particular hearing was not properly noticed. That's a big problem. The Department of Energy can't count, can't follow its own regulations in terms of the minimal things about the law.

Let me give another number from their own document. The document says that the preferred alternative building, the shiny new bomb plant at Los Alamos, that's the only alternative they're considering -- that plant is supposed to operate for 50 years. Five-zero. During that time, if it were to operate, every year it creates waste, nuclear waste. And so the alternative that has to be considered is where is the disposal site in conjunction with this facility for the low-level waste and the transuranic waste that this facility is going to create through the year 2070, using their numbers that it starts operating about 2020, 2022, and operates for 50 years? So where is the waste site?

404-2 cont'd

404-3

404-3 Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12, of the *CMRR-NF* SEIS describe waste management impacts of all of the alternatives. As addressed further in Section 2.5, Cleanup and Waste Management, of this CRD, it is expected that sufficient disposal capacity will exist for all radioactive waste projected from any of the alternatives addressed in the *CMRR-NF SEIS*. Low-level radioactive waste disposal capacity currently exists at LANL at Area G within TA-54. When the disposal units at the existing Area G location are closed, plans are to transfer low-level radioactive waste disposal operations to the adjacent Zone 4 within Area G. Offsite disposal capacity also exists at both commercial and DOE locations.

Transuranic waste disposal capacity currently exists at WIPP. If waste disposal capacity at WIPP is no longer available over the operating life of CMRR-NF, then any transuranic waste generated at CMRR-NF or elsewhere at LANL would be safely stored until additional disposal capacity becomes available. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

So the alternative -- this document also has to look at the alternative of a permanent waste site at Los Alamos for all the waste that this facility is going to create. In looking at that, it needs to consider a couple of things. It needs to consider the testimony you heard from Manny Pino, and that other Department of Energy people have heard over the years from folks at San Ildefonso and Santa Clara and other pueblos about how this would be degradation of their sacred sites.

That is not in this document. That's why you need to do a new document, start over, and get this kind of information in. And you need to understand that the Department of Energy has no disposal site that's even on its planning going out to 2070 for these kinds of wastes. So this document needs to discuss the alternatives to do that.

The other thing that needs to be said is that when you can't calculate numbers like 39 times five minutes is three hours and 15 minutes, you can't count to 15, in terms of adequate notice, you can't comply with your own regulations, that does not inspire public confidence that you can operate the existing facilities at Los Alamos or any new facility like you're talking about doing in this document.

404-3 cont'd

Response side of this page intentionally left blank.

You need to go back and start over and come back to us when you have real reasonable alternatives and real rigorous analysis that the law requires you to do. (Applause.)

MR. MacALLISTER: Ma'am.

NUMBER 16: I also want to make one more comment. People think that there's security in Los Alamos and that people are watching. A couple weekends ago, I was driving down from the Jemez and there were a couple of kids with paint ball things that had gotten under the fence into the lab proper. There was no security there.

The other thing that I'm thinking of is when the Cerro Grande fire happened, that was one match essentially lit on a windy day, and when you see the response in Los Alamos of what happened on that day, nobody knew what they were doing. I mean, Bandelier said that it was Santa Fe. Santa Fe said Los Alamos should come in. The labs waited a long time, you know, until it was right at the fence. So if you can't get the Cerro Grande fire right, how are they going to get something bigger correct? Right?

And so people have a very naive idea that there's security in Los Alamos. They're asleep at the wheel. If somebody wanted to go in and really

416-2

416-2 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Access to nuclear facilities at LANL is strictly limited. Access control stations (called vehicle access portals) on Pajarito Road restrict access to DOE badge holders only; at least one occupant of a motor vehicle must present a valid DOE badge. Bicyclists without a valid DOE security badge are not allowed to use Pajarito Road. Walkers, joggers, work crews, and others on foot on Pajarito Road must display a valid security badge. Buildings such as the TA-55 Plutonium Facility and the CMR Building have even stricter access restrictions. (Relocation of the CMR capabilities at TA-55 in the Pajarito Corridor would reduce security costs.)

Airspace over LANL is also restricted.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

74

hurt Los Alamos and the world, it would only take -- they're not paying attention in the air waves up there that, you know, there's a little small airport. I mean, a little Cessna coming through Los Alamos -- I mean, think on it. They haven't second-guessed what other people already know, that there's no security in Los Alamos. People aren't paying attention. It's a false sense of security up there. Again, why risk it? You know? (Applause.)

416-2 cont'd

MR. MacALLISTER: Ma'am, I believe you were next?

SPEAKER FROM THE FLOOR: Thank you. Whether we are employed with the federal government or not, we know that these public hearings are mere rituals and that what we say here has little significance in what will be done because we're on a coast-to-coast federal reservation, and if we studied the dynamics of control of the individual tribal reservations at the beginning of the 1800s, we will see the same dynamics being played out coast to coast. The solution and how it should be performed remains the question, and is to remove who's at the helm, because those people at the helm have nothing to do with the people, we the people. We need to quit talking about "we" when we describe what they

426-1

426-1 NNSA notes the commentor's concern regarding how seriously NNSA considers public comments. NNSA considers every comment received by U.S. mail, email, toll-free telephone or fax line, or at the public hearings. Refer to Section 2.2, NEPA Process, of this CRD for more information.

are doing. We need to make a distinction between the people's will and the will of the master, and unless we do that clearly and in public forums, we will not be able to gain the attention of those who are totally uninformed.

Such hearings as these, with all the electronic mediums we have, should be televised and broadcast in their entirety. Announcements should have been made about these meetings on the electronic waves, as well as in the newspapers. The fact remains that there are people in control who really do not want public comment. It's merely a ritual to be endured. I'm reminded of a saying of Patrick Henry, one of the early revolutionaries of this country, after the British Empire was dethroned here, and for a short time, Patrick Henry and his compatriots had an idea of self-government. Well, that got waylaid with the passage of the federal constitution, a mere 11 years after the conclusion of the Revolutionary War. This history is not really highlighted in the mainstream curricula of the public schools or the universities, so we don't know the history. But Patrick Henry understated the case when he stated, "To erect and concentrate and perpetuate a large money interest must, in the course of human

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

events, create one of two evils." We have both. "The prostration of agriculture at the feet of commerce and the change in the federal government fatal to American liberty."

Under this private commercial jurisdiction that we now live or reside under, owned by the owners of the World Bank, the IMF, and the Federal Reserve Bank, the cartel in this country, you know, everything is prostrated to the feet of commerce.

But there's also a larger plan of world domination. This nation is considered a potential threat to the new world order, because we have that history of the era of such people as Patrick Henry. If we can revive that history and remember what it was about and reinitiate the revival of the spirit of the American Revolution, the new world order's plans will be waylaid for another couple hundred years. So to subdue awareness, we are piddling around with the peripheral issues and not getting to the core issues: Who's in control of our lives? It's not us. Does talking to these people and petitioning them change their course of action? I don't think so. In fact, if you read the Declaration of Independence, one very prominent phrase that sticks out in my mind is, "our repeated petitions have been answered only by

Response side of this page intentionally left blank.

repeated injury," and as Bob Hagee said when he was up there, we've been doing this for 30 years, and is repeating the same methods and expecting a different result insanity, or are we fooling ourselves?

There has to be a different course of action. Out here talking to each other, and mocking the establishment doesn't work. We need to consider how do we remove malevolent criminal syndicates from the control of this country? How are we going to do that? And if we don't ask ourselves that question, we'll never get on the road to usurp the authority of people who have no allegiance to this country. Their allegiance is to a new world order. They want to subdue this nation, and they're working on it with many different projects, and they're doing a bad job of it, and all of us will be victims of that if we let them continue and institute a tyrannical totalitarian regime.

MR. MacALLISTER: Who would like to speak next?

MS. SUSAN RODRIGUEZ: And as some speakers were talking about the danger of an accident up in Los Alamos, I'm sure those of us know about 2,500. Does that number ring a bell? Aren't there missiles down there at Kirtland -- and they don't say whether

418-5

418-5 Activities at Kirtland AFB are beyond the scope of the CMRR-NF SEIS. NNSA notes commentor's concerns regarding accidents. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

it's there or not, but there were missiles in that carved-out mountain, and they pulled it out and now it's down at Kirtland. And the question that we asked the city council is, "Well, you have these missiles. What is your plan for the City of Albuquerque, for us to get out of here or do something?" Like, "Oh, great, I-40."

I remember I had to go up to Santa Fe and the president came into town, and Paseo -- I live on that side -- I was stuck there in traffic for half an hour. I was late to that meeting, which turned out to be awful. Maybe Joni remembers that. It was a company that was going to say they didn't find anything in the Buckman well. They were so disrespectful. Here the company is getting money to look at a project and had the poster right up here and us sitting back there. It was the most disrespectful presentation I have ever seen. And it was infuriating. And when they would talk to you, they were using pieces of paper on a board and markers. It was really kindergarten stuff.

I'm not as well-educated in the sciences as my daughter and my husband, who has a Ph.D. from Michigan, but I do have an education, and I have some self-respect. These people didn't have any

Response side of this page intentionally left blank.

self-respect and didn't have any courtesy to us. And a lot are that way, but for us at least to remember that we still have to deal with those missiles right down there at Kirtland, and we have to get answers from our delegates, because I don't know what Mr. Fleck knows about it, but probably he knows something. I don't know whether he's gotten any answers, but if that's true, that's really scary. Okay, thank you.

MR. MacALLISTER: Joni, I believe you were next. Is there somebody who would like to speak after Joni?

MS. JONI ARENDS: My name is Joni Arends. I'm with Concerned Citizens for Nuclear Safety. So my comments are addressed to Steve Fong, to Roger Snyder, to John Tegtmeier, to Bruce MacAllister. How many groups got a little letter asking to make sure that these public hearings included provisions for people to be feeling comfortable? We asked that we be able to, I believe, speak from the podium. I guess we were supposed to speak there. That's not going to work for the three other hearings.

I kind of feel like we're playing the same game that we played with the White Rock scoping meetings, that it was necessary to go in the other

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

room in order to make public comments.

When we went down to Pojoaque, there was some accommodation made. I want to contrast again the difference between when DOE headquarters does a public meeting, like the recent Greater than Class C Draft Environmental Impact Statement where we were able to hear one another. There was a facilitator, there was a court reporter. It's a very different situation when either the Albuquerque Site Office or Los Alamos National Laboratories is in charge of holding these meetings.

Now, we spent time putting together an e-mail to you all about what we needed for these meetings, and what we found tonight is, we found the facilitator standing behind the speakers in a very intimidating way. That's not going to work in the other three meetings, hopefully four. Hopefully Roger is going to consent to a hearing in Taos tonight.

I don't know why I need to spend my time reprimanding the Department of Energy when we thought that we had an agreement about the structure of these hearings. I'm also very concerned about how we were told originally that we would have five minutes each. I felt a sigh of relief through the room, where

421-2

421-2 NNSA notes comments on the structure of the public hearings. The length of time given to commentors to speak at public hearings was predicated on the number of commentors that were anticipated to request to speak, given the total amount of time available for all speakers. Time was available after all requested commentors spoke to open the floor. In addition to other methods offered at each public hearing to comment, the floor was open to the public until the allotted time. Please refer to Section 2.2, NEPA Process, of this CRD for more information.

people thought, oh, I'm going to be able to say everything that I wanted to say. And then we're cut down to three minutes.

So either you have to decide that we're having three minutes, or we're having five minutes. I mean, Don already eloquently described all of this. I didn't bring the memo with me or the request, because I thought that this was all resolved. After 30 years, like Bob has said, there comes a point where there's a level of respect, and I don't feel that tonight. I don't feel it in this process where, number one, our comments are being heard. We wrote the e-mail in good faith in order to facilitate public comment on this very serious matter. So we can try it again tomorrow night. We'd like a podium, we'd like the opportunity for everybody to hear one another speak. We'd like a presentation by the Department of Energy to explain this very complicated material. Any other suggestions, Scott, Janet? Don?

421-2 cont'd

You know, I don't want to get emotional, but it makes me really, really sad, because I don't understand if we have an agreement with John, who's the document manager, or we have an agreement with Elizabeth, or with Steve or with Roger, why, when we travel 60 miles to be at this meeting, there isn't

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

that understanding that we're going to get what we asked for when it was agreed upon.

So I probably said too much, but Mr. MacAllister, it's really important that tomorrow night you don't stand behind speakers. It's very important that you calculate the amount of time. As Don said, 39 speakers. You know, it's the same kind of disrespect as was shown in the White Rock hearing, or scoping meeting. And then the adjustments that were made at the Pojoaque scoping meeting, and I hope we don't have to fight about it tomorrow night. Thank you. (Applause.)

MR. MacALLISTER: Ma'am, you were next, and there is there somebody else who would like to speak? Sir? You'll be next.

SPEAKER FROM THE FLOOR: I have a question to ask. I really support what Joni's been saying. I have been part of these agreements, broken agreements, I guess we could call them, and I'm wondering, are you planning to stay until 9:00, since it was announced that these hearings would go until 9:00? I mean, you know, because the people that are here are done speaking does not necessarily mean that someone might not come in later. So you'll be here until 9:00? Okay.

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

And I want to reiterate what Bob has said about the 30 years of hearings, and to say that, you know, one more nuclear project for New Mexico. One more. And then one more. And then one more. And then uranium mining. Does that have to do with the fact that we're one of the poorest states? Does it have to do with the fact that we are a minority majority state? Does it have to do with the fact that we've had corrupt leaders that don't represent us? Does it have to do with the passing of money and making deals in back rooms? Why are all these nuclear projects coming here? Most of the people in New Mexico don't want them. Money and jobs. Money and jobs. We're poor. We're up against the wall. We have to have the money and jobs. You know? The Department of Energy, Department of Energy, dear Department of Energy, we need new ideas. We need the rivers taken care of. We need alternative energy. We don't need more nuclear projects. For us, you know, it's a matter of environmental racism, among other things, that these projects keep coming here. That's all.

427-1

ERIC: Hi. My name is Eric. In defense of Bruce getting behind people, I'm a master's in geology, and I've been to many conferences, and it's

427-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, alternative energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the construction and operation of the CMRR-NF.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

common for a moderator to get up when someone's time is getting close. You shouldn't feel threatened by it. It's happened to my advisors. Also my friends have given talks. The person stands up to let them know their time is up, and this happens at scientific conferences. This is not the man trying to threaten you. Even though you may feel that, I mean, in his defense, it does happen and it's not personal.

SPEAKER FROM THE FLOOR: Says you.

ERIC: Yeah, says me, right. I have a right to say it. Sorry. I'm probably the only one that -- I agree with many of your --

SPEAKER FROM THE FLOOR: This is not a geological conference we're talking about.

ERIC: It's a common moderation technique to let someone --

MR. MacALLISTER: The ground rules state that the speaker has the floor and there's not argument from the --

ERIC: I'm sorry, but it even happens in calm, fun environments.

MS. SUSAN RODRIGUEZ: We're saying we don't like it.

ERIC: Well, that's just the way moderation is done.

428-1

428-1 NNSA notes the commentor's support for how the public hearing was conducted.

MS. SUSAN RODRIGUEZ: We don't like it.

MR. MacALLISTER: Excuse me, ma'am. Again I'm going by the ground rules. Let the speaker speak. You'll have a chance to speak if you need.

ERIC: In terms of the timing, it's probably pretty easy to gauge how much time someone should have, but I think it's important, sir, you brought this issue up, and everyone understands that after everyone's done talking, people that might not have had something to say might be encouraged to say something based on what they have heard. So I think it is important to have some time after the allotted time has been taken for people to come up and perhaps say something that they were inspired to say while hearing others. And so I think there should be some time afterwards. Maybe, you know, they left too much time tonight, but I do think there should be some time for people that are inspired to say something. (Applause.)

MR. MacALLISTER: Is there another person who would like to speak?

SPEAKER FROM THE FLOOR: I just had this piece that I was interested in saying before, and when we were instructed about making our comments at the beginning of the evening, we were told we were

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

86

supposed to engage in civil comments and behaviors, civil manner, and represent high level of discourse. Even that kind of -- that's a reprimand, as if we didn't know how to speak our sentences and abide by the general social rules. It sounds as if we were some kind of rabble, "You just never know what they're going to do."

Further, the moderator was not simply signaling times up. He was standing behind you and hovering in a way that, for people like me who don't do much public speaking, is nerve-racking. I think there are many ways to do moderation that are congenial. I have spoken before, I have not fallen apart. I find this setting, just my own personal self, I find it -- not right now, but before -- very difficult.

429-1

Anyway, this was the thing that I wanted to add to the conversation, and that is sometimes we're misled by phrases. There was an article on the nuclear industry in The Reporter this last week, nuclear industry in New Mexico, and a technician was quoted as saying, quote, "The state's nuclear future is bright."

I think the language is very misleading, because we have not seen much benefit to the

429-1 NNSA notes the comment on the conduct of the public hearing. The format of the public hearings was based on previous NNSA NEPA document hearings. Please refer to Section 2.2, NEPA Process, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

communities of New Mexico from the federal funds that have poured into the laboratory. It's not the state's future that's bright. It's the nuclear industry's future that is bright, and it's simply a different kettle of fish from the state. The state ought to be here for the benefit of the population, and still we are suffering in our schools and our social systems. I won't go into the list; everybody else has done it. But I'm sure the man who was quoted in this article saying the state's nuclear future is bright -- I'm sure he was thinking that it goes to everyone. But, in fact, it's a very, very restricted benefit. That's all I have to say. Thank you.

MR. MacALLISTER: Is there anybody else who would like to speak? Sir.

SPEAKER FROM THE FLOOR: In law, it's called violation of due process. That's what Don Hancock was talking about. It's also the arrogance of power. You know, I went to the court hearings on the lack of an environmental impact statement. The environmental impact statement from 2003 and the record of decision are dead and gone. That facility cannot be built because of the seismic problems. Okay? And you know, when it got right down to the

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

bottom line, Roger Snyder and his attorneys are crying national security.

Now, I actually read some of these documents that you people write and your justification for not considering alternatives, and when you dealt with the justification for not building this facility at all, the justification was, well, President Obama and Vice President Joe Biden have said we got to have this.

Now, it's one thing to say that, and I can see Roger smiling back there. But you know, it's another thing when you have got Mr. Don Stosfield (phonetic) pimping, pimping the federal government for funds. You know? He goes to these conferences and these budget hearings, and everything. He says, you know, jeez, you know -- he combines with the other lab directors, and they get together and they say, you know, we've got to have this stuff for national security to protect ourselves, you know.

It reminds me of a book I read years ago in anthropology, and I'm not sure who wrote it, you know, but it's about cannibals. And they would go and grab one guy and take him back and cook him and eat him, and then they'd get all paranoid, you know, they'd be on the defensive, because they knew that

Response side of this page intentionally left blank.

89

there was going to be some kind of revenge coming down the road.

And that's where this country is with national defense, you know. We're so paranoid about the rest of the world. But more than that, it's a monster money-maker for your people, isn't it? That's what it's about, is the money. You have got this project.

We've got -- this project's gone from $350 million and then when you discovered seismic problems, it went to $6 million. Now you're talking about 12 years out into the future, to even finish this thing assuming, assuming you can overcome the seismic problems, and the engineering and design problems that you are faced with, but that's another 12 years. So, let's figure, what was the percentage rate of cost escalation from 350 million to $6 billion over -- let's see, from the time period of 2003 to 2011, that's eight years. I don't know, I don't have a calculator in my head.

But if you are going to continue that kind of escalation of costs, what are we looking at, $20 billion, you know, and then you make these silly remarks in your Supplemental EIS about, well, gee, the old CMR, won't work, but we're going to hold it

430-1 Continued use of the CMR Building is one of the alternatives considered in the *CMRR-NF SEIS*; however, this alternative would not meet NNSA's purpose and need for action as stated in the SEIS. As described in Chapter 1, Section 1.3, the CMR Building's nuclear operations and capabilities are currently restricted to maintain compliance with safety requirements. Due to facility limitations, the CMR Building is not being operated to the full extent needed to meet DOE and NNSA operational requirements for the foreseeable future. These limitations do not currently support the missions that NNSA has assigned to LANL. See Section 2.11, Alternatives Considered, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

90

in reserve just in case that we run into financial problems,

Well, which is it? You going to shut down the CMR or not, you know.

430-1 cont'd

Now, let's talk a little about the arrogance of power, again, when it comes to scientific investigation. You were supposed to discover what the deep seismic status beneath TA55 was. You were supposed to build at least three deep boreholes. You built one to 741 feet. I read the Klinefelter (phonetics) report, and I read another report that that was based on. And, frankly, your supplemental EIS is an advertisement for such gross deficiencies in your understanding of the seismic situation up there, that this EIS ought to be a red light to you, that we can't build this. This isn't even worth considering this site as a location for storing 13,200 pounds of plutonium, which is one of the most explosive and dangerous substances on the face of the planet.

430-2

You know, what are you thinking? You know, is your mortgage so important to you that you are willing to risk everything in the state on your ignorance, your arrogance, your obstinacy?

You know, there were people in Fukushima,

e-mail: info@litsupport.com

430-2 There has been extensive seismic characterization of TA-55 and the CMRR Project site. Chapter 3, Section 3.5.2.4 of the *Final CMRR-NF SEIS* has been revised to address the deep seismic characteristic borings referred to by the commentor. Deep geotechnical borings were drilled at TA-55 to characterize the complete geologic column down to the basement bedrock level. These borings were completed for geotechnical characterization of the subsurface and not for the purpose of identifying the presence or absence of deep faults. Three boring locations were initially identified; however, only two borings were deemed necessary to provide corroborative characterization of the deeper portions of the geologic column. The third boring was identified as an alternative and would have been drilled only if the currently planned site at TA-55 were deemed not viable. Borehole DSC-1B was drilled to a depth of 741 feet (226 meters) below ground surface, while borehole DSC-2A reached a total depth of 550 feet (168 meters) below ground surface. The geologic formations that are most relevant to TA-55 are those that would influence seismic ground response and foundation performance. Seismic ground response, as determined by these two deep seismic characterization borings, is affected by the relatively high seismic wave velocity of the basement rocks, consisting of the Cerros del Rio basalt and Tschicoma Formation dacite (both of which are relatively hard volcanic rocks), and the much lower seismic wave velocities of the overlying, softer Bandelier Tuff. From data provided by Kleinfelder (2007a), DSC-1B was the only deep borehole to penetrate into the Tschicoma Formation dacite.

they're elderly now. They're in their 80s, and they said don't build, don't build this nuclear reactor here. This is a dangerous site. We can have tsunamis here, you know.

Now, you've got the public here, and they're saying, don't build this thing here. This is a dangerous site, you know. But you're not going to listen to them. It's because of the arrogance of power. Once you start making that kind of money you feel like you can do anything. And you've got your Joe Biden and the president on your side. So you've got unlimited resources.

You know, that courtroom hearing that you were out there, Roger, doesn't it -- there's a big seal behind the judge, and it says, United States District Court. It doesn't say, people's court of the United States. And that's what the public is up against. You know, the courts assume and give great deference to the so-called experts of the government. They're supposed to know.

So if the public walks in with an expert and says, you know, that's wrong, the judge just waves them aside.

Now you guys know in the federal government that you've got that going for you. You know, you've

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

92

got money, you've got power, you've got the court system on your side. So you can go ahead with the most insane, stupid, idiotic location for building a factory. You ought to be ashamed of yourselves, you ought to be ashamed of yourselves. (Applause.)

But more than that, you ought to reconsider, you should just reconsider.

What Anastasio needs to do, and Mr. Snyder, and the rest of you guys, that have all the power, is you need to go back and tell the president, Mr. President, you know what? It's too dangerous to build this stuff here. You need to have a moment of honesty. When you really state the truth, and you start thinking about something, other than your mortgage, you start thinking about the safety of the public, the safety of the American public, and you start giving the President and Mr. Biden some real information, this site is too dangerous, folks, you know. Stop pimping the President, stop pimping the vice president for funds. (Applause.)

SPEAKER FROM THE FLOOR: I just have something very brief to say.

MR. MacALLISTER: Ma'am, in the blue, come forward.

UNIDENTIFIED SPEAKER: And that is at the

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

93

last hearing that we had, we had -- there was a professional facilitator, and he had a podium about right there. And so the speaker -- though he was far away from the speaker, the speaker could see him, and he could say, well, you know, two minutes, three minutes, one minute, and, you know, and the speaker and the facilitator could speak to each other at distance so that the speaker wasn't intimidated. I just wanted to suggest that.

MR. MacALLISTER: Ma'am?

UNIDENTIFIED SPEAKER: I just have a question to ask. I understood Don Hancock to say that because the agreement, according to the rules for holding this meeting, had not been met properly, that 15 days has to be -- it has to be announced 15 days ahead of the meeting. And he said, if I'm remembering correctly, that because of this, that you need to go back and start from scratch, on this whole issue, and go back to the regulations, follow the regulations, and erase everything that went on that was not according to those regulations, and start from scratch with a whole new EIS, that you can't start with what -- you can't carry on this continuing process when what you have to do is start from scratch.

431-1

431-1 DOE regulations state that "DOE shall hold at least one public hearing on DOE draft EISs. Such public hearings shall be announced at least 15 days in advance. The announcement shall identify the subject of the draft EIS and include the location, date, and time of the public hearings" (10 CFR 1021.313(b)). NNSA published a Notice of Availability for the *Draft CMRR-NF SEIS* in the *Federal Register* on April 29, 2011 (76 FR 24018). That notice stated that the public review and comment period would continue until June 13, 2011, and announced public hearings to be held in Los Alamos, Espanola, and Santa Fe on May 24, 25, and 26, respectively. On May 16, 2011, NNSA published a *Federal Register* notice (78 FR 28222) to extend the comment period 15 days and to add a hearing in Albuquerque. While the *Federal Register* notice appeared a week before the Albuquerque public hearing, a notice of the Albuquerque public hearing was published in the *Albuquerque Journal* on May 8 and 19, 2011, meeting the requirement for a 15-day advance notice.

All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

94

So, are you going to go back and do a different -- start with a new EIS and look at the rules and abide by them, give 15 days' announcement for the meeting, that's a public meeting, that will be held, and start again with the beginning with the EIS?

If Don is still around, if I left something out or if I misunderstood what he said, I would like to have that corrected, and get an answer from you.

MR. MacALLISTER: From me?

UNIDENTIFIED SPEAKER: Yeah, yeah.

MR. MacALLISTER: I'm sorry, ma'am, but my role is simply as a facilitator to see that everybody makes -- has a chance to make comments.

UNIDENTIFIED SPEAKER: Oh, well, if you could --

MR. MacALLISTER: I can't speak on behalf of the Department, but...

UNIDENTIFIED SPEAKER: Okay. Well, who here can speak on behalf of the department?

MR. MacALLISTER: I'm not sure that this is going to be the venue where that can happen. (Laughter from audience.) This is comments -- this is designed to receive comments, not to discuss the procedures.

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

UNIDENTIFIED SPEAKER: So you can't discuss the procedures. (Laughing.) Well, I still want to know what we have to do here, if we have to start all over because you didn't give 15 days' notice, and because the rest of the regulations were not carried out that were part of the original agreement.

MR. JOHN TEGTMEIER: I can answer the question for you to some extent.

UNIDENTIFIED SPEAKER: Okay.

MR. JOHN TEGTMEIER: We did publish in the Albuquerque Journal in advance of 15 days notice.

SPEAKER FROM THE FLOOR: Can you speak up? We can't hear.

(Speakers from the floor were talking at the same time and could not be reported.)

SPEAKER FROM THE FLOOR: Keep in mind the transcript.

MR. JOHN TEGTMEIER: Number one, I will look at the notice and I did -- we did publish notice of this meeting in the Albuquerque Journal North on Sunday, more than 15 days in advance of this meeting. So that --

UNIDENTIFIED SPEAKER: It was Sunday?

MR. JOHN TEGTMEIER: It was Sunday.

SPEAKER FROM THE FLOOR: At Albuquerque

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

Journal North?

MR. JOHN TEGTMEIER: At North.

SPEAKER FROM THE FLOOR: North?

MR. JOHN TEGTMEIER: And also in other papers. So we issued the information -- we posted the information on our NNSA Website well in advance of 15 days, including the decision to add this meeting, but I will go back and assure that, and look up when that notice was made, and I do accept the comment, and I will follow up on that.

UNIDENTIFIED SPEAKER: I don't think we get the Albuquerque Journal North in Albuquerque, I think -- at least, I don't get it.

MR. JOHN TEGTMEIER: I will look into it, yeah, but that's my recollection.

SPEAKER FROM THE FLOOR: I don't think that was the --

MR. JOHN TEGTMEIER: Comments, so --

UNIDENTIFIED SPEAKER: But that's not adequate anyway, the Albuquerque Journal is not an adequate notice.

MR. JOHN TEGTMEIER: I will look into it.

MR. MacALLISTER: Comment's noted on the record, so...

Are there other folks that would like to

Response side of this page intentionally left blank.

make -- yes, sir, would you like to make a comment?

THE REPORTER: Could you get names? You're not getting names.

MR. MacALLISTER: I'm sorry?

THE REPORTER: You're not getting the names.

MR. MacALLISTER: And I'm being asked if people are willing, to please provide their name again for each comment so that our court reporter can get that down for the record. But if you are --

UNIDENTIFIED SPEAKER: You want my name? My name is (inaudible).

MR. MacALLISTER: And that was Floy Barrett speaking.

MS. GREENWALD: And I'm Janet Greenwald. I did say my name.

MR. MacALLISTER: I'm sorry.

UNIDENTIFIED SPEAKER: Okay. I just have a few additional comments to make, because there were a lot of them, second-round comments that were very good, I thought.

432-1 To me, this project looks like it's a make work project for the nuclear industry. It's something that if we're really going to be working for peace, why are we working for war? You know, it

432-1 NNSA notes the commentor's opposition to the nuclear industry. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

just seems incongruous to me. And I think some of the -- I'm guessing at this, so it may not be totally valid. But my assumption is that some of the higher priced people that will be working on this project, after the project is over with, will be able to run home and not worry about any pollution that might occur after the project ends, if any. Let's hope not, okay?

But the record of sites that have nuclear projects going on at them around this country has not in the past been very good. So I'm just -- you know, my lack of confidence, I guess, is showing here.

Another thing that was brought up, not in this particular terminology, was the idea of mutual assured destruction. It seems like maybe we're headed in that direction, if we continue with projects like this, where all we're doing, since we hope never to use the products that we are building, at this high price tag that we're going to be building them at, if it happens, and I hope it doesn't, but we are working toward war again. We talk about peace, but it seems like the whole idea of this project seems to be flying in the face of what we talk about on the surface, our President talks about peace -- or at least in other countries, maybe

Response side of this page intentionally left blank.

not here, I don't know.

But I know, mutual assured destruction has been normally referred to as mutual assured destruction about -- in the past cold war era of the Soviet Union had an old name, firing its missiles at us, and us firing our missiles at them, and essentially doing in the entire world.

Well, there's another way for mutual assured destruction to occur, and that is, by polluting the world. Fukushima served -- I forgot the entire full name. But the Fukushima problem in Japan that just occurred recently is a good example of there's releases going into the air. I don't know how well we are monitoring our conditions, the changes here in the U.S., and in other parts of the world, but I would imagine, readings have gone up since Fukushima's problem had occurred. Apparently, it's right now in meltdown, from what I understand. But, anyway, even if it isn't --

We've also had releases that have gone into the ocean. Who knows how long or how intense those affects might be in the future?

And we are at a state now with nuclear or nuclear industry, that any accident that happens, does not just affect the place where the accident

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

happens. It has the potential for affecting the entire planet. Forget about just the U.S., or wherever an accident might happen. The results of accidents by the nuclear industry can affect us all around the entire world. And I don't think we should accept it.

I'd love to see the nonnuclear nations get together and say, look, we object to you guys having these nuclear power plants, which is a peaceful use of nuclear energy, because if another Fukushima type accident happens, who knows as nuclear plants -- excuse me, as nuclear power plants continue to be developed and produced, they may get bigger, so that the potential is not only for Fukushima, but it could be, maybe ten, a hundred thousand times the Fukushima problem happening.

And, so I think we need to be real careful about how we allow our nuclear industry to operate, and I think that's part of the reason we're questioning the DOE and other groups involved with the nuclear industry. It's just essentially mutual assured destruction in another form, in my mind. I mean, missiles are a very bad thing, and I hope we never have mutual assured destruction, called MAD. It's a very good acronym to remember, it shows how

Response side of this page intentionally left blank.

mad some of the ideas we have in this world are.

We could be using this money for increasing alternative energy in this country, we could be using it for many, many other things; education, healthcare, lots of other things. These projects are really mad.

I just want to end with a paraphrase, since I don't remember the exact quote, but it was said by one person who I think I'm attributing it to -- I will attribute to them, but you can't work on peace and war at the same time. And it's an old quote -- well, an old paraphrase, since I don't think I have the words down here exactly. But you really can't work on war and peace at the same time. And that was a very wise -- well, I will say smart, maybe not wise. I think it was wise also, probably, but that was, I believe, attributed to Albert Einstein, who had thought a lot about things like this, and, you know, I think we need to end the madness.

(Applause.)

MR. MacALLISTER: Thank you, sir.

Is there anybody who hasn't made a second comment that would like to comment? Sir? Would you like to state your name?

MR. SCOTT WATSON: Yeah, my name is Scott

432-2

432-2 Funding decisions regarding major Federal programs (for example, alternative energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.2, NEPA Process, and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

Watson. I would like to thank John for taking his time to do this.

Wow, it's a very emotional issue, I think for a lot of people, and I'm always impressed by these public comments, sort of both sides of the issue.

I guess I will stand in support of the CMRR project. Having been a 45-year resident of Los Alamos, I'm well aware of potential for hazard to my house and my livelihood and my well-being, my family, my friends, my relatives, my children.

433-1

The issues are serious, obviously, in the sense that they take careful consideration, and differing views will be presented here today.

I want to emphasize that my position is based on the professionalism, the expertise, the care, general respect for professionals like John and others who deal with this work, who also have family, children, et cetera, in close proximity to these facilities.

I also lived near Rocky Flats. I spent two tours in Iraq. I was on the BP oil spill effort. I've seen what real disasters are, and I've seen what Los Alamos is. And it is not a disaster site. It is not an accident waiting to happen, or any of the

433-1 NNSA notes commentor's support for the construction of the CMRR-NF.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

things that's been characterized here.

So, I just want to leave those comments for those that are interested, perhaps a different perspective. Thank you. (Applause.)

My name is Scott Watson.

SPEAKER FROM THE FLOOR: Do you work at the Labs?

MR. SCOTT WATSON: Yes, sir.

MR. MacALLISTER: Is there anybody else who hasn't already spoken or already made a second comment, who would like to comment? If not, we have time for other comments, and I believe, Mr. Hancock, you had your hand up next.

MR. DON HANCOCK: Just an image that I would like to leave people to think about, and I'd like the Department of Energy to include it in its further discussions. We've talked about numbers. I would hope that most, if not everybody in this room has been at the state capitol building in Santa Fe. The size of the nuclear facility, as being proposed in this document, is 50 percent larger than the state capitol.

So, one can cause a lot of images in terms of the importance of a shiny new bomb plant versus the importance of the state government, and state

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

capitol. But think about whether -- and this is a new building. It doesn't talk about the size of the existing facilities of Los Alamos. This is just the new building. What kind of statement that makes in terms of what's important in the state of New Mexico in terms of size and functions of buildings, actual -- the state capitol and proposed nuclear facility.

MR. MacALLISTER: Thank you, sir. You are next. If there's nobody who plans to speak after our next speaker, so I can cue you up, sir. You are next. Ma'am, you're on cue now, and I'm just cuing up the next person.

UNIDENTIFIED SPEAKER: Well, I was thinking as I heard this talk, and I was thinking about the magma. I don't think we've ever measured the exact temperature of the magma at its depth. In other words, we've never been to the center of the Earth. And who was it who wrote, Journey to the Center of the Earth? One of our authors. And, you know, maybe if we dig deep enough, we can measure it. And, you know, I look -- I look at everything in a positive way. I try to make jelly out of berries, you know what I mean, make it a good thing. And I just can't really find -- because everything about the WIPP site

Response side of this page intentionally left blank.

has been so negative.

When I started with Carlsbad, I tried to save the animals in Carlsbad. The bats -- Phil Ganyon (phonetics) has given up on the bats at Carlsbad Caverns because some of the streams that are supposed to be underneath the WIPP site have been contaminated.

I'm sorry, but there is proof that some of the nuclear energy from the WIPP site is going into Carlsbad Caverns. And I don't like to hear things like that. You know, what are we going to do? How are we going to make this positive? I can't see anything that can make this a positive thing. Why not just take -- dig a deeper hole than we ever had before, or is it to try to make the biggest bomb? What is the purpose of it? What exactly are we really trying to do? And, you know, Russia has a bomb, so we build a bomb. And the Germans had the first bombs, and, you know -- I mean, this goes on and on and on. Why are we competing with our fellow human beings to make the biggest bomb? That is what I can't see.

And, I'm sorry, but I'm tired of talking to the preacher. The preacher knows this. We all know this.

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

106

My point is, how do we spread that information? How do we make it into something that we can really prevent? Because, you know, we can go on in the meeting here, and talking about it, and I've been to these meetings before, and they've never done any good. So why do we have them? Why do we have a U.S. Senate? Why do we have a government? If we can't -- if people can't listen to our concerns and prevent certain things that should not happen in the first place? Why don't we talk about peace? Why don't we make the biggest peace movement in the country? Now that would be something. And then spread it to Mexico, and spread it up to the Norwegians. They are pretty good at peace. And make it grow. I mean, people tried that years ago, but it didn't work. But the bomb worked. And it's money, it's money, and how to get it, and how to keep it. And I'm so against that. I'm sorry, I sometimes get kind of emotional.

MR. MacALLISTER: Sir, you are the next one to speak.

SPEAKER FROM THE FLOOR: You have to give her your name.

Oh.

UNIDENTIFIED SPEAKER: I would just like,

Response side of this page intentionally left blank.

107

to --

MR. MacALLISTER: Mention your name if --

UNIDENTIFIED SPEAKER: I don't really want to.

MR. MacALLISTER: Okay.

UNIDENTIFIED SPEAKER: The gentleman back there that works at Los Alamos, Scott, I want to -- I think it's good that you got up here and spoke. I think it's -- it kind of -- it gives us an ability to speak to the people that work for the DOE. And I'm sure that you're a nice guy, you know, I'm sure that if I was driving around Los Alamos, you probably wouldn't cut me off in traffic, you know. But, I happen to know some of the engineers that do sampling in Cochiti Lake. And there is plutonium contamination in the sediments in Cochiti Lake. And I live down the stream from Cochiti. I live in the South Valley, and we irrigate our water. We have a well. And so that water comes from the Rio Grande.

So we're downstream from the pollution that the people that work at the Department of Energy create.

I mean, it's been shown that there are radioactive materials in the Rio Grande River.

So, I don't understand, you know, how, if

434-1

434-1 There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, including reports of contamination in Cochiti Lake and the Rio Grande, and Section 2.5, Cleanup and Waste Management, for more information on cleanup of past contamination.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

108

you won't cut me off in traffic, it's okay for you to make a living polluting our water and our air.

You know, we're real nice to each other on some surface level, but at -- and the bottom line is, we don't really give a (expletive deleted) about each other, you know, we're going to do whatever we can to make money, and buy nice cars, and have nice houses, and just live the life of luxury. You don't care who it hurts. What you do for a living hurts me. And I don't like that. (Applause.)

MR. SCOTT WATSON: If I may rebut the comments made about what I do for a living.

MR. MacALLISTER: Would you like to come to the --

SPEAKER FROM THE FLOOR: Isn't this a conflict of interest?

MR. SCOTT WATSON: I have heard a lot of discussion this evening about mutual respect or at least respect. With all due respect to you, sir, you have no idea what I do for a living. Okay? You have no idea what motivates me. You have no idea what motivates my neighbors. You have no idea what motivates my father. You have no idea. And for you to make such a comment is pretty far out there. That's really what I have to say about it.

Response side of this page intentionally left blank.

MR. MacALLISTER: Thank you, sir.

Are there any further comments relevant to the meeting topic on the environmental impact statement?

Okay. Thank you. Thank you very much for your participation. We will be available until 9:00 if there were other comments. I appreciate your courtesy and your civility. Thank you.

(There were no more speakers until close to 9:00.)

MR. MacALLISTER: May I have your attention, please? We have Leona Morgan, who would like to make a comment.

MS. LEONA MORGAN: Hi. Thank you for your time and for hearing me at the very last minute of the hearing tonight. My name is Leona Morgan. I'm Dineh, from the Navajo Nation, and the majority of my family are in the Crownpoint area.

Crownpoint, New Mexico, is one of the communities in eastern Navajo which has been plagued with a lot of contamination from the uranium mining that had gone on during the mid 20th century which contributed to the World War II manufacturing of all those weapons of mass instruction.

Right now one of the issues we're really

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

110

concerned about is not only the building of a new plutonium pit factory and using a lot of money from the United States Government to continue these acts of war. We're also worried about the push for nuclear power because that uranium that supplies the nuclear power plants comes from our area, and a lot of the Navajo communities who have been working against new uranium mining are also dealing with a lot of contamination from past mining. And there's one site in Church Rock which is a Superfund site, and as I understand, the estimated costs for cleaning up just one area goes into the hundreds -- you know, over $100 million for one little area. And that's not to count all of the abandoned uranium mines all over Navajo Nation in New Mexico and in Arizona. So the cost to clean up these contaminated areas is overwhelming.

So I have to just say that I as an individual am against this new LANL building which would also cause a lot more contamination. And if the United States is going to spend billions of dollars, why don't they look at spending it on something which would help out our communities by cleaning up the mess that was left from the last century, so our generation, myself and the people who

435-1

435-1 NNSA acknowledges that there is substantial opposition to the CMRR-NF project, concern regarding waste management, and concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, environmental restoration) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

have not even been born yet -- we're going to inherit this problem that was created by people we've never even met who will not be alive to deal with the radiation that we're going to have to live with. And we know that you can't clean up radiation, once the water is contaminated, once the earth is contaminated, the animals, our food sources, the plants, everything is going to cost not only the lives and the ecological systems, you know. It's going to cause them all to be affected, but it's also going to cost human life, a lot of human lives. And when we're talking about cost of a human life you can't really put a price on that.

435-1 cont'd

So being indigenous, like I said, I'm Navajo, I'm Dineh, and I'm sorry, I should have introduced myself. (In Navajo.) And so speaking from the indigenous perspective, when we lose human life, we also lose our cultural ways, and so whenever we talk about contaminating the earth more, I'm from Navajo and I'm dealing, you know, with the uranium mining. But I know tomorrow night you guys will be in Los Alamos and you'll probably hear from several of the pueblos and those constituents.

So I just want to leave you with a story that I heard last summer from some of the native

Response side of this page intentionally left blank.

Comments from the Albuquerque, New Mexico Public Hearing (May 23, 2011)

112

people that live around the Los Alamos National Labs. They, as a sovereign nation, have gone into an agreement with the United States back when this area was first being constructed that is it their patriotic duty to allow the U.S. Government to come in and use their land and their resources to build this plant to "win the war."

So I understand the agreement was that after the war was won, that the U.S. Government would then leave. And so there are plenty of people out there who are waiting for this to happen, and so this agreement has not been forgotten. And so I know a lot of the people who you will speak with tomorrow are going to speak to this. And that is, like the uranium mining, an example of environmental racism. So I would just like you all to know that these issues need to be consulted with on a government-to-government basis and so I think that's one thing that needs to be done. It's not only to have public hearings in Albuquerque like this, but I think you also need to have public hearings in each of the pueblos and all of the native communities downwind from this project.

435-2

And that's all I would like to say, so thank you. Thank you for your time.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

MR. MacALLISTER: Good evening, folks. If you can take your seats. We will start the meeting.

Good evening and welcome to the second of four LANL CMRR Nuclear Facility Draft Supplemental Environmental Impact Statement public hearings.

My name is Bruce MacAllister. I am the senior principal in a company called Business Excellence Solutions. I am an organizational consultant, community meeting facilitator, and a conflict resolution specialist doing mediation work for the courts and facilitation work around the community.

Let me give you kind of the layout for tonight's meeting. There will be a short presentation of about ten minutes, followed by some introductory ground rules, followed by a period for speakers to come to the podium. We have hand-held mikes tonight. You are not constricted to the podium. If you have notes and want to work from the podium, you are more than welcome to use the podium. On the other hand, if you are not comfortable with the podium, that's fine as well.

Because we have a relatively small number of people signed up to make comments tonight, as soon as we get a final number at the ground rules,

Response side of this page intentionally left blank.

3

before I start that comment section, we will give you the exact timeframe on that.

Let me go through a couple of ground rules before we get started and a few reminders. Let me start with emergency exits. There is an emergency exit behind those curtains. That's the quickest way out of the room. As you know, the entrance coming in here also serves as an exit, exit out the hallway and to those front doors. This doorway up here is also an exit. You would exit out this hallway to the front doors. The restroom facilities, if you need them, are out that door to the left and your immediate left. That should take care of the emergency questions.

As you know, we have the poster session going on back here with subject matter experts, who will be available through the course of the meeting to answer questions about the materials there. And I want to outline for you the various ways that are available to you, in addition to this public meeting format, for making comments. There is a big poster back by the table in the back in the rear corner there that has this same information on it.

There are multiple ways that you can make comments between now and June 28th, of this year.

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

There is a court reporter available to take your comment directly. We have recording equipment that you can record a statement directly there. Those statements are not limited in time. Of course, they have to be submitted between now and June 28th, but you don't have to worry about a time limitation for the length of your comment. You can submit written comments. There are work stations back there for submitting comments that you can enter through a computer. Of course, you can use the United States mail, fill in a comment form, use e-mail, a toll free phone, fax. And so there are multiple ways that you can get your comments in.

If you do want to make a comment tonight, please be sure that you complete one of the sign-in forms. The way we will take comments tonight is directly off the form in the order in which you signed up to make your comment. I will be calling people to the mike and letting the next person know that they are next so that they can be prepared.

And again, the overall agenda, we will have a 15 minute presentation at the outset by the document manager for the program, John Tegtmeier, and the comment session runs until 9:00. So we will be available between now and 9:00 for anyone who

Response side of this page intentionally left blank.

5

chooses to come in, in that timeframe.

The comment period -- let me just double check. Are we still good to go? Okay. So because we have a relatively small number of comments tonight, we would like to give people seven minutes per comment. And we will have a person, a timekeeper sitting up front to keep the time for your comments equivalent. We won't cut you off at exactly seven minutes. You will see a yellow card that will give you a 60 second warning, a minute warning, so that at six minutes you know that it's time to start thinking about your most compelling closing statement, and at seven minutes, you will get a red card. Not like in hockey or soccer. We are not going to kick you out. You will see a red poster, and that's your signal to quickly wrap it up to enable the next person to speak.

After the first round of comments, I will take a show of hands. We will see how many people have additional comments that they would like to make, and based on the show of hands, we will make a determination about timeframes for that, if any. Last night we were able to let people just speak for an unlimited amount of time within reason, and so we anticipate that that will likely be the case

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

tonight. We will just see how that goes. Don't hold me to that, pending seeing how many hands might pop up or how many late arrivals may come in.

Other basic ground rules before I turn it over to Mr. Tegtmeier, the meeting is designed principally to focus on the Environmental Impact Statement for the Chemical and Metallurgy Research Replacement Building located at TA-55 here in Los Alamos. The comments are intended to be applied to an assessment of the environmental impact of the construction of that facility.

The officials who are present tonight to answer your technical questions are not available or it's not within their role to answer questions about the larger policies of nuclear weapons, of scientific priorities, that sort of thing. So you are more than welcome to make comments in that regard. However, the officials here won't be in a position that they will be able to respond or answer those types of questions. This is a comment period, so the focus will be on listening to your comments. The role is not to have laboratory officials respond to comments at this point.

If we run out of time tonight, there are two other sessions, and again, the multiple avenues

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

for reporting.

So at this point, I will be back at the mike before we start our speaking to remind you of some ground rules for the speakers, but at this point I would like to turn it over to John Tegtmeier, who is the document manager for the project.

MR. TEGTMEIER: Good evening. I thank everyone for attending.

A little bit about my role in the process and a little background on the NEPA process, in particular to this project to date, and then what is going to happen between now roughly and the end of the comment period.

I will start off with just a little background. My role as document manager is to manage the development and preparation of the document. Also one of the big roles I have is to encourage and facilitate public involvement in the process, and I believe that's my most important role. Also one of my roles is to ensure the technical adequacy of the document and adherence to the NEPA regulations both from the Council of Environmental Quality and the Department of Energy.

For this project we prepared an

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

Environmental Impact Statement back in 2003, and that was followed by a record of decision in February 2004. And the record of decision, based on the previous Environmental Impact Statement, approved a two building concept to be located at Technical Area 55 at Los Alamos National Laboratory.

The first building is complete at this time, and it's the Radiological Laboratory/Utility/Office Building, or RLUOB, at Technical Area 55. That's largely finished construction, and they are outfitting the space within the facility, and we anticipate people will be moving into offices and other facilities probably within the next six months or so, then sometime next year into the laboratory space in that facility.

The second building is currently in design, and that's the CMRR nuclear facility, and that's the main focus but not the entire focus of this Environmental Impact Statement Supplement, and I will get into that a little more in a second.

Since the 2003 EIS and the 2004 Record of Decision, some new information has come to light about the project and the location where it's proposed to be sited at this time. Some additional geological mapping was done in 2006 timeframe, and a

Response side of this page intentionally left blank.

lot of that is depicted on the posters, and you are free to ask questions about that process. They did borehole drilling, they did fracture mapping, and they were looking in large part for the presence of faults in the vicinity. That was one aspect of the geologic mapping.

In addition, a new seismic study was done for the Los Alamos area, primarily focused on the area between Technical Area 55 and Technical Area 3, and that is a required ten year update of the probabilistic seismic hazard analysis. Each DOE site has the requirement to do that. So that document was completed in 2007, and it identified an increase in the horizontal and vertical ground motions associated with proposed earthquakes with different return periods here at the site. So as that new design information became available, that was some of the information that was briefed at the semi-annual project meetings that many of you have attended.

Based on that new information, last year the laboratory prepared a supplement analysis which is part of the NEPA process when you have an existing Environmental Impact Statement. So the supplement analysis is a further look at new

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

10

information to determine whether any additional NEPA documentation is required, and that was submitted to the Los Alamos site office last summer.

In between that period of time, a decision was made to actually go ahead and prepare the Supplemental Environmental Impact Statement for the project. So we issued a Notice of Intent in the Federal Register on October 1st last year, and we had a 30 day period for scoping which was extended. We had two public scoping meetings in White Rock and Pojoaque.

So having that information from scoping, looking at new information, and also looking at new requirements for the NEPA process, some of those in the Department of Energy realm, we looked at some new analyses. So one of those areas of new analysis that is described and analyzed in the Environmental Impact Statement is greenhouse gas emissions.

We also looked at intentional destructive acts, you know, terrorist acts, things that might create scenarios that would have environmental impacts, impacts to workers, the public, or the environment. We also did a new analysis of the transportation of demolition waste. One of the Record of Decisions also was to completely demolish

Response side of this page intentionally left blank.

the CMR Building when operations were suspended, so we did a transportation analysis for that demolition waste.

The analyses we updated, including the construction impacts. In order to meet the new seismic requirements, the building would need to be built stronger. There is more concrete, more reinforcing steel, more structural steel, more excavation, more disturbed areas to support the activities, like lay-down areas, et cetera. Here again, that information is available in any questions from the subject matter experts.

We also looked at operations impacts, not only for the new proposed facility, but also, since it's fairly complete and we understand RLUOB, operational impacts associated with RLUOB and the existing Chemical and Metallurgy Research Building at Technical Area 3. We also updated the accident analysis for the CMR Building. We have a documented safety analysis that the department approved last summer, and we also have the latest preliminary documented safety analysis for the proposed new facility. So that's also reflected in the document and a specific appendix.

We also updated some human health impacts

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

12

from radiological emissions due to operations. Part of that was due to some new changes in the modeling technique, and additionally we focused on some of the information available to date from the latest census.

The alternatives that we currently have in the Draft Supplemental EIS, we have a No Action Alternative, which is to construct and operate the nuclear facility as it was described in the Record of Decision in analyzing the 2003 EIS. In that sense, a No Action Alternative is not to change the action or change the decision that was made at the time. So that's kind of maintaining the status quo in NEPA space. That's a common way to look at no action.

We also have the modified CMRR Nuclear Facility Alternative, which is to construct and operate the new nuclear facility at Technical Area 55, certain design and construction modifications that address the changes to the seismic safety and geological conditions of the site.

We currently have two options, a deep and shallow excavation option. The shallow excavation option is new, since the time of the Notice of Intent back in October, based on information that

Response side of this page intentionally left blank.

the continuing design efforts have shed light on, so that is still under work. Here again, that's described back in the posters. We also have a continued use of the CMR Building alternative, which is also described in the document, and that's the no construction alternative, and that's not to construct a replacement and maintain the limited set of operations in the CMR Building as long as feasible and still meet the safety requirements.

As far as this document process, since the scoping, we posted the Draft Supplemental EIS for the project on our NEPA web page, the NNSA NEPA web page on April 22nd, and the Notice of Availability was published by the Environmental Protection Agency the following Friday on April 29th, which technically started the 45 day comment period.

The NNSA, based on requests from the general public, extended the comment period by 15 days, and that decision was made on May 6th of this year, and now the public comment period extends to June 28th, as Bruce mentioned.

Bruce also mentioned the public hearings. I just wanted to reiterate those. In addition to this evening, we have a meeting tomorrow evening at the Santa Claran Hotel in Española. That same

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

14

timeframe, same format, same procedures we will go through, so that will happen tomorrow evening. And also in Santa Fe on Thursday evening, same time, same format, at the Santa Fe Community College south of town.

Just a little bit more on the comments that Bruce mentioned. There are a number of ways to provide comments on the draft document. I encourage everyone to participate in that. You are not limited to just one set of comments. You can make multiple comments over time, many mechanisms. As I said, one of my main roles is to encourage and facilitate that participation.

So we are really looking at comments on what's in the draft document -- alternatives, analyses, we may have done, impacts, et cetera. So that's what we are hoping to get. And I just want to remind you that anyone is welcome to provide comments as a private citizen, no matter who your employer, so we would encourage that, but as a private citizen. I know there may be some interest out there.

And with that, I would like to turn it back over to Bruce, and we will start with the rest of the meeting.

Response side of this page intentionally left blank.

MR. MacALLISTER: Thank you, John.

MR. TEGTMEIER: Thank you.

MR. MacALLISTER: Just a few more brief comments, and then we will tie into our comment session. There are a few ground rules that I want to lay out for you all just to make sure that we are reminded that this is an official public hearing. The comments are being recorded. They will be distributed to multiple sources for multiple reasons.

And accordingly, since this is a public hearing, we are required to expect appropriate decorum in the meeting. So I'm going to be asking you all to please wait until your scheduled time to comment. And because we are transcribing the comments, it's extremely important that people speak one at a time. Comments from the audience make it difficult for the transcribers to hear the transcription, and I will be asking people, if they are carrying on conversations or making comments from the audience, to kindly step outside to have those conversations and to please refrain from making comments to the commentator as they are making their comments so that we can keep the flow of the meeting moving and the comments clear and

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

16

concise in the record.

You are not absolutely required to do this if you feel like it's not something you are comfortable with. We do request that you identify yourself at the beginning of your statement. That allows the court reporter to know where the first person started, the next person started, that sort of thing. If you are not comfortable with that, please talk to me and we will identify you by speaker number.

Again, please keep the process civil and keep your language civil and appropriate. Remember, again, this is an official public hearing, and we will have plenty of time for rounds of additional comments. So for the first round, to ensure that everybody has a chance to speak without having to wait too long to make their comments, please abide by the time limits that we have set, which will be a seven minute timeframe with a warning at six minutes. So please yield the mike to me if I request it at that seven minutes. All right.

And just as a matter of courtesy to others, please silence your cell phones and any other noise-making devices that you might have on your person. I hear some going off right now.

Response side of this page intentionally left blank.

And at this point, I would like to recognize two public officials in the house. We have Matthew Roybal, who is the constituent liaison and IT administrator for Mr. Ben Ray Lujan.

Mr. Roybal, thank you for coming.

We have representative Nick Salazar of the New Mexico legislature here with us. Thank you, Mr. Salazar, for attending. I appreciate your interest.

At this point, again, I will make the podium available and a mike available. You are not required to use the podium if you don't want to. You can speak wherever you are comfortable up here, so as long as the court reporter can see you and basically follow what you are saying. And I will be calling people by name, and I will be letting the next person in line know that they are on deck, so to speak, to be the next speaker.

So without further adieu, let me call Ray M. Baca, and he will be followed by Danny Beavers.

Thank you, Mr. Baca, and I think this mike actually works better. If it doesn't you can have this one.

MR. RAY M. BACA: Thank you very much.

Again, my name is Ray Baca. I am the

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

executive director for the New Mexico Building Trades Council. In that capacity, I represent all of the construction labor unions here in the state of New Mexico, including approximately 800 construction and maintenance workers who currently work at the laboratory. These are good-paying, family-sustaining jobs that unfortunately are otherwise not available in northern New Mexico and not for a long distance.

Let me remind everybody that the construction industry in New Mexico is in dire straits. It is in a depressed mode like it is in much of the country. The unemployment rates for construction workers in New Mexico is fully double if not triple the rates of the average unemployed New Mexican. It is not uncommon to see unemployment rates and under employment rates of 25 to 28 percent in many of the crafts that are represented.

The project, the CMR project, if it ever comes to be, would employ upwards of 1,000 construction workers off and on over the course of a 10 to 12 year period. Obviously this would be a huge boost to the construction industry in New Mexico, but much, much importantly, it would be a huge boost to the construction families in New

501-1

501-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

Mexico who are in dire need of these positions.

With all due respect to those people who are opposed to this project and other similar projects, we respectfully urge the laboratory and DOE and all the other powers that be to begin this project sooner than later. Thank you.

501-1 cont'd

MR. MacALLISTER: Thank you, sir.

Danny Beavers followed by Robert Carman.

MR. DANNY BEAVERS: My name is Danny Beavers. I am a business representative for Plumbers and Pipefitters, Local Union 412. We represent approximately 2,000 members across the state of New Mexico. And I am here to speak in favor of the project also, not only for the economic impact to the state of New Mexico, northern New Mexico, the construction industry itself, but my understanding, if I remember correctly, the facility that is scheduled to be replaced is probably 60 years old.

There is going to be nuclear weapons and there is going to be things of that nature as long as the country and the world is in the state that it's in. I would just as soon have them done in a brand new, state-of-the-art facility that's built to the codes and the specs that it needs to be built at

502-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Special designs, operations, and procedural measures to protect workers and the public would be incorporated into the design and operation of the CMRR-NF. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

than in the antiquated facility that I worked in when I worked up here 20 years ago and was built by my father who has been a member of this union for 55 years. So the building is antiquated. It needs to be replaced.

Not only will we have a safer facility. TA-55 itself I worked on 34 years ago when they were building it, so that shows the age of that facility. So they both need to be worked on, replaced, and kept up, and not to mention the thousand construction jobs, the money that that would create through the state, and the economic impact it would have throughout northern New Mexico, so I do support this project. Thank you.

502-1 cont'd

MR. MacALLISTER: Thank you, sir.

Robert Carman followed by Alfred Arias.

MR. ROBERT CARMAN: Good evening, everyone. My name is Robert Carman. I was born in Los Alamos about one year after the Soviet Union detonated their first atomic bomb. My father, who was drafted into the army, was sent to Los Alamos and helped design and build all the first atomic weapons. I guess, as such I could be considered an offspring of the atomic age.

I have an uncle who was blown to

Response side of this page intentionally left blank.

smithereens up here in the '50s when a chemistry experiment went terribly wrong. I have other relatives who have died slow and painful deaths working at the former DP plutonium sites. As a teenager during the '60s, I remember reading that the United States and the Soviet Union had enough nuclear weapons at that time between them to blow the earth up several hundred times.

Why stop there? Why not keep building these weapons of mass destruction until we can destroy the earth a million times? I only have three wishes for such an event. No. 1, that I be under the first one of these gadgets to be detonated in order that my atoms might be scattered throughout the universe in search of a sane place to rest.

No. 2, that all of you who design these things and your loved ones survive this event, temporarily safe in the underground bunkers which you have undoubtedly designed and created for just such an occasion.

No. 3, that you drive out of your bunkers in your armored humvees, and as you and your loved ones slowly begin to succumb to the inevitable horror of your act, you have plenty of time to contemplate what you have done to this earth and to

503-1

503-1 NNSA notes the commentor's opposition to nuclear weapons and nuclear facilities. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

22

the miracle we have come to refer to as life.

Genocide is too kind a word for what you are contemplating. Genocide implies the indiscriminate death of humans. Your endeavors will result in the death of the planet earth.

I do have one tidbit to offer, however, and that is that the Cold War is over. Why not do something nondestructive with all the resources at your disposal?

503-1 cont'd

Thank you very much. Have a nice day.

MR. MacALLISTER: Thank you, sir.

Alfred Arias followed by Michael Loya.

MR. ALFRED A. ARIAS: I am Alfred Arias. I am a representative of Local Union 412, Plumbers and Pipefitters Union.

We need work. We need this project to get off the ground. We need it. We don't need no more delays. We need it to get going.

504-1

The United States is a top dog of the world, and they need to stay on top of everything, including nuclear power. You know, as long as we are the top dog of the world, you know, there is people in the world that hate the United States, that hate United States citizens, and if the United States starts showing weaknesses and weaknesses and

504-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

starts showing that we are weak, you know, the Chinese, people are going to come in and take over.

And, you know, the reason why there has been no nuclear war in the last 60 years is because we have been the top dog in the world. And also, you know, what Danny Beavers said, there are a thousand jobs here on the line, and the construction industry is like 30, 40 percent unemployed right now. And there are families that need to get fed. There is little boys and girls that need to get fed. We just need to proceed with this project and get it going fast and get it done. Thank you.

504-1 cont'd

MR. MacALLISTER: Thank you, sir.

Michael Loya followed by Reverend Holly Beaumont.

MR. MICHAEL LOYA: My name is Michael Loya, and I am happy to be here to make my comments. I want to say first of all that I am a generational New Mexican, and I am a history buff, and it is very important that I state my comments today. I have had the fortune of analyzing a lot of data on the cleanup up here at Los Alamos, so this is also very important and another reason why I am here to speak about this.

What I think, too, is also that because of

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

24

this lab, it put an end, an early end to this war, to World War II, and I think that that was very important. That's a very important thing.

I have generational ties to New Mexico. My dad's first cousin, who my grandparents raised, flew with Billy Mitchell, and it was amazing that I lived in a house where my dad and mom lived World War II. My parents were farmers and ranchers down south, and they were downwinders when they detonated the first bomb there at Trinity site. I have talked about this story before, but it woke my dad up and he got mad and he stayed mad the rest of his life.

He almost lived until he was 90 years old. So he was a quite a fellow. He was also one of the first farmers and ranchers in New Mexico to have prisoners of war on the farm. That was just a wonderful thing. There is a lot of stories about that. We don't believe in war, but we believe that if you are going to get into the war, you need to have the biggest stick there, and this is very important that we have this facility here, not just on account of the jobs.

The jobs are very important, but technically this is very important. These gentlemen are working in facilities that are very, very old.

e-mail: info@litsupport.com

505-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Special designs, operations, and procedural measures to protect the workers and public would be incorporated into the design and operation of the CMRR-NF.

As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. See Section 2.7, Economic Impacts, of this CRD for more information.

I don't know. They are over 60 years old now, and I believe it's time that these facilities are upgraded, and they bring all these safety components to this new facility. I think that's very important.

505-1 cont'd

I know that back when I was younger, I had the opportunity of talking to a lot of New Mexico gentlemen that we used to rope with on the farm, and they used to talk about serving in the Pacific and how they were thankful that they did have these bombs to put a quick end to the war in Japan in the Pacific. It was very important, because we would have lost hundreds of thousands of boys out there if it hadn't been for Oppenheimer and his group. I think that's very important.

Another thing, too, is the financial implications here. These gentlemen from the trade unions and stuff brought up something that's very, very important and it's very critical, that it's time that we move forward with this project and we put people to work. People need to work. People want to work. And this is very important.

This lab has done a great service to New Mexico and, yes, there has been problems with health and whatever, but that's just the fallout, but they

505-1 cont'd

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

26

have done a lot of things now to upgrade the facilities and the working environment. That's been very crucial, and I find that very important. And I believe this facility is going to even make the working environment for the people that work in these departments even safer. And I thank them and I thank their bosses, and I thank the government moving forward with this.

505-1 cont'd

A lot of people have to understand about the geopolitical problems that are going on right now. We have some very serious things going on in the Middle East. Pakistan right now is in a big push. They built another facility, and they are in a big push to build more weapons. So we have to be ready. We have to make sure that we are armed, because -- I have said this before at the last comment period -- you can't take a knife to a gunfight. So we have to be ready for this.

I had the great honor here a while back. I was in west Texas, and this is when the fires were going on, and we were staying in a motel. There was this little gentleman, and I kept noticing him. He was just a wonderful guy. He had a smile, and we started talking. He was an old cowboy and he saw me there with my hat, so we were starting to talk. And

Response side of this page intentionally left blank.

this gentleman was one of the sailors on the Abbot Merrill. I believe that's the way you pronounce it, but that was a ship tender and it was a sea plane tender, and he was involved in Operation Crossroads.

I sat there for hours and I was listening to what this gentleman had to say. He said it was very important -- because he was there during World War II -- he said it was very important that we had these weapons to defend ourselves. Yes, there is a mountain of weapons and, yes, we can destroy the world multiple times, but we are going to have to be ready. There's very serious things going on. There's very serious implications if we are not prepared, and I believe it's very important that we move ahead as quickly as possible with this facility. Thank you. Am I cut off?

MR. MacALLISTER: No, you're good. You're fine.

MR. LOYA: Good.

MR. MacALLISTER: Reverend Holly Beaumont followed by Johnnie Martinez.

REVEREND HOLLY BEAUMONT: Thank you. I am the Reverend Holly Beaumont with Las Mujeres Hablan.

I want to begin by saying that I have deep regard and respect for people who devoted their

505-1 cont'd

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

lives to the Los Alamos National Laboratory, who are very proud that they helped to build it and sustain it by serving it. We don't always agree with the results in nuclear weapons, but that's really not what we want to talk about tonight.

What we want to talk about is that Los Alamos National Laboratory, I think in a real way, does not exist anymore, because as of 2006, the Bush administration turned the national laboratory over to Bechtel, and that's what we want to talk about in the next few minutes. One of the first things that Bechtel did was throw out a $500 million original plan and start over again. So already the cost is $500 million and proceeded from there to where we are today with costs continuing to escalate. So as I was doing some research, I realized that Bechtel has left quite a global footprint.

506-1

Which continent would you like to begin with? Let's begin with North America. In North America Bechtel is responsible for "The Big Dig." This is the design of the Boston Central Artery Tunnel project in which Interstate 95 passes under the city. The federally funded project is the most costly civil engineering undertaking in US history. It was estimated at $2.5 billion in 1985. Project

506-1 DOE and NNSA continue to provide oversight of LANL as in the past. The managing and operating contract for LANL was openly competed in 2005 for the first time in the 63-year history of the LANL site. Through 2005, the University of California had been the sole managing and operation contractor for the LANL site since its creation in 1943. The new managing and operating contractor, Los Alamos National Security, LLC, began managing LANL in June 2006. The selection of a new managing and operating contractor did not change the DOE and NNSA work performed at LANL.

expenses reached 14.6 billion in 2003. Watchdogs argued that it is extremely rare for a company to design, receive several construction contracts, and manage a project as huge as "The Big Deal."

Bechtel's gross errors included the complete absence of the planned Fleet Center -- they just overlooked the convention center in their plans -- and also an active nine foot wide pipe carrying sewage and storm runoff where planners had drawn a support wall and could not sustain the tunnel wall. So this is one of the examples of the work that Bechtel has taken on in North America.

We could go from there to the Bay Area Rapid Transit. I won't bore you with the details. This is all online. Suffice it to say that the project suffered numerous delays, massive cost overruns, as well as several accusations of fraud. In April 2000, two BART board members said they would block seismic retrofitting if Bechtel won the contract due to their poor record on human rights, minority contracting, cost overruns. There were 4 million in cost overruns and huge delays.

Then we can go on to the Alaska pipeline. The Alyeska Pipeline Service Company awarded Bechtel the role of prime management at $8 billion. Soon

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

afterward, Alyeska claimed that Bechtel over-staffed senior level executives to multiply the charges on the cost plus contract, over-filed for pipeline workers, and that the project was plagued with on-site thievery, feather-bedding, low productivity, and conspicuous supply problems. Furthermore, Bechtel stood accused of ordering the quality control staff to falsify thousands of x-rays and pipeline welds in order to accelerate construction.

In May 1975, Alyeska -- I don't know how to pronounce it -- fired Bechtel for overall mismanagement. That is North America.

We can go on to talk about what happened in South America with the Bolivian privatization of water that the indigenous people were dependent on. That resulted in Bechtel actually suing this impoverished nation for millions of dollars for not allowing them to complete the project.

We can move from South America to Asia and discuss the Basra Children's Hospital in Iraq. It's now actually listed as a completed project when, in fact, it was not completed. At the time that it was listed as completed, it was only 35 percent finished, and that's when they stopped. The original cost was estimated at 50 million, and by

Response side of this page intentionally left blank.

31

the next year, June 2006, the project was already 18 months behind timeline. And in 2007, it was awarded an additional $41.1 million. Maybe that was billion.

So I won't take up any more time except to say that this is my question, our question: How much profit does Bechtel have to make before it decides to abandon a project? I can't find a project anywhere, anywhere that Bechtel has actually completed. I wouldn't even judge it as successful or not, but I am not even finding projects that they have actually completed. So our question is: How much time is left for Bechtel on CMRR before you will be abandoning this project? How close are we to that timeline? And how much do you think it will ultimately cost us before you walk away from it?

Thank you.

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

32

MR. MacALLISTER: Johnnie Martinez.

MR. MARTINEZ: Good evening. My name is Johnny Martinez. I am a 61-year resident of Northern New Mexico and 36-year employee of the Los Alamos National Laboratories. I'm also a father and a grandfather who is concerned about the safety and security of his family.

507-1

I support the Chemistry and Metallurgy Research Replacement Project, and I have several reasons for doing so that I'd like to share with you. First regarding national security, I believe very strongly in the value of nuclear weapons as deterrence to all-out global warfare. I've had the fortune of working in the weapons program here in the laboratory, and that was a driving consideration in not only my doing so but I saw this evident in my colleagues as well.

As Dr. Norris Bradbury, a former director of the laboratory, so aptly stated -- and I know I'm paraphrasing -- the purpose of nuclear weapons is not to use them but to force people to find other means to solve their differences. I am proud to be part of an institution that's helped make these final words a reality.

I am also personally convinced that the science and technology underpinning this nation's

507-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF.

33

nuclear deterrence capabilities must be maintained and should, in fact, be strengthened to address new challenges posed by terrorism and proliferation of nuclear weapons and nuclear materials as well. The CMRR facility is designed to address these national security needs and, therefore, support construction and operation as a safe and effective resource for doing so.

Regarding the environment, as Danny mentioned earlier, the existing CMR Building is old. In fact, it's almost as old as I am, and I believe continued operation poses a much greater potential threat to the environment than does the proposed CMRR facility.

I've had the opportunity to attend briefings and tours of the CMRR system facility, the RLUOB, the Radiological Laboratory/Utility/Office Building, and I've gotten to the conviction that environmental safety is a key component in the plans for the CMRR's facilities construction and will be a fundamental element to its operation.

Regarding the economy -- and you've heard this from other people -- Northern New Mexico was selected in 1943 as the site of the Manhattan Project because of its isolation. Northern New Mexico is still relatively isolated, and many of us remain very

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

34

dependent on LANL as an economic resource. And that's a situation that I think has been -- if anything, strengthened as a result of the recent global economic condition.

The CMRR project will present employment and procurement opportunities in Northern New Mexico that would otherwise be difficult or nearly impossible to find in today's economic environment. *507-2*

So I thank you for the opportunity to share my thoughts this evening.

MR. MacALLISTER: Is there anybody else who completed a card that I did not call?

All right. We have plenty of time available for additional comments. How many people would like to make comments?

All right. What I'll do for this follow-up comment session is just call as people raise their hands, and I'll try to recognize people in order and try to keep to that order as best as my old mind will work. Okay?

So, sir, if you'd like to make a comment, you're welcome at this time.

MR. MANSFIELD: Thank you.

My name is Charles Mansfield. I'm a lab retiree, president of the Laboratory Retiree Group. And

507-2 The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

I actually operate three small businesses in the community, so many would say that I have flunked Retirement 101.

The thing that I would like to touch on is a story that I have learned over the years that some years -- probably 15, 20 years ago, a scientist in the laboratory was messing around with an ink jet printer and realized that if he put an electric charge on the -- across the stream of ink, he could deflect it from one side to another. It turns out that lasers were really getting going good at the time, and, you know, he was explaining this to another colleague.

The colleague said, Well, if he used a laser with the right wavelength and I have a droplet of material which has a very small amount of impurities in it and I need to get rid of the impurities, could you detect the impurity? Let's try it. Turns out that they could detect the impurity in a drop as small as an ink jet printer drop. There was an empirically picked reject bucket. If it was good stuff, you let it go into the main bucket.

Another colleague came in and said, Well, could you do this with organic molecules? The guy said, I suppose we could; let's try it. Where can I find organic molecules?

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

36

What they invented then was called the Coulter Counter. That became the Human Genome Project. For the first time, the laboratory began sequencing the human genome. Was it important to the Department of Energy? Yes. The Department of Energy was concerned about radioactive material -- of changes to the DNA. Eventually, the project grew so big and so fast that the DOE said, Let's turn this over to private industry, and now you have genetic analysis being done commercially in the country; all because people, in this case, who worked in the CMR Building had the freedom to ask questions and to develop new ideas. And this is probably the main reason for continuing with this type of research. It has very little to do with weapons and research itself, but it does advance the nation's capabilities and meets the needs that the nation has. *508-1*

Thank you.

MR. MacALLISTER: Thank you, sir.

Other folks who would like to comment? Anybody else?

Sir.

MR. KOVAC: Thank you.

My name is Scott Kovac with Nuclear Watch New Mexico.

First off, I would like to re-state my *509-1*

508-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

509-1 Comment noted.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

37

request from last night, that we actually have a presentation. You mentioned -- you know, give a little presentation; you know, explain the posters. I find it hard to -- I think it's hard sometimes for the public to -- you know, until they get their feet wet and to know what the right questions are to ask. And, you know, there are very friendly people over at the posters, but it may seem intimidating. For some people, it's not the best -- it's not the best forum. I would still like to see a presentation at the beginning of the -- of the hearing.

509-1 cont'd

For instance, you mentioned greenhouse gases. Like how many -- like, you know, what are the greenhouse gas emissions? Is there a greenhouse gas poster back there? I don't know if there is. It'd be nice to know what the water usage is, what the waste generation is of the CMRR. It would be nice to know, you know, what the electricity usage is going to be and items like that.

And it's all in the -- it's all in the SEIS, but it's just a matter of, you know, getting the information out to the public.

509-2

I also appreciate the work that the laboratory does. I know that there's many, many good things that come out of the lab. And we -- but, you

e-mail: info@litsupport.com

509-2 The *CMRR-NF SEIS* includes an analysis of the impacts of the proposed alternatives with respect to greenhouse gas emissions. Refer to Chapter 4, Sections 4.2.4.2, 4.3.4.2, and 4.4.4.2 of the SEIS. For all alternatives, annual greenhouse gas emissions during construction and operation would be below the draft CEQ guidance threshold that would require a more-detailed evaluation. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management for more information on Waste Management.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

38

know, the Cold War is over. We won. Let's get -- let's move on. And we want jobs. The, you know, true cleanup at the lab, including the removal of the waste from Area G, would -- you know, my estimations -- and we have the -- we have some reports out. You know, removal of the waste from Area G is a thousand jobs for 20 years, you know. And so, you know, if you want jobs, let's clean up the lab. Let's spend -- let's do some nonproliferation work. Let's -- you know, let's do actual science at the lab. There are other things we can do.

509-3

Oh, and speaking of jobs, I also had one question about the Supplemental Environmental Impact Statement, stating that the deep excavation option will take the same amount of time to build as the shallow excavation option. Both of these -- both of these time frames are given as nine years. The deep excavation option has 225,000, 250,000 of cubic yards of concrete and a hole, which, you know, from the -- from the EIS, is approximately 200 days or, you know, for -- just to pour the concrete. I don't know. Those numbers aren't really given. But, you know -- you know, it's going to take about a year, I think, to do -- a year longer to do the deep excavation option, and that's just not -- it's not included in the SEIS, best I can tell. And it's

509-4

509-3 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Consent Order and Waste Management, of this CRD for more information.

The CMR Building and CMRR-NF support nonproliferation activities, and LANL has a number of ongoing activities that support scientific and technology-development efforts.

509-4 As indicated in the Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*, it is estimated that construction of the Modified CMRR-NF would take 9 years to complete under either construction option. The additional excavation and concrete pouring required for the Deep Excavation Option is not a time limiting activity for completing the project. These activities would be conducted in parallel with other site preparation and startup work required at the site regardless of the construction option selected.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

39

509-3 cont'd

listed as ten more employees -- ten more workers for the -- for the longer -- for the longer period of time, for the deep excavation.

Thank you.

MR. MacALLISTER: I'd like to call Kathy Keith to the podium, please.

MS. KEITH: Thank you for the opportunity to comment tonight. My name is Kathy Keith. I'm the executive director of the Regional Development Corporation, otherwise known as the RDC. The RDC is a multicounty economic development organization in Northern New Mexico with a position to create a sustainable and diverse economy.

510-1

I come to speak in support of the economic impasse of the proposed CMRR Project in Northern New Mexico. Our economy in Northern New Mexico, much like the economy of the country, has been much affected by the downturn over the last three-and-a-half years. We have seen unemployment spike from about three percent in 2008 to double digits in the counties that surround Los Alamos and Northern New Mexico, and that's a seven-county region.

We are truly, in Northern New Mexico, a diverse economic region. In Los Alamos County, the medium household income is over $100,000 a year, and our

e-mail: info@litsupport.com

510-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for construction workers that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

40

surrounding six counties where poverty rates almost equal to and sometimes four times greater than those in Appalachia.

What we understand about the CMRR Project is that it will produce up to 400 jobs per year over an eight-year time period in Northern New Mexico and help us with that unemployment rate that has spiked to sometimes double digits over the last three years in the region.

We also estimate that from those 400 jobs, there will be another 2000 jobs created indirectly in our economy when an investment is made over an eight-year period of a multibillion dollar construction project. These jobs are desperately needed in the area of Northern New Mexico and especially in the construction industries, where we've seen real downturn over the last three years and spikes in unemployment levels.

So I thank you for the opportunity to come tonight and speak in favor of the economic impacts of the proposed CMRR Project in Northern New Mexico.

510-1 cont'd

MR. MacALLISTER: Are there other people who haven't already spoken who would like to make a comment?

Are there people who have already spoken

Response side of this page intentionally left blank.

that would like to make a follow-up comment?

At this point, we will recess. We will be here until 9:00, but feel free to get up and move around, check out the displays. If you want to make a comment through another channel, those stations will be available until 9:00. And thank you for attending and for your participation. We deeply appreciate it. Thank you.

Just a reminder: We'll take any public comments to be developed, afterthoughts or additional thinking as you are here in the meeting room.

(No speakers, 6:32 p.m. to 7:29 p.m.)

MR. MacALLISTER: Folks, just a reminder, we're taking public comment. That's just my periodic reminder in case anybody arrived late. We are still open for business and taking comments until 9:00.

(No speakers, 7:36 p.m. to 8:00 p.m.)

MR. MacALLISTER: Just in case you haven't heard the previous announcements, if you've come in late, we're still open and taking comments, and we welcome more comments. Thank you.

(No speakers, 8:00 p.m. to 8:58 p.m.)

MR. MacALLISTER: This is the official notice that the meeting is formally closed. Thank you.

(The public hearing concluded, 8:58 p.m.)

Response side of this page intentionally left blank.

Comments from the Los Alamos, New Mexico Public Hearing (May 24, 2011)

(The following is a non-public comment provided to the court reporter, 7:29 p.m. to 7:36 p.m.)

MR. STEINHAUS: My name is Kurt Steinhaus, and I was born in Los Alamos. I'm a lab employee, work for the Community Programs Office. And I'm a parent of two children, so I'm here as a citizen of the United States and a parent as well.

My comments will be in four categories: Safety, national security, environment and economic involvement.

My father was one of the first people to move into Wing 7 of the CMR Building and spent most of his career in Wing 7, in the field of physics and spectroscopy. And as a child, the lab had visit-your-dad day or work, and so I got to see Wing 7 of the CMR Building as a child. And I've recently taken community leaders on tours of the CMR Building and can see that the building is old. It doesn't meet modern safety standards, and for that reason, I think it's essential that the U.S. Government build a new facility.

And I had the fortune of listening to briefings about the design of the new CMRR, and I believe that the lab has been thoughtful and careful in planning the safety requirements for the new building. ***511-1***

511-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Special designs, operations, and procedural measures to protect workers and the public would be incorporated into the design and operation of the CMRR-NF.

And I feel confident that it will be a safe building, not only for the employees but also for the surrounding citizens of Northern New Mexico. So that's safety.

Under national security, I believe that science and technology is the fundamental and primary underpinning of the lab's work in meeting our national security mission, and CMRR is an essential part of the science and technology that's necessary for that national security -- to meet that national security.

Under environment, I've had the fortune of reading briefings about the Environmental Impact Statement and the process that was followed and the process that's being followed right now, and I believe that those will cover the important issues that need to be addressed to make sure that CMRR is environmentally sound and meets all of the federal requirements for an environmentally safe building. That's environment and economy.

I know that the economy of Northern New Mexico will be impacted in a very positive way with the construction of CMRR and the surrounding buildings, and for that reason, I think all of us should join in supporting this initiative.

And with that, I'd like to say thank you for the opportunity to provide my comments.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

(5:30 p.m.)

Welcome, ladies and gentlemen. My name is Bruce MacAllister. I will be your facilitator for the meeting tonight. I work for an organization called Business Excellence Solutions, which is a consortium of professionals who conduct mediations, community facilitations, and organizational excellence consulting, and I have been facilitating the last two meetings.

We will have a meeting again tomorrow night at the Santa Fe Community College.

Let me start by reminding everyone who wants to speak publicly, that there's a registration table over right by the front door. Please complete a registration card, because the way the process will work, we will take comments in the order in which we receive the registration cards, for the first round.

Let me remind you that if you don't choose to speak publicly, that's fine. If you still want to give a comment, there are at least nine ways you can give a comment.

First, there's a kiosk at the back with a computer workstation with a recording station back there for verbal comments. There is a place to receive handwritten, written comments. There's an

Response side of this page intentionally left blank.

e-mail venue, the comments can be received by mail, facsimile, or given directly to a court reporter at the back of the room.

If you want to make a public statement, we will be doing that by working off of the registration cards, and we will explain that process in just a few minutes.

The meeting will begin with a brief -- about a 15-minute presentation by the Document Manager for the project, John Tegtmeier, who is up at the front table here.

And following that presentation, we will move directly into the comment period, and comments will first be taken from elected officials, followed by folks in the order that they completed their cards.

Now, let me just check right now. Are there any elected officials in the room who would like to be recognized, or who intend to comment? Please raise your hand if there are. All right, so that eliminates that.

The focus of this hearing is to receive comments relating to the Draft Supplemental Environmental Impact Statement for the Chemistry and Metallurgy Research Building, a replacement facility,

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

4

the nuclear portion of that, the nuclear facility located near TA-55 in Los Alamos, New Mexico.

The meeting is not designed to be a question and answer session. It's a formal comment period designed to enable the public to voice their opinion, and to express comments and concerns relative to the construction and the environmental impact for the construction of this facility.

Based on the number of comments we have, we will be providing the standard five-minute window for people to give their verbal comment.

We will have a person placed in the front row, immediately in front of the podium, so that people who are speaking will be able to see that person. And at the four-minute milestone, that person will hold up a yellow sheet of paper to let you know that you have a minute left.

When you see a red card flash up, it doesn't mean that you're kicked out of the soccer game or out of the hockey game. What that means is your five minutes is up, okay?

Please, help me honor everybody else in the room by respecting the time limits and allowing the next person to take the mike after that.

What I will be doing to keep the flow as

Response side of this page intentionally left blank.

quick as possible in the comment window, is calling out the first name of the person who is up -- calling out first the name of the person who is up, not just their first name, followed by the person who will be next, so that the speaker who is coming up next can be ready to come and take the mike at the conclusion of the previous speaker.

There are subject matter experts over in the poster session area available to answer technical questions about the project. They are not here or authorized or working at the level where they are able to comment or respond about larger issues of national policy around nuclear weapons or around the overall programmatic directions of the nation or the laboratory. They are here to answer your technical questions about the Environmental Impact Statement and about the facility that is under consideration.

If we run out of time tonight, again, there are multiple avenues to give your comments at the back of the room. And in addition, there will be another meeting tomorrow night at the Santa Fe Community College in Santa Fe, New Mexico. So we will have other avenues.

The comment window for giving comments runs through June 28th, 2011. So there will be plenty of

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

time to submit statements by mail, statements by e-mail, fax, toll-free phone line, and so there are multiple avenues to give your comment.

So at this time, I would like to turn the floor over to the Document Manager, John Tegtmeier. Following his presentation, I will review a few ground rules for the next phase of that, but we will get to that point at that time.

MR. TEGTMEIER: Thank you. Thank you, Bruce.

First of all, I would like to welcome everyone here to the hearing. I appreciate the turnout. I truly am looking forward to comments on this draft document. Just a little bit about me and my role in this document.

I work for the National Nuclear Security Administration, Los Alamos Site Office. And my role in this project is the Document Manager. So I'm responsible for a number of things; the preparation of the document itself, and also I think my largest role, my most important role, is to encourage and facilitate public comment on the draft document. I take that very seriously.

So, one of my other roles and responsibilities is to ensure the technical adequacy

Response side of this page intentionally left blank.

of the document, and is to ensure compliance with the NEPA policy, National Environmental Policy Act requirements, as well as the DOE implementing requirements.

So I just wanted to start with a little background of the NEPA history behind this project, and then talk a little bit more about the specifics of what might be in the document as far as a general nature, and then also the process now between June 28th.

We prepared an Environmental Impact Statement for this project back in late 2003. It was issued in November of 2003. There's a Record of Decision prepared, and it was issued in February of 2004.

The decision out of that Environmental Impact Analysis from 2003 approved a two-building concept to Technical Area 55.

The first building of that proposed construction project is the Radiological Laboratory Utility Office Building, which is virtually complete at this time. And it's being outfitted with laboratory equipment and office equipment for moving individuals into their offices in the facility, I believe later this year, and then into laboratory

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

space sometime next year. So that first phase is complete.

The second building is currently designed. That's the nuclear facility portion of the project, as Bruce mentioned. That's also adjacent to the facility at Technical Area 55.

Since the time of the preparation of the 2003 EIS, and the issuance of the Record of Decision, additional geological site mapping was done in 2006. A lot of that is represented on the poster sessions there, and some of you may have asked some questions about some specifics.

And a couple of things came out of that. One of them is they had looked at the site, and they did fracture mapping, and they did some borehole investigation of the physical site, looking for more understanding of the geologic nature of the site that was proposed to be built on it.

In addition, a new seismic study was done, actually an update, in 2007. The DOE requires at each facility around the complex, to do a ten-year basis, a review of the potential seismic issues at each site. And, so, that was completed in 2007.

The result of that was increased ground accelerations associated with the expected earthquake

Response side of this page intentionally left blank.

of a certain return period, like the earthquake would come every 2,500 years, for example.

So as new information became available, not only the geotechnical information, and seismic response information, the project continued on with its preliminary design, and it was identified that the facility would have to be built much more robustly to resist those earthquake ground motions. And a Supplemental Analysis was done to look at the potential changes to the assumed environmental impacts and various resource areas as described in 2003.

So that Supplement Analysis was completed by Los Alamos National Laboratory in the summer of last year, and submitted to our office at the Los Alamos Site Office for review.

Before a final decision was made based on that SA, NNSA decided to go ahead and prepare a Supplemental Environmental Impact Statement to address the changes.

A Notice of Intent was issued on the attempt to prepare the Supplemental EIS, was issued on October 1st of 2010. And we had two public scoping meetings in White Rock and Pojoaque.

We factored in that information in looking

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

10

at the input and continuing of the design information, and also looked at new requirements since 2003, as far as the nature of things that we needed to analyze or update.

So the new document described in some detail the impacts of greenhouse gas emissions, from both construction operations and operations following the completion of the facility.

We also did an intentional destructive acts analysis, basically terrorist-type activities, something that might cause something in the facility that could impact the environment or the public.

And we also did a separate update, or really a fairly new analysis of the transportation of the demolition waste from the current Chemistry ans Metallurgy Building, which is nearing 60 years old right now.

Some of these analyses we updated, we updated, as I mentioned, the construction impacts. We also looked at the operations impacts, not only for the proposed nuclear facility, but for the RLUOB facility I mentioned earlier, and the ongoing operations of the Chemistry and Metallurgy Research Building itself, the older facility, because per the schedule and the new construction, it would be

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

required to be operated for longer than anticipated in 2003. So that's in the document, as well.

We also updated the accident analysis for the proposed new project, the nuclear facility, and for the existing facility, based on very recent documented safety analyses that our office approved last year.

And we also updated the human health impacts and radiological impacts. Part of that was changed in modeling, and in looking at populations at various distances from the facility. And, also, we took advantage and used the latest census data available at the time.

All of that information hasn't come in, but as it does, we'll fold that into the final document.

The alternatives are, as described in the supplemental, we have a No Action Alternative, which is construct and operate the facility as it was described in 2003, and the decision basis in 2004 Record of Decision. In the sense it's a No Action Alternative, in that it doesn't change the past NEPA decision. And so that's a way of looking at the No Action Alternative.

We also have the modified CMRR Nuclear Facility alternative, basically looked at the changes

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

12

in the construction and operations of the new facility, which is required to be larger, albeit for the same programmatic operations, to resist the seismic forces we get sitting on the new geologic information we have.

We also updated to look at the latest nuclear safety requirements, because that's a key part.

Since the scoping meeting, the project team has identified, in addition in that, two options now. In the Notice of Intent, that preferred alternative was described as the deep excavation option. What we have to do is a lot more excavation into the volcanic tuff.

The project's identified and is working to develop a shallow excavation option, and those analyses of proposed options are in the document.

We also have continued use of the CMR building alternative, and that's what you would consider the no construction alternative. So that's in there. So, we can update the continued use of that building at a reduced capability, until the new project, as proposed, should we decide to continue it, and finish that building, those operations enter into a little bit further into the future.

Response side of this page intentionally left blank.

So as far as the actual NEPA process for this document today, we posted the Draft Supplemental EIS on our usual NNSA web page on April 22nd, while we sent out documents to those that had requested them on April 21st. And the EPA published a Notice of Availability of the draft document for public comment on Friday, April 29. And that started the original 45-day comment period.

We had requests to extend that period, and the NNSA decided to extend that period by 15 days on May 6th. And, so, now the comment period runs through June 28th.

Bruce mentioned the public hearings. We had a hearing in Albuquerque on Monday, Los Alamos yesterday evening, this evening here in Española. And then we have another hearing, same format, same time, in Santa Fe at the community college tomorrow evening.

And Bruce mentioned many of the ways to submit comments. I just wanted to reinforce that and encourage everyone that there's no limit on how many times you can comment, how many ways you can comment. And I just wanted to point that out. We've had questions in the past.

I just wanted to wrap that up, and we are

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

not here to answer questions, but you can put a question in a comment.

But with that, I would like to turn it back to Bruce, and we will go ahead and get started with the main part of our hearing this evening. Bruce.

MR. MacALLISTER: Okay. Once again, if there's anybody who would like to speak publicly and you haven't completed this card, please see the kind folks at the front table there right by the front door, and we will complete this card.

If I didn't mention the emergency exits and facilities, the restrooms are right under that exit sign over to your right. The main exit, of course, is the entrance that you came in to join the meeting today. There's another emergency exit over to your far right, almost behind you, at the back of the room there, that you can use if we need to.

Let me go through a couple of ground rules for the rest of the night, and then we will get started.

Let me just double-check, are there any elected officials that have shown up since I asked earlier?

Okay. I'm going to call names, as I described. I will call the first person followed

Response side of this page intentionally left blank.

by -- and I will tell the next person who is on deck, so to speak, to be ready.

Because we are transcribing each person's comment, and people are speaking into the mike, it is imperative that we have as quiet a room as possible so that the court reporter can get the one person speaking, the content of their communication down. So comments from the floor will not be appropriate in this meeting. I will not tolerate people interrupting the speakers, because the court reporters will be dutifully trying to get the speakers comments transcribed.

Please identify yourself each time you come to the podium. It is likely, although not guaranteed, just depending on how many people register, that we will have time for follow-up comments. We have in every meeting so far, and it looks promising that we will be able to do that tonight.

So each time you come to the podium, please give your name so that the court reporter can keep track of who is making the comments. If for any reason, you're not comfortable using your name, that's acceptable, but please use a speaker number which, if I come to a card here that doesn't have a

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

16

name, I will be calling you out by a number, all right?

Again, please, honor the process by keeping your comments civil. This is an official hearing. This is an official document that's being generated. This will be read by a number of people, so we want the comments to be in an appropriate language. You're certainly free, and very grateful to have you here to voice your many varied opinions.

The time frame, again, will be five minutes per comment. My cohort back here in the front of the room will be holding up a yellow piece of paper, which will notify you when you are at four minutes, which will give you a full minute to wrap up. When you see the red card, please wrap up as quickly as you can reach an appropriate end. You don't have to stop mid-sentence, but don't carry on into your next paragraph.

If you have written statements that you are reading from, and you would like to give those, leave those to ensure that your statement is accurately transcribed. You are most welcome to give those to me, and I will see that they get to the court reporter.

And just as a final note, we're all living

Response side of this page intentionally left blank.

in that modern age where the kids are going to be calling us or what have you, please silence your cell phones, and anything else that might go off, alarms of any kind, so that we can keep the flow of the meeting as uninterrupted as possible.

If anybody needs assistance getting to the mike or needs other physical assistance, just kindly contact me, and I will help you, you know, any way, if necessary. Again, we will only be taking comments from the podium tonight, with the exception, as I explained before, that you are welcome to give as long a comment as you want in the audio recording back there, or enter one in the computer, or submit a written comment. There are no time limitations on those as far as the duration of the comments.

All comments are, however, due by June 28th.

So without further ado, let's get started with the process, and let me call the first speaker to the podium and notify who the second person is.

Our first speaker tonight is Ray Baca, and he will be followed by Danny Beavers. Thank you.

MR. RAY BACA: Good evening. My name is Ray Baca, and I am the Executive Director for the New Mexico Building Trades Council. In that

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

18

capacity, I represent all of the construction labor unions here in the State of New Mexico. And this includes approximately 800 workers, construction and maintenance workers who are currently employed by the Laboratory.

These are good-paying, family-sustaining jobs. I would like to just respectfully remind everybody here that the unemployment rate for construction workers in New Mexico, as it is in much of the country, is at least double, and in many cases, triple that of the average unemployed worker. It is not uncommon for us to see unemployment rates, or under-employment rates of 25 to 28 percent in many of our crafts that we represent.

This means not only unemployed workers, but families that are seriously hurting in many, many, spectrums -- the full spectrum of our whole society, in many communities that we represent across the state, and obviously across the country.

If this project, the CMR project comes to be, and comes to fruition, it will employ upwards of 1,000 construction workers off and on over the course of a 10- to 12-year period. Obviously, this would be a huge boost to the construction industry in New Mexico for overall economic development, but most

601-1

e-mail: info@litsupport.com

601-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

importantly, it will be a huge boost for those working construction families who are currently in very dire straits.

With all due respect to those of you who are opposed to this project, we respectfully ask the Laboratory and DOE, and all of the other powers that be, to begin this project sooner than later.

Thank you. (Applause.)

MR. MacALLISTER: Our second speaker will be Danny Beavers followed by Stuart Barger.

MR. DANNY BEAVERS: Good evening. My name is Danny Beavers. I'm a business representative for Plumbers and Pipefitters Local Union 412. I worked in Los Alamos for many years prior to being a business representative.

I'm here to tonight to speak in favor of this project for some of the reasons Ray Baca spoke of, the economic impact to the local communities and to the state, as well as the fact that the building that they are looking to replace, the CMR building, has been operating since the early '60s, late '50s.

I -- this is, myself, I did live in Española for many years, I have family that lives here, and I'd rather see them have a new state-of-the-art building processing, and working on

601-1 cont'd

602-1

602-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

20

this type of equipment and weapons, than to have a building that's 60 or 70 years old.

And, therefore, the United Association would like to stand in favor of this, and would request that we continue with it.

Thank you.

MR. MacALLISTER: Our next speaker is Stuart Barger, followed by Mike Gomez.

MR. STUART BARGER: My name is Stuart Barger. I live in La Puebla. I live downwind of Los Alamos. The only justification for the existence of government is to protect its people. Why then is our government committed to our destruction? You who are here tonight promoting this project, following the footsteps of J. Robert Oppenheimer, you have become death, the destroyer of worlds. Since 1943, you have poisoned our Earth, poisoned our water, poisoned our air, poisoned our people, poisoned our children, all to create weapons of mass destruction.

The projected cost of this facility is estimated now at $5.86 billion. Imagine what good, instead of evil, could be done with this money. Use it to decontaminate our land, purify our waters, cure our people, save our children.

As now proposed, this facility will have

603-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government and notes commentor's opposition to the CMRR-NF. Funding decisions regarding major Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

There is not, nor would there be, plutonium production at LANL. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Please refer to Section 2.4, CMRR Mission, of this CRD for more information.

the capacity to produce 6,000 kilograms of plutonium. That's enough for 9 million nuclear weapons, 9 million nuclear weapons. How many worlds do you need to destroy? Why do you not include the alternative to stop the production of plutonium?

603-1 cont'd

So, how dare you come here tonight promoting this abomination. How dare you come here. Have you no conscience, have you no morals? Have you no soul? Be gone from this place. Go home to your families and tell them that today you have promoted the destruction of our environment, the deaths of our people. Won't they be proud? You are guilty of committing crimes against humanity. The Nazi concentration camps provided great employment opportunities for prison guards. We have just convicted the last of those.

Thank you. (Applause.)

MR. MacALLISTER: Our next speaker is Mike Gomez, followed by a gentleman whose handwriting I'm having -- I believe it's Charles or --

SPEAKER FROM THE FLOOR: Churlo.

MR. MacALLISTER: Churlo? Is it Churlo?

SPEAKER FROM THE FLOOR: I don't know. Did you sign up?

MR. MIKE GOMEZ: Hello, I'm Mike Gomez, and

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

I represent the Sheet Metal Workers' Local 49.

I understand this project has got many concerns, and many hopes in the public eyes. I would like to endorse the project because of the fact that Los Alamos has been there for years, and it seems like the government does their best to keep everything safe. I haven't seen any big nuclear accidents there. I haven't heard of any big contaminations. So, I'm thinking about the living now, and not the potential of killing. I don't want to think about that.

SPEAKER FROM THE FLOOR: Boy, you're making a WIPP --

MR. MacALLISTER: Excuse me, no comments from the floor. Zero tolerance.

MR. MIKE GOMEZ: And why be negative? Let's be positive. The positive impact of this is great for the economy of New Mexico. It's good for our families, for their future. I know that the opinions are, you know, yes and no. So my opinion is, yes, because New Mexico needs this in these dark economic times.

So, I do approve the construction of this facility for the good of the people in the area, and for the good of New Mexico as a whole.

604-1

604-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Thank you.

MR. MacALLISTER: Thank you, sir. Our next speaker will be Churlo, followed by Tara Somerville. Thank you.

CHURLO: What's your name?

MR. MacALLISTER: Bruce.

CHURLO: Bruce. My fellow Americans, let's go over some terms here. America. We know that, right? This is the place we live. Fear factor, what our government thrives on, you know, with fear comes weakness. With fear, with weakness, comes illness. See, our government wants to keep us dumb and stupid, and they want to do stuff like build a bomb. How many do we have stockpiled there, Bruce? How much? You don't know? Do we need to build more? Can we -- you know, can we put nuclear waste in your next Rolls-Royce?

Anyway, sure our economic times might be hard, but only for a thousand people to get a job that might pay well, that might not give them cancer, or growth defects, that won't contaminate water for thousands of people that we have to consume because the WIPP site is built on one of the largest aquifers in the southwest, Bruce, yeah, yeah, yeah, Texas got us, okay, that as well. Texas, how does that song go

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

24

(made inaudible noise). You know, we're back in Texas -- wait, New Mexico.

Anyway, so, I'm representing kids 10 years old and under only because mommy's got a -- babysitting them with video game or something, TV dinner, Happy Meal. But the bottom line, it's those people that are going to suffer with that waste. Where are we going to put that? Here we are. Where do you live? Los Alamos, right there, right by the trashcans.

Water contamination, hum. Environmental racism, let's go with a question mark, because Los Alamos County is one of the fifth richest counties per capita in the nation. But how many people live there? So just a few thousand people, hum, you guys are tripping that, get another job.

Let's see. Where was I? Cancer's on the rise. We talked about that. Birth defects. Environmental risks, yeah, yeah, yeah, yeah. Top shelf radiation. I know you like to drink top-shelf liquor, but top-shelf radiation, okay, put this in a tin can, right? You're going to put this down in salt mines, okay. Not going to contaminate the water, okay.

(Laughing.) I'm almost done. How much

605-1 cont'd

Response side of this page intentionally left blank.

time do I have, timekeeper?

SPEAKER FROM THE FLOOR: A minute.

CHURLO: God. Oh, oh, yeah, you know why no politicians are here today? Payoff, hush money. And all of the union guys, okay, okay, my family is starving, all right, go get food stamps, okay? And then try to find another job, (laughing). Maybe you want to be a sound engineer or something, work in the television station or something. I don't know. Used cars. Oh, no way. Yeah, the money contributions. How much did you give to the party? Ha-ha-ha.

Anyways, you guys that build your bombs are really -- you guys are really insecure. We don't need any more. We need to destroy the ones we've got. Like I told Norm over here, dad-gum them, build a bomb, get your ass there and fix it, will you? (Laughing.) Put your ass to work, come on, man. Fix what you've got, and put it in the trunk of your car.

Did we learn from Hiroshima or we go to El Paso, because of that explosion. The guys that built it? He was so proud, he was so proud he killed millions of people. He affected their lives for generations to come. Ha, ha, ha, he's bad, like, you know what I'm saying. (Laughing.)

So, like I said, change your way of

605-1 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

thinking, because when you started making this waste here, everybody else is going to come here and New Mexico's a victim, New Mexico's a state, a state that can't talk. Only we can talk for it, its land, its water, its animals, it is pristine.

Valles Caldera volcano, boom, you know, it could go off, and I don't know, just because they did that bomb there, early payoff for Los Alamos to set this place up. It's all about money. Money, money, money, money, money, I just got a hundred grand a year. How about the new roadways? That's right. What do you think of that? But my friends down the road in Española where water wells are contaminated already, already contaminated. They are. And people live here, make a livelihood. Just a few in Española, oh, a junk heap, no problem, there's a few here, there's a few everywhere.

But the bottom line is human life. And we don't have to think about -- consider about human life. We don't need to think about destruction. For some odd reason those two don't go together hand-in-hand.

I've got to go. (Applause.)

MR. MacALLISTER: Our next speaker is Tara Somerville, followed by Emmy Koponen.

605-1 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

27

MS. TARA SOMERVILLE: Hi. I'm here to voice opposition to the construction of the new CMRR-NF building at Los Alamos National Labs for the following reasons: One, I'm opposed to the construction of new nuclear weapons, their capacity for genocide and massive long-lasting environmental damage, makes their use by anyone for any reason morally reprehensible, and their construction, as well. **606-1**

And, also, two, the enormous amount of money slated for the project could be used for the betterment of our state and nation towards building up green energy industries, like solar and wind power and organic farm projects. **606-2**

And, three, I've lived in Taos since 2005, and have been a business owner since 2008, and thought I've only been here since 2005, two friends, Marilyn Hopp and Jean Green, explained that the smoke from the Cerro Grande Fire in 2000, made it to Taos, and the descriptions were that it was like it was snowing ash. People got sick with symptoms ranging from respiratory infections and headaches, to brain tumors.

In Taos, we are downwind from Los Alamos, and that fire proved it. And this also underscores **606-3**

606-1 NNSA notes the commentor's opposition to the CMRR-NF project and nuclear weapons. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

606-2 Funding decisions regarding major Federal programs (for example, renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

606-3 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. A summary of possible public health impacts resulting from the fire is included in Chapter 4, Section 4.6.1.3, of the 2008 *LANL SWEIS* (DOE 2008a). As indicated in this section, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself. This section of the *LANL SWEIS* also discusses the *Public Health Assessment* (ATSDR 2006), for which the Agency for Toxic Substances and Disease Registry (ATSDR) reviewed environmental monitoring data from 1980 to 2001 and concluded that no harmful exposures

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

28

the fact that a full public hearing should also be held in Taos, because many of us had to drive many miles to come here today to be here for this. (Applause.) Thank you. (Applause.)

606-3 cont'd

MR. MacALLISTER: Our next speaker is Emma Koponen, followed by Paula Seaton.

MS. EMMA KOPONEN: I'm number 7, and I would like to have number 3's comment emphasized, because I don't have written comments. But if you love life, if you honor the planet, you would not be doing this, because it's wrong, it is immoral. You get another job, please. Do something.

Let's have other energy. We have minds, supposedly good minds at Los Alamos, please do something useful with them.

Children, the elderly, the education, my goodness, there's so many good things for $5.86 billion, that's 586,000,000, I mean, how much money, and your little construction jobs, you could build greenhouses. You could build root cellars, you could build something for the future.

607-1

So, I'm not going to say much more, but I do feel from a nuclear safety expert who dived off the Taos Bridge not long ago, it was supposedly a suicide, but his car was left running, his money is

due to chemical or radioactive contamination detected in groundwater, surface soil, surface water and sediment, air, or biota are occurring or are expected to occur in the future. The data considered in the ATSDR assessment included at least one full year of environmental monitoring results from the period following the Cerro Grande fire.

607-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

being left to the Animal Humane Society, and I have so many doubts about honesty. Thank you.

(Applause.)

MR. MacALLISTER: Our next speaker is Paula Seaton, followed by Ann Hendrie. Can I adjust this mike for you?

MS. PAULA SEATON: Today, when I was thinking about coming to the hearing, I felt like, why bother, why bother coming to another hearing when it takes time, energy, and money, and pretend that we are being heard? And it's just psychologically heartbreaking to come to these things. It takes so much out of me, and I know all of you. And we drove from Dixon, 35 miles from here.

608-1 And I am very sorry that there is not a scheduled hearing in Taos. I know there's a lot of people in that area that really wanted to speak out. And in these financial times it's hard to travel that distance.

We've had so many people in our community, that's Dixon and Embudo area, that have died in the last three to five years or have been diagnosed with cancers, pulmonary diseases, and heart disease, which I really believe are the outcome of living downwind of LANL, and may be due to Cerro Grande Fire.

608-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

I grew up in the northeastern corner of the state, and my parents both had two types of cancer. They both died of cancer. And we -- you know, I can't help but think that where I grew up, it was really right in the middle of where LANL, Pantex and Rocky Flats, all kind of are surrounded by that whole area.

I feel that we really need to spend our money wisely at this point, and this is a horrible, horrible waste of money.

I would like to thank all of the people that are continually dedicating their lives to fight and speak out for the truth.

And we live in this area, most of us can't afford health insurance, but we're living downwind from LANL, and I think that the government should definitely be paying for all of our health insurance.

One more thing, I'd like to say. The other night I had a dream about Sherry Kakowski, and she was walking on a tightrope, and she was walking across something like the Rio Grande Gorge, and it was on international media, and I happened to turn on the TV, and there she was, and she had a wireless microphone, and she was taking each step, and she was telling the world, it was international media, about

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

31

what's happening here, and I feel like I'm going to hate to give Sherry an idea, but it might take that. Thanks. (Applause.)

MR. MacALLISTER: Our next speaker is Ann Hendrie, followed by David Bacon.

MS. HENDRIE: My name is Ann Hendrie. I wrote comments because I was afraid of crying.

First of all, I want to thank the Greg Mellos of the world, the Concerned Citizens for Nuclear Safety, Nuclear Watchdog, and Los Alamos Study Group, and all those here who have voluntarily dedicated some, if not a lot, of their energy and lives to questioning the viability of our nuclear present and future. This presence of conscience in the face of seemingly insurmountable odds is the only reassuring glimpse of sanity in this room.

I have two questions for the representatives of the nuclear defense and energy industry which I would like to resurrect from the drowning of industry propaganda to which we are all subjected. These two questions are: Why do we need more nuclear warheads? To answer that first question, we need only to look at who profits from them. As for really deploying them, any one of them, I believe the US has already made its point to the

609-1

609-1 NNSA notes the commentor's opposition to nuclear warheads. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the commentor's concern about managing risks in the nuclear industry, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

32

world in 1945.

The second question is: Does the nuclear industry have the incentive, much less the means, of assessing the true risks and costs of nuclear? I suggest that economic psychology and history might provide some answers. Psychologically speaking, we do a bad job in managing risks when they are so enormous and unpredictable. We have little empirical basis for judging rare events, so it is difficult to arrive at good estimates. After Chernobyl and now Japan, there's not been even the resources or means to collect that data accurately. And when corporations run the show, there might be few incentives to think hard at all. On the contrary, when others hear the cost of mistakes, the incentives favor self-delusion.

609-1 cont'd

Experts assure us that new technology all but eliminates the risk of catastrophe. Events prove them wrong. Not only do the risks exist, but their consequences are so enormous that they easily erase the supposed benefits of nuclear technology. What insurance company is willing to be liable in case of a nuclear catastrophe? None. Thanks to the US 1957 Price-Anderson Nuclear Industries Indemnity Act, Bechtel in this case, passes off liability to the

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

public.

Is the nuclear industry lobby willing to rescind that Act? So we can conclude that a system that socializes losses and privatizes gains is doomed to mismanage risk. Compounding this self-delusion of the industry is the secrecy surrounding the nuclear industry which prevents the public from gaining much information about risks arising from their operations, much less in knowing how to protect themselves in the event of a crisis. What are the so-called emergency escape routes for Española residents, much less for the Japanese? What escape route exists when it affects the whole planet? And if university professors are hindered in the research programs to study the toxicological effects of long-term low-level exposure to radionuclides contamination, how can we adequately trace the effects back to the source? And who pays and will pay for the next 100-plus-thousand years for the still unmanaged disposal of nuclear waste? After 50 years of trying, no acceptable solutions for long- -- and I mean long- -- term storage of nuclear waste has been found. That, even by good business standards, should be unacceptable. But not, as I said, if paid for by the public. If the costs are hidden, who is

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

34

to blame?

So we can conclude that vested interests caused the nuclear industry to compulsively underestimate these costs and the risks. I do not think there is any doubt left in the public mind that our political institutions are too weak to stand up to the nuclear lobby, in terms of safety. So who is to lobby for the environment, for the uranium miners, for the populations downwind, for nature? Only the few Greg Mellos, Joni Arends, Jay Coghlans, et cetera, and us. That's who.

Even though the nuclear industry has put millions into propaganda to assure us that the risks are all but nonexistent, there are historical facts and geological uncertainties which do unquestionably exist. What political institution do you consider secure after our Arab Spring? After acknowledging who's profiting and who's paying for nuclear? Are nuclear proliferation or terrorists a part of the Environmental Impact Statement? They should be, because they, too, are part of the hidden costs of our nuclear folly. And if the experts want to argue that we need the weapons industry to supply the fuel for nuclear energy to combat global warming, that so-called solution would be, at best, only

609-2 Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. NNSA has prepared a classified appendix to the *CMRR-NF SEIS* that evaluates the potential impacts of malevolent, terrorist, or intentional destructive acts. Refer to Chapter 4, Section 4.2.10.3, Intentional Destructive Acts, for a summary of the classified appendix.

transitional. The deployment of new nuclear energy plants cannot be done quickly enough to mitigate global warming. It takes ten years to build one, and then their output would only take care of a fraction of our energy demand, not to mention that the cost of dealing with one meltdown is sufficient to move the entire world to solar power over a 20-year period. Once the transition to solar is achieved, guess what? The fuel is free.

And while I'm on the subject, it's worth noting that the nuclear industry has suppressed renewable energy development for decades. In addition, ironically, as these hidden costs of nuclear power are rising astronomically, the cost of wind and solar power is falling fast.

So in conclusion, it is logical that our nuclear industry, so embedded with the defense and energy interests of this country as they are, is deaf to all our pleas for rationality and morality, as their present existence depends on the continued funding of this insanity. But if you, dear LANL employees, are so enamored with nuclear energy that you cannot grasp the scale of the disaster in Japan and the ongoing threat of all our nuclear adventures to the entire planet, then you lose all moral

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

credibility and any claim to rationality.

(Applause.)

MR. MacALLISTER: Thank you. David Bacon followed by -- pardon me if I mispronounce your last name -- Joan Logghe.

MR. DAVID BACON: Good job. That's a hard act to follow. There's so many substories going on here. There's one that all this money is going to Bechtel, one of the worst, most corrupt corporations in the world, as far as I can tell, and one of the most incompetent. I don't know if you all have seen a movie called "Why We Fight," but it showed how Bechtel poisoned all of our soldiers in Iraq, just in the most irresponsible and completely, you know, disregarding way.

The other story that -- I was just standing there now -- is how stupid is our federal government? You know, there's 500 representatives and 100 senators, and one president, and the nuclear industry can just take them down any road they want to. 350 million is what this thing started out at -- I love these figures, as if they're real -- and someone told Congress, "It's only going to cost $350 million." And then later they say, "No, it's going to go up to like $5.87 billion," and Congress apparently every

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

37

time goes, "Okay. Okay. We got the money."

There's this sense that no one's awake at the wheel in this country. One of the women in Albuquerque, when she took the mike the second time -- because they couldn't figure out even five minutes per person or three minutes per person in Albuquerque. It was beyond their math capability. But one of the women who took the microphone the second time just said, "You people are incompetent."

And it's these kinds of truths that I come to these meetings for, because the intelligence in this room is at such a higher level than the intelligence of our federal congressional delegation, it's really quite nice to be around.

It looks like with Fukushima, Fukushima is in a serious, serious situation right now. It is not in any way done. The level of radioactivity coming off Fukushima is still incredibly high. They are admitting that a lot of the major accidents happened during the earthquake, not the tsunami. It looks like we might see Germany and Japan get completely off nuclear. That's quite a possibility right now. You're going to see two of the major technological countries in the world start going down another route, and that is an exciting thing. As usual,

610-1 NNSA acknowledges the commentor's concern that an accident similar to the one that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

we'll be lagging behind, because of the power of the nuclear industry.

The thing that really scares me about this is, they're going to have six metric tons of plutonium in this building, and we know that that's going to be a disaster. We don't know how big, but I don't see how it could be anything but. It's time that we stop accepting the colonization of New Mexico as a nuclear colony. That's not going to be easy, but we have to do it. There's no future in being a nuclear colony, especially now. We know what the future is. It's a future of death, destruction, and high, high amounts of poisoning.

610-2 We, with this money -- I did the math. I went to Bingaman's Senate Subcommittee -- or Senate Committee Panel on Global Climate Change, Colorado River Basin, Rio Grande River Basin. He was told by three guys that we are in bad trouble. We're in trouble with decreased snow pack, decreased river flow, storms will get bigger but less frequent. We need to pay attention now to our entire ecosystem. The six billion would put 12,000 people to work at $30 an hour for ten years. That's how much that would cover. They could then be looking at watershed restoration, forest restoration, grassland

610-2 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

restoration, local agriculture, and an intelligent energy system. We have millions of acres of forests in northern New Mexico that are in dire need of thinning, and the Forest Service itself doesn't even have the money to do that. So we could put -- we could -- and I feel like we really have to begin to insist now and put pressure on our congressional delegations to put no more money down a nuclear rat hole and start putting it into the communities in northern New Mexico, hire people to go to work at good wages, and to begin to restore our ecosystems and stop poisoning them. Thank you. (Applause.)

610-2 cont'd

MR. MacALLISTER: One request. I appreciate the applause. I understand why you're going to want to applaud speakers. If you can hold your applause until the end of the speaker's talk, that will allow our court reporters to catch everything that they say. If you applaud, the court reporters may miss something in the middle of the statement. So I appreciate your help with that.

Joan Logghe. Pardon me if I'm mispronouncing that. That's right? Followed by Melissa Larson.

MS. JOAN LOGGHE: Hi. David Bacon, before this started, was saying that there are different

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

40

kinds of truths, and maybe mine speaks from a more emotional level. I'm the mother of three, grandmother of three, and have lived in the valley for 38 years. I remember going to bed at night and just praying that we'd be okay living by Los Alamos. You know, many of us grew up in the Cold War era. We didn't know a life that didn't have the bomb.

And I'm part -- when they say Environmental Impact Statement, they mention the communities. I'm part of the environment that is impacted by this. I have never seen data on what's going on in my community in terms of the radiation. This doesn't seem to be available, and yet this is a community of scientists. There's a pollen count on the news every night in the spring. We talk about our allergies. We don't want there to have to be a radiation count, but I think that would be appropriate. Just like they have, elm, mulberry, plutonium. I don't know. I'm not a scientist. A count. Accountability.

611-1

I feel like some of you aren't -- I feel like the people in Los Alamos have good hearts and they want for their families and they -- I really believe this. And they're scientists, and for one reason or another, this is the path that their life has led them to take. But I feel like we all have

611-1 NNSA notes the commentor's concerns about emissions from LANL. Results from environmental monitoring of air and water emissions at LANL are reported annually in the reports available at http://www.lanl.gov/environment/all/esr.shtml.

good hearts and that the more we separate ourselves from that, the less likely we are to hear one another.

Maybe it's because I'm a poet, and I feel like the way we can get to truth is by accessing each other's hearts and intelligence in that way. But I'm really against nuclear proliferation, both bombs and power. I have been saying for years, can't we take all these brilliant minds and turn them to the good that we know we can create? We're humans. We're so imaginative. We've invented pizza and sonnets and Swahili and Little Debbie cakes, and all kinds of amazing things. You know, we can do this if we access each other's intelligent hearts.

When there was the big Cerro Grande Fire, my husband was up there. He was working at the County at the time. In La Puebla, where I live, I was driving to Santa Fe to work. I teach poetry. It's a very high-paying job. And all over my house, there was an orange -- all over La Puebla, it was orange. And then I drove to Santa Fe and people were having lattes, and I was like, don't they know the world is coming to an end, in a way? And then I drove back that night, and we watched Los Alamos burn, and our hearts were all broken for that. And I

611-2 NNSA notes the commentor's opposition to nuclear proliferation. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

42

thought, we have so much compassion, and we went and worked at the Red Cross, we have compassion for this community. I think this is an opportunity for change for hearts and minds to change.

And then Japan. I mean, things are built, and then these unimaginable situations happen. Oh, we never imagined this could happen. And yet it keeps happening in the most unimaginable way. So even though we're beefing up, we don't know how things can shake down.

Does that make senses?

I'm going to read you a poem. I wrote this in 1990. I'm a poet. And I'm speaking for myself. Even though I am the poet laureate in Santa Fe, I'm speaking for myself.

Answer me this.
Peace isn't a placebo.
Haven't we swallowed the threat of war?
And don't men want to make peace with women
And aren't women full of peace
As they fill with babies
And aren't babies made of molecules of peace
And aren't babies fools who babble on in peace

Response side of this page intentionally left blank.

Through guns and bombs? And wouldn't you
try
And wage peace and didn't your grandmother?
And wasn't she Hungarian, and knew too much
of war?
Isn't adobe made of mud and straw
And isn't my heart? And isn't a fire made
of wood
And light and don't walks eventually turn
Into flight and isn't it grand the way
peace trickles
From my hands? And isn't recycling a word
For pop cans and yesterday's news and not
For the element Plutonium. And isn't
Plutonium
Named after Pluto, god of the Underworld:
That place you turn when there is no way
up?
And couldn't Los Alamos finally turn
The way cottonwoods do in fall
To the using of sun for heat and ways
To make fuel out of music? And do you want
Your children downwind of peace or downwind
Of preparations for war? And isn't peace a
reason

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

612-1 NNSA notes the commentor's opposition to the CMRR-NF project. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Plutonium metal and oxide used at the existing CMR Building, and that would be used in the proposed CMRR-NF, cannot produce a nuclear reaction by themselves and do not produce large amounts of decay heat that are associated with nuclear reactors that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of the CRD for more information.

really want the building, that everybody's noticed, and we definitely are ready to be done with plutonium, too. Plutonium is an obsolete enterprise now. We've had our play with it, and everybody has seen that there is more pollution on the earth than anybody knows what to do with, and it's real expensive to clean that up. And so if anything, that money that you're planning to invest into this building ought to be used to clean up the mess you have already made up there. And we do want to have our clean water, and there's no way that you can put the amount of concrete -- where do you get the water to build that thing? And then what do you use to cool off that plutonium? It's just an obsolete thing at this point, you know what?

612-1 cont'd

I have been reading about -- there's an element called thorium that like India and China are now using to generate electricity and stuff. It's also slightly radioactive, but they compare it to like what unleaded fuel is to leaded fuel. It's a little bit safer. It's not the best solution, but at least it's something to move on to, and then it doesn't create nuclear weapons, and there's no byproducts that you use to blow people up and stuff.

So if people really need to work on power,

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

I think, you know, for one thing, solar energy is great, you know. One thing I heard is that that Cassini mission that went out to outer space, it was carrying 72 pounds of plutonium on board, and somebody said that if that thing didn't make it and came down, it was going to kill like 30 to 40 million people, and that's only 73 pounds of plutonium. So you can imagine what 6 metric tons of it is going to do.

And there's a lot of plutonium on the earth right now. Actually, it's a real problem for the scientists, I understand, because they have created so much of it, and with the nuclear power and stuff that they're trying to promote also, even though Fukushima has proved that, everybody with any brains at all wants to look at the future, they're already thinking we've got to find some other power source, you know.

So I think solar energy is great. In fact, I heard like those missions to outer space, they're always saying oh, plutonium, that's like a space battery and stuff. But actually, solar energy works really good for space missions and everything, too.

So you know, the scientists know that there's lots of other ways to do it. It's not that

Response side of this page intentionally left blank.

it's so hard to come up with these new ideas. It's just that the old ideas are kind of -- they're still making the money. Somehow, like this, I guess, I don't know who's got invested in it that much, because obviously none of the people -- the only ones who really want to see this thing go up are the ones who have got jobs there, and are going to be building it, or something. But otherwise, all the people in New Mexico want their clean land, their clean water, their clean air. That's the only thing that's going to keep the life here going.

And we love this land, you know, and we love all the living things here, so we don't want to see it all go down into some plutonium thing and everyone get evacuated and have to move far away and leave the land to waste, you know.

So we've already seen that happening in Fukushima today, and I noticed in the SEIS about this plan that they only had like one small paragraph about the Fukushima thing, and it didn't really go into any detail at all, and I suppose you need to have a nice security clearance in order to get the information that they're not telling us, but I think that really just common sense would have anybody know, and everybody here that's talking against it

612-2

612-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. As discussed in the response to Comment 612-1, the plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

seems to understand that it's just something that we don't need and that there's a better use for the money and there's better uses for the scientists' minds.

And you know, plutonium was a cute little experiment back in 1940, and maybe a lot of guys got real turned on about it or something, but I think that it's an old thing now, kind of like those, you know, videocassette things that they used to have, and stuff like that. Once it becomes an obsolete thing, you just have to go out and do something else. You can't just keep using the same old thing. That's proved that it's not working, and that it's only going to wreck the earth.

So anyway, basically, these hearings are a sham because they have already decided that the building is what they're going to do. And they're just trying to say they're considering these alternatives, but there's no alternative they're considering.

And so I came here, just for the record, to let you know that I don't think it's a good alternative, and, you know, go through the process with you, but make the motions, you know. But obviously, there's no way to stop it. You know,

612-1 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

49

there's no way to stop it, no, there's no way to stop it. Can't stop it even if you try. (Applause.)

MR. MacALLISTER: Our next speaker will be Jay Coghlan, followed by Julie Sutherland.

MR. JAY COGHLAN: I'm Jay Coghlan, with the Nuclear Watch New Mexico. I'm going to respectfully disagree with the previous speaker. We can still stop this thing, you know, and we're going to work hard towards that end.

I'm a self-confessed wonk at times. I'm going to speak wonk-speak in an attempt to, I don't know, impede this process. But these hearings, of course, are happening pursuant to a federal law, specifically the National Environmental Policy Act. And I basically want to discuss what I see as two broad vulnerabilities to this Draft Supplemental EIS.

The first is that it makes no attempt and, in fact, rejects revisiting the purpose and need in what the mission should be for the nuclear facility. It rejects that kind of consideration out of hand, and basically just tries to confine the study essentially to seismic issues and the construction methods used to mitigate those concerns, et cetera, et cetera.

But I would like to suggest -- and the NNSA

613-1 NNSA notes the commentor's concerns regarding the purpose and need for the CMRR-NF project. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, and Section 2.11, Alternatives Considered, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

50

folks may want to think about this -- that you possibly make this process legally vulnerable by not going back and reexamining mission and need. And the SEIS explicitly states that nothing has changed since the 2003 EIS. And juxtaposed against that, I found it ironic that just a couple of days ago, NNSA released a fiscal year 2012 strategic plan and the first thing it says is that so much has changed since we last released a strategic plan in 2004.

613-1 cont'd

The first thing that this NNSA strategic plan points to is President Obama's April 2009 speech in Prague in which he enunciated a future world free of nuclear weapons to be a national security goal. And I bring that up, that that is a double-edged sword, but I will reemphasize the fact that, to me, it clearly contradicts the assertion that NNSA makes in the Supplemental EIS that nothing has changed.

Now, for me to cite Obama's Prague speech is, again, double-edged because out of one side of his mouth, Obama, you know, has his lofty goal of a future world free of nuclear weapons. And basically in his next paragraph, he goes, "In the interim, we of course are going to maintain a strong nuclear deterrence."

So it's two sides of a coin, and it's tough

Response side of this page intentionally left blank.

to deal with in that Obama, the administration, subsequently came out with a high-level policy document called the Nuclear Posture Review, and that review specifically endorsed construction of the CMRR project and the nuclear facility. But the one key thing that that review did not do -- and this gets to, I believe, the heart of the argument either for or against the nuclear facility -- that review did not raise the level of plutonium pit production.

The laboratory is very fond of saying that the nuclear facility will not be a facility for pit production, and that's true in a narrow sense, but it's misleading, if not downright disingenuous, to be saying, because what the nuclear facility really is, it is the keystone to an expanded plutonium production complex, that Technical Area 55. And this huge new facility will be linked via underground tunnel to the existing pit production facility.

So to my mind, this is just a semantic argument that I think the laboratory should drop. Just because you have two different facilities under two different roofs, you're making the claim that production doesn't actually take place in this new $6 billion facility at issue here.

That's deceptive. You know, quit saying

613-2

613-2 As stated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA needs to act to provide the physical means for accommodating the continuation of mission-critical analytical chemistry and materials characterization capabilities at LANL beyond the present time in a safe, secure, and environmentally sound manner. Concurrently, NNSA proposes to take advantage of the opportunity to consolidate analytical chemistry and materials characterization activities for the purpose of increasing operational efficiency and enhancing security. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As described in Chapter 1, Section 1.2, of the *CMRR-NF SEIS*, NNSA's ability to perform these capabilities has been curtailed because of safety restrictions at the existing CMR Building; some types of materials characterization work have been suspended because of these limitations. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

52

that. You are setting out again to create this expanded production complex for plutonium pits.

613-2 cont'd

Now, other things that have occurred since the Environmental Impact Statement for the CMRR, we had a prestigious panel of independent experts come out with a study that Nuke Watch initiated, by the way, but a study that concluded that plutonium pits have reliable lifetimes of basically a century. And again, this gets to, I believe, the heart of the need or, better put, the lack of need. Just because plutonium pits last on the order of a century, where is the need for new production at which the nuclear facility is going to play a key part?

And I can see I'm only going to get halfway through my comments, so I look forward to the next round, and I'll get to the lack of alternatives that's being considered in the site Environmental Impact Statement.

But in an attempt to close now, there is no real mission need for this nuclear facility. It is provocative to be building it. I've raised a family. I had to have a job. I'm very sympathetic to the notion that, you know, the population clearly needs jobs. Just try to imagine the jobs that we could create if we put that $6 billion into something else

613-3 NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a). It should be noted that plutonium aging is only one of the variables affecting nuclear weapon system reliability; other variables can control overall life expectancy of nuclear weapon systems.

besides this expansive plutonium facility that is, hopefully, for a shrinking business of nuclear weapons production. (Applause.)

MR. MacALLISTER: Our next speaker is Julie Sutherland, and she will be followed by Marilyn Hoff.

MS. JULIE SUTHERLAND: Hello. I'm a farm worker, and I live off the grid in northern New Mexico. And I love it here. I will need my comment.

A new EIS is needed. As the old one of 2004 is obsolete and inapplicable. The scope of the project has changed dramatically and the price tag has increased from 600 million to 6 billion. We do not need more nuclear weapons. Instead, clean up of legacy waste has to happen, and a return to sanity.

Our children deserve a future free from the terrorist threat that Los Alamos National Lab proposes.

We want our health back. Think of life-affirming alternatives to this technological destruction. Wind and solar energy are the harbingers of the future and sustainable, to boot.

Don't pollute. Reduce, reject this SEIS, and rejoice with peace and love. (Applause.)

MR. MacALLISTER: Our next speaker is

613-3 cont'd

614-1

614-1 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. This *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements.

NNSA notes the commentor's statements about additional nuclear weapons and legacy waste. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for a discussion of the nuclear weapons mission. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

54

Marilyn Hoff, and she will be followed Jeanne Green.

MS. MARILYN HOFF: Thank you for the opportunity to speak. I am Marilyn Hoff. I'm from the northern part of the state. As an aside, I want to say that the Mayor of Taos has offered a room. He is a leader of a band, so he will probably offer a sound system. There's really no reason why these hearings cannot be held in Taos.

615-1

This Supplemental Environmental Impact Statement or SEIS, for the proposed Chemical and Metallurgical Research Replacement Nuclear Facility, intended for the processing of plutonium, with which to make plutonium pits, with which to make nuclear bombs, amongst the pages and pages of inelegant prose have failed to tell the whole story.

This supplemental also fails to achieve the thoroughness of a complete EIS. The EIS pretends to supplement, address the building design that is no longer on the drawing board.

So, now, we find more costly and complicated still evolving designs, yet the final cursory plans from a mere supplemental.

This site is complied by a hardly neutral defense contractor. It is notable for what it does not contain.

615-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

615-2 The *CMRR-NF SEIS* is an SEIS to specifically address changes in the design of the CMRR-NF based on additional seismic information and safety requirements. The design has matured since the 2003 *CMRR SEIS* and more information is available about construction and operations impacts. The description of the Modified CMRR-NF Alternative in Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS* presents information about the two construction options, the Deep Excavation Option and the Shallow Excavation Option.

All proposed new DOE facilities are required to be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment. DOE Order 420.1B, "Facility Safety," requires that nuclear or nonnuclear facilities be designed, constructed, and operated so that the public, the workers, and the environment are protected from the adverse impacts of natural phenomena hazards, including earthquakes. The order stipulates the natural phenomena hazards mitigation requirements for DOE facilities. DOE Standard 1020-2002, *Natural Phenomena Hazards Design and Evaluation Criteria for Department of Energy Facilities* (DOE 2002a), implements DOE Order 420.1B and provides criteria for the design of new structures, systems, and components to ensure that DOE facilities can safely withstand the effects of natural phenomena hazards.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

First, the CMRR-NF is not emphasized. How could it be? Its design is incomplete. Billions have been added to its price tag. The costs of grappling with the building's projected location in earthquake country, and in grappling, too, with the dangerous potential for the plutonium to burst into flame.

Will the sky-high cost of making this building resistant to earthquake, inspire the designer to cut costs on fire suppressants? The SEIS does not say. What if an earthquake cracks the CMRR building wide open, and plutonium ignites as it often does, and the cost-cutting fire suppressant system fails and plutonium oxide billows forth into our surroundings? Nobody will learn what happens next from this SEIS.

So, the SEIS is not really about the CMRR-NF. The SEIS is about jumping through National Environmental Policy Act or NEPA hoops just high enough to give LANL's corporate contractors a windfall of money from Congress.

615-2 cont'd

Also, not in the SEIS are any meaningful opportunities to building this CMRR-NF. The No Action Alternative to the SEIS consists of building the CMRR-NF according to its original design, which

As described in Chapter 2, Section 2.6 of the *CMRR-NF SEIS*, the CMRR-NF would be constructed in accordance with DOE requirements for nuclear facilities, protection, site seismic design, and security. The building design includes safety-class fire suppression equipment. Fire suppression water storage tanks would be located on the lowest building floor or level. The dedicated water source for fire protection within the building and backup generators would ensure fire protection in the case of a power outage. Regarding the commentor's statement about plutonium releases, the dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives, including the impacts of potential accidents.

615-3 The *CMRR-NF SEIS* addresses changes in the design of the CMRR-NF based on requirements related to additional seismic information. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years.

The CMRR-NF SEIS contains three alternatives: Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967). See Section 2.11, Alternatives Considered, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

did not take into account the recently upgraded danger of earthquakes. Thus the SEIS redefines, no action to mean totally stupid action.

The only other alternative involving Los Alamos, $6 billion CMRR-NF contained in the SEIS, is to continue with that plutonium in the old CMR, without refurbishing that building or cleaning up the polluted radioactive mess it has become. The SEIS has redefined this alternative to mean totally stupid, same old, same old.

With nothing but totally stupid alternatives to choose from, we're left with the blurry CMRR-NF, which the SEIS cannot bring into focus.

The SEIS does not contain the No Action Alternative that would truly result in no action. And hence no billions in appropriations.

The SEIS does not contain any of the discussion of the need for a CMRR-NF. Such a discussion will be required in a full-fledged Environmental Impact Statement, but the SEIS falls short of the studies, the considerations that an EIS would require. Thus, the SEIS can refuse to consider refurbishing the old CMR building, or building the new CMRR-NF in a different, safer, cheaper location,

615-3 cont'd

Response side of this page intentionally left blank.

on less shaky ground, or discontinuing the manufacture of plutonium pits/nuclear weapons, or changing the mission of LANL to something more productive.

The SEIS can dismiss such alternatives, and it's inconsistent with the CMRR-NF mission, while venturing no discussion of the pros and cons, or even the purpose of this alleged mission.

Ostensibly we're here to talk about and critique the SEIS, but what this SEIS is not, far outweighs what it is. What it is is a lacking job done with appearances to contend with the NEPA law that requires it. It does the least that could be done to satisfy this law. Its makers may well get away with stretching the NEPA law to give us a mere supplement to cover how the whole process is all about something that is incomplete.

This SEIS professes to assess a not yet fully realized building to be built at extraordinary costs for an extremely dangerous purpose, in an unsafe location, that will bring enormous financial windfalls to unnamed corporations. And the SEIS won't tell us who those beneficiaries are.

615-3 cont'd

The SEIS does not ask who needs any more nuclear weapons per year. The SEIS does not examine

615-4

615-4 NNSA acknowledges the commentor's statements about nuclear weapons and the nuclear arms reduction treaty. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.9, Treaty Compliance, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

58

how come the U.S. should increase its potential output of nuclear weapons, while at the same time signing on to nuclear arms reduction treaty. The SEIS ignores whether making more -- I have only one more paragraph, okay?

MR. MacALLISTER: I won't take the microphone, wrap it up, though.

MS. HOFF: I don't have much left. All right.

The SEIS ignores whether making more nuclear weapons could contribute to nuclear proliferation and to the desire of nonnuclear states and tariffs, to acquire the nuclear weapons for themselves.

The SEIS does not say how making more nuclear weapons of mass destruction can prevent war, while our so-called nuclear deterrents, and see our country engaged in a war without end.

The SEIS disregards whatever possible purpose this useless increase and useless weapons that must never be used, will serve.

SPEAKER FROM THE FLOOR: You can have my time.

OTHER SPEAKERS FROM THE FLOOR: (Could not be recorded, because everybody was speaking at the

615-4 cont'd

Response side of this page intentionally left blank.

same time.)

MS. HOFF: Okay. One more paragraph. Okay. The SEIS passes over the possible deadly plutonium and the use of a bomb factory, like Rocky Flats before it, might bestow on those living downwind or downstream.

615-5

The SEIS avoids the issue of environmental racism, while the Native Americans and Hispanic Americans receive the brunt of LANL's eliminations.

The SEIS does not consider whether the billions estimated to be spent on the CMRR-NF might more productively be spent on green jobs, renewable energy, crumbling infrastructure, environmental needs, and environmental cleanup, especially cleanup on the blight on the land of enchantment known as Los Alamos National Laboratory. (Applause.)

One more. I have one more sentence, one more sentence.

MR. MacALLISTER: You're going to have to abide by the time period. There are lots of people waiting.

SPEAKER FROM THE FLOOR: Let her give the last sentence.

OTHER SPEAKERS FROM THE FLOOR: (Could not be reported, as everybody was speaking at the same

615-5 Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, describes the environmental justice analyses for the three alternatives and concludes that there would not be any disproportionately high and adverse impacts on minority or low-income populations under any of the alternatives. Funding decisions regarding major Federal programs (for example, defense, education, healthcare and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

60

time.)

MS. HOFF: (First part inaudible because people were talking from the audience at the same time.) A complete EIS, the so-called supplement is not the appropriate thing, the appropriate thing that it might be good for is toilet paper. (Shouting and applause.)

MR. MacALLISTER: There are a number of people waiting. Please abide by the time frame, because I don't want to have to take the mike from people. If there's a possibility and we have time left, and we have so far in the other meetings, we will have a second round. But I am going to be cutting people off at their time, because it's part of mutual respect for everybody in the room. Thank you.

The next speaker will be Jeanne Green followed by Margarita Denevan.

It's Jeanne Green. It looks like Jeanne.

MR. MacALLISTER: Thank you.

MS. JEANNE GREEN: First of all, we want a hearing in Taos. Our mayor has requested it, and thus far has been refused a real hearing. We can have a performance, but not a real hearing. And I have these 62 signatures here I want to submit for

616-1

616-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

the record in support of our mayor's request.

That wasn't part of my speech. And I'm going to have to skip through.

But LANL's SEIS does not meet NEPA requirements, because it does not offer a true No Action Alternative. The supposed No Action Alternative is to construct the planned 2004 CMRR-NF, which does not meet current seismic standards, and quote, "The No Action Alternative does not meet NNSA's purpose and need, and thus would not be implemented," unquote. Page S-9. If it has already been determined that this option is not viable, then it's not a No Action Alternative. To not build the currently planned modified CMRR-NF would be a viable option to consider.

Option 3, continued use of the CMR building without extensive upgrades is not an alternative either. Quote, "A portion of the CMR building is located over a fault that could severely damage or destroy the building in the event of an earthquake," unquote.

This is not a true alternative, either, and extensive upgrades to the CMR was an alternative considered and dismissed because, quote, "The cost for geotechnical investigation, structural and

616-1 cont'd

616-2

616-2 The *CMRR-NF SEIS* addresses three alternatives. The No Action Alternative included in the *CMRR-NF SEIS* is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD. Based on new information learned since 2004, however, the 2004 CMRR-NF would not meet the standards for a PC-3 structure as required to safely conduct the full suite of NNSA analytical chemistry and materials chemistry mission work. In addition, as described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, NNSA considers the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated, and the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This latter "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building, distributing the functions assigned to the CMRR-NF among different LANL facilities, or considering other possible locations outside of LANL for the activities that would be accomplished in the CMRR-NF. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level due to seismic and security concerns associated with this 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined to not be a reasonable alternative for a number of technical and programmatic reasons as discussed in the section referenced above. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

security upgrades, et cetera, would be substantial, although not likely to approach those associated with the modified CMRR-NF alternative," unquote, page 2-27.

So the upgrade of the CMR, which is currently being used, and currently could be destroyed in an earthquake was considered and dismissed because it would not be as expensive as building a new CMRR-NF. Hmmm.

By the way, the upgrade option was included in the scoping Notice of Intent, but is not in this supplement.

616-2 cont'd

Furthermore, no cost analysis is included in this document, which is supplementing the EIS 2004 figures.

616-3

So, I go on here about -- so, really, we only have one option being considered, and that is to build the, to be determined, but somewhere around $6 billion building for expansion of plutonium pit production, i.e., analytical chemistry and materials characterization, AC and MC, for nuclear bomb triggers. Oh, no, the SEIS says, quote, "Pit production does not take place at the CMR and would not take place at the CMRR facility," unquote.

This statement is disingenuous, if not an

616-4

e-mail: info@litsupport.com

616-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, and is not a required part of an EIS or SEIS. However, cost will be one aspect that NNSA takes into consideration when making its decision.

616-4 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

outright lie. Expanded special nuclear material, AC and MC, will directly support the expanded pit production capabilities of up to 80 pits a year, as stated in your 2008 document. Besides, why do you need six metric tons of plutonium on-site if you are not manufacturing nuclear bomb triggers of one kind or another?

616-4 cont'd

So, I'm going to have to skip some of this, but I'll go down to this. This is not how the NEPA process is supposed to work. Besides the lack of any alternatives to the new CMRR-NF there are serious lapses of logic and consideration of fact in this document.

We need a new and comprehensive Environmental Impact Statement to address the many flaws and omissions in this SEIS produced primarily by SAIC, Science Applications International Corporation. SAIC is a Fortune 500 technology company worth $8 billion that partners with Boeing on defense projects, and sells products to the Department of Defense, the Army and Navy, and the Department of Homeland Security. There's an obvious conflict of interest here.

616-5

SAIC has produced a document that absolutely excludes the very highly possible offsite

616-5 Before DOE awards a contract to prepare an EIS, or in this case an SEIS, it reviews the contractor's proposal and makes a determination that there is no conflict of interest. The simple fact that SAIC does work for agencies or companies involved in defense work does not constitute a conflict of interest.

616-6 Chapter 4, Section 4.2.10, presents the accident analysis for the 2004 CMRR-NF. Accidents involving this facility would be expected to result in very large, unmitigated releases of radioactive materials.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

NNSA has prepared a classified appendix to the *CMRR-NF SEIS* that evaluates the potential impacts of malevolent, terrorist, or intentional destructive acts. Substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. Chapter 4, Section 4.2.10.3, presents information about the classified appendix.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

64

consequence of possible accidents like Fukushima, terrorists -- that's classified -- earthquakes. The area sits on five fault zones. Spills, without immediate mitigation, and contamination of our air, land and water.

To say that the chances of a facility accident for the preferred alternative is one chance in 11 million per year, page S-31, is farcical. I would like to see your statistical models for an accident at Fukushima, or how about 9/11? One chance in how many million? I could find no real mention of terrorism in this document.

616-6 cont'd

The statistical computer modeling you used has no relationship to reality. Quote, "Operation of the modified CMRR-NF and RLUOB, would have no impact on surface water or groundwater quality," unquote. We are supposed to believe that when there's already contamination with radionuclides of our surface water all the way down to Elephant Butte Lake.

616-7

Here's another. Under normal operations, quote, "The average annual -- I'm almost to the last paragraph here, okay?

SPEAKER FROM THE FLOOR: You can have my time.

MS. GREEN: Under normal operations, quote,

e-mail: info@litsupport.com

616-7 There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, including reports of contamination in Cochiti Lake and the Rio Grande. NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF.

616-8 The *CMRR-NF SEIS* addresses public health and safety of the local communities, including impacts on water supply. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, and Appendix C of the SEIS.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

65

"The average annual individual risk of developing a latent cancer fatality is one chance in 500 million," unquote, page S-30. We don't have 500 million people in New Mexico, but we have more than one cancer fatality from radiological contamination by the Lab in our air, water, soil, and food.

616-8 cont'd

To conclude, the SEIS -- I'm wrapping up -- is totally insufficient and illegal, we need a new EIS, and in it consider this alternative, do not build the CMR-NF. We do not need more nuclear bombs just to line the pockets of Bechtel. Decontaminate and decommission the current dangerous CMR, sitting on an active fault system.

616-9

SPEAKER FROM THE FLOOR: Bring in the Mexican guy.

MS. GREEN: Temporarily consolidate current missions at the Rad Lab and PF-4, until it all can be decommissioned. And reallocate the 65 percent of your budget that goes for unneeded nuclear weapons, instead to nonproliferation in accordance with NNSA's mission. Clean up the tons and tons of radioactive waste that is migrating to our life sources of direct -- our drinking water, air to breathe, and soil to grow food, in accordance with the consent order.

616-10

FAX (505) 843-9492
1-800-669-9492
e-mail: info@litsupport.com

616-9 NNSA acknowledges the commentor's support for a new EIS. Based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. Please refer to Section 2.2, NEPA Process, of this CRD for more information.

As noted in the response to comment 616-2, the *CMRR-NF SEIS* addresses three alternatives: (1) a No Action Alternative, to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 *CMRR EIS* and selected in the associated 2004 ROD and the 2008 *Complex Transformation SPEIS* ROD; (2) the Modified CMRR-NF Alternative in which a Modified CMRR-NF would be constructed and operated; and (3) the Continued Use of the CMR Building Alternative in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This third, "no build" alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. Furthermore, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. The CMRR-NF SEIS does addresses the possible impacts from decontaminating and decommissioning the existing CMR Building in Chapter 4, Section 4.5.

616-10 In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

MR. MacALLISTER: Please, just wrap up, okay?

MS. GREEN: These are our tax dollars, not Bechtel's, and their cohorts, SAIC, and there is no justification for building more nuclear bombs, including the profit motive. (Applause.)

MR. MacALLISTER: If the pattern of running well over the time continues, I will have to start taking the mike, because we still have a large number of comments left. If we run out of time, these people are denied their right to comment.

SPEAKER FROM THE FLOOR: Who decides how long the meeting goes on? Why do you get to make these rules up?

MR. MacALLISTER: Because the rules are the rules --

SPEAKER FROM THE FLOOR: Oh, no, that's (expletive deleted).

MR. MacALLISTER: Sir, I will have you removed from the meeting if you make another outburst like that. Your language is inappropriate, your decorum is inappropriate. One more outburst like that, you will be removed. I have security here ready to do that. I'm sorry. I won't tolerate that.

(Noise made by several audience members.)

Response side of this page intentionally left blank.

MR. MacALLISTER: The next speaker is Margarita Denevan, and she is followed by J.R. Trujillo.

SPEAKER FROM THE FLOOR: It's the only chance we have to talk. It's horrible.

OTHER SPEAKERS FROM THE FLOOR: Yeah, we all need to speak.

OTHER SPEAKERS FROM THE FLOOR: Take all the time you want, guys.

MS. DENEVAN: Well, so many of the people who have preceded me have said a lot of the things that I think and feel.

But what I wanted to say is that when we talk about CMRR-NF, what we're really talking about is national security, the budget, jobs, and then I realized, welfare.

National security -- now, I'd like to know, how secure can we feel when we know they're building this building over a seismic area that recent reports say could have the potential of what happened in Japan? So how secure are we when we know they are building this? And then how secure are we when we know that in the building of the facility itself, there's all of this green gas, greenhouse gas emissions. So how secure can we feel when we know we

617-1

617-1 NNSA acknowledges the commentor's concern that an accident similar to the one that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Construction and operation of the CMRR-NF is expected to add very little to LANL's overall greenhouse gas emissions (refer to Chapter 4, Sections 4.2.4.2 and 4.3.4.2).

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

68

are breathing this stuff that's poisoning us?

And think about all of the water that's necessary. Somebody brought that up. We all know, we are -- we need water. We are at a water shortage. How much water is used for the production of these pits that they say they are not building, yet I've heard the term over and over that they want to build 80 a year. **617-2**

And we've heard the shelf life of every pit is a hundred years. And I recently read that there's as many as 14,000 of these pits that are at our disposal right now. So why do we need more?

Somebody asked that the -- whatever the strategic plan, never takes into consideration what is the purpose of this building? And what is the need? We don't need it. When this is said, it's obsolete. Nuclear weapons were obsolete the minute they were produced. We don't need them. 9/11 happened, the whole world knows -- knew at that time, that the United States had the largest nuclear weapons, supplies stockpiled. It didn't stop 9/11. So we need this for national security, oh, dear, dear me. I don't believe it. **617-3**

Then what about the nuclear waste? We don't know what to do with the nuclear waste we have, and yet our government is proposing to take **617-4**

617-2 NNSA notes commentor's concern with water usage in construction and operation of the CMRR-NF. Water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

617-3 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

617-4 Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12, of the *CMRR-NF SEIS* describe waste management impacts of all of the alternatives. As addressed further in Section 2.5, Cleanup and Waste Management, of this CRD, it is expected that sufficient disposal capacity would exist for all radioactive waste projected from any of the alternatives addressed in the *CMRR-NF SEIS*. Low-level radioactive waste disposal capacity currently exists at LANL at Area G within TA-54. When the disposal units at the existing Area G location are closed, plans are to transfer low-level radioactive waste disposal operations to the adjacent Zone 4 within

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

69

$6 billion of our tax money to produce more nuclear waste. And it makes no sense to me at all.

And, then, just think, national security. How secure are we when we know that they are proposing to bring even more nuclear waste to New Mexico? Because we are empty, I guess.

617-4 cont'd

Okay. There's $6 billion, tax dollars, that are going to be spent to build something we don't need, and we can't possibly use. Just think, a nuclear war where the countries are firing these things at each other, who's going to survive it? We don't need these pits. Oh, dear me.

Then, the budget. All of that money went at a time when -- just think, how many times have we heard that a democracy depends on an educated citizenry, and what happened today in New Mexico? Well, no, I come from Taos. Actually, I live north of Taos. In our school district, they're laying off 23 teachers. That means there are going to be more kids per class, and how many times have we heard the smaller the class, the greater the learning?

And if a democracy depends on educated citizenry, does that -- what's that mean for our democracy? So we need that money to save our democracy.

617-5

Area G. Offsite disposal capacity also exists at both commercial and DOE locations.

Transuranic waste disposal capacity currently exists at WIPP. If waste disposal capacity at WIPP is no longer available over the operating life of CMRR-NF, then any transuranic waste generated at CMRR-NF or elsewhere at LANL would be safely stored until additional disposal capacity becomes available. Please refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

617-5 Funding decisions regarding major Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

70

And then the people who came up and said, from the building industries, okay, what I would like to know, is if we can build this building to produce plutonium pits, why can't we build that building to produce renewable energy? We have scientists and engineers who are working there. Why can't they take their knowledge and use it to produce renewable energy? We have asked people whose jobs have been outsourced. I'm sorry. They have been -- their jobs have been outsourced. We've asked them to retrain. I would like to say, why can't scientists and engineers be retrained to produce renewable energy?

617-5 cont'd

Thank you so much.

MR. MacALLISTER: Our next speaker is J.R. Trujillo, and he will be followed by Jean Nichols.

MR. J.R. TRUJILLO: Hi. My name is J.R. Trujillo, and I looked in the room and I wished I knew more of you. I am happy, though, to see that there are so many people here that care about our community. But, you know, Española has a lot of difficulties, and one of the difficulties that we face is a lack of opportunity, a lack of economic growth, and as a family man, I have a wife and children, and as a businessman, as a past City Councilor here in the City of Española, we really

618-1

618-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

hope that this project moves forward. We hope it provides an economic engine that can help our children obtain jobs and education. We hope it will help take some of these people off of their path to drug abuse. We hope that we will see a brighter future for this part of the country, because I will tell you, there's very little for our people to do, very little for our people to have. And it's becoming dire.

Our mayor, Mayor Lucero, has asked me to come here tonight to voice that we were in favor of this project. We hope that these hurdles can be cleared. We hope that the project starts quickly.

I'm also one of the board members for the Regional Development Corporation. We are in favor of this project. We hope it moves ahead quickly.

And, again, as the Chairman of the Small Business Advisory Committee for the City of Española, the small businesses hope that this project moves ahead swiftly.

We have, of course, asked that the contractors up on the hill, as in the past, utilize our small businesses, utilize our workforce, to help with this great effort.

And if we can give any assistance to you,

618-1 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

please call on us to do so. Thank you.

MR. MacALLISTER: Our next speaker is Jean Nichols, followed by Joni Arends.

MS. JEAN NICHOLS: I really feel for the people who are concerned with getting jobs and everything, but like other people said, there's many other ways to have jobs and, you know, there could be a lot of other ones. We have to really talk to -- well, I don't know, who do we talk to? We've been talking for 35 years.

You know, I didn't prepare anything tonight because I wasn't even going to come. It's such a sham. We need a new EIS on this. This is an illegal and immoral process. You know, whatever -- I thank so much all the people who came with all of their prepared statements.

619-1

And I want to remind you that some people only spoke for a minute, or something, so I bet if you averaged it out, the people that went over a little, it was okay.

I live in Peñasco, and we're 40 miles downwind of the Lab, and during the Cerro Grande Fire, we got the smoke predominantly most of the time, and we're the agricultural kind of cradle of the area up there.

619-1 NNSA notes the commentor's statements regarding the need for a new EIS. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

In 2006, the dust in my house was determined to be too high with strontium-90, and the plum trees on La Yegua were too high with americium, and the people who tested it, told the people living there, do not feed these to your grandchildren. I mean, this is real. You know, I have test results from this.

This is, you know, one thing to get the jobs, but, you know, we say, okay, let's have a bright future. It could be a bright future that goes up in a flash.

You know, my next door neighbor, he's got black lung disease from, you know, his job that he had, you know, working in the mines. It's insanity what we are doing here. And I know that it's the political will, and so it's not the people here, it's not people at the Lab who can do it. It's Congress.

As I pulled into the parking lot today, I was listening to the news, and they were saying, you know, Congress's biggest problem right now is the budget deficit, and yet we're going to spend $6 billion to make nuclear -- more nuclear weapons.

You know, it makes you want to cry. There's a nuclear numbness going on. That's why there isn't, you know, more people here speaking out,

619-2

619-2 Current air sampling programs at LANL include ambient nonradiological air monitoring programs, a radiological ambient air sampling network, and stack sampling for radionuclides. All LANL operations, regardless of when they began, currently comply with state (New Mexico Air Quality Control Act) and Federal (Clean Air Act, Toxic Substances Control Act, DOE, and EPA) regulations and have valid permits. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF.

The question about contaminated fruit was addressed in an issue response in the CRD for the 2008 *LANL SWEIS*. In May 2006, the New Mexico Environment Department reported detecting americium in a single fruit sample collected in Dixon, New Mexico, one of the sites where LANL collects regional samples. LANL scientists evaluated New Mexico Environment Department data and concluded that this was likely a "false positive." Americium is a heavy radioactive element that is found as a contaminant in the plutonium used for research and pit fabrication and is one of the radionuclides for which LANL routinely monitors. Low concentrations of americium are found throughout the environment, mainly as a result of past releases to the atmosphere from aboveground nuclear weapons tests.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

74

because people just do not want to think about it. We are expected every day to accept unacceptable information, and unacceptable things.

You know, the fact that the EIS in 2003 or 2004, it's totally changed its scope. That's why we needed a brand-new EIS. And what with the whole global weirding that is going on, and just the tornadoes -- I mean, there's going to be more of that stuff happening all the time. There should be jobs for everybody just going to help with those disasters.

619-1 cont'd

You know, it's time for the world community to get together and take care of the world. I know you don't care at Los Alamos about the people and our health, but, you know, there's so many people with brain tumors, cancers. I was diagnosed with the cancer last year. You know, could it be that I have strontium-90 in my dust? I mean, I don't know. But it's just unreal. The lack of heart and the lack of common sense and, I mean, it's just insane.

Okay. I will give my last few minutes to the next person who's prepared.

MR. MacALLISTER: Our next speaker is Joni Arends, followed by Bonnie Bonneau.

SPEAKER FROM THE FLOOR: I love you, Joni.

Response side of this page intentionally left blank.

OTHER SPEAKER FROM THE FLOOR: I love you, too.

MS. JONI ARENDS: Good evening. My name is Joni Arends. I'm with Concerned Citizens for Nuclear Safety.

So Bruce, I said a couple of times in the back of the room that I would yield some of my time to other speakers, and I want to find out how much time I have right now.

MR. MacALLISTER: You have the full five minutes, unless you want to yield to somebody else right now.

MS. JONI ARENDS: The previous speaker yielded the remainder of her time to the next speaker. So, seven minutes?

MR. MacALLISTER: You have five minutes per speaker.

MS. JONI ARENDS: So I want to thank Bruce and John for making changes to the format this evening, so that it's actually more civil than it was in Albuquerque and more civil than it was last night in Los Alamos. So thank you.

And I want to thank the folks who traveled long distances to be here, because the National Nuclear Security Administration could not figure out

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

76

whether they could have a hearing in Taos. We know the request was made almost a month ago. So, I want to appreciate everybody who spent energy and gasoline and money to get here.

So for the gentleman who spoke earlier who didn't feel any effects from LANL, I just want to reiterate some of the points that have been made over the times that LANL has released contamination into the air, into the soil, and into the water.

And one example of the contamination into the air was from the early operations, where emissions from one facility at the Lab, in the late '40s, early '50s was more than all of the releases of plutonium from Savannah River, from the Hanford Production Facility, and from Rocky Flats, another production facility.

That contamination is documented in the Los Alamos Historical Document Retrieval and Assessment Project.

With respect to contamination in the soil, there's over 21 million cubic feet of waste buried contamination is migrating to groundwater, to surface water. Some evidence of buried waste is that in one site in particular, there were PCBs at 38,000 times the human health standards. That site has now been

Albuquerque, NM 87102
(505) 843-9494
FAX (505) 843-9492
1-800-669-9492
e-mail: info@litsupport.com

620-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Chapter 2, Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

620-2 The commentor is referring to a dose reconstruction project initiated by the Centers for Disease Control and Prevention to estimate the possible exposures of populations from releases of radioactive and chemical materials from LANL during its historical operations. A final report addressing the first phase of the project – the Los Alamos Historical Document Retrieval and Assessment project – has been published (ChemRisk et al. 2010). This report addresses past operations at LANL and is not representative of current processes.

Current air sampling programs at LANL include ambient nonradiological air monitoring programs, a radiological ambient air sampling network, and stack sampling for radionuclides. All LANL operations, regardless of when they began, currently comply with state (New Mexico Air Quality Control Act) and Federal (Clean Air Act, Toxic Substances Control Act, DOE, and EPA) regulations and have valid permits. NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF.

Regarding the comment about contaminant migration, there are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is cleaned up, but they wanted to ship that waste through Antonito in polyethylene sacks with zippers.

And with respect to contamination in the water, contamination has been found in the Buckman Wells, contamination has been found in the Rio Grande, contamination has been found in the canyons that flow from the lab to the river.

620-1 cont'd

And speaking of water, the EIS says in table 4-52 that the modified nuclear facility alternative will use 16 million gallons of water per year. That's about 49 acre-feet. That's a lot of irrigation water. That's a lot of water that could be used for -- as David was talking about -- watershed restoration, adjusting to climate change, 49 acre-feet per year for nuclear weapons manufacturing, nuclear weapons plutonium complex at the laboratory.

It's also important to know that Los Alamos County has 1,200 acre-feet of San Juan/Chama water that they haven't diverted, and they have presented a proposal to the Buckman Diversion Board to divert that water at the Buckman and pipe it across the river and lift it 1,000 feet to the White Rock water treatment facility.

So I just want to put everybody on notice

620-3

conducted at LANL (described in the *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, for more information on cleanup of past contamination.

All shipments of radioactive and chemical waste are conducted in accordance with Federal and state requirements.

620-3 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

78

that like right now, the river is running about 350 cubic feet per second. And that's pretty low right now in this drought condition. And Eldorado, south of Santa Fe, is now in class 1 or area 1 water restrictions. And Las Vegas is, too. But the flow in the river right now doesn't include the fact that the County has 1,200 acre-feet a year to be able to divert.

Now, the County and the lab have a relationship, so it's unclear how much of that 1,200 acre-feet per year would be allocated to laboratory operations. So I just want to put that out there, that this is another piece to this whole plutonium complex.

620-2 cont'd

I want to talk more about the seismic issues, so I'm going to stop right now and hopefully there will be another opportunity to speak. And we have some more of these signs in the back if anybody wants any of them. (Applause.)

MR. MacALLISTER: Our next speaker is Bonnie Bonneau, followed by Pat Vigil.

MS. BONNIE BONNEAU: I'm Bonnie Bonneau. I'm from the Taos area. And I have been to a lot of these public hearings over the years, and you know, you call them public hearings, but it really implies

621-1 NNSA notes the commentor's concerns. NNSA considers every comment received by U.S. mail, email, toll-free telephone or fax line, or at the public hearings. NNSA has prepared a classified appendix to the *CMRR-NF SEIS* that evaluates the potential impacts of malevolent, terrorist, or intentional destructive acts. Refer to Chapter 4, Section 4.2.10.3, Intentional Destructive Acts, for a summary of the classified appendix.

Please refer to Section 2.2, NEPA Process, of this CRD for more information.

that somebody's listening and that we're being heard, and so often we feel like we're just talking to the wind and nobody really gives a poop what we're saying anyway. And I really hope you guys will like open up your minds and listen with your hearts and really pay attention, because it's very important. It's not just, you know, dollars and cents. It's life and death.

The lab is endangering New Mexicans in so many ways. They create health hazards and poison our air and our earth, and the more and the bigger and the more complex Los Alamos becomes, the huger a terrorist target it becomes with the biological labs up there. And TA-55 alone -- I mean, the whole process has been flawed from the beginning. To begin, you know, your environmental studies after you have dug a giant $200 million hole is really a very defective way to do an Environmental Impact Study.

It seems like you never really considered any alternatives. I mean, it's absolutely insane to put bomb factories on top of a humongous volcano. It's the biggest volcano on the continent and who wants to build bombs on a volcano? This is a totally insane alternative, that you didn't find any place in the state, you know, that doesn't have a giant rift

621-1 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

80

621-1 cont'd

or a fault going the whole way across the state and volcanic activity, and venting steam through hot springs all around it, you know. I just can't imagine people up there have any brains at all sometimes.

All the alternatives are insane and there hasn't -- not one reasonable one was suggested for, you know, if you really feel like you have to behave like this and build bombs and plan to murder people as your hobby or your way of making a living. But maybe you should have considered like that salt flats or someplace in Idaho or someplace on solid ground.

621-2

TA-55 is extremely old and it really needs to be decommissioned and decontaminated itself. I bet you anything it's a Superfund site. I bet if you had the Geological Service or the Army Corps of Engineers go through and do an honest analysis of TA-55, you'd find it was just ready for decontamination as, you know, a CMR building, and you know, you should not be adding on to it. Those tunnels they mentioned, you know, nonspecific -- TA-55 has got to be in a real Environmental Impact Statement and not, you know, just tagged onto some EIS supplement at the TA-55. The Environmental Impact Statement will be the only first step if you

e-mail: info@litsupport.com

621-2 NNSA acknowledges the commentor's support for a new EIS. Based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. Please refer to Section 2.2, NEPA Process, of this CRD for more information.

The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years.

621-2 cont'd

really seriously wanted to pursue building bombs at Los Alamos, which is not a very good idea for anybody, either to build bombs or -- that's about as dumb a place as you can build them, and making a mockery of the NEPA process. And you should like shut down the project right now and sort it out in a more intelligent way, please. (Applause.)

MR. MacALLISTER: Our next speaker is Pat Vigil, followed by Beata Tsosie. Pat Vigil?

I think he left.

All right, I'll come back to him. Maybe he stepped out. Beata Tsosie?

MS. BEATA TSOSIE: (In Navajo.) My name is Beata Tsosie Peña.

622-1

I'm against the CMRR-NF, an acronym for insanity. It is not wanted or needed here. It is not needed in a world struggling for peace, for healing, reprieve from violence.

I'm in solidarity with my respected sovereign government. The Tribal Council of Santa Clara Pueblo, Kha'p'oo Owinge, passed Resolution Number 08-16 opposing the expansion of the current CMR facility and any activity that would increase pit production and make the facility permanent. (Applause.)

It is of vital importance for

622-1 NNSA notes the commentor's opposition to the CMRR-NF, pit production, and the existence of nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

NNSA has undertaken public outreach efforts to ensure that tribal members understand the project and its implications. NNSA meets regularly with governors and others representing the Pueblos and tribes near LANL.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

622-1 cont'd

government-to-government relations to be respected, that our tribe is not subordinated by not being heard. Like other tribal leaders, I am concerned for our well-being and health, our cultural preservation, our rights as indigenous peoples. Whether the US recognizes these rights or not is irrelevant. They exist, we exist.

622-2

I am afraid because of the numerous safety implications that come with the instability of the geological strata beneath this facility, which are not addressed adequately in the current EIS, that increased seismic hazards are not addressed in this Environmental Impact Statement. The problem of forest fires is not addressed, either. The desecration of our sacred sites, the preservation of my people and all people, future generations, the plant people, the animal people, the insect people, the water beings, the cloud beings, are not addressed in this EIS. A new EIS must be created. This process of public comment is not meaningful except for this moment, all of us here together, which I'm grateful for and I appreciate.

622-1 cont'd

It is not relevant. We are going through motions that are severely flawed. We deserve real communication and dialogue. I demand, as a mother,

622-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive as a citizen, that this project is frozen, halted, stopped. I demand that someone involved in the final decision-making process talk to me and my pueblo, the surrounding communities, and sit down and listen to us, explain to us why we are an expendable population, why the label "national sacrifice zone" has never been retracted, why our health care is administered by the military. Why there has never been cleanup in accordance with the 2005 New Mexico Environmental Department consent order, why no health studies -- if this nuclear complex is so great for our economy, then why has our county remained the poorest in the nation and Los Alamos the richest?

622-1 cont'd

622-3

My heart goes out to workers who are being split in two, and I resent our community workers who are being put in the predicament of having to choose between a livelihood that supports their families and life. We need to heal from the split in our spirits this contradiction against our life ways of being land-based people, yet trying to survive in an imposed culture of violence.

The jobs created by this facility are not permanent, not sustainable. The billions that would be spent making billionaires richer and our communities poorer on so many levels -- spend it

materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources). Also, refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Impacts on all resource areas are included in Chapter 4 of the SEIS. NNSA does not agree that a new EIS is required.

622-3 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

As summarized in Chapter 3, Section 3.11.4, of the *CMRR-NF SEIS*, a number of health effects studies have been completed or are underway for LANL. Chapter 4, Section 4.6.1, of the 2008 *LANL SWEIS* provides additional detail on these studies. See the Centers for Disease Control and Prevention (CDC) website (http://www.cdc.gov/nceh/radiation/brochure/profile_los_alamos.htm) for more information on the status of the LAHDRA study.

622-4 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government and economic impacts. Funding decisions regarding major Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

instead on our schools, health care, health studies, cleanup of legacy waste, true sustainable energy and preservation of our forests and historical and cultural sites. Thank you. (Applause.)

622-4 cont'd

MR. MacALLISTER: Our next speaker will be Marian Naranjo, followed by Lisa Putkey.

MS. MARIAN NARANJO: My name is Marian Naranjo. I'm a member of Kha'p'oo Owinge, known as Santa Clara Pueblo. I'm a mother of four children, and a grandmother of six. I reside at Kha'p'oo Owinge. I'm a lifetime potter and also the founder and director of a community-based organization at Kha'p'oo Owinge called Honor Our Pueblo Existence, or HOPE.

I would like to thank the NNSA for this opportunity to make comments on the Draft Environmental Impact Statement for the construction and operation of the proposed CMRR project and also for the opportunity to speak my truth.

I would like to begin by making it clear the geological function and what this place means to me and to many pueblo people. This area, our Jemez Mountains, is a dormant volcano with many layers and many types of earth. The volcanic flow formed the finger-like mesas presently known as the Pajarito

Response side of this page intentionally left blank.

Plateau. This system was naturally designed so that the cloud blossoms could make and bless us with rain and snow that is naturally stored and filtered through the rocks so that the springs throughout the area could provide living things with pure water. This is known as the Pajarito fault system. This place breathes and moves. This place is the aboriginal homelands of the pueblo people. This place has sustained our people since time immemorial. These ancient mountains are a place that continues to nurture our life ways as they have throughout millennia.

The peoples of this area have always understood their responsibility in a relational coexistence as the caretakers of this place, because we are this place. As land-based people, in the short 65-plus years since the Manhattan Project, we have witnessed how the modernized world through industry and technology has changed our present and future relationship to the land.

When the United States Government and the military began its operations at LANL in 1943, the land was seized under a set of values that separated the peoples from the land. The purpose was to create weapons of mass destruction. It was an unnatural

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

86

occurrence that changed life as we know it. The culture of violence was forcibly incorporated into our story. It is truth to say that all people, everyone in this room, are inherently interconnected with the land. Our ecosystems must be respected and cared for so that our communities are healthy now and into the future. This is the true national security. If we don't take care of the land, air, and water, it will not take care of us.

On March 1, 2005, a consent order was signed with the New Mexico Environment Department as a Department of Energy commitment that requires cleanup of Area G, the nuclear dump site at Los Alamos National Laboratory. From what I understand, tons of uncharacterized wastes from nuclear weapons research and manufacturing is stored in unlined trenches, pits, and shafts. It's evident that the proposed CMRR will only add to contamination and the waste, especially when it plans to store six metric tons of plutonium.

This does not make sense to me, especially when looking at the amount of nuclear waste there is, and no plan in place on where or what to do with it. It also makes no sense to me why DOE/NNSA wants to build this nuclear facility in a place that is

623-1 The Consent Order referred to by the commentor includes Material Disposal Area G among the specific sites to be addressed in accordance its requirements. Note however, that there is a difference between the waste that has been disposed at Material Disposal Area G and the six metric tons of plutonium mentioned in the comment. The plutonium is not waste and would be stored within a vault within the proposed CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

unstable geologically and, furthermore, changes the plans, after the fact of the seismic hazards analysis, to excavate 220,000 cubic yards of earth under the facility and fill the hole with concrete.

It's bad enough that DOE/NNSA wants to continue destroying and desecrating this sensitive natural earth system, much less spending taxpayers' money on mistakes and taking chances with Mother Nature. If you want to take chances, go to our casino.

I don't mean to be disrespectful, but I hope you can see where I'm coming from. Do you know what $4.5 billion could do to clean up the environmental impacts that still have not been adequately addressed and restore this sacred place?

I also don't understand why building this facility and sending out an Environmental Impact Statement is part of the NNSA mission. I understand the NNSA's mission's responsibility is for the management and security of the nation's nuclear weapons and nuclear nonproliferation, not building a nuclear facility with capabilities to make more than it's allowed presently.

I thought nuclear nonproliferation meant to stop the spreading of nuclear weapons. Was I

623-1 cont'd

623-2

623-2 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government and purpose and need to construct the CMRR-NF. Funding decisions regarding major Federal programs (for example, environmental restoration) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA is charged with managing the Nation's nuclear weapons complex and, in this role, prepares environmental impact statements for proposals affecting the complex.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

88

dreaming that there's a START treaty and that the president called for a nuclear-free world?

I understand that it's now recognized that the old CMR was built on two faults. Is this not a sign or warning to rethink this portion of the DOE/NNSA/LANL Complex Transformation operation in this place?

For the past several years, there have been government ads, programs, and training on prevention of all types of things in order to be healthier. It would be good for NNSA to consider taking their constituents' advice on prevention. It would be terrible if NNSA had to respond to a nuclear or radiological emergency at its own safe facility because of a natural disaster, such as seismic activity, and this is also part of the NNSA mission responding to nuclear and radiological emergencies in the United States and abroad. At this time, I know of no emergency evacuation plan for surrounding communities. Does that mean in case of an accident or radiological release, we shelter in place? Are we then or are we already stamped as collateral damage, even though the risks of building this nuclear facility --

MR. MacALLISTER: I need to get you away.

623-3

623-3 Chapter 3, Section 3.11.6, Emergency Preparedness and Security, of the *CMRR-NF SEIS* addresses emergency response preparedness. Emergency response facilities and equipment, trained staff, and effective interface and integration with offsite emergency response authorities and organizations support NNSA's emergency management system at LANL. LANL personnel maintain the necessary apparatus, equipment, and a state-of-the-art Emergency Operations Center to respond effectively to virtually any type of emergency, not only at LANL, but throughout the local community as well. Additional information on the Emergency Operations Center can be found in the 2008 *LANL SWEIS.*

SPEAKER FROM THE FLOOR: She can have my time.

SPEAKER FROM THE FLOOR: We want to hear her now.

MS. MARIAN NARANJO: It's just a little.

SPEAKER FROM THE FLOOR: I can give her a little bit of my time.

MR. MacALLISTER: Do it quickly, because we have lots of people. Hopefully we'll have time for a second round.

MS. MARIAN NARANJO: Are there agreements for compensation and health care for generations to come?

This proposed action by the NNSA is not a pleasant thought for me or for other native and indigenous people. We are not blind to the actions taking place globally to other native and indigenous people in the name of profit. History has already been written of the manners of this government to the seizing of native lands and natural resources for profit for a few. As a member to an Accord Tribe, I respect the government-to-government relationship Santa Clara has with DOE, although I have seen actual proof of consultation in other EISs such as the Greater-Than-Class-C Draft EIS, but I did not see

623-4

623-4 Chapter 5, Section 5.7, Consultations with Agencies and Federally Recognized American Indian Nations, of the *Final CMRR-NF SEIS* has been revised to include more information regarding government-to-government interactions with the Pueblos that are specific to the SEIS.

A section has been added to Chapter 5, Section 5.7.1, to describe how NNSA carries out consultation requirements with federally recognized American Indian Nations.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

90

this in the CMRR EIS or the CMRR SEIS.

I'm not finished, but --

MR. MacALLISTER: Thank you. Our next speaker will be Lisa Putkey, followed by Reverend Holly Beaumont.

MS. LISA PUTKEY: Yo. Hey. I'd like to remind people that there are some lovely snacks over in the corner provided by Donea and myself to help you guys. You know, when I get depressed and anxious and stressed about the death of my community through radioactive contamination, it helps to eat something good.

My name -- sorry. I'm sick today. My name is Lisa Putkey. I moved here to Chimayo a year ago. Chimayo, New Mexico. I love it. Sadly, I wish that I could say that this is the place that I would love to raise my family, but whenever I think about having children here and having children, with all the releases that have already been in the area and all that are going to come, it scares -- it scares me. It scares the (expletive deleted) out of me.

I work with an organization called Think Outside the Bomb. We came -- I came here and moved here from Washington, D.C., where I was working on a national level to kill the CMRR project along with

Response side of this page intentionally left blank.

two other facilities that make -- together with Oak Ridge, Tennessee, here in Los Alamos, and in Kansas City, Missouri, these three facilities make all the parts of a nuclear weapon, and all three of them happen to be being rebuilt with four times the capacity to make new bomb parts.

That's real funny, especially when we're saying we're going to disarm and we already have 10,000 nuclear weapons, just about, and 2,000 that are on hair-trigger alert, well, between us and Russia, just floating around, floating around the world ready to be unleashed to obliterate the populations.

I want to talk a little bit about plutonium, six-metric-ton vaults of plutonium. Plutonium, as it's been described to me, is the most carcinogenic substance known to exist. Carcinogenic, I mean cancer. One little invisible speck about ten sizes smaller than the width of a human hair can cause cancer, if inhaled. I'm just going to repeat what Joni said earlier. Joni says --

624-1

Whoa. Was I too loud? I'm sorry. You don't need to turn me off.

As Joni says -- can you raise it? I mean, I have a really sore throat right now. Okay, thank

624-1 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. The *CMRR-NF SEIS* addresses public health and safety of the local communities, including impacts on water supply. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, and Appendix C of the SEIS.

Chapter 3, Section 3.11.4, Health Effects Studies, of the *CMRR-NF SEIS* includes a summary of a number of epidemiological studies that have been conducted in the LANL area, as well as a summary of cancer incidence and mortality figures for the Los Alamos region as derived from data from the National Cancer Institute. During the period 2003 through 2007, the annual cancer death rate for Los Alamos County was smaller than that for the state of New Mexico as a whole, and for the entire United States. The cancer incidence rates, however, of melanoma of the skin, prostate cancer, thyroid cancer, and female breast cancer were elevated in Los Alamos County with respect to state averages, while cancers of the lung, colon, and rectum occurred at rates below the state averages.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

you. I'll try. I get excited.

So I'm talking about plutonium and a six-metric-ton vault, so a molecule ten sizes smaller than a human hair can cause cancer, in a six-metric-ton vault up on a fault line in Los Alamos that we are downwind of. Interesting.

624-2

Joni talked earlier about the years between 1948 and 1955, that the Los Alamos Historical Document Retrieval Assessment Project showed that in that amount of time, from that one facility, there were 12 instances where plutonium was let out into the air. This area is more contaminated than Rocky Flats, which was closed. It was closed because of the contamination of the community. More contaminated than Rocky Flats, Savannah River site, and Hanford, in just that small window. We are most contaminated site of plutonium in this country, and they want to bring six metric tons. That's tripling our current capacity.

624-1 cont'd

Why? Why do we have to continue to bear the same burden when we've already suffered? I have been living here a year, and already I have noticed that there are so many health problems. So many people have diabetes. So many people have cancer. And rare types of cancer that you don't see

624-2 There are established programs at address the monitoring of air, water, and soil contamination in the area surrounding LANL. The results of these surveillance efforts are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). An element of this monitoring program is conducted to detect contamination that has resulted from past practices (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5). To address contamination from past practices, NNSA intends to continue activities to implement the Consent Order, which addresses environmental restoration of past contamination and disposal sites, such as Material Disposal Area G. NNSA does not consider environmental restoration to be optional and progress on implementing those efforts is not linked to decisions on construction of the proposed CMRR-NF; however, environmental restoration activities are beyond the scope of the *CMRR-NF SEIS*. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

everywhere. So many people have deformities. So many people that have had miscarriages. And it continues and continues to go on, and there have not been health studies.

Can you please give us some health studies, so we can at least know what you're doing to us, to ourselves? We don't even have baselines, but we'd like to start.

624-1 cont'd

So yeah, environmental justice. Not happening here. Area G. It boggles my mind that we're spending 6 billion dollars on this new project to make new ways and new nuclear weapons when we already have tons -- we have all this waste contamination up there, waiting to be cleaned. Still waiting to be cleaned. Area G, like Joni mentioned, and Marian -- I was very honored to get a tour over around the area, Area G, went down a couple miles, and oh, there's all these baseball fields where everyone comes in the summer and does their tournaments right nearby.

Area G is leaking. Even the labs have document footage of the plumes that are spreading radioactive contaminants. What else is in that area? And under the ground? Santa Clara's watershed. How long are we -- do you know what their current plans,

624-2 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

94

their number one plan, for cleaning up Area G is? To put a tarp over it, basically. It's a special evapotrans-something tarp. But basically, what they need to do is evacuate, and they should spend those billions of dollars on evacuating all this stuff that has been left in unlined pits. Unlined. Just buried in there. But no, the Department of Energy is looking at bringing more radioactive waste in.

624-2 cont'd

I just want to -- I'm going to wrap up a little. How is my time?

MR. MacALLISTER: You're out, but --

MS. LISA PUTKEY: Okay, I'm bringing it to a closing. I have been working here with you, and someone said that we need to think about the future of our youth and how this could be good and positive.

I have been living in Chimayo. I have been working with youth. I know about the drugs and the violence and the gangs and the 60 percent dropout at Española High School. It's horrible. And the answer to that is not investing in the military. The answer to that is investing in our communities, investing in our youth. And I'm sorry, but after 65 years of operation, the highest millionaires per capita are up in Los Alamos, and the Appalachia of the west -- we're one of the poorest counties, Rio Arriba County.

Response side of this page intentionally left blank.

I'm sorry, but if we're still just blue collar workers, I don't see much progress. Thank you. Oh, wait. One more. Never mind.

MR. MacALLISTER: Let me remind speakers, if they want to add to their time and they run out of time up here, they can continue their entry. Using the microphones that are recording the statements in the back is one option, just as one alternative.

Our next speaker is Reverend Holly Beaumont, and she will be followed by Teresa Chavez.

REV. HOLLY BEAUMONT: Good evening. I'm the Reverend Holly Beaumont with Las Mujeres Hablan. I want to preface my statements this evening by reminding us that one of the time-tested strategies of empire as a way of controlling the people that they have conquered and seek to oppress is by turning them against each other. It's worked in India, Ireland, former Yugoslavia, Rwanda, Iraq, and it could be happening here. So I want us to be really sensitive to the fact that we will not succeed in this unless we broaden the base of opposition to the CMRR. And that means that we have to be really sensitive, all of us, as we are related to this industry which has controlled and in many ways oppressed us now for generations. We have to find

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

96

ways to be coming together around this, rather than allowing empire to polarize us.

I want to shift my focus again this evening from the project to those who are in charge. You probably all know this. But I'm just learning, and it's been very interesting.

625-1 I think that 2006 was a pivotal moment for Los Alamos National Laboratories. I know that there are many here who have been studying the lab for decades, but I think something important happened in 2006 when the national laboratory became a for-profit industry and was turned over to, of all corporations on the face of the planet, Bechtel --

So this is what I know about Bechtel, that I'm learning, and I do want to apologize for a misstatement I made last night when I was listing some of Bechtel's projects, which are Bechtel is at work on every continent on the globe except for Antarctica. Last night I said that I could not find any evidence of any project that they have ever successfully completed. And I apologize, that's incorrect. They were responsible for building Hoover Dam.

So very quickly, Basra Children's Hospital in Iraq. It was abandoned only 35 percent complete,

625-1 DOE and NNSA continue to provide oversight of LANL as in the past. The managing and operating contract for LANL was openly competed in 2005 for the first time in the 63-year history of the LANL site. Through 2005, the University of California had been the sole managing and operation contractor for the LANL site since its creation in 1943. The new managing and operating contractor, Los Alamos National Security, LLC, began managing LANL in June 2006. The selection of a new managing and operating contractor did not change the DOE and NNSA work performed at LANL.

although it is listed as complete. Many delays. Within a year they were already 18 months behind time. I don't know how you -- somebody else do the math on that. Doubling the cost.

There's the Boston Central Artery Tunnel Project for I-93, which was designed to pass under the city, and it reached a $14.6 billion price tag with a number of significant gross errors, including the fact that Bechtel overlooked plans for the Fleet Center, which is a 19,600-seat arena. In their plans to build this, they just failed to note that there was this Fleet Center planned right in their path. Active nine-foot-wide pipe carrying sewage and storm runoff where planners had drawn a support wall. It was not enough to support the tunnel walls.

Then there's the Alaska pipeline project awarded to Bechtel in 1974. By May of 1975 -- this is probably, you know, a world record -- Bechtel had already been fired for overall mismanagement, including duplicating charges, overstaffing, plagued with site thievery, feather-bedding, low productivity, conspicuous supply problems. Furthermore, Bechtel was accused of ordering the quality control staff to falsify thousands of x-rays of pipeline weldings in order to accelerate

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

construction.

So tonight I thought, because we're in the Española Valley, it would be interesting to look at Bechtel's infamous water wars in Bolivia, since water is such an issue for all of us and since, like Bolivia, this land historically belongs to indigenous people.

In November of 2001, Bechtel sued the country of Bolivia for $50 million for cancelling a contract to run the water system in the third-largest city in the country after local people took to the streets to protest massive price hikes for water. The price hikes triggered the water war, and claims made by Bechtel that they did not increase the water rates by any more than 10 percent have been proven to be false; that, in fact, they were doubled and, in some cases, even more, on people who were in crushing poverty. The price hikes that triggered the water were driven by -- Bechtel then took a suit to the World Bank and sued Bolivia for $50 million based on the fact that they were, of course, losing their profits but also they had been required to pay off a $30 million debt owed by the previous public water company. The debt works out that -- this $30 million works out to be roughly Bechtel's revenues for

Response side of this page intentionally left blank.

one-half of one day. Obviously, they were extremely put out by that, and in Bolivia $30 million is the annual cost for hiring 3,000 rural doctors, 12,000 public school teachers, hooking up 125,000 families who don't have access to the public water system.

So the poorest people in Bolivia -- rates went up, Bechtel claimed, barely 10 percent when we know now that it was far more.

But then I want to conclude with a positive note because I am a clergy person and I always have to close with hope. Bechtel took this suit to the World Bank and it attracted so much attention worldwide from indigenous peoples and other advocacy groups around the world that the World Bank actually denied Bechtel's suit against Bolivia, and according to what I read, this is an unprecedented decision.

So let me just say this as a word of hope. Bechtel has been defeated before, and we can do it again. Good night. (Applause.)

MR. MacALLISTER: Our next speaker is Teresa Chavez, and she will be followed by Sheila Cooper.

MS. TERESA CHAVEZ: My name is Teresa Chavez, and I would like to identify myself as an individual who is not profiting from the war

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

100

industrial complex. I have lived in northern New Mexico the majority of my life, and I have become more aware in the last few years of the negative consequences of waste and contamination from LANL's operations.

I pose a question. You started off this meeting talking about benefits, so I pose a question. Do the benefits of the CMRR outweigh the costs? So the benefit is obvious: Money. Let's talk about jobs for local people. They fall on the low end of the salary scale. They'll be temporary. So does it really, in the long-term, benefit local communities, you know? Higher-salary jobs will not benefit local communities. At one of the meetings, it was indicated that this beautiful building was going to try and employ and attract the brightest and the best, but I have a feeling that's not going to get -- we're not looking for the brightest and the best in these communities. They're from nationwide people that aren't going to be from here. Corporate profits. That's the majority of what's going -- what's the focus of all of this, and why this continues and they will benefit, but that does not benefit local communities, and guess what? Corporations do not have to pay taxes, so that's

626-1

626-1 The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

another thing that will not benefit our communities.

So the consequences are health care, and the health care cost of workers whose health will be impacted. The health care and the health costs of members of the community. As a person that works with young children, for the last ten years, I have known of many children with neurological and medical conditions and high incidence of cancer, and one of the parents that I know of was posed the question from a UNM doctor specialist, "What's in the water up there up north?" They have seen a high incidence of illnesses that are not seen in other communities, neurological disorders that are just skyrocketing, and this is impacting children's learning, their well-being. *626-2*

Another unforeseeable cost is if an accident occurs, and also the impact of the environment in cleaning up the environment. *626-3* Those costs -- those are huge costs. Corporations may have an equation that places a number value on the cost of a life versus profit to be made, but life to our communities can't be measured. The cost of the CMRR are enormous and the benefits minimal.

I am adamantly opposed to the CMRR and *626-4* would like to challenge the government to do the

SANTA FE OFFICE

e-mail: info@litsupport.com

626-2 Chapter 3, Section 3.11.4, Health Effects Studies, of the *CMRR-NF SEIS* shows the cancer rates for the counties surrounding LANL and the Agency for Toxic Substances and Disease Registry issued a study of the health effects of LANL operations in 2006, and concluded that, "Overall, cancer rates in the Los Alamos area are similar to cancer rates found in other communities. In some time periods, some cancers will occur more frequently and others less frequently than seen in reference populations. Often, the elevated rates are not statistically significant" (ASTDR 2006).

626-3 It is understood that if a severe accident were to occur at LANL it would be expensive to clean up. To minimize these potential costs, these facilities are designed to minimize the release of radioactive materials in the event of an accident. See Section 2.8, Nuclear Accidents, of this CRD for additional information on this topic.

626-4 NNSA notes the commentor's opposition to construction of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

right thing, halt construction of the CMRR, and start cleaning up the mess that's already been created.

626-4 cont'd

(Applause.)

MR. MacALLISTER: Our next speaker is Sheila Cooper, and she will be followed by Jay Gilbert Sanchez.

MS. SHEILA COOPER: Hello. My name is Sheila Cooper, and I live in Alcalde, here in the valley. And I have lived -- I am now downwind of Los Alamos, and I have lived in the shadow of Los Alamos all my life.

I understand the perspective of the construction workers and scientific workers who are supporting this project and hoping that it happens. I understand that there's tremendous poverty in this valley, and that jobs are desperately needed. And I understand -- I want to tell you a little bit about what my story is. When I was a child growing up, I lived next door to some of the family who owned the Los Alamos Ranch School and gave up their property for Los Alamos to happen. In 1953, my father, the first of his family to graduate from college, got a good job. He got a good job at Sandia. He was present at 12 atmospheric nuclear explosions at Tonopah in Nevada. At each one, he was told and we

Response side of this page intentionally left blank.

were told there was no danger. We were not afraid. He was not afraid. We believed him. It was a good job. We were happy to have it.

He was present at I don't know how many atmospheric nuclear explosions in the Pacific. Again, we were told and he was told there was no danger. And it was well-intentioned people who I think believed what they were saying, that were telling us that.

My father died of a brain tumor when he was younger than I am now. I live in Alcalde. I have many neighbors there who worked at Los Alamos because they were the only jobs in the area. Most of those neighbors are a little bit older than me, and they're dying of lung problems and other problems.

627-1

When I lived in Santa Fe, some very dear friends of mine worked at Los Alamos because that was the place that they could work. And their children had birth defects, the children born after he started working at Los Alamos. And we were never told there were any dangers.

So I urge you all who are working for -- and I would wish I had the opportunity to speak personally to everybody that's hoping for a job at Los Alamos, but we have no way of knowing if this is

627-1 Chapter 3, Section 3.11.4, Health Effects Studies, of the *CMRR-NF SEIS* includes a summary of a number of epidemiological studies that have been conducted in the LANL area, as well as a summary of cancer incidence and mortality figures for the Los Alamos region as derived from data from the National Cancer Institute. During the period 2003 through 2007, the annual cancer death rate for Los Alamos County was smaller than that for the state of New Mexico as a whole, and for the entire United States. The cancer incidence rates, however, of melanoma of the skin, prostate cancer, thyroid cancer, and female breast cancer were elevated in Los Alamos County with respect to state averages, while cancers of the lung, colon, and rectum occurred at rates below the state averages.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

104

safe, and we have no way that we can trust this Environmental Impact Statement. And I am speaking in opposition to this project, even though I understand the need for the jobs and how enticing that is, because I have been personally and devastatingly affected by these good jobs.

Until this Supplemental Environment Impact Statement fully considers all the alternatives and fully considers the impact on the health, safety, and welfare of the communities that it surrounded, which, as has been testified over and over again here tonight, has never been done, we can't allow this to go forward. None of this. Those of you working on it, those of us in the audience, those hoping for a job, we can't allow this to go forward, because you're in danger and we're in danger. So I hope that we can work together and find good jobs that don't involve endangering health.

627-2

MR. MacALLISTER: Our next speaker will be J. Gilbert Sanchez, followed by Whitney Nieman.

MR. J. GILBERT SANCHEZ: Timing me now? I have to say a piece before I start. Thank you. (Native language spoken.)

Under diplomatic diplomacies that we have, that you have, I have just stated to the people of

627-2 NNSA notes commentor's opposition to the *CMRR-NF SEIS*. The *CMRR-NF SEIS* addresses public health and safety of the local communities, including impacts on water supply. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, and Appendix C of the SEIS.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

105

Santa Clara, as a guest in their community, and as an elder and former governor, I have that right to speak as long as I have to without being interrupted, without being stopped or given time limitations.

With that in mind, my name is J. Gilbert Sanchez. As I stated, I'm the former governor of San Ildefonso. I am not here representing the pueblo in any iota, any way, any means.

I do have a concern. And that concern happens to do with my sacred area. In our sacred area, I, as a young man, and my young men and young women go there to harvest wild game. With the activities and the actions that are ongoing today, as you state, in preparation for this building you're building, I oppose it, and wholeheartedly, because you have not addressed how you are going to address the migration of wildlife and wild games that we have harvested since time immortal throughout the time that we were there.

628-1

Yes, during World War II, we gave up that right to go in there under the assumption that it was a top secret action that was going on there. But the United States government also bought the Fernando Hill grant from the Pueblo of San Ildefonso and its Hispanic neighbors. Up to this date, we have not

628-1 NNSA notes the commentor's opposition to the CMRR-NF and acknowledges the commentor's concern for the migration of wildlife. Text has been added to the *Final CMRR-NF SEIS* in Chapter 4, Section 4.3.7.1, to show that migration patterns of wildlife would not be adversely impacted. Construction and operation of the CMRR-NF, if chosen in the ROD, would take place within a fenced area already maintained. Other areas potentially used outside of TA-55 during construction would only be temporary.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

been allowed to exercise some of those written things. There are written agreements and whatnot.

I stand wholeheartedly with everyone who's spoken up against the CMRR building. I think it's a disgrace to this country when this country's Congress is talking about welfare, cutting welfare, cutting my Social Security, my Medicaid, but yet the nuclear welfare chain continues to move and grow at every opportunity. It is a welfare chain. You are on welfare. I'm not on welfare. I deserve that, I worked and I put that. But when the country's wealthiest county is sitting up there with less than the number of people that it has up there, and most of them are employees of the nuclear industry, there is a welfare chain, not only here in this state, but in all 16 major sites across the country.

And you continue to milk that cow, $6 billion what it could do wonders for us, for this country. Congress is sitting there debating, wanting to cut every social program there is, but yet, not touching the war machines' money pocket. Where are you at?

And I say this to you guys, how many of you are here as elected officials? Where was that gentleman that stood up so bravely in front of all of

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

us to say, he represented all of these people and the Mayor of Española, and yet not sit here throughout the whole time to listen to what's going on?

I will tell you one thing (applause), if there's a Pueblo governor, a councilman or elected official in this room at this point in time get off the skirts of the welfare lines and nuclear welfare lines. Go out there and find something.

The great City of Chimayo has artists, Alcalde has artists. The Hispanics have artists. 20 years ago I talked to Pete Domenici, I told him, Pete, and told him, I gave him an idea. I said, if all of those young men and women up in Chimayo and the lower valley, in Española Valley, could set up an opportunity to go out there and build lowrider cars, design them to the commissions and ways of people they want, we would have an economic growth so big that it's going to outshine the nuclear industry up in Los Alamos, because people are going to be hired. And we are going to be able to go to the great centers where Hispanic populations are, and even non-Hispanics will want to have a classic car rebuilt and designed the way they want it. We could do a factory up here.

We have not done that, because why?

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

108

Because just like the ones that are saying they used to go around, you are on welfare, you don't want to get off of welfare. That's what you are. The nuclear scientists, the people that are working up at Los Alamos, you're on a nuclear welfare chain, and you can't get off of that nipple. Because it's so much, it's such an easy way of you getting money.

And as long as we continue to do those things, we can make fictitious enemies throughout the world.

My life history has been about struggle. And I know how this government works. And I know how you all work, how you offer this work, and I know where I've been, and I've seen what I've seen.

When you go out there under the guise, up in the tech, to take a bow, like in North Korea when you turn over all of the nuclear information they want, so you can have an enemy, you create your own enemy, and those are the things that you do. But get off this welfare line. Get off nuclear welfare line. You have damaged my people. You have damaged my homeland, my spiritual land. You have spent -- this country has spent billions and billions of money since 1948 in supporting and defending a religion in this world -- Israel. Yes, some of you may be of the

Response side of this page intentionally left blank.

109

Hebrew persuasion, you may throw rocks at me and whatnot, but that is a religion that this country is defending. Yet at the same time it's destroying my religion without blinking an eye.

I agree with someone that said we need a baseline. And I think if you are going to employ people from the valley, you need to set up a baseline and draw blood and urine samples, and put it in storage, because 10, 15 years, 20 years from now when they start coming down with the illnesses that they're going to come down with, it is going to impact us, healthcare, everything else. We need all of that. I need that.

628-2

Again, I oppose the going forward without doing a full NEPA Environmental Impact Statement, because there are things that have not been addressed, that need to be addressed. Water, the amount of water you are using. The health impact that we have, the spiritual impacts you have, cultural impacts you have in our daily lives is self-sustaining from the wildlife that we gather from this sacred area that we have next to you.

I thank all of you who have come up. I thank all of you for being here, for showing concern, for standing up against the monster that is here. I

628-2 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. NNSA prepared the *CMRR-NF SEIS* as a result of changes in construction of the CMRR-NF based on additional seismic information.

As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL. Other impacts on resources, to include health effects and cultural resources, for all alternatives are discussed in Chapter 4 of the *CMRR-NF SEIS*.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

110

thank you very much. I'm not as technical as all of you, as I would like to be, but the man to my right is very technical, he watches his clock. He must be paid pretty well. Get off of that welfare line.

MR. MacALLISTER: We still have a number of speakers to go. The next speaker is Whitney Nieman, and he will be followed by Julian Pratt, or --

SPEAKER FROM THE FLOOR: Pyatt.

MR. MacALLISTER: Pyatt? I'm sorry, I think it's Pyatt. Mr. Nieman?

MS. WHITNEY NIEMAN: Ms.

MR. MacALLISTER: Ms. Nieman, I'm sorry.

MS. WHITNEY NIEMAN: Haven't you ever heard of Whitney Houston?

Hi. My nickname is Molly. And I had a wonderful time with a group of people from Taos last weekend creating these. And the reason why we were creating these is because we were trying to find a way to make a connection between what's going on up there, what's going on with our nuclear energy and our nuclear weapons manufacturing.

And I'm quite baffled. I've never actually participated in a hearing before, but I'm just wondering who is listening to this? I mean, I was going to be talking to the people. I wanted them to

Response side of this page intentionally left blank.

listen to me. I mean, I think there's a simpatico group here, we are beautiful, and it's heartwarming to connect this way, and we are connected, but there's a disconnect, there's a serious disconnect, in my real marriage to the beautiful brain and the human beings that work up in Los Alamos to wake up, wake up.

This is the 21st century. Our main issue is our Earth, our climate change, and what are you doing? I just -- there's sort of like -- it feels like the 20th century up at Los Alamos. That's a mindset, where with nuclear energy, we're going to save the world. Well, now that's not the truth. It's not.

And I just have a couple of lovely thoughts here. I just would like to say to the people who aren't here, the people I wanted to talk to, to throw out that 20th century mindset, a dead end, literally.

I would like to see your brilliant, beautiful brains harnessed for something we really, really need, and that's cutting edge green technology. (Applause.) Put your energy into creating restoration of our Earth, air and water. Revitalize all of that from the contamination of what has been coming out of our past production up on the

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

112

hill and around our country.

Don't wait not one more day, not one more day, not one more minute. I'm calling on you to be heroes, you beautiful, brilliant people in Los Alamos -- we are your brothers and sisters and we are asking that of you.

629-1 More nuclear warheads from your pit production will not bring our security and peace as we talked about tonight, it just hasn't shown that. All it does, is increase the proliferation more than people wanted to protect themselves against the United States.

And, of course, don't you think that you're vulnerable for terrorist activities?

A creative mind is truly a terrible thing to waste. I vote no action on the CMRR.

MR. MacALLISTER: Julian --

MS. JULIA PYATT: I guess you can't read my writing. Julia.

MR. MacALLISTER: Julia, followed by Ruth Teller.

MS. JULIA PYATT: Thank you. Hello everybody, and I wanted to thank all of the organizers at this meeting tonight. *630-1* I'm from Taos, and I just wanted to ask, one more time if we could

629-1 NNSA notes the commentor's opposition to the CMRR-NF pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. NNSA has prepared a classified appendix to the *CMRR-NF SEIS* that evaluates the potential impacts of malevolent, terrorist, or intentional destructive acts. Substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. Chapter 4, Section 4.2.10.3, summarizes information about the classified appendix. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

630-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

113

have a hearing up there. I do think it's really important that all of the people of northern New Mexico can be heard and represented as well, with this major project. So, I'm asking for that. And I'm voting, yes, for the Environmental Impact Statement. Definitely we need that, and a new EIS, and no building on the seismic fault line, which according to what I've read, is on the same geological magnitude as we just experienced in Japan.

630-1 cont'd

And I also would recommend that we have the scientists and nuclear experts from Japan come and speak to us here, come and speak to the scientists at Los Alamos, maybe we can learn from them and from everything that's happening in that part of the world and, my God, their whole fishing industry is destroyed, all of the ecosystem, it's just the people -- everything that's happening there, it's just really horrific.

630-2

So, if we could learn from Japan, learn from Rocky Flats, learn from Chernobyl, learn from all the nuclear incidents that have happened around the world. And I do have to agree with Molly that, it seems to me that for the other countries that our nuclear weapons manufacturer-producers, that if the United States being the grand king of all of that, if

absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Chapter 2, Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

In response to the commentor's concern for construction on a seismic fault line, the geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

630-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

they are producing more, wouldn't that make Pakistan and North Korea, and all of those other countries want to amp up their weapons? Where does that leave us? I guess I really do get confused about that disconnect. And I thought we were supposed to be going to a more peaceful world, a more positive, dynamic, loving world. I mean, it would be so cool if we, as a people, as a human race, to actually just try for once, let's try to go the positive route. Let's try to do, you know, sustainability, and the holistic way of living. Let's try it as an experiment. This one really hasn't worked very well.

So, I did encourage that, I just, you know, really would encourage all of the wonderful people that we have at Los Alamos, to put their energies towards that. I think it would be just an absolutely monumental example to the world. It could totally change the whole dynamic of where we are at right now. It would be very exciting for this country and for everyone around the world.

And, then, lastly just as an -- there's an interesting film that's out, which I heard an interview with, and I saw the trailer, and if you all want to go see Atomic Mom. And that's a documentary. The daughter of one of the scientists at Los Alamos,

Response side of this page intentionally left blank.

who worked on the Manhattan Project and other nuclear projects at Yucca Mountain, it was her mother's testimony, and her mother was sworn to secrecy, because everything was, you know, classified. And it took every ounce of courage she had to actually speak, you know, what was really on her mind, towards the last days of her life. It's a brand-new film.

And then also Robert Kennedy, Jr., has just come up with Cold Mountain, which is screening at Sundance right now, but it's released nationwide in June.

So, that's not about this issue, that's about coal mining in West Virginia, but those are two films that could educate everybody, and thanks, thank you all for being here, and thanks for going into the positive.

MR. MacALLISTER: Next speaker is Ruth Teller, followed by Stephanie Hiller.

MR. T. RUTH TELLER: Thank you. You forgot the T. It's T. Ruth Teller. I am an elected representative. I am the president-elect of Northern New Mexico College. No, not the president-elect. The student president-elect. I'm sorry. Student president-elect. And why am I the only elected representative here? Why am I the only one with the

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

116

integrity to speak? Ben Ray Lujan receives $8,000 from Bechtel and $11,000 from Honeywell just in the last two years. It might be because the majority of Espanola City Councilors work for LANL. Maybe there's some money corruption going on. Just an idea.

We have a choice. We can be like the people in Spain and rise up against the corruption of our political institutions in favor of real democracy now, or we can be like Japan -- like Germany, where they're decommissioning their nuclear infrastructure. Or we can be like Japan. We can be like Egypt, where the people overthrew the corrupt political dictators who for decades were destroying their country and stealing their money, or we can be like Japan and suffer the consequences of nuclear catastrophe.

This process, this charade of a hearing, is a fraud and a sham. It is dictatorial because no alternative except the construction of CMRR is being considered, and our voices are not being generally heard. This SEIS explicitly states that and refuses to address most of the substantive concerns that opponents of CMRR raised in the original EIS hearings.

This is fake democracy in action, i.e.,

631-1 NNSA notes the commentor's opposition for the *CMRR-NF SEIS*. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. Refer to Section 2.2, NEPA Process, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

117

dictatorship. Politics aside, and discounting the morality of nuclear weapons production, the plan to build CMRR in a seismically active nuclear zone is sheer insanity. The Defense Nuclear Facility Safety Board created by Congress to oversee the DOE's nuclear facilities stated that LANL estimates a 1-in-50 chance of seismic collapse during a ten-year time frame, which would result in a collapse of nuclear materials. That was a quote from the Defense Nuclear Facility Safety Board.

If the CMRR is built as planned, the old CMRR will still need to be used for at least the next ten years. For a citizen to live here, a 2 percent chance of nuclear carcinogenic in the next decade is 2 percent too high. The Preferred Alternative should be to immediately decommission the CMR and stop building the CMRR.

The Española School District right now is laying off teachers. I'm a student in the teacher education program. What is Mary Alice Lucero doing to save our teachers? What is the mayor doing to create good, healthy, green, positive jobs in our community? Why did her representative not stay here? If the mayor was a student in my civics class, she would get an F for dishonesty, corruption and selling

631-2

631-2 All proposed new DOE facilities are required to be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment.

As described in Chapter 2, Section 2.6, of the *CMRR-NF SEIS*, the CMRR-NF would be constructed in accordance with DOE requirements for nuclear facilities, protection, site seismic design, and security. The building design includes safety-class fire suppression equipment.

Regarding the occupancy of the CMR Building, the existing CMR Building operates at a reduced level due to seismic and security concerns associated with this 60-year-old building. As stated in Chapter 1, Section 1.2, a series of upgrades have been performed to address changing building and safety requirements. As a result of operational, safety, and seismic issues, a number of actions have been implemented to enable continued use of the current CMR Building while ensuring safe and reliable operations. Changes that have occurred to maintain safe and reliable operations have been to administratively restrict the amount of material stored within the building and in use at any given time, completely remove operations from three wings of the building, and generally limit operations in the other three laboratory wings that remain functional.

See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

118

out our children's future. She fires teachers with one hand while she lobbies to build bombs with the other. Where is the Rio Grande Sun? Where is our community newspaper? Are they here? No. They're not here. They love to report gossip but they don't report real news. Why? In light of Fukushima, this is really a travesty.

I would like to get personal for a moment. I was sitting behind you, and I couldn't see your eyes, but I think you should really be ashamed for your role in authoring this travesty of a document.

And you, sir, I could look in your eyes, and I think you should be locked up before you kill again, because this really is genocide, what you are doing to this community, what you're doing to communities around the world for your nuclear weapons. And people who support jobs and would rather sacrifice their health and our community's environment for a few dollars -- I think you should really go to Japan, because I hear there's some great jobs there cleaning up after their nuclear disaster. Go there. Clean up the disaster there.

So I hope that we really can learn from this, and it's been really inspiring to listen to all your voices, and we should have this kind of

Response side of this page intentionally left blank.

community meeting without LANL in the room and really do something to change our circumstances. And as your student president, I look forward to serving you in the next year. Thank you. (Applause.)

MR. MacALLISTER: Our next speaker will be Stephanie Hiller, followed by Andrez Juarez. Stephanie Hiller?

MS. STEPHANIE HILLER: Here I am. Hi, everyone. I'm Stephanie Hiller. I live in Santa Fe, and it's been a great pleasure listening to all of you. I don't have a prepared speech. I actually started one, and then I never finished it, and so I'm actually just going to say a few thoughts in response to things that have been said before, mostly.

I'm pretty shaken up by that young man's presentation. Youth is ruthless, huh? And thank God for that. It's time we really listened to our young people, and it's time they really felt like they could shout. And it's really time for all of us to shout.

The things that are happening in our world now are just so distorted and perverted and weird, and you know, we're getting used to it. There's a story a nuclear activist likes to tell about the frog experiment. Forgive me if you have heard this one

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

120

before, but it's been haunting me lately. The frog experiment is, you have a pot of boiling water and you throw a frog into it and the frog leaps out. It's hot. Or you have a pot of water, you put it on the stove, and you put the frog into the pot of water, and you heat the water slowly, and the frog dies, because he slowly got used to the rise in temperature and lost the vim, vigor, and vitality -- remember vim, vigor and vitality? -- to get out.

It's this strange slumberous state we're in in this country that is so frightening. And we lapse into it, even those of us who are here spending our evening talking about this horror show up on the hill that is not just up on the hill. It's everywhere. It's all over the place. And when you look at the map about where nuclear contamination is in this country, it's all over the country. It's everywhere. You can't just leave. You can't just say, "Okay, that's it, I'm getting out of Santa Fe." I say this every now and then. "I don't know why I came here. I'm leaving. The water has, you know, got plutonium in it. I'm leaving."

Where am I going to go? If you really look at the map, there's Idaho Falls, there's Hanford, there's Rocky -- my son lives right down the road

632-1

632-1 NNSA notes the commentor's concerns regarding the effects of nuclear technology. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

from Rocky -- where Rocky Flats is. You know they made a park out of it? You know, I think we really -- when I listen to the people here from the pueblos -- and it's happened to me before when they speak -- it's so clear, and I just think we need to listen to them, because we white people, we Americans, we've lost our minds. Our minds are just -- they're not operating anymore. I mean, to spend $6 billion and talk about taking seniors off -- I can speak to that -- taking seniors off of Medicare, I mean, this is just total -- it's lunacy. Let's just spend more money so we're prepared to defend ourselves by killing more people in a minute overnight.

Oppenheimer once was filmed saying, "Is it true that if we continue on this path, we'll be able to destroy 40 million people in eight cities overnight?" "Yes. It is true."

And that was then. So think of what we can do now.

So on a slightly happier note, I wanted to tell you that Obama is looking for money from the nuclear budget to cut. He wants to cut $400 billion from the nuclear weapons budget, so maybe some of us want to write to him and make a suggestion of

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

something he can cut.

Lately, I have been thinking of the line that -- I think it was in the '60s -- "What if they had a war and nobody came?" And you know, it's more than just a clever line. It's a strategy. What about not participating in this whole engine of destruction? What about just pulling out, pulling the plug, looking at all the places where we feed into it, and not doing it anymore? And we could have town meetings and we could discuss it, and we could host it, and we could invite people who work at the lab, because I honestly -- I don't know how anyone can make a living making this stuff. I just don't. I recognize that we're all human beings and I believe that we really can, all of us, come together to get out of the really dangerous predicament we're now in. We could do that, and we really, really must try. Thank you. (Applause.)

MR. MacALLISTER: Our next speaker is Andrez Juarez, followed by Kathy Sanchez.

MR. ANDREZ JUAREZ: Good evening, everyone. I'd like to thank everyone for showing up and once again, to the city councilman who was here and wanted to improve our schools, maybe he should consider firing everybody on the school board.

Response side of this page intentionally left blank.

I'm going to be honest with you. I'm for this. I think they should build the CMRR. In fact, I think the military-industrial complex should expand. I think what we need is more nuclear research. What we need is more bombs. Because for every bomb we have, we don't have to build a school to educate people. We don't have to build a home to house poor people. We don't have to supply health care for poor people. And you know, to be honest, I think this is, you know, going to ensure that our country continues down its spiral to becoming a third world country, really honestly, because remember, we only need people smart enough to operate the machines, not smart enough to ask questions. Thank you. (Applause.)

MR. MacALLISTER: Our next speaker is Kathy Sanchez, followed by David Norris.

MS. KATHY SANCHEZ: (In Navajo.) My name is Kathy Sanchez, and I'm from San Ildefonso Pueblo, and I also work with Tewa Women United. I did not really prepare a speech, but I just wanted to speak from the heart of the things that I have been hearing or that's going on. Tomorrow we're hosting a group of Middle Eastern dignitaries at our office, and they're coming here to ask us native people about

633-1

633-1 NNSA notes the comment. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

124

human rights. What's the UN human rights applicability here in the United States? And I must say this hearing is an example of environmental injustice that's happening. Our lives, our culture, are being demised and we're not really being informed, so human rights are being violated.

Indigenous human rights finally was, I think, adopted by the United States in 2007, yet this thing is sitting in our sacred lands, and right now, the Indigenous Forum is happening in New York, and they're talking about biodiversity and taking of resources, things from indigenous lands for use, because the people with the money have a right to sue those if they don't make a profit.

I think once the lab has turned to a for-profit organization -- and our government is part of it -- that they're probably going to sue all of us if they die in the process and don't make their money back. They're probably just going to leave the mess for us again, and that's a right that we have to be well, and yet they're taking that away from us.

Again, last year, a couple of years back, there was a NEPA process, a public hearing, happening again and we posed the question that the NEPA process is not adequate, it's like taking one step forward,

634-1

634-1 It is customary for NNSA final EISs to summarize what changes were made to the draft EIS. Please refer to Chapter 1, Section 1.8, Changes from the *Draft CMRR-NF SEIS*.

two steps back, and then they leave it there. They don't come back to us to tell us what corrections they made. They say, "Go look at the book, we made a comment, not applicable," which is what the CMR EIS is about. So they cut that out.

So again, we all know violations are happening. Who's going to hold our government or for-profit organizations accountable? It has to be us that speak up. And the youth are strong in their voice and I'm glad they were able to say what they say, because our behavioral dispositioning is taken from us, when they say, "You can't shout, you have to be polite, you have to be calm in these situations, we're going to give you money, don't worry."

I was going to say (expletive deleted), but maybe I shouldn't say that word, so scratch that out. But this is just like they were saying, madness, crazy. How many reactors do we need to have meltdowns? Japan is on the ocean and the oceans are now contaminated. Where is our water? Our water is hiding from us because the water wants to be safe for people, wants to be safe for children, and yet, who's taking the bulk of that secret water from us?

Our children, children's children, are miscarrying because they can't come to full term. We

634-2

634-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accidents that occurred at the Fukushima Daiichi Nuclear Power Plant, and earlier at the Chernobyl Nuclear Site, requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

went to visit Chernobyl and visited a scientist who had jars of all the babies that were still in their mother's womb from week one, two, three months, four months, five months. They were all baked like in a microwave oven. He had them up there to show what happens to women that are carrying when there's an accident that happens like Japan.

634-2 cont'd

Well, our people here, the indigenous peoples, the population is already showing that our death rates have far exceeded our birth rate, and that's what Russia was telling us at that time. So we're already experiencing that there. There is no logic to this EIS CMRR going on a supplemental, when you need a new one, when all the accidents that have happened with the fires and all the faults are showing, the shaking. It shouldn't even be there in our sacred -- they should have already left by now. That industry should have already infolded in on itself, because, I mean, it's just insanity that's happening, and the culture of violence has numbed us all out to where we don't even recognize our ability to be sacred, to be connected to our Mother Earth.

634-3

We as Tewa Women United are writing our objectives, and the people with the money were telling us, "You cannot write 'mother earth' in

e-mail: info@litsupport.com

634-3 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

there, because that's not an objective."

So stopping the violence against Mother Earth, I would declare that here, that's one of our violations that are happening with our human rights. Thank you. (Applause.)

MR. MacALLISTER: Our next speaker is David Norris, followed by Teresa Juarez. David Norris? All right. Teresa Juarez?

MS. TERESA JUAREZ: I don't run on five minutes. It disturbs me when people come to my community and they tell me, "You got five minutes to speak." And if I had a salary like yours, I wouldn't worry about it.

Let's see. You know, it's kind of hard to keep repeating what everybody else has already said, and the reason is that it's like, you know, how many times can we come to these meetings and repeat the same things over and over again? And then they go back and they put in these books, about ten stacks of boxes. One time we asked that we would like to read some of this stuff, and they sent like 20 boxes that high of material, and I said, "Well, you know, can you like break it down for us?" Like we try to break it down here.

But I do want to speak to one thing, you

635-1

635-1 The *CMRR-NF SEIS* is a large document due to the amount of material and the level of detail required. For this reason, a Summary document is provided to highlight the major conclusions. NNSA may provide a copy of just the Summary of the *CMRR-NF SEIS* upon request.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

128

know, and that is the poverty in our communities. You know, I heard that here a while back there was a study done that said that one out of every three children born here are born into poverty. And the other thing is that, you know, I don't think they have done a good study of the high cancer rates that really exist in this area, probably because they really don't want to know, you know. It wouldn't be beneficial to them, because what is beneficial to them is to develop this CMRR.

635-2

I was telling somebody I don't even know how to say it, you know, pronounce it, so I'll use the acronyms, as everybody else did.

And the other thing is that you know, I think we've heard from people here, both Gilbert and Kathy Sanchez, speaking about the impacts to indigenous communities, and also recognizing Chicano traditional communities, Hispanic communities here, that are impacted and every other community that is impacted by the contamination since the contamination has no boundaries, and does not discriminate. That's one thing that doesn't discriminate. So we should all say we finally found an answer to discrimination, because that baby doesn't discriminate, believe me.

And so, you know, if our water gets

635-2 It is not within the scope of the *CMRR-NF SEIS* to perform a government health study of the residents in the Espanola Valley. However, Chapter 3, Section 3.11.4, Health Effects Studies, of the *CMRR-NF SEIS* shows the cancer rates for the counties surrounding LANL and the Agency for Toxic Substances and Disease Registry issued a study of the health effects of LANL operations in 2006, and concluded that, "Overall, cancer rates in the Los Alamos area are similar to cancer rates found in other communities. In some time periods, some cancers will occur more frequently and others less frequently than seen in reference populations. Often, the elevated rates are not statistically significant" (ASTDR 2006).

contaminated, everybody's water gets contaminated. And we heard that two wells in Española had been contaminated but then they backtrack and they said, "Well, you know, there is this natural occurrence that happens in water that creates that, you know. So you know, it can't be contamination coming down and your water can't be contaminated. So you know, again, go back to sleep."

And so one of the things that bothers me a lot, too, is they always try to brush this off, especially in northern New Mexico, with the issue that most of us or most of our families or extended families are all drugged up. Not only do we live on welfare, but we're all drugged up. You know? And so then you got to look around and say, well, you know, why is that? Because I have always wanted to know, why it is that most of our communities across the country, be it here in New Mexico or Savannah or Hanford, wherever, has a drug problem? We're drugged, unemployed, and living on welfare. That's no coincidence. We had some of the highest rate of unemployment in some of these communities. Our people can't even get a job.

And then to complain about the secondary markets, you know, and then our schools. Los Alamos

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

got good schools. They got good teachers. They got the best. But when you come down here to the valley and you start talking about education, and you look at what our kids have to go through, to fight to graduate, it's insane, you know. But that's what this government has done.

And they play these games. How much do you get paid to sit there? One time I was at a meeting and the man fell asleep. And I said, "Oh, great. I wish I was getting paid what you're getting paid," what, at that time, I think they were getting paid almost like $300 an hour. Some ridiculous thing for days. We don't even got people in this community making $300 to live on. This is the reality of what Los Alamos has done to this community. It has impoverished our community.

Don't come up here, sir. Please don't come up here.

MR. MacALLISTER: I'm just letting you know --

MS. TERESA JUAREZ: Don't let me know. I know. Okay? I don't want to hear it. Okay. You know, so that's what Los Alamos has done to us. That's what it's done to the indigenous communities, the Chicano community, the poor white community and

Response side of this page intentionally left blank.

every community that you can talk about. It has created poverty. What do we have to do? Go work at Wal-Mart, $7 an hour, if you're lucky? No benefits? Come on, let's get real, people.

And don't upset me, because you know then I'll really get upset, you know --

MR. MacALLISTER: Your time is up.

MS. TERESA JUAREZ: My time is up, sir, when I say my time is up. And hey, you know what? I don't need your microphone, because I'm going to tell you one thing --

MR. MacALLISTER: I will have you removed.

MS. TERESA JUAREZ: Hey, you can have me removed, because I would like to see any of the newspapers standing here right now.

SPEAKER FROM THE FLOOR: Let her speak.

MR. MacALLISTER: Sir, I'm going to need --

MS. TERESA JUAREZ: I want to say --

SPEAKER FROM THE FLOOR: Let her speak. Let her speak.

MR. MacALLISTER: We still have -- are you willing to keep the rest of the people from speaking? You want her to cut off other people?

MS. TERESA JUAREZ: Don't touch me.

SANTA CLARA SECURITY OFFICER: Ladies and

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

gentlemen, hold on a second. Hold on a second. Listen up. Okay? To let you know, this is Santa Clara Tribal Security. This is tribal land. This has nothing to do with the seminar here. This is our room, and I'm going to tell you now we have rules that we enforce in this room.

SPEAKER FROM THE FLOOR: A five-minute rule?

SANTA CLARA SECURITY OFFICER: This is not -- you know what, that's not that rule. This is the rule of our facility right here. This is our facility, tribal land. You know what? You got to follow the rules.

SPEAKER FROM THE FLOOR: I can't hear what the rule was.

MS. TERESA JUAREZ: I asked him to let me say the last comment that I had, and he wouldn't.

SANTA CLARA SECURITY OFFICER: Your time is up.

Sir, if you can go ahead and continue.

SPEAKER FROM THE FLOOR: Let's take a vote.

MR. MacALLISTER: We'll have more time for the second round. We'll have more time.

(A discussion was held off the record.)

MR. MacALLISTER: If we can get the meeting

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

133

back in order, hopefully we'll have time for another round of speakers. But it's disrespectful to the speakers.

The next speaker is Miguel Moreno, followed by Robert Chavez.

MR. MIGUEL MORENO: I want to thank everybody for coming out tonight. Thank you, Nonny, thanks everybody for, you know, coming and giving you guys great opinions about, you know, the death and destruction of our communities, you know, the legacy of death and chaos within our world.

And, yes, I do oppose the CMRR-NF facility, the Chemical and Metallurgy and Research Replacement Nuclear Facility. And, no, as a taxpayer I do not want to invest $180 billion into the war complex for the -- you know, on the course of the next ten years. What I'm sick and tired of is being sick and tired. Sick and tired of coming to these hearings, listening to this (expletive deleted), and listening to these people talk about how, you know, we are going to -- we want to attract bright, new minds, you know, bright young minds. What about the minds of our community? You know, what about the health of our community here in New Mexico and northern New Mexico?

I just came from Savannah River site two

636-1 NNSA notes the commentor's opposition to the CMRR-NF project. Funding decisions regarding major Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

weekends ago. You know, I go all over. You know, this isn't something new. You know this chaos, they're paid to be here to listen to our, you know, quote, unquote (expletive deleted) but, you know, it's okay, because we are here for the long run, you know. My kids and my kids' kids, are the ones that are going to have to deal with the death and destruction and the contamination of our community, the contamination of our water and land.

You know, here, Española alone, we had to shut down three wells, water wells, drinking water wells because of contamination, due to Los Alamos.

You know, I'm sick and tired of coming to these, you know, public comments, with my grandmother being harassed by the, you know, 180 thousand, million, trillion dollar-an-hour A-holes that we have to deal with.

Yeah, that's what I have to say, and I oppose the CMRR building. I oppose, you know, any new construction that goes, you know, along with the nuclear complex. If we want to get real about it and let's help our communities to thrive by focusing on some of these bright, new, young minds that you guys are talking about bringing with $180 billion that's coming out of the -- you know, out of the war budget

636-1 cont'd

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

135

towards, you know, renewable energy, towards cleaning up our water, towards, you know, giving our communities a fighting chance.

Thank you.

MR. MacALLISTER: Our next speaker is Robert Chavez.

SPEAKER FROM THE FLOOR: Robert.

MR. ROBERT CHAVEZ: Hello, everybody. Thank you guys for being here today. I would like to take a couple of seconds for silence to honor the people who have lost their lives, dedicated people, in all of the nuclear industries up and down. (Silence.) All right. Thank you.

So, as this gentleman back here so finely told you, that we are on Native American land, and I'm Native American. These are my people's land. We have been here for thousands of years, and we wish to continue being here.

At Chernobyl there's an area the size -- an that is not livable, 25 miles wide and a hundred miles across.

I am less than 30 miles from Los Alamos. If something was to go wrong, would I have to leave my home, would I not be allowed to return for the rest of my life? It's plutonium that we are talking

637-1

637-1 NNSA acknowledges the commentor's concern that an accident similar to the one that occurred in Chernobyl at the nuclear reactor site could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at Chernobyl requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

136

of here, plutonium, large amounts of plutonium.

I don't know about you guys, but I'm not in favor of plutonium or any facility that holds any amount whatsoever, because it's not big amounts of plutonium, it's the very small particles that get in your lungs. From what I hear, that's really dangerous.

637-1 cont'd

You know, people have dedicated their lives, have gave up their futures to try to -- excuse me, I'm speaking, can I have a little bit of silence?

SPEAKER FROM THE FLOOR: Yeah. (Applause.)

MR. ROBERT CHAVEZ: I just want to say that throughout it all, I want to thank you guys. You guys have really taught me a lot. You guys have given me a lesson in life. The CMRR has introduced me to some wonderful people. It has made and brought to me relationships that will last a lifetime. But I have to say that maybe the way in which it was done is not the best of ways. Why do I have to go meet people, wonderful people, opposing nuclear industry fighting for my future, fighting for my life?

I say here today, I stand here today, in the hopes that in the future, I will be able to hold my head high and say, I did it, me and my community stood up, and there no longer is going to be a

Response side of this page intentionally left blank.

nuclear facility here in New Mexico whatsoever.

People, I've learned a lot over the last few years, a lot. I've been -- I've known about Los Alamos my whole entire life. It's all I've ever known, since I was young, watching videos, propaganda videos, learning about the effects of plutonium, learning about the effects of other harmful radioactive materials and learning just how involved all of us are in what goes on.

Each and every person standing here, every single one of you guys, has a life. You only live it one time. You may wake up tomorrow, and the person beside you may not be there any more, or you, yourself, may not be there any more.

It's about life, ladies and gentlemen. It's about the right to be able to live a healthy, well-deserved life that each one of us has gotten the equal opportunity to live. And it's just not happening. We learned from our mistakes. No, we haven't. We haven't, no. Not by a long shot. There is much more work ahead of us, a lot more fight within me. I will put my life on the line for all of my fellow community, all of my fellow people, no matter what color, religion or race.

Sure, I'm Native American, but that doesn't

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

138

stop me from loving everybody. It doesn't matter if you're white, green, yellow, pink, purple, silver, I'm still going to care about you, you know.

You people working for Los Alamos, I could come here and insult you guys or whatever, but you guys are real people, too. You guys have heartbeats, you have red blood, all of you guys. You guys all have two eyes. You guys all stand here today, you guys will all go back to your families tonight, loving and caring, and I just ask you guys that you give our community a chance to do the same.

Thank you, guys, very much.

MR. MacALLISTER: We have final call for Pat Vigil or David Norris. Final call.

We have just a very few minutes until the official end of the meeting. Is there somebody who would like to make a comment? Yes, sir.

MR. SCOTT KOVAK: Thank you, sir. It's probably okay. Thank you everyone. My name is Scott Kovak with Nuclear Watch New Mexico. I just would like to take a quick second here and read from the SEIS. Turn your hymnals to page S-39, and we're looking at the socioeconomic impacts of construction of the modified CMRR-NF alternative, and I quote, "Peak direct" -- quotation marks -- "790 workers,

638-1

638-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The *CMRR-NF SEIS* presents the environmental impacts of construction and operation of the facility; one area of environmental impacts is socioeconomics, including jobs. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for additional information.

The commentor is correct. Workers that would work in the Modified CMRR-NF are expected to come from the CMR Building and other facilities at LANL.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

plus indirect, 450 workers, employment would represent less than one percent of the regional workforce and would have little socioeconomic effect." That's for construction.

For operations, socioeconomic impacts read, for the modified CMRR-NF alternative, "Approximately 550 workers would be at the CMRR facility, and they would come from the CMR building and other facilities at LANL. So the facility would not increase employment or change the socioeconomic conditions in the region."

638-1 cont'd

SPEAKER FROM THE FLOOR: Right on.

MR. SCOTT KOVAK: So, now, first I thought, well, how can you spend $6 billion and have little socioeconomic effect.

SPEAKER FROM THE FLOOR: You can't.

MR. SCOTT KOVAK: The way you do that, I think, is by maintaining the status quo. So what could possibly happen, and what will happen is that the most of the money, most of this $6 billion, will stay on the hill at the Laboratory. The crumbs will roll off the hill to the outlying region. We need to stop and not accept the crumbs any more.

638-2

140

gentlemen, at the 9:00 o'clock mark. And so this brings us to the official close of our meeting. And I thank you all for your attendance, and -- a question?

MS. JONI ARENDS: Where's your e-mail traffic? I will come up here to the mike. My name?

MR. MacALLISTER: Yes, please.

MS. JONI ARENDS: Joni Arends for Concerned Citizens for Nuclear Safety, with Susan Gordon, with the Alliance for Nuclear Accountability, John Green with Code Pink, and others, we wrote a letter, an e-mail to Mr. Tegtmeier about the hearing process, and he said that for safety reasons the hearing shouldn't go beyond 10:00 p.m. So I think the question needs to be asked at this point, how many people want to speak, and how many minutes will they take. And to understand how long we would stay longer for this -- at this period of time.

That was part of our e-mail traffic.

MR. TEGTMEIER: Part of the reasoning for that is to make sure that everyone had a chance to speak, and I believe we can make another pass at the room for those who haven't had a chance to speak yet.

SPEAKER FROM THE FLOOR: Make them go to the mike.

MR. TEGTMEIER: I would like to ask, is there anyone else here that's not yet had the chance to speak, other than Scott, and I would like to accommodate them.

MR. MacALLISTER: Are there people that would like to make a statement who have not yet had the chance to make a statement?

SPEAKER FROM THE FLOOR: What about people that wanted to continue their statement, like they were cut off earlier?

MR. TEGTMEIER: How many individuals? I think there was two or three that wanted. But here again, we would like to limit that to a few minutes to finish out, for those who didn't.

SPEAKER FROM THE FLOOR: Oh, yeah, we can do that.

MR. TEGTMEIER: I believe there's only a few individuals.

SPEAKER FROM THE FLOOR: I only have one thing to ask --

MR. MacALLISTER: Can I have a show of hands for people -- one. How many other folks would like to just --

MR. TEGTMEIER: I think just a few.

MR. MacALLISTER: Looks like we've got four

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

people or five.

UNIDENTIFIED SPEAKER: The only thing I want to ask, and I hope it goes with that document you are typing in there.

MR. TEGTMEIER: It will be recorded.

MS. TERESA JUAREZ: Is that I think what we need here is that we need to develop, and the money -- and there needs to be money placed in that so we can develop a community board. And that is representative of the people that are affected by this, and it doesn't mean the citizens advisory board, and it doesn't mean other stakeholders. It means community people that are having to deal with the effects of the contamination, whether that's in our groundwater, whether that's in our soil, or air, or whatever it is. But that committee needs to be developed so that we can talk about also the impacts of, you know, the poverty in our community, and the joblessness that exists in this community. And that there needs to be a fair market in order for our people to have a fair way to get into those job markets that we don't have access to.

635-3

If we're going talking about, we don't want them bringing outside construction, you know, people that come and build it like the gentleman was talking

635-3 NNSA notes the commentor's statement.

about. We're not going to benefit from that. And I think it's about time that we be able to have those committees that addresses our issues, and not always the stakeholder on the other side. (Applause.)

MR. MacALLISTER: One thing I should mention, because we are still recording everybody's statement, and I'm not now announcing you by name, it would be very helpful, if you don't mind, giving your name on the record, so that when the person transcribes it, they can have your name attached to your statement.

MS. TERESA JUAREZ: That's Teresa Juarez.

MR. MacALLISTER: Thank you, Ms. Juarez. Who would like to speak next? Yes, ma'am.

MS. JEANNE GREEN: Jeanne Green. I just have a question, Mr. Tegtmeier. Why is it that we cannot have a full hearing in Taos?

616-1 cont'd

MR. TEGTMEIER: We're not here to answer that question, but we are continuing to pursue alternatives for Taos.

SPEAKER FROM THE FLOOR: Microphone.

MS. JEANNE GREEN: What are the reasons that we cannot have a hearing in Taos?

MR. TEGTMEIER: I can't speak to that myself personally.

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

MS. JEANNE GREEN: You are the Document Manager.

MR. TEGTMEIER: That's correct, but I don't make all of the decisions.

MS. JEANNE GREEN: Are you on a board that's making this decision? No?

MR. TEGTMEIER: No, I don't. Actually it's my management that makes that decision in part. So, I can't speak to specifics.

MS. JEANNE GREEN: Okay. So who is the name of the person I need to speak to?

MR. TEGTMEIER: We are working that issue right now.

MR. MacALLISTER: Let me go to a mike so I can repeat what you said without the microphone.

MS. JEANNE GREEN: I didn't get that. Who was that now? Who is your management?

MR. TEGTMEIER: We are working with the request and determining the exact nature of that and setting up that right now, I'm not aware of all of the details of that. I'm not sure if the individual is here in the room.

MS. JEANNE GREEN: Well, what I heard was that there was not -- that you didn't want to pay for a building, and the mayor has offered a building, so that can't be the reason.

Response side of this page intentionally left blank.

MR. TEGTMEIER: No.

MS. JEANNE GREEN: So I don't know why it would be more expensive to have a hearing to let people to speak, than it would be for you to come down and do a presentation, and have a microphone. I don't understand, you know, where's the expense? And if we are talking about a six-and-a-half-billion-dollar facility, why can't we spend a little -- for a hearing in Taos? We're within your 50 miles, we are affected, we were affected by the fire.

616-1 cont'd

MR. TEGTMEIER: If you allow us to continue with the details --

OTHER SPEAKERS FROM THE FLOOR: Louder.

MR. TEGTMEIER: If you allow us to continue with the details, we're working on the issue, but haven't come to a final resolution, so we can't answer that at this meeting, but we certainly have the request. We have the signatures from the folks who have been working with the Mayor's Office, and will be finalizing the arrangements and announcing those appropriately, and we are in the process of doing that, but we can't do that this evening.

MS. JEANNE GREEN: Well, I would just like the name of the person or persons who are making this

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

decision.

MR. TEGTMEIER: It's a collective decision within our office, and we'll let the folks know when the details are available. That's all I know this evening.

MS. JEANNE GREEN: Thank you.

MR. MacALLISTER: And just in case people didn't hear that, the question was, and it's been repeatedly put on the record, there's a request to have a hearing in Taos, for the benefit of the community, that it's a hardship to drive long distances outside of Taos. The response to that, if I understand it correctly, if I'm wrong, is that that request is being worked, there is efforts under way at this point. There isn't a final -- there isn't concrete information to provide. Is that a fair recap?

MR. TEGTMEIER: That's correct. We're working on the issue, and we will announce the details as they are developed. And it won't be very long from now.

MR. MacALLISTER: Is there somebody else who wanted to make a comment? Yes, sir. And remember to give your name again.

MR. JAY COGHLAN: That's fine. I am Jay Coghlan with Nuke Watch New Mexico. I will try to

Response side of this page intentionally left blank.

abbreviate my supplemental comments tonight, expand on them tomorrow in Santa Fe.

I tried to get up and identify what I believe are two pretty serious general legal vulnerabilities to this Supplemental EIS, and I got as far as talking about how this document fails to revisit mission and need.

613-1 cont'd

And to expand on that a little bit more, you know, once again, this nuclear facility, it's not only about, but it's primarily about, expanded plutonium production.

613-2 cont'd

I think it useful to try to briefly review the history of pit production since 1989, because the audience generally won't be aware of this. But in 1989, the FBI raided Rocky Flats, investigating alleged environmental crimes. And, at that time -- I don't know this for a fact, but Rocky Flats was probably, you know, producing on the order of a thousand pits a year. But that FBI raid just cut it down, you know, literally pits and the pipeline, just cut it out just like that.

So, after that, DOE, with the pit in production at that time, the W88 for sub-launched warhead, a Trident warhead, 450 kiloton warhead.

So, there were 350 that were produced, and

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

the Department of Energy always maintained that there weren't enough W88 pits. And that's kind of like the camel's nose under the tent. The reason DOE used to reestablish pit production first at Los Alamos, limited capacity.

But then -- this was about seven years ago, then the Department of Energy comes out with a proposal for the modern pit facility to be situated at five -- one of five candidate sites, but that was originally proposed to produce on the order 450 pits a year. And that got defeated in part through a NEPA process like we're undergoing now.

Then, the National Nuclear Security Administration came back with something they called the consolidated plutonium center, that was going to produce 125 pits per year.

And at that particular time, that was specifically tied, that number was tied to production of new designed nuclear weapons, the so-called Reliable Replacement Warhead.

That got shot down. Again, in part, through a NEPA process like this.

And then NNSA came back, proposed producing up to 80 pits per year at Los Alamos. That, too, got shot down.

Response side of this page intentionally left blank.

I'm trying to display a history, what I regard as a favorable history. Look at the overall trend. Now, if we're going down for producing, like, a thousand pits back in 1989, defeating a proposal for 450 pits, and 125, then 80, and the overall trend, you know, is very clear.

Now, the reason I bring this up -- I bring this up for a number of reasons. First of all, it's to encourage citizen activism. It actually works. You ought to give it a shot.

But look at the historic trend, and this gets to the need for, or rather the lack of need for the CMRR Nuclear Facility. And I just don't think that Congress is going to allow production of new design weapons, especially when we have Senator Dianne Feinstein, head of Senate Energy and Water Appropriations. She is not going to allow that.

What I believe NNSA is trying to do in the laboratories is trying to achieve their RRW-like aims incrementally through life extension programs. And these life extension programs are growing ever more aggressive, and now talking about intrusive modification of pits, which can only take place at Los Alamos, specifically at the plutonium facility for PF-4, which next door, the nuclear facility will

613-1 cont'd

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

be located.

So, this whole business about the nuclear facility is to aid and abet future life extension programs.

Now, if I'm going to try to quit, I want to eat dinner, I bet you there's a lot of other folks. But, again, the historic trend of pit production is on a big glide path down, and that's a good thing. And I think it's going to hold that way, and because of that, there is no real need for the nuclear facility.

Now, tomorrow, I will expand or begin to talk about what I regard as the other legal vulnerability of this document, and that being that it really doesn't offer a true spectrum of alternatives, and that gets to the heart of NEPA.

I believe that government is required as a matter of federal law, to give, you know, a genuine range of reasonable alternatives, and I don't believe that this document does it. But that's for another night. (Applause.)

MR. MacALLISTER: Thank you. Is there someone else who would like to make a follow-up comment, or someone who hasn't commented? Sir.

UNIDENTIFIED SPEAKER: No, I will not give

Response side of this page intentionally left blank.

my name. The first time I spoke, I did not give my real name. I refuse to dignify this illegal undemocratic process with my name. And if this was a real legal hearing with a force of law, it would be illegal for me to stand here and falsify my name. The fact that there is no judge, there is no legal authority here, except for Santa Clara Pueblo, should speak volumes about the unjustness of this process.

So, the next time you go to a hearing, perhaps tomorrow in Santa Fe, you can say your name is Mickey Mouse, because this is a Mickey Mouse process.

MR. MacALLISTER: Marian, you also wanted to finish?

MS. MARIAN NARANJO: I just wanted to finish, where I left off.

At this time, I know of no emergency evacuation plan for the surrounding communities. Does that mean in case of an accident or radiological release, we shelter in place? Are we then, or are we already stamped as collateral damage, even though the risks of building this nuclear facility have been clearly stated and identified?

Are there agreements for compensation and healthcare for generations to come?

639-1

623-3 cont'd

639-1 No response necessary.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

152

This proposed action by the NNSA is not a pleasant thought for me, or for other native and indigenous people.

We are not blind to the actions taking place globally to other native and indigenous people in the name of profit.

History has already been written of the manners of this government to the seizing of native lands and natural resources for profit for a few.

As a member to an Accord Tribe, I respect the government-to-government relationship Santa Clara Pueblo has with DOE. Although, I have seen actual proof of consultation in other EIS's, such as the greater-than-class, GTCC Draft EIS, but I did not see this in the CMRR EIS or the CMRR SEIS. I feel this document is incomplete without it.

623-4 cont'd

Not only am I a member of Kha'Po Owingeh, but I am a citizen of the State of New Mexico, and I am a citizen of the United States of America. I do not condone the use of military might to take natural resources from others for my livelihood or my economic survival, or contaminating land, air and water with hazardous nuclear waste and toxic materials for profit or national security.

HOPE's mission is that we embrace the

Response side of this page intentionally left blank.

Pueblo teachings of love, respect and care, working together improving the life ways of our people in order to provide an enhanced and sustainable environment for generations to come.

Having said that, I stand here today to exercise my rights in the NEPA process to oppose the construction and operations of this CMRR Nuclear Facility in our sacred mountain, as a matter of environmental justice, in protecting the health and welfare and cultural survival of the surrounding Pueblo communities, and also for the reasons and questions I have stated before.

Again, thank you for this opportunity. Kunda, goodbye.

OTHER SPEAKERS FROM THE FLOOR: Just a real quick, I wanted to let you guys know something. A couple of weeks I did presentation at the local high school here, the Española Valley High School, and you would think that being so close to Los Alamos that people would be -- would know about Los Alamos' activities. And right now what I would like to request -- or I'd like to say that there's not enough education to students about Los Alamos and the possible negative health effects that brings, because it does bring negative health effects.

623-5

623-5 NNSA notes the commentor's opposition to the CMRR-NF project. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

154

And that when I went in to do this presentation, to speak to these kids, you know, 90 to 95 percent of them had no idea of what was going on. They are really oblivious to the fact that they really are a huge part of nuclear industry. Thank you. Thank you. (Applause.)

MR. MacALLISTER: Is there anybody who would like to make one final comment?

MS. SHEILA COOPER: I have a question, and I'll come to the microphone.

MR. MacALLISTER: If you would, please. I'm not sure that we will have an answer, but we will certainly put the question on the record.

MS. SHEILA COOPER: I will give my name. It's Sheila Cooper. And I guess I'm really struck at this meeting of how strong the feelings are about Los Alamos, and how much pain and hurt was expressed here tonight, and I wonder if Los Alamos couldn't do some sort of outreach separate and apart from this process, but some sort of outreach to the community, so that there's not this us versus them idea.

627-3

And there's some understanding of the impacts that Los Alamos has had on some communities here. And, you know, I realize you guys may not be the ones to ask, but that question is coming up in my

627-3 NNSA acknowledges the commentor's statement. LANL is involved in many facets of the community. Information regarding outreach efforts at LANL can be found at http://www.lanl.gov/.

mind. I'm really -- I mean, I guess I knew it, but I hadn't really heard it and felt it quite as strongly how feelings are right on the surface, and they are visceral.

And, you know, Los Alamos is going to be there, and we have talked a lot about the bad, but it's not all bad, and if there could be some sort of outreach, I think it would be mutually beneficial.

MR. TEGTMEIER Thank you.

MR. MacALLISTER: Thank you. Is there anybody else who would like to make a last comment? All right. Well, thank you very much for attending this meeting. These meetings are a critical part of our democracy, and I appreciate your candor and your energy and your input.

So, again, we will have another meeting tomorrow at Santa Fe Community College, at 6401 Richard Avenue. And thank you very much. The meeting is now officially closed. Thank you.

(The following is a statement taken by the court reporter in a private session.)

MR. DAVID NORRIS: I spent the second, third year of my life living in a trailer court on DP Road in Los Alamos. And I have been sterile all my life. My younger brother was conceived and born

Response side of this page intentionally left blank.

Comments from the Española, New Mexico Public Hearing (May 25, 2011)

156

there, and he died at three from cancer. My next youngest brother was conceived and born while my other brother was being treated for cancer, and he's had skin problems his whole life. And as it turns out, I guess there was a wartime dump in that trailer park, before the trailer park. And I have heard that other people have been compensated, but very, very little on it. I'd like to know more.

(The hearing adjourned at 9:21 p.m.)

640-1

640-1 Chapter 3, Section 3.11.4, Health Effects Studies, of the *CMRR-NF SEIS* includes a summary of a number of epidemiological studies that have been conducted in the LANL area, as well as a summary of cancer incidence and mortality figures for the Los Alamos region as derived from data from the National Cancer Institute. During the period 2003 through 2007, the annual cancer death rate for Los Alamos County was smaller than that for the state of New Mexico as a whole, and for the entire United States. The cancer incidence rates, however, of melanoma of the skin, prostate cancer, thyroid cancer, and female breast cancer were elevated in Los Alamos County with respect to state averages, while cancers of the lung, colon, and rectum occurred at rates below the state averages.

Response side of this page intentionally left blank.

MR. MacALLISTER: Welcome everyone. My name is Bruce MacAllister. I will be your facilitator.

And before I introduce myself, let me start by explaining where the emergency exits and the facilities are. The primary exits for this room are the two doorways in the back. If there is an emergency and we need to vacate the building quickly, there are double doors, two sets of double doors that exit immediately onto a patio right off this alcove. If for any reason those are blocked, the exit through the main cafeteria area of the community college will also be available. If for any reason you have to use one of these exits up here, you will exit through the door and make an immediate right. You go down the hallway to your right, and you will exit again to the right into the hallway adjacent to the cafeteria.

So as far as drinking fountains, there are drinking fountains out the rear doorway and to the left on the wall. As you turn left and look left, there will be drinking fountains. Restroom facilities are multiple being a college campus, but the closest ones, if you walk left past the food services area that right now is closed and screened

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

3

off, there are men's and ladies' facilities just up that hallway to the left. Alternatively there are restrooms at the back end of the cafeteria, and there are restrooms further down that hallway.

Again, as I mentioned, my name is Bruce MacAllister. I am a self-employed small business person doing mediation, community facilitation work, and organizational development work through a small business called Business Excellence Solutions.

I am not affiliated with Los Alamos National Laboratory other than having a contract to provide facilitation services. I'm not employed by the Department of Energy, by the NNSA, or by any of the major contractors to the Department of Energy, other than as I mentioned, for purposes of my facilitation contract.

Also our host tonight, I would like to thank the Santa Fe Community College, but again, the community college is not involved or taking any official position one way or another with respect to the issue that we are here to discuss.

The content of tonight's meeting is the Los Alamos National Laboratory Chemical and Metallurgy Research Replacement Facility. It's the nuclear facility portion of that project that is

Response side of this page intentionally left blank.

under review. The comments that we are soliciting tonight have to do with the Supplemental Environmental Impact Statement.

This public hearing is commenced under the laws pertinent to the Environmental Impact Statement.

Just a reminder, if you intend to speak tonight, there will be sign-in cards at the table just out your door to the left. They look like this. These are the draft CMRR-NF SEIS comment cards. You will be given a number, and as soon as we roll into the comment period, we will be taking your comments in the order of the sign-in, in the order in which you signed in.

If there are elected officials from federal, state, local, or tribal entities here, I will be asking them for comments first, if there are people here that choose to comment. And before we have the comments, we will have about a 15 minute presentation.

I would like to introduce at this point the document manager for the project, John Tegtmeier. John is the official hearing representative for the meeting. Sometimes it's been my impression in the previous meetings, that because

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

I am facilitating, people believe I am the person they need to speak with. Let me assure you there are times when I'm not even listening, because I am focused on running the logistics of the meeting. So the official that you need to be addressing comments to is Mr. Tegtmeier.

The comments will be transcribed, and I will be going through the ground rules for giving comments in a few minutes.

Again the focus for this hearing is on receiving comments relative to the Environmental Impact Statement. We are not here to debate or answer questions about larger questions of national nuclear policy. Those decisions are made by entities beyond those that are represented in this meeting. So we would request that you understand that the comments that are going to be most relevant to us will be those comments relating to the project at hand.

We will be timing the comment time to ensure that everybody has an opportunity to speak. Based on the number of people that have signed up so far, it looks like we will be fine allowing people up to five minutes to speak. I will explain more ground rules about that after the presentation.

Response side of this page intentionally left blank.

May I remind you, there is a poster session that's going on outside. You are free at any time, if a question surfaces that you want technical information concerning, to return to the poster area, and there will be subject matter experts in that area available to answer technical questions relating to the project. The purpose of this session is not a question and answer session.

This session is to hear. The officials are here to listen to your comments and to receive those comments officially into a transcribed record.

If we run out of time tonight, there are many other avenues to give comments. This is the last of the officially scheduled formal hearings, but there are nine other avenues for you to give comments. There is a kiosk set up at the back, looking at this direction as you exit the doorway, the back left-hand side of the alcove out there, set up with work stations to enter into a computer your comments, to record comments directly in the system. There is also a court reporter out there available to take your transcribed statement. You can e-mail, you can mail, you can fax, and there is a toll free phone line.

Now, unlike the meeting, the recorded

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

7

session here which has time limits, all of these other options are available without a time limit. So those will be available to you.

As I mentioned earlier, I will as soon as we have finished with the presentation, revisit some of the other ground rules before opening up the session for comments. But at this point, I would like to introduce Mr. John Tegtmeier who is the document custodian, the document manager for the project that we are here to discuss. Thank you.

MR. TEGTMEIER: Thank you, Bruce.

Good evening. I appreciate everyone coming. It's very important that we obtain public input on the draft document that we have out for review. My name is John Tegtmeier, as Bruce mentioned. I work for the National Nuclear Security Administration, Los Alamos Site Office. I am the document manager, and I have many responsibilities, so I would like to share with you very briefly with that.

I have a responsibility for the preparation of the document, that the document meets the requirements of the National Environmental Policy Act from the Council of Environmental Quality, as well as the DOE implementing

Response side of this page intentionally left blank.

requirements that are also federal law, but I believe my most important role is to encourage and facilitate public participation in this process. It's very important to me, and I take that very seriously.

So I would like to start with a little bit of background on the environmental impact background of this project. Back in 2003, an Environmental Impact Statement was prepared for the project, and it was followed by a Record of Decision in February of 2004. In that decision, an approval was made for a two building concept sited at Technical Area 55 at Los Alamos that's adjacent to the existing plutonium facility.

The first building is complete. That's the Radiological/Laboratory/Utility/Office Building. It is currently being outfitted, No. 1, for the office space and training facilities for the workers, and the second piece is the outfitting of the laboratory space for the radiological laboratory in that facility, and those laboratories deal with very small quantities of material. So that's happening right now.

The second building is in design, and that's the nuclear facility that the main focus of

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

this Environmental Impact Statement Supplement is about, but there is more that I will get into in a minute.

Since the time that the Environmental Impact Statement was prepared, there has been additional geological mapping at the site, and some information on that is available at some of the poster sessions out in the hallway. So basically they exposed some of the strata on the proposed construction site, and they did some crack mapping. They were looking for the presence of faults. They also did borehole investigations, and so they have a better idea now of the geologic conditions directly underlying the site.

In addition in 2007, a final or an update to the probabilistic seismic hazard analysis at the laboratory, which focused primarily on the area of Technical Area 55 and Technical Area 3, was finalized. One of the outcomes of that analysis was that the ground motions, the ground accelerations associated with a postulated earthquake that might impact the site that would form the basis for the design increased those ground accelerations.

So both of those factors combined were looked at as the design became more mature, and that

Response side of this page intentionally left blank.

identified the fact that certain aspects of the building would require significant upgrading as the design progressed to resist those earthquake forces and potential other interactions with that geologic site.

So that work was analyzed, and last summer the laboratory prepared a supplement analysis, and that's part of the NEPA requirements, to determine whether or not enough change had been identified such that a Supplemental Environmental Impact Statement should be prepared. The outcome of that, even though that supplement analysis was not formally decided upon, the NNSA did decide to pursue the Supplemental Environmental Impact Statement. That's the draft that's currently out for public review.

We had a Notice of Intent that was issued on October 1st in the Federal Register. That was a Notice of Intent to prepare the Supplemental Environmental Impact Statement. As part of that, we had two public scoping meetings in White Rock and Pojoaque in early to mid October last year.

So taking that information and some other initial internal scoping within the NNSA, we started preparation of the Supplemental Environmental Impact

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

11

Statement, looking at the environmental impacts of those changes primarily to the construction of the facility, but also the operations that I will get into here. There are some additional types of analysis required due to new requirements in 2003.

So some of the new analyses you will see in the document are analysis of greenhouse gas emissions. That's from construction operations as well as operations in the facility long-term. The intentional destructive acts, there is a new requirement that we do that, so we have an analysis that we perform for those things like terrorist incidents that you might see inside the facility and the impacts of those. And we also updated the analyses, as I said, for construction, for operations, and those are operations for the existing Chemical and Metallurgy Research Building that was completed in 1952.

We also did the operations impacts for the RLUOB facility that I had just mentioned, because we have very good data on that now that the design is complete. We also did operations impacts associated with the proposed new nuclear facility. We also updated the accident analyses for the existing CMR Building. That's based on a documented safety

Response side of this page intentionally left blank.

analysis that our office approved last summer, as well as the preliminary documented safety analysis, the most recent version of that that the project prepared last summer and also approved by our office.

The last thing that we updated is the impacts, human health impacts, primarily radiological impacts, and there were a few things that were involved in that. One of them, there were some modeling changes in the modeling software that's used. And we also took advantage of the very latest census data available at the time. Now, all that final documentation or the data for the census has still not been received, but that will be folded in as it becomes available for the final EIS, Supplemental EIS.

So briefly the alternatives we looked at, there is a No Action Alternative, and the No Action Alternative is in the sense that that no action means no change to the Record of Decision back in 2004, so we would not change our direction in terms of the decisions made based on the past NEPA analysis.

We also have a modified CMRR nuclear facility alternative, and that's a facility that

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

incorporates the additional strengthening of the facility to resist the earthquake forces at the facility. And one thing that we did identify since the time of the scoping meeting, the project team, as the design developed a little further, they identified a possibility that we may be able to build the same facility, the same modified nuclear facility that was described in the Notice of Intent, which we call now the deep excavation option. We also identified the possibility of a shallow excavation option, which is basically the same facility built on the same piece of ground but built higher up in the strata so as to avoid the one layer that we were more concerned about beneath the facility site.

The last alternative we looked at is the No Construction Alternative, and that's to continue to use the existing CMR Building as long as we can without significant upgrades at a reduced amount of programmatic operations because of its vulnerability to seismic, so that's the No Construction Alternative that we analyzed.

So a little bit more about the process of where we are now as far as the public and stakeholder participation. We posted the Draft

Response side of this page intentionally left blank.

Supplemental Environmental Impact Statement on the NNSA website on April 22nd. That was followed the following Friday by the Environmental Protection Agency publishing the Notice of Availability in the Federal Register, and that publication in the Federal Register started the formal 45 day comment review period.

Subsequent to that, based on input and requests from members of the public, the NNSA decided on May 6th, to extend that comment period by 15 days, so the current comment period closes on June 28th, 2011.

Bruce mentioned the public hearings. This is the last of the four scheduled public hearings on the project in the Supplemental Environmental Impact Statement. We had meetings in Albuquerque on Monday evening, Los Alamos on Tuesday evening, Española yesterday evening, and then tonight is the final public hearing.

Bruce mentioned a number of ways to provide comments. There is no limit on the number of times you might comment. You can use any of the avenues. We don't want you to make one set. That doesn't close the door for you. Feel free, to the end of the comment period, to make comments using

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

any of the means that are available to do that, and I encourage that type of input from the concerned people and to forward the draft document comments to us.

With that I would like to turn it over to Bruce, and he will go over the final ground rules before we get started. Thank you.

MR. MacALLISTER: Thank you.

Before we start, I noticed there are a few video cameras rolling, and I just want to mention that those are not cameras that are operated officially by the Department of Energy or as an adjunct to this meeting. So if anybody objects to being videotaped, you will need to take that up directly with the videographer.

We have a pretty good number of folks who want to comment tonight, and the process has been designed with a preference to make sure that everybody has an opportunity to speak. Anybody who wants to speak in the allotted time we try to accommodate. The meeting will run until 9:00, and we will try to manage the time within that time limit to ensure that everybody who has registered has a chance to speak. Does anybody have an objection to the process trying to enable that

Response side of this page intentionally left blank.

everybody who has signed up has a chance to speak?

You object to that?

MS. JONI ARENDS: Joni Arends with Concerned Citizens for Nuclear Safety. We were one of the signers on to the e-mail that requested additional time if there were enough people, and Mr. Tegtmeier said that if possible we would stay until 10:00. So I don't know the amount of time or the number of people that have registered to speak. It would be interesting to know, because there has been a difference of the amount of time. In Albuquerque first there was five minutes. Then it got changed to three. In Los Alamos there was seven minutes, and last night there was five minutes. So I would like to understand how many minutes are currently scheduled for people to speak.

MR. MacALLISTER: I can answer that question. I can't answer how many are registered, because we continue to take people as they show up. It looks like, based on our best estimate -- and once we make this decision, we stick to it -- that we will be able to provide the five minute time limits.

Is there anybody who has any objection to me treating each speaker equally with respect to the

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

amount of time? All right. Finally is there anybody who believes they are entitled to more time than the allotted five minutes?

MR. DOUG DORAN: We would have the right to yield the balance of the time. If we didn't take the full amount of time, we could yield it to someone else?

MR. MacALLISTER: No. You have the right to yield your block of time. We can't get into measuring fractions of minutes for time. If we run ahead, that time goes into the pool, at the end of meeting, wherein we take open questions, open comments.

If on the other hand somebody runs out of time and the audience would like to hear more of them and somebody chooses to yield their time slot to that speaker, when I reach that person's card, and I call them, they can tell me I yield my position to a particular speaker. I will move that person's card who yielded to the back of the stack, and if there is time allowed, we will take that comment at the end before we conclude the meeting. Right now it looks like we will have plenty of time.

Another question from Joni Arends.

MS. ARENDS: Yes. I have a due process

Response side of this page intentionally left blank.

question. At the three other hearings there was an opportunity for a second round.

MR. MacALLISTER: Yes.

MS. ARENDS: Is there an opportunity for a second round this evening?

MR. MacALLISTER: As with all the other hearings, the second round is contingent upon there being available time. At every other meeting, even at last night's meeting where there were more people signed up, we did have time for some follow-up questions. So I anticipate that as long as there is time available, that we will have second round.

Now, this facility has limits on how late we can remain in this facility. I will point out that this is the fourth meeting. My understanding is that the due process requirements for meetings technically have been fulfilled. I am looking at the document manager for verification of that. He is, just for the record, indicating that that's the case.

I have no doubt, as soon as we roll into this, that there will be ample opportunity for follow-up comments. Okay.

MS. ARENDS: I reserve time to object during the process. Thank you.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

19

MR. MacALLISTER: You can use your time, your allotted time for anything you want.

As far as the ground rules going on, please wait until your scheduled time to provide comments. Heckling from the audience, there is absolutely zero tolerance for it. We don't want any speaker of any philosophy, any position they want to take feeling remotely intimidated in terms of their ability to give their honest opinion to the document manager. So please reserve your applause, and please refrain from making comments during people's presentations.

It's important that we don't interrupt presentations with shouting or comments, because this is a transcribed hearing and the court reporter has to hear the speaker.

Sir, you had a question.

MR. ERWIN JULIAN RIVERA: (Comments in Spanish.)

MR. MacALLISTER: As far as a translator, John, we don't have that capacity at tonight's meeting.

MR. RIVERA: It's okay. I do.

MR. MacALLISTER: I will be calling you by name. So in the first round it's a little less

Response side of this page intentionally left blank.

critical; however, I am famous for mispronouncing some people's names. So it's helpful when you come to the mike to please confirm, yes, my name is Joe Jones, because I may have mispronounced your name. For the record, it will be helpful for us to make sure we have the right people in the right order.

Yes, sir.

MR. KEN LAING: Do you intend to remove people who refuse to stop speaking after their time by force?

MR. MacALLISTER: I am getting to that.

I am asking you all to abide by the time limits. There is not going to be anybody here -- I have no intention of arm wrestling with anybody at the mike. However, if we cannot maintain order and if people refuse to yield the floor following the ground rules of the meeting, I will put the meeting into recess, the court reporter will be instructed to stop taking the official transcription, and the mike will be cut off, and we will be in recess unless and until we can restore order and the next speaker is up to speak.

MR. LAING: So was last night's attempt to remove a speaker peculiar to that setting? We are not intending to do that again?

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

21

MR. MacALLISTER: There was no attempt to remove a speaker. There was an attempt to get the speaker to yield the floor. I'm not going to argue about other -- I'm going through the ground rules for tonight. We have made some adjustments to make it clear that we intend to give everybody an equal opportunity to participate in the meeting.

Again, please keep your comments as civil as you can and finish your statement as early as possible.

Sir, you have a comment.

MR. KIRK OWENS: If somebody would like to give comments in other than English, since we can't accommodate anything else here, we can take comments in another language, and there is also an audio recording capability out here. If you leave them in Spanish or a native language, we will make every attempt to get them translated for the document.

MR. RIVERA: I don't mean to be argumentative, but we requested that in many hearings and to have the reports issued back -- based on the New Mexico Constitution, we are an official bilingual state, and we have yet to receive anything back in answer to our request. I appreciate your comment, but it's still not adequate

Response side of this page intentionally left blank.

for us, but I am multi-lingual.

MR. MacALLISTER: And again, if we cannot regain order of the meeting, we will be in recess. However, we will continue to take comments from people at the kiosk, and there will be an ultimate decision about whether to adjourn the meeting or to continue based on our ability to restore the structure of the meeting.

A final comment, a final request on my part is please silence your cell phones and anything else that might make noise at this time so that the speakers are not interrupted. And again, just as a reminder, I will be taking comments from any elected officials first, or representatives of those offices, at the outset of the hearing, and then I will be taking the next comments in order.

I believe we have at least one representative of an elected official here, Jennifer Catechis. Pardon me if I mispronounce.

MS. JENNIFER CATECHIS: It's close, very close. I am with Congressman Lujan.

MR. MacALLISTER: Thank you. And would you like to speak, ma'am?

MS. CATECHIS: No.

MR. MacALLISTER: Thank you. Thank you.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

23

Are there any other representatives or elected officials, representatives of offices that are from the elected officials' offices here present tonight? Are there any tribal officials present tonight? Any municipal or county? All right.

Then without further adieu, we will begin the process.

One last ground rule, to help you with the timing to abide by the five minute rule, you will see at your four minutes, at one minute out, our timekeeper will hold up a yellow card, so you will know that it's time to begin preparing to conclude your statement. When you see the red card, your time is up. If you don't wrap up in a timely manner with the red card, I will approach the podium and ask you to yield the floor. If at that time you don't yield the floor, I will instruct the court reporter to cease recording, and we will go off the record, and we will be officially in recess until such time as we get the podium back. Thank you.

Okay. Our first speaker -- I will be calling out the name of the first speaker. Then I will, as with the other meetings, call out the next person in line to speak so that that person can be getting ready.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

24

Our first speaker is Ray M. Baca and he will be followed by Danny Beavers.

MR. RAY M. BACA: Thank you very much. My name is Ray Baca. I am the executive director for the New Mexico Building Trades Council. In that capacity, I represent all of the construction labor unions here in the state of New Mexico. This includes approximately 800 construction and maintenance workers that are currently employed by the laboratory.

These are good-paying, family-sustaining jobs that unfortunately are not otherwise available in northern New Mexico to that degree. As most of you may already know, the construction industry in New Mexico, as it is in much of the country, is in a depressed state. The unemployment rate for construction workers is fully double and in many cases triple that of the average unemployed New Mexican. It is not uncommon for us to see unemployment rates of 27 to almost 30 percent in the various crafts that we represent.

This project, the CMR project, if and when it comes to be, would employ upwards of nearly 1,000 construction workers off and on over the course of a 10 to 12 year period. Obviously this would be a

701-1

701-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for additional information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

huge boost to the construction industry in New Mexico. It would be a huge boost to economic development and opportunity in northern New Mexico, but much more importantly, it would be a huge boost to those working construction families in New Mexico that are in dire straits.

With all due respect to those of you who are opposed to the project, we respectfully urge the laboratory and DOE and all the other powers that be to begin this project sooner than later. Thank you.

701-1 cont'd

MR. MacALLISTER: Thank you, sir.

Our next speaker is Danny Beavers and he will be followed by Jennifer Sequieira.

MR. DANNY BEAVERS: My name is Danny Beavers. I am a business representative for the United Association of Plumbers and Pipefitters. I am here today to speak in favor of the proposed project for a couple of reasons. Throughout my lifetime, there have been nuclear weapons, and I'm sure they will be around long after my life is over. In my opinion, they are and will continue to be necessary to assure the safety, freedom, and way of life of our country.

Next, the current facility was opened in the late '50s, early '60s, and has been in operation

702-1

702-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Special designs, operations, and procedural measures to protect workers and the public would be incorporated into the design and operation of the CMRR-NF. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for additional information.

for well over 50 years. Due to the fact that nuclear weapons are going to continue to be a reality, I would personally feel better knowing that that type of work is being done in a new state of the art facility as opposed to an antiquated facility.

Lastly is the economic impact of a project of this size, not only to northern New Mexico but the entire state of New Mexico, from vendors to suppliers, not to mention the estimated 1,000 construction workers that it is scheduled to employ over the course of the project. These are all good-paying jobs that include family health care and pensions. Therefore, I stand in favor of this project and respectfully request that it move forward without further delay. Thank you.

702-1 cont'd

MR. MacALLISTER: Thank you, sir.

Our next speaker is Jennifer Sequieira followed by Scott Kovac.

Jennifer Sequieira.

Scott Kovac.

MR. SCOTT KOVAC: Good evening. Thank you, everyone, for coming out this evening.

Members of the public who have spoken in support of this CMRR -- sorry. Members of the

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

27

public who have spoken out in support of the CMRR nuclear facility who just left, have, for the most part, pointed to jobs that would --

(There was a buzzing sound from the mike.)

MR. MacALLISTER: See if that's better.

MR. KOVAC: My time is not starting yet.

All right. Members of the public who have spoken in support of the CMRR nuclear facility so far have pointed to the jobs that have been produced. Nuclear Watch New Mexico agrees that more jobs are sorely needed in northern New Mexico. We don't agree that the CMRR nuclear facility is the right way to get these jobs.

703-1 First of all, it is wrong to advocate nuclear weapons programs as a job program. Secondly, $6 billion for an expanded production complex for plutonium bomb triggers is an astronomical amount of money, but what do we really get in the way of added jobs? The answer is nothing. There is no net increase in permanent jobs. This is not just nuke watch saying this. This is the Supplemental EIS saying it also.

The CMRR-NF would not create additional jobs. It would simply relocate existing employees from an old facility to a new facility, one that

703-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. The *CMRR-NF SEIS* presents the environmental impacts of construction and operation of the facility; one area of environmental impacts is socioeconomics, including jobs. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for additional information.

would cost around $10,000 a square foot to build. To quote the summary of the Supplemental EIS, approximately 550 workers would be at the CMRR facility. They would come from the old CMR Building and other facilities at LANL, so the facility would not increase employment or change socioeconomic conditions in the region. I will say that last line again -- so the facility would not increase employment or change socioeconomic conditions in the region.

What the $6 billion approximately CMRR project would do is help reserve the socioeconomic status quo for Los Alamos County, which is already the sixth richest county in the United States and is tied for the lowest unemployment rate in the United States. This is all while public school teachers are being laid off in neighboring Rio Arriba County and in the majority of states across the country.

The nuclear facility does create additional construction jobs, but these are limited to last only a finite period of time. The SEIS states that there will be an average of only 420 construction jobs over nine years, with a peak of 790 jobs. The SEIS further states construction employment would represent less than one percent of

703-1 cont'd

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

29

the regional workforce and would have little socioeconomic effect.

In short, it's remarkable how little $6 billion buys for northern New Mexico. Let's look at the math. For the sake of discussion, let's assume that the average construction worker makes 40 bucks an hour for 2,000 hours during an average work year. With an average of 420 construction workers over nine years, that would be a payroll of a little over $300 million or just five percent of the total project costs. This is less than has already been spent so far for the design alone of the CMRR facility. Design costs are now at $500 million and climbing, and have we seen any socioeconomic gain from that? Has anybody noticed?

703-1 cont'd

Nuclear Watch New Mexico argues that far more jobs could be created than through almost any federal effort over the CMRR nuclear facility. Its limited positive socioeconomic impacts will stay mostly in Los Alamos County and will hardly be noticed in the rest of northern New Mexico. Only crumbs will roll off the hill to the rest of us as usual.

To invoke a cliche: Why can't we have clean, green jobs instead of mean jobs? A $6

703-2

703-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on major Federal programs (for example, education) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for additional information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

Refer to Section 2.5, Cleanup and Waste Management, of this CRD for information about LANL environmental remediation activities.

billion plutonium investment will lock Los Alamos' future into the hopefully shrinking business of nuclear weapons production and research and will be a loser in the long run for job production. Full clean-up of LANL's radioactive waste dump is estimated to cost $32 billion, but the lab opposes that form of clean-up because it's far too expensive.

This may be, but while protecting our environment in the Rio Grande, what a job producer comprehensive clean-up at the lab would be. Thank you.

703-2 cont'd

MR. MacALLISTER: Thank you. (Applause)

Actually that reminds me of one thing that I should have mentioned. If you have a written statement that you would like to submit to the court reporter to make sure that you have got word for word what you wanted to say in the record, that's more than welcome as well. All right.

Our next speaker will be Robert Gilkeson followed by Dave McCoy.

MR. ROBERT H. GILKESON: Thank you. My name is Robert Gilkeson. I am a registered geologist with over 40 years of experience with activities in the earth sciences, including teaching

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

at the University of Illinois, research and ground water contamination issues across the United States and especially at Los Alamos National Laboratory, research and exploration for ground water resources, and research in seismic geophysics.

From 1988 to 1999, I was a technical consultant at Los Alamos National Laboratory on issues of environmental contamination, and I was the lead consultant for a period of a few years for installation of the large network of monitoring wells in the regional aquifer below and away from the laboratory.

In 2009, I wrote a paper with Joni Arends, the executive director of Concerned Citizens for Nuclear Safety about the large number of deficiencies in the LANL 2007 Probabilistic Site Wide Seismic Hazard Analysis Report. There was a mouthful. And also in the geotechnical report, the 2005 geotechnical report for the geotechnical investigation of the seismic hazard at the proposed site for the CMRR facility in Technical Area 55.

Joni Arends and I took that paper to a meeting with the Defense Nuclear Facilities Safety Board in Washington, DC on May 23rd of 2009. And that paper, currently Joni and I are updating the

704-1

704-1 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

paper for current events, and that will be provided to this hearing by the end of the public comment period.

My presentation today is the findings and conclusions in a paper written by scientists at the Los Alamos National Laboratory with their studies to identify that there has been active earthquake with surface rupture at least three times during the period of the Holocene. And the Holocene covers earth history going back to 10,000 years from the present. It's a very excellent paper, and it was published in the June 2009 issue of a journal named "Geosphere."

The name of the paper -- if I can find it here -- "Fault interaction and along-strike variation in throw in the Pajarito fault system, Rio Grande rift, New Mexico." I have a handout which will be out where the CCNS materials are, the table of CCNS materials, and there is a map on the back of that handout that shows the great complexity of the Pajarito fault system. It's a network of faults that extends from north of Los Alamos to south of Los Alamos to approximately Cochiti Pueblo. The fault is over a total distance of around 48 kilometers or 29 miles.

704-1 cont'd

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

I'm going to read some of the findings in the report by the LANL scientists. From the abstract, "The seismically active Pajarito fault system of northern New Mexico, United States, is a complex zone of deformation made up of many laterally discontinuous faults and associated folds and fractures that interact in ways that have important implications for seismic hazards at Los Alamos National Laboratory," and I would say including Technical Area 55, the proposed site for the CMRR facility.

From the conclusion section of their report, I'm going to present the bulleted findings: New paleoseismic data show three Holocene surface rupturing earthquakes, one ground surface rupturing event, 1,400 years ago on the Pajarito fault; a second ground surface rupturing event from 5,200 to 2,500 years ago. That's the range of time.

704-1 cont'd

MR. MacALLISTER: Sir, your time is up to take a closing statement.

MR. GILKESON: That was five minutes already?

VOICE FROM THE FLOOR: Can I yield?

MR. MacALLISTER: No, you can't yield now. You can yield when it's your turn.

Response side of this page intentionally left blank.

VOICE FROM THE FLOOR: Well, I can pull my card out right now.

MR. MacALLISTER: It doesn't work that way, because others signed up hoping to get in here.

MR. GILKESON: Let's hold to the rules. I will probably get a chance later to finish this.

MR. MacALLISTER: Thank you, sir.

MR. GILKESON: There is a handout of this report at the table with CCNS materials. Thank you.

MR. MacALLISTER: Thank you, sir.

(Applause)

Our next speaker is Dave McCoy followed by Bob Walsh.

MR. DAVE McCOY: Dave McCoy, director of Citizen Action.

As an attorney, I want to address some of the legal issues. First I want to address the raft. If the raft won't float, we are going to sink and all be on the nuclear brink.

Anyhow, to hold DOE accountable to protect public health and safety, Congress should introduce legislation for the public to bring a citizen suit against the DOE for violation of the DOE Orders. DOE Orders sound good but are not rigorously enforced by DOE.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

In the case of the SEIS, there is no safety analysis report that has been issued as is required to be performed, quote, at the earliest practicable point in conceptual or preliminary design for which we have spent $500 million already. Adequate protection of the public and workers is not assured because the chosen site above volcanic ash is a seismic formula for disaster.

Deactivation, decommissioning, decontamination at end of life are not considered in the SEIS proposed 50 years of operation. Waste disposal operations are not considered in the SEIS and the liquid radioactive waste facility is at the end of its operational lifetime.

The controlling statutes are DOE Order 420.1 and DOE Guidance 420.1-2 which requires structures, systems, components at DOE facilities be designed and constructed to withstand the effects of natural phenomena and hazards.

Now, you can't very well know what the health impacts are going to be where the full seismic hazards are not known. The choice of this location as a site is extremely poor. Other requirements are found in DOE Order 5480.28, and they are supposed to provide for safety work places,

705-1

705-1 NNSA has developed the appropriate level of safety documentation for this stage of CMRR-NF design, and this safety documentation is used in designing building safety features. Because of security concerns, the safety documents are not made available to the public.

DD&D impacts are discussed in Chapter 4, Section 4.5, of the *CMRR-NF SEIS*. For purposes of analysis, only disposition of the entire CMR Building is addressed in detail because activities associated with this option would have the greatest potential environmental consequences, including generation of the largest amount of radioactive wastes (see Section 4.5.1). DD&D procedures for dispositioning the CMR Building would be common actions across all of the alternatives analyzed in the *CMRR-NF SEIS.* DD&D of the CMRR-NF at the end of its useful life is also addressed, although it is noted that impacts would depend on the disposition decision taken at the time, which could range from reuse to DD&D of the entire CMRR-NF (see Sections 4.5.2 and 4.5.3).

Waste management and pollution prevention is addressed for construction and operations for all three alternatives in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12, of the *CMRR-NF SEIS.* As described in the 2008 *LANL SWEIS* (DOE 2008a) and in annual *LANL SWEIS* yearbooks issued since its publication (LANL 2010a, 2011d), RLWTF processes liquid radioactive wastes and meets current discharge standards. The 2008 *LANL SWEIS* addresses alternatives for upgrades to RLWTF (DOE 2008a).

The CMRR-NF is designed to be in compliance with DOE requirements for nuclear facilities, including projected seismic event response performance and nuclear safety-basis requirements based on new site geologic information, fire protection, and security requirements. The accident analysis in Chapter 4, Sections 4.2.10.2, 4.3.10.2, and 4.4.10.2, and Appendix C of the *CMRR-NF SEIS*, is based on knowledge of potential natural or manmade hazards and the amount of radioactive material that would be available for release (material at risk) to estimate potential exposures in an accident.

See the response to Comment 705-2 regarding seismic concerns.

36

protect against property loss or damage, continued operation of essential facilities, and protecting public health, property, and the environment against exposure to hazardous materials.

Well, we don't know what the hazard is going to be there, so we don't know what the exposure might be in the event of an accident. In fact, we don't even know what a full accident can be there. They talk about a spill. Well, it could certainly be more than a spill of plutonium when they are talking about 13,200 pounds being stored in the same location and the possibility for ground rupture at the site.

705-1 cont'd

There is also Executive Order 12699. I'm not going to go through that, just cite it.

LANL is choosing to not know the hazard by doing poor quality work. In 1992, the SHB-1 borehole at TA-55 was drilled. The seismic profile from the borehole was published in Wong, et al. in 1995. LANL scientists knew from the velocity profile for this borehole that there were low shear velocities that greatly increased the seismic hazard at the TA-55 site for use of plutonium bomb factory.

Rather than recognize the problem, LANL low-balled the cost to Congress for the facility

705-2

705-2 The potential seismic hazards at LANL have been the subject of numerous studies performed in the past 30 years. Additional information about seismic and other geologic issues has been provided in Section 2.6, Seismic and Geologic Concerns, of this CRD, and in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazards analyses of the LANL region were issued (LANL 2007, 2009), and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazards analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The results of this evaluation have been included in the design of the CMRR-NF, which is still under way and will continue to evolve. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

even though LANL knew the initial design was incorrect and not supported by their own information. Then there came a 1995 study: Seismic margins assessment of the plutonium processing facility at Los Alamos National Laboratory.

They said they couldn't meet the DOE Order 5480.28, and stated, "Results of this study indicate that seismically induced loads will be significantly greater than those for which the structures, systems, and components for the plutonium processing facility, PF-4, at Technical Area 55 were designed." The study was based on a value of .33 g, ground acceleration.

This 1995 report was made before the knowledge obtained in the May 2007 probabilistic seismic hazard analysis that indicated an increased acceleration value of .5 g. Even the .5 g acceleration is questionable and may be an underestimate, because selection of Kappa that was used was based on compromised data.

How many minutes do I have left?

THE TIMEKEEPER: You are just about done.

MR. McCOY: You have touted the 2007 report, the update. Well, let's look at Chapter 10 and what it says. Recalculate the hazard, conduct

705-2 cont'd

Response side of this page intentionally left blank.

additional detailed high precision mapping and displacement measurements, conduct paleoseismic trenching studies of Santa Clara Canyon, reevaluate the entire data schedule for the Rio Grande rift, conduct additional studies to better constrain Kappa. Kappa is a key parameter in assessing the hazard at LANL. Improvements in the network may be necessary to improve data quality. No improvement has been made.

So to sum up, you haven't done the work, you haven't done the studies, you are exposing the public to great risk, and you need to stop this project. Thank you. (Applause)

705-2 cont'd

MR. MacALLISTER: The next speaker is Bob Walsh followed by Jan Boyer.

MR. BOB WALSH: Please hold the timing flags up high and wiggle them so I will notice them.

THE TIMEKEEPER: Yes, sir.

MR. WALSH: Thank you.

My name is Bob Walsh. I am retired from a career which included many years of nuclear safety analysis.

About 20 years ago, I was the lead on a safety analysis for a proposed plutonium storage facility for Pantex in Texas. We found that

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

aircraft accidents from overflights were a signature contributor to risk with possibly horrendous consequences.

Last November I commented on the potential scope of the SEIS, asking that they be sure to include the accident analysis and potential terrorist acts. In the draft SEIS, there was a response that says that the accident analyses present the impacts of a range of possible accidents, and that a classified appendix was prepared to address the impact of intentional destructive acts, including terrorism, but substantive details were not released to the public, because disclosure could be exploited by terrorists, which is reasonable.

706-1 In the appendix that actually evaluates accident impacts, Section C.3, it states that selection and evaluation of accidents was based on the "Nonreactor SAR Preparation Guide." In that guide, Section 3.4 states, external events will be analyzed if frequency of occurrence is estimated to exceed 10 to the minus six per year conservatively calculated, or 10 to the minus 7 per year realistically calculated. The analysis that substantiates frequency need only be referenced.

706-1 In response to similar comments, the text in the *Final CMRR-NF SEIS*, Appendix C, Section C.3.2, has been revised to more clearly reflect the consideration of an airplane crash into the CMRR-NF. The largest aircraft that is considered to have a conservative probability greater than 1 in 1 million per year of accidentally crashing into the CMRR-NF is a general aviation aircraft. References were added to support this conclusion, including the *DOE Standard: Accident Analysis for Aircraft Crash into Hazardous Facilities* (DOE 2006) and a site-specific technical evaluation of the potential for aircraft crashes (LANL 2011a).

In the draft SEIS, Chapter C.3.2 states, "The probability of an airplane crash during overflight is less than 10 to the minus six." There are two deficiencies in this paragraph. First we assume that they intended to say 10 to the minus six per year. Second, no analysis is referenced to support the statement.

706-1 cont'd

Having discovered two oversights upon examination of only one section suggests that this document has not been subjected to rigorous, independent review. The general public is neither technically qualified nor adequately funded to perform a comprehensive review. Consequently, I have four comments, all of which are in the form of requests.

One, please provide a reference to an analysis that substantiates the probability of an airplane crash during overflight does not exceed 10 to the minus six per year conservatively calculated.

706-1 cont'd

Second, please provide a rigorous independent review of this document by an independent professional organization in order to increase public confidence in the conclusions.

706-2

Third, please provide an unclassified overview of the classified appendix, omitting

706-3

706-2 NNSA and DOE engage their own technically qualified staff and subject matter experts to prepare the SEIS along with qualified contractors. The analyses include the evaluation of accidents and intentional destructive act impact analyses. NNSA does not intend to pursue an independent external review of the analysis in the *CMRR-NF SEIS.*

706-3 As indicated in Chapter 4, Section 4.2.10.3 of the *CMRR-NF SEIS*, substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. NNSA considered a range of possible terrorist or intentional destructive acts and performed a detailed analysis of selected scenarios. Selected scenarios provide a reasonable range of events, including those with the largest expected impacts. NNSA and DOE engage their own technically qualified staff and subject matter experts to prepare the SEIS along with qualified contractors. The analyses include the evaluation of accidents and intentional destructive act impact analyses. NNSA does not intend to pursue an independent external review of the analysis in the *CMRR-NF SEIS.*

NNSA has an extensive program related to preventing terrorist threats. This includes ongoing evaluations of facilities and security forces to prevent successful attacks. In evaluating intentional destructive acts, the probability of a given scenario occurring is not a factor in the analysis. Therefore, the programs and funding of other entities, such as the Transportation Security Administration is not a relevant factor. The intentional destructive acts appendix presents consequences projected to occur in the event of a successful attack. The results of these analyses will be reviewed and considered by NNSA in making its decision on the CMRR-NF and are shared, as appropriate, with senior Administration officials and Congress.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

41

details but including at least answers to the following questions: First, does the appendix include consideration of attacks using aircraft? Second, in determining risk from terrorist attacks, does the appendix assume continued funding for government agencies other than NNSA, such as the Transportation Security Administration? Third, does the appendix estimate the consequence of a successful terrorist attack? If so, have these potential consequences been brought to the attention of the president and congress for consideration in decisions on nuclear weapons policy.

706-3 cont'd

And then the fourth request, please provide a rigorous independent review of the classified appendix by an independent professional organization with appropriate clearances, and include in this environmental impact statement an unclassified summary of that assessment. Please include the identity of the organization, and the amount budgeted for the review as an insurance that the review is independent and thorough. Thank you.

706-2 cont'd

(Applause)

Response side of this page intentionally left blank.

42

MR. MacALLISTER: Our next speaker will be Jan Boyer, followed by Charles Cole.

MS. BOYER: My name is Jan Boyer, and I'm very concerned about this facility and request that an environmental assessment be done at this time because of the magnitude of the changes since the beginning of the planning around that.

I'm also speaking because I keep remembering a talk that Winona LaDuke gave one time, and she said, You know, when my children make a mess, they can't make another mess until they clean up the first mess.

I wish that would be considered in issues like this, because to me, there is an awful lot of toxicity that could be cleaned up before we make more messes. So I'm pretty concerned about that.

The other thing is, I have a master's degree in clinical psychology, so I'm fascinated by how people use themselves and their skills. And one of the things I know is that scientists do really good science. Thank goodness. I really have a lot of respect for the way scientists do science. The only problem is that in human capability, the weakness of scientists is in noticing the implications of their actions. That's the weakest link in the way a scientist thinks. What are

707-1

707-2

707-3

707-1 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

707-2 DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

707-3 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

43

the long-term effects? What are the implications?

So when I read that this is going to house six tons of plutonium, I can't believe that. I keep thinking, gee, I must have made a mistake in reading that, but I think I read that in a few places. Isn't plutonium one of those things that has a half life of something like 108,000 years? I can't imagine having this much toxicity.

There are a number of authorities speaking out these days from the United States and other countries, and they're saying, you know, there are so many toxins in our environment that people cannot thrive. Even on the news hour, they've had a primary medical researcher from Harvard and she said, The issue with autism is the carcinogenic substances, the endocrine disrupters and all of the toxins. A child can no longer thrive in the United States. That's kind of daunting to me because I'm one of the kinds of people who does think about the long-term implications.

707-3 cont'd

So if anybody wants to party with six tons of plutonium, I think that deserves a very serious diagnosis.

Please don't do this. This is just too bizarre.

Thank you.

Response side of this page intentionally left blank.

(Applause.)

MR. MacALLISTER: Thank you, ma'am.

Our next speaker is Charles Cole, followed by Bridjette Kennedy.

MR. COLE: My name is Charles Cole. I'm a resident of Santa Fe, and I was the coordinator for the Faith Conference of Nuclear Weapons, which was held here in Santa Fe in 2010. I'm speaking as a member of the United Methodist Church and as director of the General Board of Church and Society of the Church.

708-1

The SEIS declares that pit production does not take place at the CMR Building, and it will not take place in any Chemistry and Metallurgy Research Replacement facility. But the SEIS also states, quote: "All nuclear analytical chemistry, AC, and materials characterization, MC, will be housed in the Hazard Category 2 nuclear laboratory building," unquote, part of the proposed CMR nuclear facility. And, quote, "AC and MC services support virtually all nuclear programs at LANL." It seems, then, that although pit production will not take place specifically in the proposed new facility, the CMRR-NF, this new facility will support pit production at LANL, which may reach a total of 80 pits per year.

This increased pit production is ostensibly

e-mail: info@litsupport.com

708-1 The commentor is correct. The analytical chemistry and materials characterization capabilities that would be located in the CMRR-NF would support all nuclear programs at LANL, including pit production. Based on the ROD (73 FR 55833) for the 2008 *LANL SWEIS*, the current level of pit production is up to 20 pits per year.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

part of a Stockpile Stewardship Program whose implementation, according to the Nuclear Posture Review completed by the Obama administration last year, is, quote, "essential to facilitating reductions while sustaining deterrence under New START and beyond."

The Stockpile Stewardship Program, then, is to support reductions and to sustain deterrence. Let me address the deterrence issue. At our Faith Conference on Nuclear Weapons, Dr. Joseph Martz, J. Perry Fellow in National Security, Stanford University -- and I believe still related to LANL -- defined deterrence as, quote, "the ability to inflict unacceptable costs upon an adversary, such that that adversary is deterred from conducting an undesired act."

The United Methodist Church declared in a resolution passed at its 2008 General Conference, of which I was a member, that quote: "The doctrine of nuclear deterrence is morally corrupt and spiritually bankrupt," unquote.

Why is this so? The first reason is prudential. Nuclear deterrence is not an effective doctrine for the new age of global terrorism. In fact, the production of more plutonium simply makes more material available for terrorists to steal and use in making nuclear weapons.

708-2

708-2 NNSA notes the commentor's opposition to pit production and the policy of nuclear deterrence. Since the 1940's, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Since the end of the Cold War, DOE has changed site missions and activities consistent with changing national security policies that reflect the new national security posture, including maintaining a smaller nuclear weapons stockpile. However, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Therefore, along with its obligations to reduce its nuclear weapons stockpile and promote the nonproliferation of nuclear weapons to nonnuclear states the United States must also ensure that its nuclear weapons stockpile remains safe, secure, and reliable. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

46

The second reason is moral. As the United Methodist resolution states, quote: "When used as instruments of deterrence, nuclear weapons hold innocent people hostage for political and military purposes." Among those held hostage are United States citizens, who must live in continual dread of nuclear war. And when even conventional military weapons take a heavy toll of civilians, the use of nuclear weapons threatens an even higher rate of civilian casualties.

I and others in the United Methodist Church, then, question both the wisdom and the morality of the new CMRR facility. To continue to produce more pits works against President Obama's goal of a nuclear-free future. Producing more plutonium pits as a way to facilitate reductions is inconsistent with the pursuit of this future.

708-2 cont'd

Our national security needs can be met within the $750 billion national defense budget for 2011 without increasing plutonium pit production. We have more than enough armaments to defend our country and product ourselves against purported terrorists.

We call on LANL to focus more on another of its goals, quote: "To reduce the global danger from weapons of mass destruction," unquote.

I would support the "No Action" alternative

708-3

708-3 NNSA acknowledges the commentor's support for a No Action Alternative of no pit production. As stated in Chapter 1, Section 1.5, of the *CMRR-NF* SEIS, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

of the SEIS, except that such an alternative does not actually seem to be provided for in the SEIS. I ask, then, that new alternatives be considered, including no pit production at LANL.

Thank you.

(Applause.)

MR. MacALLISTER: Our next speaker is Bridjette Kennedy, followed by Angela Werneke.

MS. KENNEDY: Can I defer my time to Robert Gilkeson?

MR. MacALLISTER: If you'd like to yield the floor at this point --

MS. KENNEDY: Yeah, because I agree with his position that the facility is unsafe, and he has good scientific proof of that.

MR. MacALLISTER: Okay. Gilkeson, are you available?

MR. GILKESON: What are the ground rules this time?

MR. MacALLISTER: According to the ground rules, you have another five minutes. The other speaker yielded the position to you, so --

MR. GILKESON: Okay. The reason I am here is that I pointed out at earlier meetings this week the public was told that there has been no earthquake

704-2 Chapter 3, Section 3.5.1.4, Seismicity, describes the seismicity of the LANL region including the three Holocene surface-rupturing earthquakes mentioned by the commentor. The three seismic events are 1) an earthquake on the Pajarito Fault, approximately 1,400 years ago; 2) an earthquake on the Pajarito Fault approximately 5,000 to 6,000 years ago, which is consistent with an event during the same general timeframe on the Guaje Mountain Fault; and 3) an earthquake on both the Pajarito and the Rendija Canyon Faults, approximately 9,000 years ago. Surface rupture along these faults does not mean that surface rupture occurred within the current location of TA-55. As described in Section 3.5.1.3, Faulting, TA-55 is located within an area of relatively simple structure, where no surficial fault deformation has been documented.

48

activity on the fault system at Los Alamos National Laboratory for longer than the past million years, and that's simply incorrect. As shown by this excellent report that I am just providing excerpts from, that show the LANL scientists have determined that there have been a minimum of three large earthquakes over the period of the last 10,000 years. And by large earthquake, I mean the power for ground rupture. And so I presented excepts from this report that describe that fact, and that specifically is new PALEON scientists data show three Pliocene [sic] -- that means the past 10,000 years -- surface rupturing earthquakes, one ground-surface rupturing event 1400 years ago.

And then a second rupturing event that occurred approximately between 5000 and 6500 years ago, but there were two simultaneous earthquakes on different fault segments at that time, for that earthquake event. So there were two surface ruptures at that time.

And then the third ground-surface rupturing event 9000 years ago was also separate rupturing events -- ground-surface rupturing events on both the Pajarito Fault and the Rendija Canyon Faults.

And then the report goes on and says: When two ground-surface ruptures occur simultaneously as part of the same event, the results in earthquake magnitude

e-mail: info@litsupport.com

704-3 The PSHA (LANL 2007) included both simultaneous and synchronous earthquake rupture models in calculating design ground motions for TA-55. Simultaneous ruptures were slightly favored in the model with a weight of 0.6 because this is the standard model used in PSHA practice, and displacement data for the Pajarito fault system suggest this type of rupture occurred in the past. However, synchronous ruptures were also included in the analysis with a weight of 0.4.

The PSHA did not calculate higher hazard for the simultaneous rupture, but the PSHA did estimate slightly higher maximum magnitudes for the simultaneous rupture model. Preferred maximum magnitudes for both simultaneous and synchronous ruptures were estimated using the same general approach, which has a sound technical basis. It is somewhat counterintuitive that the slightly bigger simultaneous earthquake can result in a lower ground motion hazard, but the two synchronous earthquakes result in higher ground motions for nearby sites, particularly when the site is located between the rupturing fault segments, because energy is coming from two sources.

For both synchronous and simultaneous ruptures, maximum magnitudes were estimated in the PSHA based on surface rupture lengths and available displacement data, as appropriate to the particular rupture scenario. The main difference between the simultaneous and synchronous ruptures is that all of the moment (energy) is released in one event in the simultaneous model, versus the moment being split into two slightly smaller synchronous subevents on different segments of the Pajarito fault system, in the synchronous model. Thus, the slightly smaller magnitudes for the synchronous ruptures are a direct result of splitting the fault rupture into two portions for this model. In addition, the 10 percent difference in the total moment release between the two models primarily results from the different geometries used and the fact that displacements do not scale the same as surface rupture lengths in the empirical relations. Finally, as maximum magnitudes for both synchronous and simultaneous ruptures were calculated correctly using techniques that meet SSHAC and DOE guidelines. The calculated results were checked and thoroughly peer reviewed.

Chapter 3, Section 3.5, Geology and Soils, of the CMRR-NF SEIS was revised to improve the discussion of faulting and seismic hazards at LANL.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

49

is greater than when the main Pajarito Fault ruptures alone.

Another excerpt is: The evidence for fault interaction suggests the potential for static stress concentrations and earthquake triggering.

So this means it's an active fault while we're here this evening. There's movement going on on this fault system at all times, and that movement is gaining strength and will eventually trigger an earthquake event.

So I think I'll stop with that, and thank you.

MR. MacALLISTER: Thank you, sir.

(Applause.)

MR. MacALLISTER: Our next speaker is Angela Werneke, followed by Caitlin McHugh.

MS. WERNEKE: I get really nervous speaking in front of people, so bear with me.

First, as a New Mexican living downwind and downstream in LANL, I feel the cleanup of existing contamination is a priority over building a new pit production facility, the sole purpose of which is to perpetuate nuclear weapons.

Secondly, the United States is on the edge of economic disaster, which can either be remedied or

704-4

709-1

704-4 There is no geologic or seismologic evidence that the rate of occurrence of surface-faulting earthquakes (magnitude > 6.5) is increasing along the Pajarito fault system. Paleoseismic investigations indicate that that three large earthquakes ruptured along the Pajarito fault system during the Holocene period (past 11,000 years), suggesting that this recent activity may represent a temporal cluster in the long-term behavior of the fault (LANL 2007; Lewis et al. 2009). However, this possible pattern in the activity rate of the Pajarito fault system has been incorporated into the PSHA (LANL 2007, 2009). There is also no geologic or seismologic evidence that would suggest that the maximum potential earthquake along the Pajarito fault system is increasing in size. The maximum earthquake for the Pajarito fault system has been estimated for the PSHA based on observed fault displacements from past earthquakes and rupture dimensions of the potential fault rupture. Over the lifetime of the CMRR Facility and much longer, that is, thousands of years, the level of seismic hazard at the CMRR-NF site is not expected to change because there are not expected to be changes in the maximum potential earthquake and activity rates of the Pajarito fault system. The general behavior of the Pajarito fault system is not expected to change over the time scale of the next century.

709-1 NNSA acknowledges the commentor's support for cleanup of existing contamination. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Funding decisions regarding major Federal programs (for example, education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

50

exacerbated by the choices we make for ourselves. Do we choose peace and prosperity or nuclear weapons. While the defense budget continues to increase, one in four Americans is worried about having enough food for their families. Funding for defense may benefit a few, but the vast majority of Americans will lose.

In truth, we all lose if we value weapons production and poisoned rivers over peace, health and prosperity for all.

Linda Hogan, in her book "Dwellings," speaks for many of us here when she says:

"Cornmeal and pollen are offered to the sun at dawn. The ears of the corn are listening and waiting. They want peace. The stalks of the corn want clean water, the sun that is in its full clean shining. The leaves of the corn want good earth. The earth wants peace. The birds who eat the corn do not want poison. Nothing wants to suffer. The wind does not want to carry the stories of death." Rather, Linda Hogan goes on to say: "The language of life won't be silenced."

Thank you.

(Applause.)

MR. MacALLISTER: Caitlin McHugh, followed by Norman Budow.

MS. McHUGH: Hi. My name is Caitlin

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

51

McHugh, and I've lived in Santa Fe for the past 30 years. I'm not affiliated with any organizations. I just feel very strongly that there hasn't been adequate safety consideration given for this new facility.

The safety issue is a big, big problem, contamination of our water, which we know is so precious in this community, and also the geologic issues that have been brought up.

I also feel that this Supplemental Environmental Impact Study hasn't adequately addressed all the options that are available. Basically, I find it perverse that in the name of safety justifying building of nuclear weapons, that the safety of the local people haven't been considered in this -- in this situation.

That's all I have to say. I would like -- I'd like our government to please protect us appropriately.

Thank you.

(Applause.)

MR. MacALLISTER: Norman Budow, followed by Susan Odiseos.

You can correct me.

MS. ODISEOS: Odiseos.

MR. MacALLISTER: Thank you.

710-1

710-1 The *CMRR-NF SEIS* addresses public health and safety of the local communities, including impacts on water supply. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, and Appendix C of the *CMRR-NF SEIS*.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

MR. BUDOW: Thank you, folks. Glad that you're all here on this subject.

And I want to say that it's a subject near and dear to my heart. Why? My granddaughter is a seismologist in California, and her heart's desire is to find a way to predictability [sic] of fault lines and earthquakes. She read a paper in -- on the Island of Hokkaido, Japan, a northernmost island. And I'm glad she read it then because I wouldn't want her to go near the Japanese archipelago now.

711-1

I have a little anecdote that might emphasize why I'm concerned. My wife lost family over from [sic] Ukraine. They lived 25 miles from Chernobyl. We brought them here, and they were telling me how they trusted and listened to their experts. And then she said after they had the meltdown, they had people -- well, before the meltdown, they had scientists come from their lab, and they were telling them, Be on guard. They were telling them what vegetables and fruits they could eat from their garden. It was sort of like -- sort of like playing Charade. You can eat the carrots from here. Don't eat those radishes over there. And she was, you know, kind of hurt that they believed and believed.

Now, at Fukushima, there was a real

711-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.5, Cleanup and Waste Management, of this CRD for more information. NNSA complies with Federal, state, and local laws and regulations, and DOE orders to protect human health and the environment.

There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accidents that occurred at the Fukushima Daiichi Nuclear Power Plant, and earlier at the Chernobyl Nuclear Site, requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

resentment that their experts told them; the nuclear power plant was safe, safe, safe, and it turned out not to be all that safe.

I had an experience a couple of years back when Admiral Stansfield Turner, under the auspices of the International Relations Community -- organization here in Santa Fe. There was a dinner, and he was speaking about his hope and desire to reduce the amount of nuclear bombs from 6000 to 2000. And I was troubled by that. And I was -- my banquet table -- my banquet table was right underneath the speaker's dais. So I asked him after the dinner, the supper, Why 2000, reduced from 6000 to 2000; why not have it much less than that or zero? And he looked at me and he said, Well, I appreciate your concern; I appreciate your concern, but it's a start; it's a start. So I was not very, very happy at his attempts to comfort me, that it's a start.

One of our desires is to prevent nuclear proliferation. We provide a terrible, terrible example where we continue -- continue proliferating our own -- it's like taking nuclear waste, making it over here, and taking it out over there. And it's still here. It's still here.

So I'm hoping that we can follow the edict

of Albert Einstein. And Albert Einstein made a statement: The definition of insanity is to keep doing the same thing over and over and over and expecting a different result.

Thank you.

(Applause.)

MR. MacALLISTER: Thank you, sir.

Susan -- I won't butcher your last name again -- followed by Jay Coghlan.

MS. ODISEOS: Susan Odiseos. It's a Greek name, but I'm a Danish princess, in case anyone asks.

(Laughter.)

MS. ODISEOS: I'm a resident of Santa Fe. I'm a member of the Justice and Peace Committee of St. Pete's Church. You won't hear me talking in technical terms because that's not what I do.

My comment to Mr. Tegtmeier and his colleagues is going to be in the form of a question. But to get to it, let's take, first, into account the serious budget situation in our country, whereby the funds sought for the CMRR facility could alleviate the need to cut critical human service programs, and taking into account that the old facility, which sits on a fault, is only a little over a mile from the planned-for facility. The new facility is within two-thirds of a

712-1

1-800-669-9492
e-mail: info@litsupport.com

712-1 NNSA notes the commentor's concern regarding the budget situation in our country and funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA acknowledges the commentor's concern for the need and location of the CMRR-NF. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The commentor's concerns that an accident (similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant) could happen at LANL is addressed in Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

mile of a known fault. To add to that uncertainty, the total extent of seismic fault under the lab is not completely mapped. Haven't we learned anything from the tragedy in Japan?

712-1 cont'd

Use of the fear factor to propel preparedness against our enemies is beyond comprehension. The proposed amount of plutonium to be stored so close to us, with all the risks entailed, would create a bomb too big to drop without annihilating mankind.

The unprecedented growth of this project from a mere 350 million to now nearing 600 billion -- 6 billion for just the nuclear facility, with final design not yet completed, without an undated environmental impact statement in place to accompany the design changes, is most unfortunate, if not irresponsible.

712-2

It's hard not to connect the dots and see clearly that this project involves mostly privatization, with private companies receiving more than 80 percent of the monies involved.

Finally, the fact that so many people are opposed to efforts to continue armament efforts, the simple and straightforward question I have is: What will it take for you to stop this project?

712-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

(Applause.)

MR. MacALLISTER: Thank you.

Jay Coghlan, followed by David Bacon.

MR. COGHLAN: I'm Jay Coghlan with Nuclear Watch New Mexico. I spoke twice last night at the Espanola --

UNIDENTIFIED SPEAKER: Speak louder.

MR. COGHLAN: Okay. Jay Coghlan.

MR. MacALLISTER: Do you want me to raise that, Jay?

MR. COGHLAN: Yes, if you would.

Okay. Again, I'm Jay Coghlan with Nuclear Watch New Mexico. I spoke twice last night at Espanola, and time flies when you're having fun. I only got like halfway through or something like that.

And I was looking to make two broad points. You know, first of all, I note that these hearings and the entire process is required by federal law, that being the National Environmental Policy. And towards that end, I -- I'm pointing to what I believe are two possible broad legal deficiencies to the draft. And specifically, it's that NNSA has chosen to not revisit the need for the CMR nuclear facility. It basically says that nothing has changed since the 2003 Environmental Impact Statement. *713-1*

e-mail: info@litsupport.com

713-1 NNSA notes the commentor's concern that a new EIS, not an SEIS, should be prepared. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

NNSA also notes the commentor's concern that maintaining a secure and reliable nuclear stockpile is contradictory to President Obama's goal of a nuclear-free world. Since the 1940's, the President and Congress have directed DOE and it predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

57

And then the other broad point that I'm reaching for is that this draft Supplemental EIS doesn't really offer genuine spectrum of reasonable alternatives.

Now, with respect to the first point that I made, again that I believe erroneously NNSA has not decided to visit mission needs, again saying that not much has changed since 2004, I was amused last week to run across a new strategic plan by NNSA that the first thing it said was how much things had changed since it had last produced a strategic plan in 2004. And it specifically -- it right away pointed to the speech that Obama made in Prague in April 2009 in which the President of the United States annunciated having a future world free of nuclear weapons to be a national security goal. So indeed much has changed.

Now, at the same time that Obama said that, he also said that in the interim we're going to maintain a secure and reliable stockpile. And towards that end, the Obama administration has specifically endorsed and given lots of money to the CMRR nuclear facility.

But getting to mission need, what -- what the Obama administration has not done nor has the Bush administration done, despite repeated attempts, it has not raised the level of plutonium pit production from

713-2

713-1 cont'd

713-2 NNSA notes the comentor's opinion that the *CMRR-NF SEIS* does not analyze a reasonable spectrum of alternatives. Taken together, the alternatives section of the *2003 CMRR-EIS* and this *CMRR-NF SEIS* provide the range of reasonable alternatives. In response to public comments like these, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* has been revised to describe in more detail the alternatives that NNSA considered but found would not meet the purpose and need for continuing CMR operations into the future. See Section 2.11, Alternatives Considered, of this CRD for more information.

the currently sanctioned level of 20 pits per year. And I don't think there are any immediate prospects that that rate of production will be raised.

And nobody should be under any illusions. The CMRR, it's not only about but it is primarily about expanding pit production, despite denials in the Supplemental EIS. I can point you to a number of other NNSA documents, such as the Fiscal Year '11 Strategic Stockpile Stewardship and Management Plan, such as a solicitation for a bid to manage the Lawrence Livermore Laboratory, which has specifically tied expanded pit production to new design reliable replacement warheads.

Now, I know I'm going to run out of time, and I'm hoping I'll get another chance to speak. But I think it's illustrative and important to look at the history of the pit production since 1989. And in that year, the FBI raided Rocky Flats. And Rocky had -- its peak was probably capable of -- don't hold this for a fact, but it was probably capable of producing on the order of 1000 pits per year. Well, the FBI raid just shut that cold.

And then the Department of Energy spent, oh, the next 15 years or so trying to re-establish interim pit production here at Los Alamos. And the purported reason or rationale for doing that was to

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

59

produce the particular type of pit for the W88 warhead that was being produced when Rocky was shut down.

Well, subsequently, LANL has done its production run for about 30 W88 pits; completed it last year. I don't believe it's going to be producing any more W88 pits, and it's not clear why any other pits would be needed. There are approximately seven other types of pits.

This goes back. I don't think the laboratory -- the labs and the Nuclear Weapons Complex, in general, I don't think they have entirely given up on new designed weapons, and they're doing it by another name. And they're seeking to incrementally achieve their aims through these so-called life extension programs, which they're going to take existing weapons and radically modify them. So I'm still waiting for the red sign to come up.

But to conclude for now: Again, it's the aim of the Weapons Complex to radically change existing weapons, to change their military capabilities, in fact. And they will begin intrusive modification of existing pits up at PF4, the existing pit production facility, which will be integrated into the CMRR nuclear facility. And I'll continue my remarks later.

MR. MacALLISTER: Thank you, sir.

Response side of this page intentionally left blank.

(Applause.)

MR. MacALLISTER: David Bacon, followed by Leslie Alderwick.

UNIDENTIFIED SPEAKER: David will be back later. He has to give a radio show.

MR. MacALLISTER: Okay. Leslie Alderwick? Forgive me if I'm mispronouncing that name.

MS. ALDERWICK: Hi.

I guess I'm a little confused. I was sitting in a restaurant in Taos, and I picked up the Journal, and it said something about a meeting down here about this issue. But nowhere in the paper did it say that this new building -- 6 billion, is it? A $6 billion building, when we have no money for education, is going -- nowhere did it say it's going to build detonating devices for nuclear bombs. Nowhere did it say that. Why not? Why not? Why isn't this room filled with people trying to make it clear that life is really more important. You've got intelligence. You're educated. We have brilliant minds here; poetry. And we're going to build more nuclear bombs? Come on. It is time that everybody gets on the same page.

Do you like your life? Do you enjoy breathing air? Do you love your children? And we're going to build more bombs? Let's get that information

714-1

714-1 NNSA notes the commentor's opposition to nuclear weapons and concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

61

out into the public. Shouldn't we? It's not in the public view. These newspaper reports don't tell you what's really going on. Why don't you tell us the truth? Why isn't the truth out there? If it's okay and building all these bombs is a good thing, why don't you tell us you're doing it?

714-1 cont'd

I think we need a little more truth. With all this intelligence and all this poetry, how about a little truth? How about a little belief in life instead of money and all the things that war brings?

(Applause.)

MR. MacALLISTER: Thank you.

Pamela Gilchrist, followed by Erwin Rivera.

MS. GILCHRIST: I'm Pamela Gilchrist, and I live in Santa Fe.

In addition to the previous comments, most of which I fully agree with, I want to emphasize that the Department of Energy must consider what I believe to be the only viable alternative, and that is to abandon this project.

(Applause.)

MS. GILCHRIST: Cleanup of the existing waste -- cleanup of the existing waste must be a DOE priority, not a new nuclear facility, on which 450- to $500 million has been spent.

715-1

715-1 NNSA notes the commentor's support for cleanup and concerns regarding the funding priorities of the U.S. Government. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. An alternative involving an abandonment of the project does not meet NNSA's stated purpose and need (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*).

Although I'm speaking as a private citizen tonight, I served on the Northern New Mexico Citizens' Advisory Board to the DOE for the cleanup at LANL. I've served on the board for two years, and I'm familiar with the current cleanup effort. I feel that the DOE can be proud of the dedicated team doing this critical work.

DOE has made a commitment to cleaning up the legacy waste at LANL when it signed the consent order of the New Mexico Environment Department on March 1st, 2005. The order requires cleanup by December 31st, 2015, including Area G dump site at Technical Area 54. However, cleanup is proceeding there at only 25 percent of capacity, and the only constraint is money, a mere $400 million, not even as much as has been spent on the studies for the $6 billion facility. $400 million is needed for the cleanup to be done at 100 percent capacity. To avoid the NMED fines, cleanup at 100 percent capacity needs to happen to meet the 2015 consent order deadline. We've done the math. So in order to meet the consent order deadline of 2015, DOE's cleanup operation at LANL needs to run at 100 percent; currently running at 25 percent. They can do it. They just need the funding. DOE must comply with consent order, not build a new nuclear facility.

(Applause.)

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

63

MR. MacALLISTER: Thank you.

Erwin Rivera, followed by Annal Hansen.

MR. RIVERA: David Bacon has arrived, if you care to go with him.

MR. MacALLISTER: Well, what I'm doing with people who are out of the room, I will call them; they won't lose their turn, but we'll stay in the order. Thank you for --

MR. RIVERA: (Speaking Spanish; no translation.)

And I'm bilingual or multilingual. I wish I could speak in the language of my Taos ancestors or in Tewa, but I hope I speak with some common sense and convey to you the prayer of our ancestors.

I speak mostly also as a grandfather and my responsibility to them, because as I was taught, whether I'm a Chicano from land grants or an Indio from Taos Pueblo, that we understand that what we do, say today will have an impact upon seven generations unborn. My grandmother has held my grandchildren, meaning there are five living generations in my family. But that still means I have a responsibility to my grandchildren's grandchildren, to account for the shame and neglect that our generation has allowed to happen, to be there at that end [sic], their inheritance.

Response side of this page intentionally left blank.

64

I'm not here to debate the scientific information but merely to say it's not dependable. It can't be held accountable. And the only consistency, beginning from when the Los Alamos Laboratories started, began at gunpoint when my children's ancestors were forced off of the Pajarito Plateau at gunpoint in the name of the national security with the promise that first rights of rescission would go back to those first descendants of that land, and they lied.

There is no credibility by DOE or LANL, no proven accountability, and so whatever is said in any of the reports paid for by immoral money cannot be trusted. But what I do trust is the conviction of people that can speak truth to power and stand up to the corruption that Los Alamos is merely one example of.

Those homesteaders that were removed by force, then bought off by silence in the settlement that was made of several million dollars, hidden in a military appropriation, thanks to Plutonium Pete Domenici. Their story of injustice is yet to be told. But $7 million isn't enough to hide the truth of the injustice or what happened to the Pueblos, because we know the power of the Jemez, which holds the largest caldera, volcanic crater, on earth, and with many sacred sites that also were desecrated from the very beginning

716-1

716-1 NNSA notes the commentor's opposition to LANL.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

65

that those laboratories began.

Then we had the Cerro Grande Fire and more sacred sites revealed, and illegal dumping that is beyond the records and the memory and the accountability of Los Alamos to admit to. And they want us to trust their technology? I don't, because technology over common sense -- Cerro Grande -- all you had to do was see if the wind was blowing (demonstrating).

To tie this to the rest of the technological solutions of nuclear energy, nuclear power, nuclear terrorism, we have been victims at every aspect of the nuclear chain in Nuevo Mexico, beginning from the national sacrifice area of the Jackpile Mine and highest birth defects on earth of the Laguna Pueblo people, and that nothing will grow there and that people cannot grow their corn, which is primary to all our prayers.

But in the promise of jobs as the Vaseline for what was to come, to all the way to WIPP, and all's they can come up with their technology is another landfill just built a little deeper. And nuclear energy and the promise for nuclear and energy independence is just another fancy way of boiling water. What's the technological gift?

I also need to speak with a promise of the

716-1 cont'd

Response side of this page intentionally left blank.

time that we know we are in. We are in the time of prophecy in the native way. So I please ask -- this is not comments for your applause. So that none of the sacredness of what needs to reach your heart is shaken off of you. We are in the time of prophecy, and Aztecs call this time Iztsolin [phonetic], time of earth movement.

Our young people are fulfilling prophecy because they want to return, and they're asking to learn the old prayers. Our younger generation's prepared to sacrifice by fasting for the good of the people, and they will have a memory to hold us accountable to what we have done or not done by our neglect to assure future generations.

The drilling into the geothermal pools, what we have heard from experts about seismic activity, only correlates what our ancestors have told us of their warnings of what we are attempting and what risk that we have placed upon all of us.

So my last message is to the highest concentration of Ph.D.'s on the face of the earth so that you can face your children in the eye: Convert that intelligence and that education for life and for peace so that we can look each other in the eye as hermanos -- (speaking Spanish; no translation) -- and

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

have a future that will -- (unintelligible).

Thank you.

MR. MacALLISTER: Thank you.

Annal Hansen, followed by John Withan.

And pardon me if I'm mispronounced your name. Correct me.

MS. HANSEN: My name is Annal Hansen.

717-1

In 2000, I was chair of Concerned Citizens for Nuclear Safety during the Cerro Grande Fire. After that, we organized a conference called the Cerro Grande Fire and the Aftermath. We requested cleanup of Los Alamos. It -- still, ten years later, nothing has been done. It is only being done by a consent order. Los Alamos Labs and Los Alamos National Security now will not do anything to take care of the citizens of New Mexico in the future, because -- unless they are taken to court. They do not care about our lives. Our lives are not a value to them.

President Obama said, when he was running for president, that he wanted a nuclear-free world. If so, why are we building more pit? We do not need any more nuclear weapons. We do not have the money to build the new building, and we do not need any more bombs. This project must be abandoned.

Nuclear power, nuclear energy, nuclear

717-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Please refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

NNSA also notes the commentor's concern that maintaining a secure and reliable nuclear stockpile is contradictory to President Obama's goal of a nuclear-free world. President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

68

weapons is deadly from the beginning to the end, from uranium mining that killed our native people, who have been the miners, to the end product, which is death. A bomb is to kill. Nuclear power plants kill people now. They are not made for peace.

We need green jobs, really clean green jobs.

I am also extremely concerned that this planned pit production, bomb building, is being built upon our water supply, which right below where the building is being built is the major water diversion plant for the City of Santa Fe. All of that water also goes downstream. We already have plutonium in the Rio Grande. It is a fact, a documented fact. Lake Cochiti was built to stop the plutonium from going into Albuquerque. So we have a real serious problem with plutonium already in the water stream, not to mention all of the toxins and the chemicals that are created by the process of making nuclear weapons.

And 60 years ago, when they built the lab, they said, Oh, don't worry; it'll take 600 years before we -- you see any contamination; there will never be any contamination. It's only taken 50 years or less to have contaminated springs along the Rio Grande. So there is absolutely no reason to build this kind of building.

717-2

717-2 NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, of this CRD for more information on cleanup of past contamination.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

69

The financial costs of trying to build a plutonium pit production complex in a geological unstable area are just too high. A new nuclear facility will detract from cleanup of the existing mess, and we must make sure that the legacy waste that is running into the Rio Grande every time there is a large water event or a snow event -- they had to create the Buckman Diversion with doors so that they could close the doors in order -- when there was a runoff from Los Alamos so that that water would not be going into our drinking system. So that is just one small example of the damage that is being done to all of us through this.

717-3

The U.S. does not need 80 new plutonium pits a year. We don't need any. We need to move away from killing, and we need to have life-affirming activities. And manufacturing of plutonium pit is a dangerous and polluting threat to the health and safety of those living downwind and downstream. So please be considerate of the world, and stop the nuclear menace.

(Applause.)

MR. MacALLISTER: Our next speaker is John Withan, followed by Jack Franco.

MR. WITHAN: I'd like to yield my time to Jay Coghlan.

MR. MacALLISTER: Jay.

717-3 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL, such as cleanup activities, are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

MR. COGHLAN: Jay Coghlan, Nuclear Watch.

When I was last talking, I was trying to trace the history of plutonium pit production from 1989.

And briefly, Rocky Flats was making on the order of 1000 pits. The FBI raided it; shut it down. W88 pits were in production at that time.

Interim production was re-established at Los Alamos, but in, like, 2002 or 2003, NNSA was coming forward with a proposal for a modern pit facility, capable of building 450 pits per year. And in Part 3 of the NEPA processes like this, that was defeated, and Congress declined to fund it.

NNSA came back with a proposal for a consolidated plutonium center, and that was to produce 125 pits per year. And that got defeated as well. NNSA came back proposing to expand pit production to 80 pits per year. This was in 2006, if I remember correctly. But that, too, was defeated.

What I'm trying to depict is the overall trend where this country is going down from producing 1000 pits per year to under 20. In this particular year, I don't believe that Los Alamos is producing any pits whatsoever or pits certified to go to the stockpile. And as I previously said LANL did a production run of approximately 30 pits for the W88

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

71

warhead, which met their strategic needs. So there is no apparent reason for future pit production, save one.

And up until 2006, NNSA was claiming that pits had a lifetime -- serviceable lifetimes of around 45 years. And Senator Bingaman, at our request, asked NNSA and some independent experts to perform a pit lifetime study. And the pertinent conclusion is that pits last a century or more. So they're known to be relatively stable.

Again, underlying the fact that there is no clear need for plutonium pit production, save one, and so the past argument was over the so-called reliability of pits. We beat them at that argument. In response, NNSA has come back and used what I'm going to derive as being an apple and motherhood argument of: Now we have to have absolute surety in our weapons. And surety means preventing the unauthorized use by anybody else.

Now, that sounds like a great idea, and I'm all for that. But the problem is, I believe this is being used as a rationale for intrusive modifications at Los Alamos. And there can be -- this could actually undermine our national security, because a pit has to pretty much perfectly, symmetrically implode in order to reach criticality, and anything that can possibly perturb that perfect implosion could affect the

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

performance of the stockpile.

713-3

Now, let me be clear: I want a future world free of nuclear weapons, just like our president professes and most countries around the world profess. But in the meanwhile, I don't want any excuse for the weaponeers to be messing with existing weapons that are known to be highly reliable, and I think much of this smacks as being make-work.

Now, before I get cut off, I just spent all that time undermining the need for the nuclear facility, which is explicitly for expanded pit production. There's no ifs, ands and buts about it.

713-4

My second criticism of this Supplemental EIS is that it offers no real, genuine spectrum of alternatives. What it posits, or three [sic], which is the so-called "No Action" to build a nuclear facility as proposed in 2004, that's a nonstarter. We know that -- you know, that can't happen because of the new seismic data and knowledge.

The third alternative, continuing to operate the old CMR building without upgrades, is also a nonstarter. We just know that operations cannot be continued there without serious upgrades. And, you know, should I ascribe malicious motive here? I don't know. I shouldn't do that. But basically three

713-3 NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years.

713-4 The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare an SEIS when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding the alternatives to be

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

alternatives are positive, and two of them are automatically straw man, as far as I'm concerned, leaving just the preferred alternative paragraph, which suggests that we should have at least two other credible and reasonable alternatives, which I submit that the National Environmental Policy Act requires that there be credible, reasonable alternatives.

One is to look, again, at upgrading the old CMR building such that necessary operations can be continued in the interim. And I should point out that in the past, CMR upgrades were rejected because they were too expensive. Well, now that the CMR Replacement Project has exploded tenfold to 6 billion, that argument no longer holds water.

713-4 cont'd

Thirty seconds. And I can suggest the other credible alternative, and this is the one that Nuclear Watch prefers and advocates. We do not think that the nuclear facility should be built at all. We think that old CMR missions can be relocated to the recently constructed rad lab, which is 108,000 square feet, and to the existing pit production facility, PF4.

713-5

And I'll close there, since Bruce is getting anxious. But in sum, we'd argue, NNSA has to go back and revisit mission in need and gets -- and needs to present a credible spectrum of real alternatives.

addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD. The No Action Alternative in the *CMRR-NF SEIS* follows the decision announced in the ROD for the original *CMRR EIS*. Another alternative addresses the option of continuing to use the CMR Building, although its continued use would not fully meet NNSA's stated purpose and need.

Although it was listed as one of the alternatives in the Notice of Intent, after further consideration, NNSA eliminated the alternative to upgrade the CMR Building from further consideration. In the 2003 *CMRR EIS*, DOE considered the proposal to complete extensive upgrades to the existing CMR Building's structural and safety systems to meet current mission support requirements for another 20 to 30 years of operations and dismissed it from detailed analysis. Beginning in 1997 and continuing through 1998, a series of operational, safety, and seismic issues surfaced regarding the long-term structural viability of the CMR Building. In the course of considering these issues, DOE determined that the extensive facility-wide upgrades originally planned for the CMR Building would be less technically feasible than had been anticipated and would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Structurally upgrading the entire structure to a significant extent would require construction of new walls and other building components adjacent to the existing ones that have utilities and structural building features already in place. This work would have to occur while continuing uninterrupted operations in the CMR Building using nuclear materials and hazardous chemicals. The technical challenges of implementing extensive seismic upgrades to the entire CMR Building as discussed in the 2003 *CMRR EIS* remain. However, in response to public comments on the *Draft CMRR-NF SEIS*, NNSA has considered undertaking a more limited, yet intensive, set of upgrades to a single wing of the CMR Building, Wing 9, to meet current seismic design requirements so that this wing could be used for a limited set of Hazard Category 2 analytical chemistry and materials characterization operations. After careful consideration of the complex engineering and operational issues, as well as the CMR Building site's seismic concerns, this potential Wing 9 upgrade alternative was also determined not to be a reasonable alternative for meeting NNSA's purpose and need for action. NNSA also has considered the possibility of renovating, upgrading,

74

(Applause.)

and reusing other CMR Building wings and additional wing combinations to provide the space needed for continuing analytical chemistry and materials characterization work in the building and found that the other wings and wing combinations are not reasonable alternatives for providing adequate safe and secure space for future operations in a feasible, cost-effective manner and are not considered further in the *CMRR-NF SEIS*. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

713-5 In response to public comments like these, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* has been revised to describe in more detail the alternatives that NNSA considered but found would not meet the purpose and need for continuing CMR operations into the future. The alternative of distributing analytical chemistry and materials characterization capabilities among multiple facilities at LANL was considered, but not analyzed as a reasonable alternative. Because of the quantities of special nuclear material involved, to fully perform the analytical chemistry, materials characterization, and plutonium research capabilities, facilities would need to be classified as Hazard Category 2 and Security Category 1. RLUOB was not intended as a nuclear-qualified space to handle Hazard Category 2 or 3 levels of nuclear material. Thus, NNSA could not operate RLUOB as anything other than a radiological facility, which would significantly limit the total quantity of special nuclear materials that could be handled in the building. As a result, analytical chemistry and materials characterization operations requiring Hazard Category 2 and 3 work spaces could not be carried out in RLUOB. Using space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work. Use of other locations at LANL would introduce new hazards for which the facilities were not designed and would not conform to the objective of collocating plutonium operations near the TA-55 Plutonium Facility. Performing work at a location remote from the TA-55 Plutonium Facility would necessitate periodic road closures and heightened security to enable transport of materials between the facilities. In addition, other facilities would not have the available space, vaults, and engineered safety controls and requirements for this type of work.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

75

MR. MacALLISTER: Jack Frenkel, and he will be followed by David McCoy because Liz Rando has yielded her time to Mr. McCoy.

MR. JACK FRENKEL: Mr. Chair, members of the public, I am Jack Frenkel. I live in Santa Fe. I am a physician and scientist.

718-1

I came mainly to listen and to hear, and I want to summarize many of the uncertainties and the lack of trust expressed during these previous hours. So the uncertainties expressed and the mistrust expressed relate to the safety in terms of water supply for Santa Fe and for Albuquerque.

The problem of the fire danger, similar to the Cerro Grande fire or a worse one, is perhaps not very intense right now since most of the fire has destroyed the forest. But the remaining trees, I believe, will have to be removed and regrowth would have to be prevented.

Thirdly, this seismic activity is not satisfactorily presented and discussed. Fourthly, the capacity to defend this large store of plutonium against terrorists, particularly as much as mock attacks in previous years, the mock attackers, I was told, were generally prevailing and the defense was inadequate. So the building should be constructed

e-mail: info@litsupport.com

718-1 The *CMRR-NF SEIS* addresses the areas of concern listed by the commentor. Water usage and the impacts on water quality are addressed in Chapter 4, Sections 4.2.6, 4.3.6, and 4.4.6, as well as in Section 4.6, Cumulative Impacts.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Please refer to Section 2.6, Seismic and Geologic Concerns, of this CRD, which summarizes and responds to comments on seismic issues. The CMRR-NF would be designed and constructed to withstand natural and manmade hazards, including terrorist attacks. A classified appendix to the *CMRR-NF SEIS* addresses intentional destructive acts. The CMRR-NF would operate under DOE safety regulations and guidance, which require that safety analyses be routinely updated. Safety issues pertaining to the design and operation of the CMRR-NF and other nuclear facilities at LANL are subject to oversight by DNFSB.

in a way to make it safer.

And fifthly, I think there should be a continuous means of updating and renewing the certification of the safety of the installation, because as we have seen in the Japanese disaster, new problems, unforeseen problems constantly arise and they have to be incorporated.

Inasmuch as this is the safety planning stage, I think it is the most important time to handle this matter now to the best possible degree.

718-1 cont'd

I am in favor of construction of the laboratory, only -- let me emphasize only -- so that scientists can do their function in a safe and efficient way since the old building is probably too inadequate to work very much longer without curtailing activities.

By no means, however, should this be a reason for increasing weapons production, which all indications are we have adequate numbers right now. We actually are reducing them in the recent agreement with Russia. So there is no reason to produce more weapons. Our general tendency should be one of decrease of the weapons.

So finally let me emphasize that we need to increase the certainty of safety and increase the

718-2

718-2 NNSA notes the commentor's support for the construction of the CMRR-NF project but opposition to an increase in the number of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

77

amount of trust that we convey to the general public. Thank you.

MR. MacALLISTER: Thank you, sir. Thank you, sir. (Applause)

David McCoy followed by Doug Doran.

MR. DAVID McCOY: Well, you have heard a lot of statements that indicate that the truth has not come out and that there has been serious damage to the environment for many years. How many of you people out there -- raise your hands, too -- feel that this is really a criminal enterprise which we have undergone?

Well, it seems that a lot of the DOE personnel have left, so at the next major meeting, I would suggest that the citizens get together and make a citizens' arrest of those people and have them thrown in jail. It would certainly make a statement that would echo around the world.

Now, I was speaking earlier about some of the problems of Kappa. You know, the site they have chosen is on soft volcanic ash, and it's going to shake like a bowl full of jelly, only in this case, you are not going to be shaking jelly or jello. You are going to be shaking plutonium, a lot of it.

Now, they need to know what the value of

Response side of this page intentionally left blank.

the Kappa is. That's the energy that comes up from deep in the earth and goes through these different layers, okay, and that's how much shaking you are going to get on these volcanic tufts, and it's going to be focused up on this mesa.

Now, they just did a study in California, Volume 26, No. 4, November 2010, "Earthquake Spectra, Professional Journal of the Earthquake Engineering Research Institute." We all know how famous California is.

They say other areas of bedrock, including the Santa Susanna and much of the Santa Monica Mountains and the Palos Verdes, Puente, and San Joaquin Hills are underlaid by sandstone and shale. Amplification in these areas results in shaking potential up to 75 percent more than firm rock. So when you have an earthquake at this particular location -- and you can have simultaneous faults earthquaking there, as Mr. Gilkeson explained -- you can have a much increased level of shaking because of that soft volcanic ash.

Now let's talk about how they determined Kappa. This is in the Updated Probabilistic Seismic Hazard Analysis from 2007 which they tout as resolving those problems. Listen to the language.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

79

I am an attorney, and I always look at language. I look at language for whether it's certain language or whether it's uncertain language. Does it connote risk? Does it connote that we are safe?

Now, listen to some of this stuff. For the new analysis, both segmented and unsegmented rupture models were considered for the Pajarito fault system, favoring the latter which is characterized by a 367 kilometer long floating earthquake rupture source. Floating earthquake rupture source, in other words, this thing just kind of floats around. We don't know where it's located. The preferred range at maximum earthquakes is for moment magnitude, 6.5 to 7.3. 7.3 is a whopper of an earthquake, and it's three times as strong as one of their other reports says they can have there.

In addition to the dominant Pajarito fault, 55 additional fault sources were included in the PSHA. Three aerial earthquake source zones were defined based on seismotechtonic provinces in the LANL region: The Rio Grande rift, southern Great Plains, and Colorado plateau.

Well, are these faults that we are talking about up by Los Alamos related to the Rio Grande rift? Just how big an earthquake can we have in

705-3

705-3 See Response to Comment 705-2.

this region, folks? I don't think we really know.

Because the epistemic -- oh, I love that word. That means you don't know what you don't know, so you just kind of go ahead anyhow -- because the epistemic variability was deemed insufficient as provided by the five attenuation relationships, they were all scaled to obtain a total sigma. In other words, they used computer modeling without real data.

They say, because any one seismic event was recorded at only a few sites -- and they didn't know if those few sites were actually explosions that happened or actually seismic events -- there was considerable uncertainty in their computed distances and depths, as well as measured amplitudes, uncertainty in the reliability of instrumental calibrations, full inversions to estimate Kappa and stress drop were not successful.

To compensate for the lack of region-specific attenuation relationships, the well-known Stochastic Ground Modeling Approach was used. Again, modeling. We don't have the data so what do we do? We model.

MR. MacALLISTER: Thank you, sir.

(Applause)

705-3 cont'd

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

Doug Doran followed by Louise Baum.

MR. DOUG DORAN: Doug Doran. Thank you. Thanks to everyone.

How to make a target. The long-term plan is to make the local culture work for its own extermination. The plutonium factory will push the plan a long way down this path toward the ultimate goal. This is the sociopathic doctrine known as, "Manifest Destiny," supremacy of the white race.

Now, awareness of this is evident throughout the workforce at both LANL and Sandia, and that awareness poses by far -- by far the most serious threat to national security. In fact, awareness is the threat of threats, because it could cause projects guided by this Saurian doctrine to backfire. This explains the trouble and the faulty analysis that Greg caught.

I understand C.G. Jung said there are many people who are only partially conscious. Even among absolutely civilized Europeans, there is a disproportionately high number of abnormally unconscious individuals who spend a great part of their lives in an unconscious state. They know what happens to them, but they do not know what they do or say. They cannot judge of the consequences of

Response side of this page intentionally left blank.

their actions. These are people who are abnormally unconscious, that is, in a primitive state.

What then finally makes them conscious? If they get a slap in the face, then they become conscious. Something really happens, and that makes them conscious. They meet with something fatal, and then they suddenly realize what they are doing.

When it comes to LANL, I go up and down. I want them to shut it down and clean it up. (Applause)

MR. MacALLISTER: Thank you, sir.

Louise Baum followed by Elana Sue St. Pierre.

MS. LOUISE BAUM: Hello. I noticed when I came in a lot of very kind of sharp looking men with name tags. I kind of feel for you. I realize probably your careers, your livelihoods are caught up in having this building built. But I also know that you are all human beings. Probably many of you have children. You have bodies that are affected by radiation.

I think these are very intense times. A lot is going on now that they we thought was unthinkable. We really did not think that what has happened to Japan was a possibility. Obviously they

719-1 NNSA acknowledges the commentor's support for cleanup of existing contamination. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

83

didn't think either that it was a possibility.

I think there is something called common sense and there is something called honor, and I feel as an American, I felt my country had both those qualities. But this project is telling me that it is really lacking. I mean, it's so clear that if you look at Japan, you know the unthinkable happens. You know people have not had enough imagination and enough commonsense to look at all the possibilities.

There was a tsunami. The backup generators failed because of the water. The earthquake affected things. All these things happened. This means millions of people in Japan have been radiated. The whole globe on the northern hemisphere is full of radioactive toxic clouds. It's coming down on all of us. It has gone completely around the planet.

This is the time to shut down activities that involve radiation. It's quite clear. It's commonsense. Let's look at it. Let's act on commonsense instead of our wishes for things to go back to a normal that really never existed.

It's not normal to be building weapons that can kill everyone on the planet. It does not

720-1 NNSA notes the commentor's objection to the CMRR-NF project. There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information. Chapter 4 of the *CMRR-NF SEIS* analyzes the radiological impacts associated with operations at the proposed CMRR-NF. The radiological hazards would be small. See Chapter 3, Section 3.4.3, regarding current radiological emissions at LANL.

NNSA notes the commentor's statement about activities involving radiation and opposition to nuclear weapons. Please refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. NNSA also notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*.

DOE Order 420.1B "Facility Safety" requires that nuclear or nonnuclear facilities be designed, constructed, and operated so that the public, the workers, and the environment are protected from the adverse impacts of natural phenomena hazards including earthquakes and fire.

make sense. It's also not honorable to have a process in which you are constantly circumventing it and not living up to the rules. There was an awful lot of talk when I came in this room about the rules, about if someone talked long, they were going to be thrown out. They were going to stop the whole process.

You know, you have not followed the rules that have been put in place by DOE, that have been put in place by the Congress. You are not being honorable and you are not being honest. It is not right, and it also is very dangerous for all of us, for everyone here.

The thing we realize in Japan and we realize really in Chernobyl, because people in England were told not to nurse their babies after Chernobyl went off. This is not local. It is affecting us more if we have an earthquake, which is a huge possibility. If we have another fire like Cerro Grande, it's going to affect us more here, but it affects the whole globe. It affects the whole human race and every living thing -- the air, the water, everything. Does this make sense? It does not make sense.

720-1 cont'd

Let's make sense. Let's go back to

commonsense. It's really simple. I mean, you look like a very intelligent man, but what about the commonsense in this.

I know this project has immense amount of momentum. It's carrying a lot of people's careers and hopes. I really felt for the people who came up and talked about how we need construction jobs. Well, we do, but there are so many things we could construct. We could keep people working. We could make our education systems much better with this money. This is not a reasonable or sensible thing to do, period. Let's stop it. (Applause)

720-1 cont'd

MR. MacALLISTER: Thank you, ma'am.

Elana Sue St. Pierre followed by Shannyn Sollitt, because Jan Lustig yielded her time to you.

MS. ELANA SUE ST. PIERRE: I would like to thank everybody for being here.

My name is Elana Sue St. Pierre. I am an occupational therapist providing home-based therapy for our community's most medically fragile infants. I am a spokesperson for Healthy Water Now, ASAP, representing over 300 parents with children with special needs, therapists, doctors, nurses, doulas, midwives, and child educators.

I speak for the children whose voices will

Response side of this page intentionally left blank.

86

hold everybody here accountable in days yet to come. The nuclear footprints of this nation's first weapon of mass destruction lies hidden in secret files, documents, and nuclear waste buried in the canyons between Los Alamos and the Rio Grande, this community's major source of water. Less than a hundred yards from the intake of this community's water supplies lies traces of plutonium and radioactive heavy metals buried only three feet deep within the Buckman well field and along the banks of Rio Grande.

Current radioactive clean-up standards and methods for radioactive clean-up do not protect us, they do not protect pregnant women and children. These silent yet deadly nuclear footprints may be seeping into our life-giving limited water supplies, becoming waters within the wombs, birthing lives plagued by deformity, sickness, and death.

The air we breathe, the soil that grows our food radiates background contamination from these nuclear bombs, nuclear footprints of the nuclear age threatening our national security as well as the health and safety of this downwind, down river, downstream community.

We intend that all funding for this bomb

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

factory be redirected toward remediation of nuclear contamination that already threatens us. We intend there be reevaluation that prevents any nuclear bomb factory from being created in this water-scarce, seismographically active region. **721-1**

A few years back, the Pecos River flowed backwards due to an earthquake. The Valles Caldera was created when this planet's largest mountaintop was blown to bits by the earth quaking. And we all quake to think that our world's best scientists would plan to store over 13,000 pounds of plutonium in this unstable area. We ask that the billions of dollars earmarked for this disastrous plan be redirected for bio remediation and alternative research. **721-2**

We would like to hold a moment of silence for contemplation in prayer to honor and to give power to the voiceless victims of the nuclear age and that the weapons of mass destruction have already created over the generations.

My father, a World War II veteran, always told me I would not be alive if the bomb had not been dropped. He was ready to be shipped out to the front lines and would most likely have been killed. He felt I owed my life to those that made the bomb.

721-1 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Please refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

NNSA acknowledges the commentor's concern for the need and location of the CMRR-NF. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

721-2 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

And so I stand here today, and I say, "Gracias, adios."

For today the kamikaze fighters have abandoned their planes, Hitler's bones have turned to dust, and the race to create a bigger and better gadget -- what they called the first bomb, the gadget -- it no longer serves a national defense purpose. It rather creates potential national disaster.

Germany leads the way away from nuclear energy and self-destruction. Japan is in a state of nuclear disaster realizing there is no safe place. Where the laws of nature rule, earthquake and nuclear stockpiles equate disaster.

The potential to transform and transmute the power of destruction into life sustaining technology lives in the hearts and the minds and consciousness of all of us here. To vision alternatives which protect innocent women and children is why I come here to this hearing. This silence we will hold carries the screams for help from the hearts and the wombs of our future. As we touch our hearts together from this place of silence, all answers can unite us beyond our dreams. And I will hold silence and ask that you hold

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

89

silence.

(A moment of silence was observed.)

MS. ST. PIERRE: Thank you.

MR. MacALLISTER: Thank you.

Shannyn Sollitt followed by Adele Caruthers.

MS. SHANNYN SOLLITT: Thank you, Elana, for those poignant thoughts and words. And thank you all for coming.

My name is Shannyn Sollitt. I am a citizen of Santa Fe, New Mexico. I have been positing the idea of the Los Alamos Peace Project to transform the laboratories of weapons of mass destruction into institutions that engage only in life affirming research and development. For more than a decade, I have just been putting it in the ethers.

722-1

And this is not the first time these hearings have been held about this very subject. Why do you need to keep coming back to find out whether the citizens of northern New Mexico approve of this bomb factory at Los Alamos labs? Do you think that people's opinions have changed? Do you think that anything has changed?

LANL still sits atop a windswept mountain

722-1 NNSA notes the commentor's opposition to nuclear weapons and concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed at the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

in a seismic zone where wildflowers and contaminated runoff continue to threaten and compromise the health and well-being of millions who live downwind and downstream. Where does the government get the right to exert this form of cruel authority over the people here who repeatedly, year after year, have to leave their fields of endeavor and take the time to defend their communities against this form of tyranny?

Citizens have repeatedly spoken out and submitted written testimony to defend our rights to have air and water free from the horrible radionuclide contamination created by the lab, and you blithely want to create more. No. Our opinions do not change, and clearly our voices have not been heard, or you would not keep returning over and over just to test us to see if you have worn down the opposition of the citizenry of New Mexico.

722-2

These hearings are an exercise in futility that pretend to affirm that we still live in a democratic country. But you are not fooling us. These hearings have always been a sham and this hearing is a sham. Nuclear bombs are immoral. They are a vulgar and heinous crime against planet earth and humanity. The only worse crime against humanity

722-2 Comment noted. NNSA considers every comment received by U.S. mail, email, toll-free telephone or fax line, or at the public hearings. Consistent with the purpose and intent of NEPA and the implementing regulations, public comments assist NNSA in determining the scope of the analysis to be included in a NEPA document and in improving the analysis and range of alternatives evaluated. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

would be the actual utilization of them.

Their very existence goes against the very tenets of freedom and prevention of tyranny that our founding fathers designed the constitution to protect us against, and those who perpetuate this crime are tyrants, despots, and traders to the constitution.

Please tell us how will this proposed factory protect the inalienable rights of US citizens to life, liberty, and the pursuit of happiness.

You may respond that the very existence of these weapons prevent war, and for that reason we must continue the proliferation of our nuclear arsenal. But since the inception of the nuclear bomb, the United States of America has been waging wars in at least 18 countries -- Korea, Guatemala, Cuba, Indonesia, Congo, Peru, Laos, Vietnam, Cambodia, Lebanon, Grenada, Libya, El Salvador, Nicaragua, Panama, Bosnia, Afghanistan, Iraq, and we fund wars and channel arms to Columbia, Mexico, and Israel.

The United States has been far and away the world leader in the development of weapons of mass destruction, and the existence of these weapons

Response side of this page intentionally left blank.

by our country holds the rest of the world in fear, has been the cause of nuclear proliferation, has shredded the fabric of global potentials for cooperative security that the whole rest of the world is yearning for. Let us call a spade a spade.

This plan to spend 180 billion over the next decade to modernize the nuclear weapons complex, this CMRR complex is being created to line the pockets of military contractors in bed with the legislators in Washington. So you traitors to the US constitution who have led us down the road to a failed democracy, you are out of compliance with the Nuclear Nonproliferation Treaty, the Strategic Arms Reduction Treaty. Traitors, cease and desist.

722-1 cont'd

(Applause)

MR. MacALLISTER: Adele Caruthers followed by Dominique Mazeaud.

MS. ADELE CARUTHERS: I am Adele Caruthers. I am an occupational therapist and a member of the Peace and Justice Committee of St. Bede's.

I do hope that you folks are listening, because what I heard tonight I will never forget. And I just have to say I moved here from the Boston area 20 years ago because of the beauty and the

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

93

clean air and the just amazing state of New Mexico, and now I just can't believe what I am hearing, what is happening.

I feel like I am standing on a train track, and the train is coming full speed ahead. So how do I stop it? I can just learn what is the truth. I am trying to figure that out. Do you know what is the truth? Are you telling us the truth?

Six hundred billion for plutonium; is that right? Six hundred billion --

VOICES FROM THE FLOOR: Six.

MS. CARUTHERS: Six billion, okay. And we cannot afford to pay our teachers. Now we are closing schools and doubling up. So as far as the money is concerned, we have to think about the budget of the country.

We are asking other nations to disarm and pretending like we want to be nonnuclear, as Obama said, and what are we doing? We are doing exactly the opposite. Pretending, isn't that hypocritical for us to pretend and then do the exact opposite?

There are three things -- and I will be very brief -- but there are three things that I am thinking about, and one of them is the cost, the cost of building weapons. The second one is the

723-1

723-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. CMRR-NF would operate under DOE safety regulations and guidance, which require that safety analyses be routinely updated. Safety issues pertaining to the design and operation of CMRR-NF and other nuclear facilities at LANL are subject to oversight by DNFSB. Seismic investigations and considerations are addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD.

safety, which everyone has mentioned with the earthquake prone site, and the third is the morality of contaminating our beautiful land, our water, our air, and Santa Fe, to contaminate our own life, our planet. That's all I want to say. Okay.

(Applause)

MR. MacALLISTER: Thank you, ma'am.

Dominique Mazeaud followed by Joni Arends.

MS. ARENDS: I want to give my time to Bob Gilkeson.

MS. DOMINIQUE MAZEAUD: I am going to be very brief, Joni, so I can give my time.

I am Dominique Mazeaud from Santa Fe and before that from Europe. And I wouldn't be here without the goodness of America. I was brought up by a family, a father especially who kept talking about the arms of goodness of America. And this is why my destiny brought me here, and now I have been in Santa Fe for 24 years, before in New York.

And as I have been living here, I have discovered the arms of goodness of America are not so good. Now the arms are what we are talking about this evening, and I am just -- you know, my friends, people here have talked statistics and facts, and I'm not going to repeat them. But I want people to

723-1 cont'd

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

95

remember, to me, as a new American, I really believe in the soul of this country. This is why I am here and I have stayed here all these years, but as I am staying here, my heart is broken, because I really feel the soul of America is being very compromised by these arms that she is making. Thank you. **724-1**

(Applause)

MR. MacALLISTER: Thank you.

Joni Arends followed by Mitch Buszek.

MS. JONI ARENDS: Good evening. My name is Joni Arends. I am with Concerned Citizens for Nuclear Safety.

I just want to provide some information about this project. For the construction alone, the laboratory is proposing to use about 4.6 million gallons per year of water in order to mix the concrete. That's about 11-acre feet per year. You could water a lot, irrigate a lot of farmland with 11-acre feet a year.

For operations, they are proposing to use 16 million gallons per year, which is about 49-acre feet per year. And it's really about choice, isn't it, about how we are going to use our limited resources, the limited water that's available. **725-1**

Another matter is that the Los Alamos

e-mail: info@litsupport.com

724-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

725-1 NNSA notes commentor's concern with water usage in construction and operation of the CMRR-NF. Water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

County and the lab own 1,200-acre feet of San Juan, Chama water. They haven't diverted any of that water yet, but the county has made a proposal to the Buckman board to be able to use the diversion site and run a pipeline across the river and lift the water about a thousand feet up to the White Rock water treatment facility.

I think it's important for people in Santa Fe to know that. It's under consideration right now. There are engineering studies being done. I don't think our intention in Santa Fe for the diversion project was necessarily to provide facilities for Los Alamos County and the laboratory to use the Buckman diversion project to obtain water.

This has been a very difficult process these last four days, and I think Scott and I have attended all four hearings. Each night the rules have changed a little bit. The rules have been tweaked a little bit. And it's not like the recent hearings.

The hearings that are held by the laboratory are much different than those that are run by DOE headquarters, and DOE headquarters runs hearings across the country for Programmatic

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

97

Environmental Impact Statement under the National Environmental Impact Statement. And basically when headquarters is running a hearing, we know what to expect. We know there is going to be a court reporter. We know they are going to record the hearing. We know there is going to be a podium. There is going to be a microphone. We are going to be able to hear one another speak, because we learn and we find solidarity amongst ourselves.

But this whole adventure with this proposal for the nuclear facility has been very, very difficult. Even from the first scoping meeting in White Rock, where if you wanted to make comments, you had to go into another room and nobody else could hear you speak, and that there were poster sessions and we couldn't hear each other speak.

725-2 And NEPA, as Doug says, our voices empower NEPA, and we need to be able to hear one another. And many of us have been in these rooms for 10, 20, 30 years. And especially for the LANL proposals, it would seem that the laboratory would know who we are. And what our concerns are. As Shannyn said, you know, we have opposed this project for years, these proposals to expand the pit production.

And by not providing us with consistency

725-2 NNSA acknowledges the commentor's concerns about the *CMRR-NF SEIS* public participation process and LANL water usage. Please refer to Section 2.2, NEPA Process, and Section 2.10, Water Resources and Usage, of this CRD for more information.

under the National Environmental Policy Act of what we can expect, it's really disheartening. And I hope that through this process, the laboratories, the Tonys, the Rodgers, the Johns, the Beths could put together a manual that mimics what happens at headquarters for these NEPA processes, and that it would be available on the web so that people can know what to expect.

This whole thing about seven minutes in Los Alamos, three minutes in Albuquerque, five minutes in Española, and maybe we will get five minutes here in Santa Fe tonight, it's getting very old. We are very knowledgeable. We are a very knowledgeable community -- I know. I have one more sentence -- we are a very knowledgeable community. We have been successful through this process.

725-2 cont'd

And we have to continue doing what we are doing, and we need to continue to speak truth to power. Thank you all for coming. (Applause)

MR. MacALLISTER: Thank you.

Mitch Buszek followed by Eric Wilson. Pardon me if I mispronounced it.

MR. MITCH BUSZEK: That's pretty good. It's Buszek like music, but close enough.

MR. MacALLISTER: Thank you.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

MR. BUSZEK: My name is Mitch Buszek. I come here as a parent of a 22-year-old daughter. I come as a veteran. I actually am a veteran for peace if you can imagine such a thing. We have quite a few of them here, and I have been involved in this nuclear mystery since I met Joni about 22 years ago.

I would like to thank some people for what they are doing and what they have done, and I would like to thank you for being here. This probably isn't the most delightful evening of the month. I would like to thank some people. Irwin was kind enough to talk about lineages and generations, and there are some people here that have really put their heart and soul into educating us about this issue and advocating for us.

Previous speaker Joni Arends has been a real beacon of light for a lot of us, and Holly Beaumont, who has done a thing or two here in the last few years.

Shannyn Sollitt, thank you for your work.

Dr. Jack Frenkel, I don't know you, but you sound like you have been at it for a while.

Jay Coghlan and the gentleman over here -- I didn't catch your name, but it sounded like you

Response side of this page intentionally left blank.

have been around this stuff for a while.

MR. DAVID McCOY: David McCoy.

MR. BUSZEK: David McCoy, thank you for being here.

I would like to make a suggestion. My sense of most of the speakers that I managed to hear tonight were addressing things like values and what is important to them personally and what is important to the community. We have talked about environment and health and safety. And I got a little talking to, as I talked to a couple of gentlemen out in the hall, and it's like the budget for this thing has been approved by Congress.

VOICE FROM THE FLOOR: No.

MR. BUSZEK: It hasn't been? Okay. Straighten me out on that. But they are proceeding as though it's funded. Is that accurate? Okay.

And I would like to suggest that the two most important people in this room to hear what we have to say are the representatives of our Congressional staff. We have a young lady here from Congressman Ben Ray Lujan's office. Is that you, Solidad? What is your name?

MS. JENNIFER CATECHIS: Jennifer.

MR. BUSZEK: Jennifer. And I think we

726-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

have a representative from Senator Udall's office; is that accurate? What is your name?

MS. MICHELLE JAQUEZ-ORTIZ: My name is Michelle, and our office has been in all the meetings. We have been advocating very hard behind the scenes for some of what Joe, me, and Jay are pushing.

MR. BUSZEK: I really appreciate what some of our representatives have done. The two represented here tonight have really done the work.

I would like to suggest that the forum that would most suit us is a forum with Congressman Lujan, with Senator Udall, and with Senator Bingaman so that we can articulate to our elected representatives how we would like to spend our federal money and our tax money.

To take another step in that direction, we have got a very skilled moderator in the audience. Lorraine Nells back there in the back row is a talented TV interviewer and talk show host. I think we have the skill in this room to fill up both of these rooms and talk about the things that we care about and things that we value.

And I think these guys, oh, boy, I think it's a difficult thing. I mean, they are here to do

Response side of this page intentionally left blank.

a job. They are doing it as conscientiously and honestly as they can, but our values are just miles apart. And I think it's incumbent on us to pick the right people to talk to, and I think if we could get a forum with our representatives, that's really who needs to hear our pleas for help.

I think that's all I have to say. Thank you very much. (Applause)

MR. MacALLISTER: Thank you, sir.

Ma'am, can I ask the representative from Senator Udall's office to restate her name. The court reporter wasn't able to catch your name, and we would like to have it since you spoke from the audience.

MS. MICHELLE JAQUEZ-ORTIZ: Do you want me to state it out loud or do you want me to go up there?

MR. MacALLISTER: If you will just state it, I will restate it for you.

MS. JAQUEZ-ORTIZ: It's Michelle Jaquez-Ortiz. It's like Jaque with a z at the end, dash, Ortiz. I am the senator's northern New Mexico field representative. I was at the Los Alamos meeting, the Española meeting to the end, by the way, last night. It ended very late. And then we

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

had Bill Wald at the Albuquerque meeting.

MR. MacALLISTER: Thank you, ma'am.

MS. JAQUEZ-ORTIZ: We also weighed in on the Taos meeting as well.

MR. MacALLISTER: Thank you, ma'am.

Our next speaker is Eric Wilson followed by Sam Hitt.

MR. ERIC WILSON: My name is Eric Wilson, and I think I want to tell a little bit of a story today, because everyone has so many more facts than I really do. But I have opinions, and the story is about when I was a kid, and I had a fish. I got a fish for my birthday in a little round bowl, and I really liked that fish. It was really cool.

One day I decided it would be really cool so that the first thing you saw when you came into the house, and we put that fish bowl right on the very end of the stairway banister. We had a nice little round place there, and I put it there. My mom told me we couldn't keep it there. I was like, well, it was great there. I showed her. I set it there and it stayed there and it didn't fall off. It was very safe there, I thought. She said, you know, you don't understand. It's just not safe there.

Response side of this page intentionally left blank.

One day when she was away, I put it back there. My friends came over. We were rough housing around again. Sure enough, it fell right off and smashed on the floor. The fish didn't do so well. The whole thing went to hell.

And I guess I kind of see this project in the same way. People are saying that it's safe, people believe it's safe, but I think the information isn't really there.

The story goes on a little bit, because then I started asking my mom like, you know, if I could get another one. And she was like, well, you know, you could get another one, but it was your fault that it got destroyed. She goes how about this, instead of going to -- there was a great place called Story Town that we went to every year. Instead of the trip to Story Town, we will get you another one.

Well, I didn't really want another fish as much as I wanted to go to Story Town, so I didn't go for that. I think that's also kind of the same thing. We are having conversations in Congress this week about what we had to cut out of our budget in order to be able to send disaster relief to Joplin, Missouri, where they are suffering. I never thought

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

105

that conversation would ever have happened in our country. We would always take care of people like that.

But in a time when we are having that kind of conversation, I think we need to look at our priorities. Should we be looking to spend this kind of money on this kind of project, or are there more important priorities for us at this point in time? I think without question, if you ask every person in the country what their priority is, building more nuclear weapons or taking care of disaster relief and educating our children and converting to a sustainable economy, I think overwhelmingly people would say, yes, of course.

727-1

But that's not really the point. The real point here is: What are we trying to do? We are trying to make more nuclear weapons. We are talking about not just like we need them immediately, but we are building a facility that won't even be doing it for a long time, investing a lot of resources in that, because somehow we believe that in the long-term, in the future, we are still going to need nuclear weapons. And for what?

I mean, I really thought at some point -- a long time ago I had a lot of hope in our country

727-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

as I was growing up, because it really seemed like we were moving in a good direction. I thought that once we used nuclear weapons, that we really had learned our lesson. We were going to move away from that.

Instead now, at a time when we have no -- I mean, I don't know if we are expecting these are going to be useful against some theoretical opponent that's going to come from outer space. I really don't see what the point is. Who wins with a nuclear weapon? Who wins when even one nuclear bomb ever goes off for any reason? Nobody really wins.

I really think there are three things we really need to think about. One is, this is crazy. Just, I mean, most people when I talk to them about it, they say, well, what's it for? And when I say just to build more nuclear weapons, they are like, I didn't think we were still doing that. I thought we were dismantling our arsenals.

But then when you get it back to the amount of money that's involved. Take it back to, even if it were a great idea and we are at the peak of our economy, we had all the resources in the world, why in the world would we stick it on that banister where it's so likely that there is a

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

107

problem. If we had to, if we really had a need for nuclear weapons and we had to build them, why in the world would we choose this place to do it? It just doesn't make any sense from the very top to the bottom.

So I really hope we can stop this. I hope there is a real reason for this hearing, that this hearing is really an opportunity, well, everybody here was against it. Okay, here we go. We are not going to do it. I suspect that's not the case. So I hope -- I hope our congressional representatives not only go back there and fight for this, but make sure that the awareness is there for the whole congressional delegation, that if you want to save money, here is a great place to start. (Applause)

MR. MacALLISTER: Sam Hitt followed by Reverend Holly Beaumont.

MR. SAM HITT: Thank you very much. My name is Sam Hitt, and I am a concerned citizen with a long time interest in the NEPA process.

Just to remind us all, that NEPA is the charter for the protection of our environment passed in 1969. It's really the software that we have in our democracy to avoid tragic mistakes, to make informed decisions, and to create a future for our

Response side of this page intentionally left blank.

children that is long-term and sustainable.

And key to the implementation of NEPA, as contained in the implementing regulations, is this phrase that I think everyone should keep in mind, that public involvement will occur, shall occur, to the fullest extent possible. This is legal language, to the fullest extent possible.

Now, to me that means not a highly managed process like we are having tonight, where we are limited to five minutes to make our dog and pony show. No, no. It's when we sit down with the drafters of this document, with the people who are putting together this project, who are making key decisions every day, and discuss and sit at the table with and have access to the information that is behind the words, so we really can be informed citizens, so we really can exercise this function of directing our democracy, of not just being pawns and not just being little cogs in the machine, but actual actors with a great deal of power.

I have reviewed somewhat the Supplemental Draft Environmental Impact Statement, as in most cases, there is an emphasis on the direct impacts, but there is very, very little discussion of the indirect impacts or the cumulative impacts. These

728-1

728-1 NNSA notes the commentor's concern regarding the discussion of cumulative impacts. Chapter 4, Section 4.6, of the *CMRR-NF SEIS* addresses cumulative impacts of LANL and regional activities on key environmental resource areas, including electrical use, water use, waste management and health and safety.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

are key to the environmental consequences that have to be evaluated. So I would urge that this document be reformatted, and that every time there is an issue, cumulative indirect impacts are discussed, as many other agencies do in their NEPA process, so the public really has a chance to evaluate, particularly the cumulative impacts.

728-1 cont'd

Now, we can't just rely on local government and state agencies and others to respond to letters and inquiries about what they think the cumulative impacts would be. No, no. We have to, the laboratory and citizens have to go out and seek out that information. We can't just be passive recipients, and I did not see that in the current document.

Also key to me is the evaluation of alternatives. There are three alternatives being evaluated in this case. I think a very reasonable alternative would be to look in detail at abandoning the current structure and not building the new structure. That's more than just no action, which is required by the regulations. That's actually an affirmative alternative that would implement, I think, what would be desired by most taxpayers in this country and, of course, many people in this

728-2

728-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967). See Section 2.11, Alternatives Considered, of this CRD for more information.

room.

So I think that's about it. Thank you very much. (Applause)

MR. MacALLISTER: Thank you, sir.

111

MR. MacALLISTER: Reverend Holly Beaumont, followed by Rebecca Ortega.

REVEREND BEAUMONT: Good evening.

I'd like to start this evening by thanking Nuclear Watch and Concerned Citizens for Nuclear Safety and also Cultural Energy. I don't know if we have written checks recently for these organizations, but I think it's one of the best ways you can invest in helping us to create the kind of community that we hope to achieve, by doing more than just this. These organizations really need money.

I also want to thank all of you for being here. I know there was a debate going on about whether we were wasting our time or not, and I was reminded at an event earlier today that was held by Department of African-American Affairs, a quote from Martin Luther King, Jr.: "Our lives begin to end the day we become silent about things that matter." So thank you for being here.

In 2006, Los Alamos National Laboratory became a stunning example of privatization of public property when the Bush administration handed it over to Bechtel. The lab's historic record of patriotic service to this country, however misguided, was replaced by a maniacal, insatiable drive for profits.

729-1

729-1 DOE and NNSA continue to provide oversight of LANL as in the past. The managing and operating contract for LANL was openly competed in 2005 for the first time in the 63-year history of the LANL site. Through 2005, the University of California had been the sole managing and operation contractor for the LANL site since its creation in 1943. The new managing and operating contractor, Los Alamos National Security, LLC, began managing LANL in June 2006. The selection of a new managing and operating contractor did not change the DOE and NNSA work performed at LANL.

So who is Bechtel? Well, I've been using this as an opportunity. I clearly am opposed to the project, but I'm increasingly concerned to learn about our new neighbors. I call them -- well, I call them "Bechtel on the Hill." That's one of the friendlier names. But who are these people?

Bechtel Enterprises is headquartered in San Francisco and is a privately held firm and the world's largest engineering construction company. There are just -- oh, Bechtel estimates that it has built 40 percent of U.S. nuclear capacity and 50 percent of nuclear power plants in a developing country. God bless them. Bechtel received a ten-year contract in December 2000 with the U.S. Department of Energy to design, build and start up waste treatment facilities at Hanford that will transform liquid radioactive waste into a stable glass form, a process known as vitrification. And I'm just beginning to learn about this, but it's scary. These are just a few -- these are a few more of the notable Bechtel projects.

Bechtel built the San Onofre, California Nuclear Plant on a major earthquake fault line, and installed the seismic braces backward, meaning the braces will increase the impact of an earthquake rather than reduce it. Good work.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

113

Bechtel has also been sued by former employees of the plant for exposure to radiation.

Three Mile Island cleanup. Bechtel was invested [sic] by the Nuclear Regulatory Commission, who found that -- was investigated by the Nuclear Regulatory Commission, who found that Bechtel -- I quote -- "improperly classified modifications to the plant as not important to safety in order to avoid safety controls." In 1985, the NRC fined Bechtel for harassing and intimidating workers who complained about these lapses.

The Radioactive Campaign reports that their sampling efforts along the Hanford Reach of the Columbia River, begun in 1983 with Greenpeace, has revealed evidence of Hanford's still secret production of uranium-233 for many nuclear battlefield weapons.

In 2001, TRAC found that 60 percent of the Hanford Reach and seven out of ten major salmon spawning grounds were contaminated with by-products from U-233 production.

In 2002, TRAC discovered a previously unreported discharge pipe that may have been used to discharge radioactive waste directly into the Columbia River.

Now, I wanted to say something about water, based on Joni's concerns -- raising those concerns.

Response side of this page intentionally left blank.

114

Through subsidiaries and joint ventures in the U.S., Europe and, infamously, in South America, Bechtel was also involved with over 200 water and wastewater treatment plants; the privatization of water in Cochabamba, Bolivia resulting in exorbitant water prices, as much as 1- to 300 percent increase. Mass demonstrations in Bolivia in opposition to the water system eventually forced the reversal of the contract, and then Bechtel attempted to sue Bolivia, an impoverished nation, for $50 million because they were losing $30 million in profits they spent cleaning up what was left behind by the previous owner. $30 million is, for Bechtel, one half of their daily profits.

I will close.

If the CMRR is, in fact, necessary to our national security, then it is far too important and, in light of Fukushima, potentially far too dangerous to be entrusted to a corporation like Bechtel, with your [sic] abysmal, indeed criminal record of environmental degradation, human rights abuses, cost overruns at taxpayers expense and the privatization of community commodities -- public commodities. *729-2*

Thank you.

MR. MacALLISTER: Rebecca Ortega, and then I will begin calling people who had stepped out or who

729-2 Regarding the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

had yielded their time.

MS. ORTEGA: (Greeting in Native American language; no translation.)

It is with respect that I come here today. My name is Rebecca Ortega, and I am from the Pueblo of Santa Clara. I'm a tribal member from Santa Clara Pueblo.

Our pueblo sits directly downwind from Los Alamos, and, you know, it's really, really sad that all of this stuff that's going on at Los Alamos is contaminating the water, the air, the land.

And on top of that, Bechtel, which the young lady just mentioned, is here -- it's a for-profit organization. They're not here for us. They're not here to give us jobs. They might say, Yes, we're coming to bring you jobs. But guess what kind of jobs? They're giving us janitorial, secretarial, all the low-end jobs. I know for a fact that they are bringing their own top people that they're paying top dollar, $300,000 a year, $200,000 a year, you know. They're bringing their own people.

But why do we live in New Mexico? Why do so many people come to New Mexico? Because they love New Mexico; because it's beautiful; it's clean. You know, we have a lot of culture here. It's peaceful.

Response side of this page intentionally left blank.

But guess what? If we don't stand up to what's going to be coming up in Los Alamos -- it doesn't matter if it's scheduled for 5 years or 10 years or 15 years. If we don't stand up for it, our children and grandchildren and our great-grandchildren will not enjoy the same kind of life and beauty that we are living in right now. And it's going to be our fault.

Yes, I know a lot of people say, Well, you know what, you can go there and talk against whatever the government wants, but you know what, I had to come today to say how I feel and what's in my heart and what I see. Because if I don't -- yes, maybe Los Alamos Labs -- maybe they're still going to do what they want, because just look at what they're doing to us right now. The government -- the government does whatever they want.

If they want to raise the prices to us for $3.73 a gallon, $4.00 a gallon in some places -- I went up to TA for jury duty about two, three weeks ago: $4.05 a gallon up in Chama.

Now, then about two, three weeks ago, I'm watching World News, Diane Sawyer. Diane Sawyer says, Well, you know what, Exxon, Chevron and all these oil companies have already, the first quarter, made a $32 billion profit. And guess what? On the backs of all of

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

117

us Americans.

If this was happening in some other country, wouldn't we be the first ones to say, Why are those poor people losing their houses? Why are people being thrown out, in foreclosures? Why are they being charged exorbitant prices for food? Why are they being charged exorbitant prices for gas? You know, I'm just wondering about all those kind of things.

And like I said, I am from the Pueblo of Santa Clara. I am from Santa Clara Pueblo. And the sad thing is that -- we have to live together. We live together, what, 2-, 3,000 people. The reason we live together is because that is the way we can maintain our traditions, our culture, our dances, our language. We cannot -- we cannot go away and try to get together and, oh, yeah, you know what, we're going to have a corn dance today; oh, yeah, we're going to have this dance today. How can we? That's why we live together, because we come together; we practice our dances; we practice our songs, our traditions, our culture, our language.

If -- and which I'm saying probably not even if, but when all of our land, our water and our air is contaminated, where are we going to go? What city, what state is going to accept 2-, 3,000 Native Americans

Response side of this page intentionally left blank.

to come there to live together to continue the culture? It isn't. And what's going to happen? It's another form of let's get rid of those Indians. Terminate, you know. This has been going on for a lifetime, and this is just another form. Except this time, it's not just going to be the Native Americans that are going to be driven away from their homelands. It's going to be everyone else that's in this room that came here from somewhere else because they wanted to live in peace and beauty. You know, it's just really sad.

And not only that, look what happened in Japan. Did we not learn from that? Did we not learn from that? That is just crazy.

730-1

You know, I just feel like in the next few years, when our land is contaminated, what are we going to tell our children, our grandchildren when they have major health problems, when there is no clean water, when there is no clean air, no clean land? And the government's going to say, Hey, guess what, your land is condemned; you have to move away from there. Like I said, where are we going to go? They'll tell us, You're on your own, buddy.

You know what, we have no money. We have no money for health care even for us now. But guess what? Congress has the best money [sic] for themselves,

730-1 Regarding the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL, there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

119

but what about for the rest of us? Nothing.

MR. MacALLISTER: Your time is up, ma'am.

MS. ORTEGA: Okay. One more sentence.

MR. MacALLISTER: Sure.

MS. ORTEGA: I absolutely do not want to see any more plutonium labs built up in Los Alamos. We have to have respect for life. We have to have respect for each other. We have to have respect for our children. We have to have respect for our mother earth. And we have to have respect most of all for what our Lord God has given us, and he has given us this planet to cherish, to use and respect.

730-2

MR. MacALLISTER: Thank you, ma'am.

(Applause.)

MR. MacALLISTER: Thank you, ma'am.

I will cycle back through the people who may have stepped out or they may not be here or people who have yielded the floor in the order in which I had originally called them.

The first person I'm calling is Jennifer Sequeira. Is Jennifer here?

The next person is Bridjette Kennedy? Is Ms. Kennedy here?

MS. KENNEDY: I had deferred my time to Robert Gilchrist.

730-2 NNSA notes the commentor's opposition to more plutonium labs. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

120

MR. MacALLISTER: Yes. And we're now through everybody, so if you want to speak now, you're welcome to.

MS. KENNEDY: Okay. Yeah. Thanks for coming to speak your heart for -- for the love of this beautiful place. And a social responsibility of money is a good one. Jobs for a peaceful economy is better than to proliferate wartime, the nuclear and military industrial complex. Over 50 percent of our tax-paying money goes there, and it's -- it's a very powerful thing to come up against and say that it's wrong.

731-1

My father was involved with the nuclear industrial -- military industrial complex, being involved with engineering intercontinental ballistic missiles, radio tracking devices and Star Wars. And I give thanks to my father, who recently died, to teach me the importance of the social responsibility and how you earn your living. So I became a landscape architect, thinking I love the planet and I want to make it whole and beautiful again and help heal the planet.

And so the first job that I was given was the design -- being involved in the design of a military base for the nuclear weapons on submarines, a military support base in Kings Bay, Georgia. And so I told them, Yeah, this is a great landscape architecture office, but

731-1 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on major Federal programs (for example, education) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for additional information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Refer to Section 2.7, Economic Impacts, of hit CRD for information on the economic impacts as evaluated in the *CMRR-NF SEIS*. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for information about LANL environmental remediation activities.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

I have to quit because I believe in social responsibility.

And, you know, my dad did it because he wanted to put us through college. Money is important, but social responsibility means living the truth of your conviction of life-affirming processes. And I hope that we have a future in this world to have a peaceful society where love and helping others is a priority and destruction and pollution and hazardous waste and --

The peacemakers of the Hau de no sau nee people created the first democracy in America. And his premise is to bury all weapons under the Sacred Tree of Life and let those roots grow in four directions for the seventh generations, as well as Hau de no sau nee premise that was -- that the peacemakers spread the word of peace in Upstate New York. And I hope -- I hope for a future of peace and burying all weapons and letting that grow in the four directions. And this is a great place to start right here, where we live in the shadow of -- of a defunct nuclear and military industrial complex.

Thanks.

(Applause.)

MR. MacALLISTER: David Bacon.

MR. BACON: The fact that I've only heard

Response side of this page intentionally left blank.

two other people from Santa Clara, but I think if we had maybe 25 more out, we could win this thing tomorrow. It's got to be a very impressive community.

We heard from Marian Naranjo and her grandson from Espanola, and it was a powerful -- empowering testimony.

I think that part of the difference we're seeing tonight is some -- some fascinating struggle that I see, having been to the Espanola, Albuquerque and then this hearing. And there is a tremendous struggle going on here that we don't really see very clearly. The labs are involved only, basically, in massive -- the most massive violence and brutality imaginable to man.

I have a prayer here from -- Chatral Rinpoche's is a 90-something-year-old lama now. And I'm not going to read it, but I have it out back for those of you who are interested. And in it, he prays for the end of this demon war, this violence that goes so far beyond anything that any of us could imagine as simple human beings. And yet within this struggle, we have these voices that we're hearing from our community that are so powerful, so clear, so right down the line in terms of truth, truth at every level, the spiritual level, the emotional level, the data level. It's an astonishing and wonderful thing to see.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

And I was thinking of the difference between the terms "power" and "empowerment," and the labs do not empower. They hold power over. They hold power over us, over the planet.

A nuclear weapon is simply the most violent form of power that anyone could hold over anything on this plant. As Shannon said, it's just a -- it's just a massive form of tyranny, and yet our stories clash, because the lab's story can never be told honestly. They will never allow it to be told as an honest, straightforward story, that we are only involved in the destruction of all life on the planet. This is a story that is too monstrous to even begin to tell.

So our stories -- there's a -- there's a question as to. As to whether these -- these hearings are legitimate, but I was telling Zubie [phonetic] of the radio show, activists don't participate in legitimate stuff. Activists participate against illegitimate stuff. That's what we do.

And what I'm hearing from the activist community up and down the Rio Grande, I feel maybe we should tip our hat to Bechtel because I feel that what Bechtel woke up in Bolivia, they're finally waking up here in Northern New Mexico.

And what about our communities -- the

Response side of this page intentionally left blank.

pueblo and communities that suffered the initial hit from this thing, because there weren't many other people living in the area back then? And as Erwin Rivera so eloquently stated, the land grant communities on the Pajarito Plateau. So it's the older communities, the deeper communities that I feel are going to take -- that are going to guide us now, that are going to show us where we need to go. And the growth from just a few, 50, 60, people at these hearings who speak so eloquently, I feel it's going to grow now. And I feel we're seeing a movement evolve in Northern New Mexico. And where I see the difference in the movement from the past to now is that people are not only saying no to things like the CMRR building, which is a fairly prosaic argument, but they're saying yes to the life on the planet and to the life of the communities that exist up and down the Rio Grande now. They're saying yes to the wisdom of the people. And they're saying, That money that you're throwing away on nuclear rat holes belongs rightly to us and has to be put to use for life now, life on the planet, restoring the planet, cleaning up the mess of Los Alamos and completely eliminating what my good friend Kathy Sanchez calls the culture of violence.

And she said last night, in Espanola, that

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

125

we're all so blown out by the culture of violence because alone we hardly ever confront it as what it is. Together, in rooms like this, our legitimacy can begin to come forward in so many different ways that we then confront the culture of violence, and it's where this is going to go that I think is so exciting now and it's real. This isn't make believe.

We have a lot of work to do, but it's really the only work that we have right now. It's the only legitimate work that we really have. And I feel that in Northern New Mexico, we can begin to focus on this issue, our bioregion, the damage done to it and the political reality that can come out of healing our bioregion, and it'll be wonderful.

732-1

Thank you.

MR. MacALLISTER: Thank you.

MR. BACON: By the way, anyone who doesn't know Robin (indicating)? He's like Bodhisattva reporting these meetings; Cultural Energy from Taos.

(Applause.)

MR. MacALLISTER: John Withan.

MR. WITHAN: John Withan with Nuclear Watch New Mexico.

As part of an organization that's really trying to do an analysis of this document, as blah as it

732-1 NNSA notes the commentor's opposition to the CMRR-NF

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

seems to be, I'd like to point out that the numerous references that were cited in the document were not only cited by a generic name that sometimes points to a 1400 page document that's a photocopy without any page reference, and many of the reference documents were not placed online at the time that the SEIS came out.

So in doing formal comments and doing research for the formal comments, it makes it difficult if not all the references are available, and when references are cited, they are cited so generically that if one cannot actually do a word search on that document, it takes a vast amount of time to find what that reference is. And that's all I have to say right now.

733-1

MR. MacALLISTER: Thank you, sir.

Liz Rando? Liz Rando?

She had yielded earlier to David McCoy.

Liz, are you here?

Is there anybody who has not had a chance to speak yet who would like to speak at this point?

Is there anybody who would like to make a follow-up statement at this time?

And one thing, when you make your follow-up statement, it's very important to give your name so that the court reporter can have it, since I won't be

733-1 Problems with links to references that may have been experienced during the public comment period were corrected as soon as they were identified. In addition, the references were placed in a number of libraries in the area surrounding LANL as identified in Chapter 9 of the *CMRR-NF SEIS* and the Notice of Availability for the *Draft CMRR-NF SEIS* (76 FR 24018) published on April 29, 2011. Regarding the references cited in the comment, LANL 2010d was checked on the NNSA website and the link labeled “LANL 2010d” in the “References” page NNSA’s *CMRR-NF SEIS* page (http://nnsa.energy.gov/ nepa/cmrrseis) connected to “http://nnsa.energy.gov/sites/default/files/seis/CMRR%20NF%20Project %20and%20Environmental%20Description%20Document%20Final_LA-UR%2010-07497.pdf,” which brought up a copy of the correct reference document, “CMRR-NF Project and Environmental Description Document (LA-UR-10-07497).” LANL 2011 is included at the bottom of the reference list on the NNSA website because it is broken into a number of sections.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

announcing people. Thank you.

MR. McCOY: Dave McCoy.

One thing I'd like to mention is, we're focused on the CMRR, which is one little piece of the planet. We've got 104 nuclear reactors operating. There are 444-odd nuclear reactors in the whole world, 38 of them sited in highly dangerous seismic areas. We've got White Sands, Alamogordo, Sandia Laboratories, Kirtland Air Force Base. What we're doing is making atomic deserts all around the planet day after day, year after year.

An 8-million gallon jet-fuel spill at Kirtland Air Force Base. They've trashed the aquifer for Albuquerque. They're not really telling you how bad it is.

568 nuclear and hazardous waste dumps across Sandia Labs and Kirtland Air Force Base and Albuquerque. You've got the mixed-waste landfill, million and a half -- 1,500,000 cubic feet of hazardous waste over Albuquerque's drinking water in unlined pits and trenches. Other sites at Sandia dump billions of gallons of contaminated water.

The NMED doesn't really look closely at this.

You've got TA 54, Areas G, H and L up at

Response side of this page intentionally left blank.

Los Alamos.

You think people are going to be able to live on those sites? They're not. Nobody's living where they exploded the first atomic bomb. Nobody's living out at the Nevada Test Site, you know. We're doing this all around the planet. This is like a terrible, terrible cancer that's spreading. Fukushima is just an example.

Roger Snyder, back there, he says -- I mean, this guy only takes notes when you attack the NEPA process or the SEIS. He doesn't care about values or how heartfelt we feel about this. He's only listening to NEPA arguments or arguments as to why the SEIS is not an effective valid document. Okay? But you hear them talk about, well, we can't change the goal of national security. And why can't we? Well, because the President and Joe Biden have said that we've got to have this pit production. Okay?

Well, I submit to you that this is too much power to be placed in the hands of one person or two people in the first place and that we have to get to President Obama and tell him that we don't want this. But also the Roger Snyders and the others out there at LANL have to be honest for a change and go to the President and Senator Biden -- or Vice President Biden

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

129

now and say, Look, we don't need these. This is a dangerous area. It's just going to create more contamination.

What would the explosion of 13,000 pounds of plutonium be like? I keep wondering about what that would be like if that came together.

Now, we've got this enormously hefty building that's sitting there, and they expect it to float on this soft volcanic ash. Well, this is really ludicrous, you know. Inside they're going to have these huge tanks of water; they're supposed to suppress the plutonium fire if they have one. But in an earthquake, we know what happens. Equipment isn't available. Are all the components and the pipes and the backup generators going to be available to release this water? Well, there's what you call hydro wetting, you know. Once all that water might escape from the building, it gets down in that volcanic ash, you're going to have -- you're going to have first-rate slush.

So the heat from all this plutonium; the plutonium's got to be kept in some kind of tanks, cooled with water. That's going to be an incredible weight in its own right.

How much is this building going to weigh, by the way? I never did find that number in the SEIS.

705-4

705-4 Fire protection water storage tanks would be located inside the Modified CMRR-NF. The building and its components would be designed to survive earthquake damage. The fire suppression system would be operated by backup generators in case of a power outage.

Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazards analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). The updated seismic hazard analyses (LANL 2007, 2009) provide a better understanding of the ground motion and seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF building site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. The revised design is reflected in the revised cost estimates. Per DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets, final or detailed design cannot be started until the NEPA document (Final SEIS in this case) has been completed, so as not to prejudice the outcome, or restrict or narrow the range of alternatives to be considered.

Site specific geotechnical investigations have been completed for the proposed CMRR-NF project site for both the Shallow Excavation Option and the Deep Excavation Option and recommendations issued related to the design of the CMRR-NF (Kleinfelder 2007a, 2007b, 2010a, 2010b). Such recommendations take into consideration potential sinking, including seismically induced and non-seismically induced settlement, and lateral shifting of the foundation. The *CMRR-NF SEIS* has been revised to include this information. Refer to Section 2.6, Seismic Concerns, of this CRD for more information.

The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase

130

Write that down. We want to know what the weight of the building is going to be when you finally get done with it.

Do you know?

MR. KOVAC: Yes.

MR. McCOY: What is it?

MR. KOVAC: 400- -- 490 million pounds.

MR. McCOY: 490 million pounds. And an earthquake occurring, and we don't even know what the size of it potentially is.

I want to tell you something. I dealt with Bechtel when I was 27 years old as a -- as a nuclear intervenor. They wanted to expand spent fuel storage at the Trojan Nuclear Reactor. And I found secret documents from the state geologist that were suppressed, and those documents said they could have an earthquake twice what the Trojan Nuclear Power Plant was designed to withstand on the Columbia River. Okay? That's Bechtel.

You're right, Holly.

(Applause.)

MR. MacALLISTER: Thank you, sir.

We've got time for another speaker or so, depending on how long people go. Is there somebody else who would like to speak?

the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option. A draft slope stability analysis has been prepared and determined that indicated that global slope stability is not an issue for the Deep Excavation Option (LANL 2011a:LANL site, 028). If the Deep Excavation Option were selected, as part of the ongoing design and evaluation process, studies would be completed to verify that all geotechnical stability issues had been addressed.

The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

Anybody else who would like to speak?

All right. Then at this point, I will officially close the meeting.

And thank you-all for your attendance, and I thank many of you for your attendance multiple times. Your stamina is applauded. Appreciate it.

(The public hearing concluded, 8:56 p.m.)

(5:46 p.m., non-public comment of Doug Doran provided to Court Reporter Mary C. Hankins.)

MR. DORAN: I would like to read four comments written by Bob Walsh, W-A-L-S-H, of Santa Fe. So I'll just read them as they're written here.

"I now provide" -- if I go too fast -- "I now provide the following four comments on the Draft Supplemental EIS.

"Number one: Please provide a reference to an analysis that substantiates that the probability of an airplane crash during overflight does not exceed ten to the negative sixth/year, conservatively calculated. ***719-2***

"Number two: Please provide a rigorous, independent review of this document by an independent professional organization in order to increase public confidence in the conclusions. ***719-3***

"Three: Please provide an unclassified ***719-4***

719-2 In response to similar comments, the text in the *Final CMRR-NF SEIS*, Appendix C, Section C.3.2, has been revised to more clearly reflect the consideration of an airplane crash into the CMRR-NF. The largest aircraft that is considered to have a conservative probability greater than 1 in 1 million per year of accidentally crashing into the CMRR-NF is a general aviation aircraft. References were added to support this conclusion, including the *DOE Standard: Accident Analysis for Aircraft Crash into Hazardous Facilities* (DOE 2006) and a site-specific technical evaluation of the potential for aircraft crashes (LANL 2011i).

719-3 NNSA and DOE engage their own technically qualified staff and subject matter experts to prepare the SEIS along with qualified contractors. The analyses include the evaluation of accidents and intentional destructive act impact analyses. NNSA does not intend to pursue an independent external review of the analysis in the *CMRR-NF SEIS*.

719-4 As indicated in Chapter 4, Section 4.2.10.3 of the *CMRR-NF SEIS*, substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. NNSA considered a range of possible terrorist or intentional destructive acts and performed a detailed analysis of selected scenarios. Selected scenarios provide a reasonable range of events, including those with the largest expected impacts. NNSA and DOE engage their own technically qualified staff and subject matter experts to prepare the SEIS along with qualified contractors. The analyses include the evaluation of accidents and intentional destructive act impact analyses. NNSA does not intend to pursue an independent external review of the analysis in the *CMRR-NF SEIS*.

NNSA has an extensive program related to preventing terrorist threats. This includes ongoing evaluations of facilities and security forces to prevent successful attacks. In evaluating intentional destructive acts, the probability of a given scenario occurring is not a factor in the analysis. Therefore, the programs and funding of other entities, such as the Transportation Security Administration is not a relevant factor. The intentional destructive acts appendix presents consequences projected to occur in the event of a successful attack. The results of these analyses will be reviewed and considered by NNSA in making its decision on the CMRR-NF and are shared, as appropriate, with senior Administration officials and Congress.

overview of the classified appendix omitting details but including at least answers to the following questions: (A) does the appendix include consideration of attacks using aircraft?; (B) in determining risks from terrorist attacks, does the appendix assume continued funding for government agencies other than NNSA, such as the Transportation Security Administration?; (C) does the appendix estimate the consequences of a successful terrorist attack? If so, have these potential consequences been brought to the attention of the President and Congress for consideration in decisions on nuclear weapons policy?

719-4 cont'd

"And four: Please provide a rigorous, independent review of the classified appendix by an independent professional organization with appropriate clearances, and include in the SEIS an unclassified summary of that assessment. Please include the identity of the organization and the amount budgeted for the review as an assurance that the review is independent and thorough."

719-3 cont'd

And that's all I'd like to say.

(Conclusion of Mr. Doran's comments, 5:48 p.m.)

(5:57 p.m., non-public comment of Lawrence Quintana provided to Court Reporter Mary C.

Response side of this page intentionally left blank.

Comments from the Santa Fe, New Mexico Public Hearing (May 26, 2011)

133

Hankins.)

MR. QUINTANA: Lawrence G. Quintana.

I'm very much so in favor of the CMRR Project going forward. I think that every delay is wasting a lot of resources, and it's actually creating large problems. The research and the development that this facility can do to help mankind is unbelievable, and if they'd just give it a chance, I think they can get it done. These study groups that keep studying just don't seem to get it together. You can't confuse the facts because your mind is made up.

The facts are that this facility is needed. The research and development needs to go forward. The benefits to the public is immense, and it's proven time after time. So I am very much for the CMRR going forward.

(Conclusion of Mr. Quintana's comments, 5:58 p.m. and conclusion of non-public comments.)

734-1

734-1 NNSA acknowledges the commentor's support for construction of the CMRR-NF.
