The release mechanisms are assumed to be similar to those for the Safety-Basis Scenario. The material at risk is reduced from 6.6 tons (6.0 metric tons) to 660 pounds (300 kilograms) of plutonium-239 equivalent in powder form because it is assumed that the vaults in the Modified CMRR-NF would not be vulnerable to fires in this earthquake. The SEIS scenario conservatively assumes that several mechanisms contribute to the release: powder spills as with the seismically initiated building collapse, pressurized releases of powder from storage containers due to localized fires, and localized fires as with the facility-wide fire scenario. The seismically initiated building collapse is assumed to result in powder spills as discussed above under the seismically induced spill SEIS scenario (that is, a release of about 0.21 ounces [6.0 grams]).

Pressurized releases of powder due to localized fires are assumed to occur with a limited number of storage containers. The scenario conservatively assumes the damage ratio is 0.01, taking credit for equipment and facility features and mitigating factors that should prevent most of the material from being out and vulnerable. It is likely that even with a collapse scenario, material in the vaults would not be subject to release either through impacts or the thermal stress of fires. The released respirable fraction (airborne release fraction times respirable fraction) for the material at risk is estimated to be conservatively represented by an airborne release fraction of 0.005 and respirable fraction of 0.4, or 0.002, for the venting of powders or confinement failure to pressures of approximately 25 pounds per square inch or less (DOE 1994).

In addition to the release due to spills, some of the material is also vulnerable to release due to fires as with the facility-wide fire scenario. As with that scenario, it is conservatively assumed that the material at risk in the fire is estimated to be approximately 660 pounds (300 kilograms) of plutonium-239 equivalent in the form of metal (90 percent), oxide (8.3 percent), and liquid (1.7 percent). The fire release portion of the scenario conservatively assumes the damage ratio is 1.0, taking no credit for equipment and facility features and mitigating factors that should prevent most of the material from being out and vulnerable even in a seismically initiated facility-wide fire. The released respirable fraction (airborne release fraction times respirable fraction) is estimated to be 0.00025 for metal, 0.00006 for oxide, and 0.002 for liquid. The overall effective released respirable fraction for the fire release is 0.000267.

The building leak path factor is unknown, but it is expected that in an event this severe, building confinement would fail and pathways would exist for the material that does become airborne to be released directly to the environment. Thus, a leak path factor of 0.1 is assumed for transport of the material out of storage containers and enclosures, such as gloveboxes, and through the building equipment, damaged structures, and rubble to the environment. The source term for radioactive material released to the environment is about 0.21 ounces (6.0 grams) from the spill release, 0.021 ounces (0.60 grams) from the venting of pressurized powders from heated containers, and 0.028 ounces (0.80 grams) from the fire, for a total of about 0.26 ounces (7.4 grams). The frequency of the earthquake that results in wide-scale damage and loss of confinement for the building (on the order of once in 100,000 years), coupled with a widespread seismically initiated fire, is estimated to be in the range of 0.000001 to 0.00001 per year or once every 100,000 to 1,000,000 years. The frequency is conservatively assumed to be 0.00001 per year for risk calculation purposes.

C.4.3 Continued Use of CMR Building Alternative

The accidents described in this section pertain to the CMR Building. For this existing building, the safety-basis scenarios and the NEPA scenarios are similar since they are based on the existing facility and the existing safety analyses. The principal differences in the safety-basis approach and the NEPA approach is the degree of conservatism in the estimation of the material at risk, release mechanisms, damage ratios, fractions made airborne and respirable, and leak path factors. The safety-basis scenarios assume damage ratios of 1.0. The fractions made airborne and respirable by the real-world stresses implied by these scenarios are also conservative. Because of the age and construction of the building, the NEPA scenarios would assume similar damage ratios and leak path factors as the safety-basis scenarios and no separate analyses are provided. It is estimated that real-world releases for any of these CMR Building accident scenarios would be somewhat lower than these conservative safety-basis estimates. Operational practices and limits at the CMR Building limit the potential consequences of these accidents by limiting the material at risk within the building.

Wing-Wide Fire—This accident scenario postulates that combustible materials near an ignition source are ignited in a laboratory area and the fire spreads to a second wing, engulfing both wings. The fire could be initiated by natural phenomena, human error, or equipment failure. The fire is assumed to propagate uncontrolled and without suppression to adjacent laboratory areas. The material at risk is estimated to be approximately 22 pounds (10 kilograms) of plutonium-239 equivalent in any form (for example, metals, solutions, oxides, powders). The scenario conservatively assumes the damage ratio and leak path factors are 1.0. No credit is taken for equipment and facility features and mitigating factors that could cause the damage ratio and leak path factors to be less than 1.0. A range of released respirable fractions (airborne release fraction times respirable fraction) are estimated depending on the form of the material at risk. The source term for radioactive material released to the environment is about 0.4 ounces (12 grams). The annual frequency of the accident is estimated to range from 0.0001 to 0.01 or once every 100 to 10,000 years. The frequency is conservatively assumed to be 0.01 per year for risk calculation purposes.

Loading Dock Spill/Fire—This scenario was selected to represent a wide range of spills and fires that might occur outside the CMR Building associated with the loading dock. This scenario is postulated to involve waste containers being shipped from the loading dock or a large vessel being delivered to the facility for processing or cleanup. Many engineered controls should prevent or mitigate both the likelihood of this type of accident or the damage that might occur, including design of the loading dock to minimize the risk of impacts to multiple containers and use of shipping packages designed to withstand shipping accidents. It is very conservatively assumed that a vehicle impacts waste drums containing the entire material at risk of 13.2 pounds (6.0 kilograms) of plutonium-239 equivalent with a subsequent spill or fire involving the containers. Since this would occur outside, any release would be directly to the environment. For safety basis purposes, it is assumed that the damage ratio is 0.1 for mechanical insults associated with vehicles moving in and around a loading dock per DOE-STD-5506-2007 (DOE 2007).

The leak path factor is assumed to be 1.0. The released respirable fraction (airborne release fraction times respirable fraction) is very conservatively estimated at 0.001 for the spill. The resulting source term of radioactive material released to the environment is estimated at 0.0212 ounces (0.60 grams). The annual frequency of the initiating accident is estimated to range from 0.0001 to 0.01 or once every 100 to

10,000 years. The frequency of a spill accident of this magnitude is conservatively assumed to be 0.01 per year for risk calculation purposes. A loading dock spill and subsequent fire was also considered but found to be with reasonable assumptions, ARFs, and RF, the source term and consequences would not be higher than those predicted with the bounding spill source term. With a damage ratio of 0.1 and a leak path factor of 1.0, and assuming that some of the drum contents are ejected and subject to unconfined burning, and some subject to confined burning, a source term of 0.0198 ounces (0.56 grams) was estimated.

Seismically Induced Spill—This accident scenario postulates that an earthquake of lower magnitude than the current design-basis earthquake causes internal enclosures to topple and become damaged by falling debris. The material at risk is estimated to be about 33 pounds (15 kilograms) of plutonium-239 equivalent. The reduced material at risk in this scenario compared to the CMRR-NF accident scenarios is a result of changes made in CMR operations due to safety concerns associated with the performance of the CMR Building in an earthquake such as the one postulated in this accident scenario. Material at risk that is released as a result of the seismic event may be in any form, including powders, solutions, and metals. The scenario conservatively assumes the damage ratio and leak path factors are 1.0 indicating that the building structure has failed and is providing an open pathway to the environment. No credit is taken for equipment and facility features and mitigating factors that could cause the damage ratio and leak path factors to be less than 1.0. A range of released respirable fractions (airborne release fraction times respirable fraction) are estimated depending on the form of the material at risk. The source term for radioactive material released to the environment is about 1.1 ounces (30 grams). The frequency of the accident is estimated to be in the range of 0.0001 to 0.01 per year or once every 100 to 10,000 years. The frequency is conservatively assumed to be 0.01 per year for risk calculation purposes.

Seismically Induced Fire—This accident scenario postulates an earthquake causes internal enclosures to topple and become damaged by falling debris. Combustibles in the facility are ignited and the fire engulfs radioactive material. The material at risk is estimated to be about 33 pounds (15 kilograms) of plutonium-239 equivalent. The reduced material at risk for this scenario compared to the CMRR-NF accident scenarios is a result of changes made in CMR operations due to safety concerns associated with the performance of the CMR Building in an earthquake such as the one postulated in this accident scenario. Material at risk that is released as a result of the seismic event may be in any form, including powders, solutions, and metals. The scenario conservatively assumes the damage ratio and leak path factors are 1.0. No credit is taken for equipment and facility features and mitigating factors that could cause the damage ratio and leak path factors to be less than 1.0. A range of released respirable fractions (airborne release fraction times respirable fraction) are estimated depending on the form of the material at risk. The source term for radioactive material released to the environment is about 2.1 ounces (61 grams). The frequency of the accident is estimated to be in the range of 0.000001 to 0.0001 per year or once every 10,000 to 1,000,000 years. The frequency is conservatively assumed to be 0.0001 per year for risk calculation purposes.

C.5 Accident Analyses Consequences and Risk Results

The potential impacts of a radiological accident on workers and the public can be measured in a number of ways depending on the application. Three measures are used in this *CMRR-NF SEIS*. The first measure of consequences is individual dose, expressed in terms of rem or millirem for a member of the public or worker, and collective dose, expressed in terms of person-rem for members of the public or a population of workers. The second measure is a post-exposure effect that reflects the likelihood of an LCF for an exposed individual or the expected number of LCFs in a population of exposed individuals. Individual or public exposure to radiation can only occur if there is an accident involving radioactive materials, which leads to the third measure. The third measure of potential accident impacts is referred to as risk that takes into account the probability (or frequency) of the accident's occurrence. Risk is the mathematical product of the probability or frequency of accident occurrence and the LCF consequences. Risk is calculated as follows:

For an individual

$R_i = D_i \times F \times P$ where:

- R_i is the risk of an LCF for an individual receiving a dose D_i in LCFs per year
- D_i is the dose in rem to an individual
- F is the dose-to-LCF conversion factor, which is 0.0006 LCFs per rem for individuals.
- P is the probability or frequency of the accident, usually expressed on a per-year basis.

For a population

$R_p = D_p \times F \times P$ where:

- R_p is the risk for a population receiving a dose D_p in LCFs per year
- D_p is the dose in person-rem to a population
- F is the dose-to-LCF conversion factor, which is 0.0006 LCFs per person-rem for a population of workers for members of the public.
- P is the probability or frequency of the accident, usually expressed on a per-year basis.

Once the source term, the amount of radioactive material released to the environment for each accident scenario, is determined, the radiological consequences are calculated. The calculations and resulting impacts vary depending on how the radioactive material release is dispersed, what materials are involved, and which receptors are being considered.

For example, if the dose to an individual (the MEI or a noninvolved worker) is 10 rem, the probability of an LCF for an individual is $10 \times 0.0006 = 0.006$, where 0.0006 is the dose-to-LCF conversion factor. If the individual receives a dose exceeding 20 rem, the dose-to-LCF conversion factor is doubled, to 0.0012. Thus, if the MEI receives a dose of 30 rem, the probability of an LCF is $30 \times 0.0012 = 0.036$. For an individual, the calculated probability of an LCF is in addition to the probability of cancer from all other causes.

For the population, the same dose-to-LCF conversion factors are used to determine the estimated number of LCFs. The calculated number of LCFs in the population is in addition to the number of cancer fatalities that would result from all other causes. The MACCS2 computer code calculates the dose to each individual in the exposed population and applies the appropriate dose-to-LCF conversion factor to estimate the LCF consequences, 0.0006 for doses less than 20 rem or 0.0012 for doses greater than or equal to 20 rem. Therefore, for some accidents, the estimated number of LCFs will involve both dose-to-LCF conversion factors. This indicates that some members of the population are estimated to receive doses in excess of 20 rem.

After any accident that had the potential for a release of concern, the standard emergency procedures require survey of the nearby areas to check for potential contamination and identify areas where radioactive particles had been deposited. With modern radiation survey techniques, plutonium particles in the environment can be detected at very low levels.

Tables C–1 through **C–6** present the facility accident impacts under the alternatives. For each alternative, there are two tables showing the impacts. The first table presents the consequences (doses and LCFs) assuming the accident occurs, that is, not reflecting the frequency of accident occurrence. The second table shows the accident risks that are obtained by multiplying the LCF values in the first table by the annual frequency of each accident listed in the first table.

Table C–1 Accident Frequency and Consequences Under the No Action Alternative

Accident	Frequency (per year)	Maximally Exposed Individual		Offsite Population [a]		Noninvolved Worker at Technical Area Boundary	
		Dose (rem)	Latent Cancer Fatality [b]	Dose (person-rem)	Latent Cancer Fatalities [c]	Dose (rem)	Latent Cancer Fatality [b]
Safety-Basis Scenarios							
Facility-wide fire	0.0001	1.1	0.0007	700	0 (0.4)	5.9	0.004
Seismically induced spill	0.01	600	0.7	140,000	84	20,000	1
Seismically induced spill and fire [d]	0.0001	5,600	1	3,900,000	2,300	47,000	1
Loading dock spill/fire	0.01	0.028	0.00002	6.6	0 (0.004)	1.0	0.0006

Seismically induced spill	1×10^{-5}	4×10^{-3}	3×10^{-4}
Seismically induced spill and fire[d]	3×10^{-7}	7×10^{-5}	5×10^{-6}
Loading dock spill/fire	4×10^{-7}	7×10^{-5}	4×10^{-6}

CMR = chemistry and metallurgy research.

[a] Risk of a LCF to the individual.

[b] Risk of an additional LCF in the offsite population.

[c] Based on a projected 2030 population estimate of approximately 502,000 persons residing within 50 miles (80 kilometers) of TA-3.

[d] In the seismically induced spill and fire accident scenario, two sequential events are considered: first the seismic spill occurs and then releases due to the fire occur.

C.6 Potential Land Contamination Following Severe Earthquakes

Seismic events that result in failure of building containment of plutonium facilities have the potential to release sufficient quantities of plutonium, leading to concerns regarding surface contamination in the immediate vicinity of the facility. Even for the severe earthquakes that could lead to major damage within the facility and the building structure and failure of confinement systems, there should not be large energy sources to drive the materials that would typically be used in the proposed CMRR-NF, such as plutonium metal and oxides, out of the damaged building and rubble. Seismic collapse scenarios that result primarily in spills could release plutonium materials through the rubble, but that material would not generally go far from the building site. Seismic collapse scenarios that involve large fires have the potential to loft materials such that transport of radioactive materials downwind might result in land contamination at levels that could require monitoring or additional actions.

The seismically induced spill and seismically induced spill with fire SEIS scenarios discussed in Sections C.4.2.1, C.4.2.2, and C.4.3 were modeled using the HotSpot code (LLNL 2011) to evaluate the potential land area that might be contaminated above certain levels as a result of these extremely unlikely accidents. This *CMRR-NF SEIS* uses a plutonium areal concentration of 0.2 microcuries per square meter as a screening level for determining the lateral extent of contamination that might require cleanup actions (Chanin 1996). This screening level was first proposed by EPA in the late 1970s but never formally adopted. It has been used in many environmental impact statements to indicate land areas that would not likely require remedial actions. Land contaminated with transuranic material at levels above the screening level would likely require additional monitoring and evaluations to determine if cleanup were appropriate. Estimations of land areas that might be contaminated are highly dependent on specific accident source terms and metrological modeling assumptions. This is because the amount of radioactive material that may accumulate on the ground is highly dependent on the size of the particles that get through the building rubble and released to the environment (which determines how fast they settle back to the ground), the specific accident conditions (for example, including a fire or not), and specific meteorological conditions during the earthquake. In general, unless there is a fire that can effectively loft the plutonium particles into the air, most of the particles would return to the ground within a few hundred meters of the building location.

If a large fire is assumed to follow the seismically induced spill at the 2004 CMRR-NF, then the heat energy could effectively raise the release height such that ground contamination at the screening level could extend out to approximately 10 miles (16 kilometers) from TA-55 depending in large part on the meteorological conditions at the time of the earthquake. A similar scenario involving the Modified CMRR-NF has a much lower expected source term (0.26 ounces [7.4 grams] of plutonium-239 equivalent compared to 4.68 ounces [132.8 grams]) (see Section C.4). If this accident were to occur at the Modified CMRR-NF, no land outside of TA-55 is projected to be contaminated above the screening level. A similar seismically induced spill and fire at the existing CMR Building with its reduced material at risk would result in an estimated release of 2.1 ounces (61 grams) of plutonium-239 equivalent (see Section C.4). If this accident were to occur at the CMR Building, it could contaminate downwind areas extending out to approximately 6.2 miles (10 kilometers) from TA-3, depending in large part on the meteorological conditions at the time of the earthquake as discussed above for the 2004 CMRR-NF.

As stated earlier, contaminated areas at levels above 0.2 microcuries per square meter would potentially need further action, such as radiation surveys or cleanup. Costs associated with these efforts, as well as continued monitoring activities, could vary widely depending upon the characteristics of the contaminated area and could range in the hundreds of million dollars per square kilometer for land decontamination (NASA 2006). In addition to the potential direct costs of radiological surveys, potential cleanup, and monitoring following an accident, there are potential secondary societal costs associated with the mitigation from high consequence accidents. Those costs could include, but may not be limited to the following:

- temporary or longer-term relocation of residents
- temporary or longer-term loss of employment
- destruction or quarantine of agricultural products
- land-use restrictions (which could affect real estate values, businesses, and recreational activities);
- public health effects and medical care

C.7 Combined Impacts from TA-55 Building Collapses and Fires Resulting from a Beyond-Design-Basis Earthquake

If a severe earthquake were to occur in the Los Alamos area, nearby individuals could receive impacts from several facilities that might be damaged. Individuals close to and downwind from TA-55 might receive exposure from radioactive material releases at the existing TA-55 Plutonium Facility as well as the proposed Modified CMRR-NF should it be built. The Modified CMRR-NF would be designed to withstand an earthquake with a peak horizontal ground acceleration of 0.47 *g* and a peak vertical ground acceleration of 0.51 *g* (with a return period of 2500 years) with limited releases. The TA-55 Plutonium Facility was originally designed to a lower seismic standard, but NNSA is in the process of upgrading it to withstand higher seismic loadings. By the time the proposed Modified CMRR-NF would be operational, the TA-55 Plutonium Facility is expected to be able to survive the current design-basis earthquake (peak horizontal ground acceleration of 0.47 *g*, peak vertical ground acceleration of 0.51 *g*) with limited releases. Both the Modified CMRR-NF and the upgraded TA-55 Plutonium Facility would have multi-layered defenses to limit releases from storage containers, gloveboxes, equipment, vaults, and the building. Even with limited failures of containers, gloveboxes, equipment, and the building structures, the releases would be limited as discussed earlier for the Modified CMRR-NF Alternative. The release mechanisms for either the Modified CMRR-NF or the TA-55 Plutonium Facility would be similar and the total amount of radioactive material that could be released would be more or less proportional to the amounts and forms of materials that might be at risk in either facility. As proposed, the Modified CMRR-NF would likely have much less material at risk in a severe seismic event than the TA-55 Plutonium Facility.

The potential impacts due to releases from the TA-55 Plutonium Facility from severe earthquakes were evaluated in the 2008 *LANL SWEIS* (DOE 2008b). For a site-wide seismic event, which corresponded to approximately a PC-3 earthquake[4] the estimated doses from the Plutonium Facility (TA-55-4), the Storage Facility (TA-55-185), and the Safe, Secure Transport Facility (TA-55-355) totaled about 160 rem to the MEI and 14,880 person-rem to the population residing within 50 miles (80 kilometers) of TA-55. About 150 rem of the dose to the MEI was estimated to be from the TA-55 Plutonium Facility. These doses represent a probability of the MEI developing a fatal cancer of 0.19 or approximately 1 chance in 5, and are expected to result in about 9 LCFs in the population surrounding the site, if the accident occurred.

DOE has committed to seismic upgrades to the TA-55 Plutonium Facility that would result in an updated safety-basis estimate (NNSA 2011) of mitigated consequences less than the 25 rem to the MEI (the DOE Evaluation Guideline described in DOE Standard 3009) for a seismically induced fire. Proposed future improvements that will be incorporated into the TA-55 Plutonium Facility include fire-rated containers, seismically qualified fire suppression systems, and seismically qualified portions of the confinement ventilation system. The 2011 safety basis analysis prepared in support of NNSA's response to the Defense Nuclear Facilities Safety Board (DNFSB) concluded that seismically upgrading the fire suppression system would further reduce calculated offsite consequences to the MEI to the level estimated for the seismically induced spill without fire, which is about 9 rem (NNSA 2011).

The upgrades to the TA-55 Plutonium Facility are ongoing and would be complete prior to the proposed Modified CMRR-NF becoming operational. However, under the No Action Alternative, the 2004 CMRR-NF, could be completed prior to completing the TA-55 Plutonium Facility upgrades. The 2004

[4] The estimated dose consequences included in the LANL SWEIS (DOE 2008b) were based on a PC-3 seismic event with a return period of 2,000 years and a peak horizontal ground acceleration of approximately 0.31 g (the current PC-3 seismic event return period is 2,500 years). The 2007 Update of the Probabilistic Seismic Hazard Analysis and Development of Seismic Design Ground Motions at the Los Alamos National Laboratory (LANL 2007) had been recently issued and an evaluation of the effects of the new data on LANL facilities was just getting underway. The consequences of a current PC-3 seismic event likely would be higher than estimated in the LANL SWEIS.

CMRR-NF would be located at TA-55 and would also be vulnerable to releases during severe earthquakes. For the 2004 *CMRR-NF SEIS* scenarios, Table C-1 indicates that the MEI doses from the seismically induced spill or seismically induced spill plus fire are estimated to be about 6 rem. For the MEI closest to the TA-55 area, the doses from the 2004 CMRR-NF would add directly to those from the other TA-55 facilities. The dose from the TA-55 Plutonium Facility, with its larger inventory, is still expected to be the major contributor to the offsite doses. When the updated TA-55 facility doses are combined with the projected doses from the 2004 CMRR-NF in the event of a severe earthquake, prior to completion of the TA-55 Plutonium Facility upgrades, the dose to the MEI would be about 166 rem, and the 2030 estimated population dose within 50 miles (80 kilometers) of LANL would be about 16,400 person-rem. These doses correspond to a probability of the MEI developing a fatal cancer of 0.2 (1 chance in 5) and the likelihood of up to 10 LCFs in the 50-mile (80-kilometer) population. After completion of the TA-55 Plutonium Facility upgrades, the dose to the MEI would be about 25 rem, and the 2030 estimated population dose within 50 miles (80 kilometers) of LANL would be about 6,000 person-rem. For the MEI, this analysis takes into account the revised MEI dose of 19 rem (9 rem from the revised 2011 safety basis for the TA-55 Plutonium Facility and 10 rem for releases from other facilities at TA-55 from the 2008 *LANL SWEIS*). Note that the MEI dose is independent of the changes in the population, since it focuses on the maximum dose to an individual at the nearest site boundary. Given a severe seismic event, these doses represent a probability of the MEI developing a fatal cancer of 0.03 or approximately 1 chance in 33, and the likelihood of up to 4 LCFs in the exposed population surrounding the site.

The proposed Modified CMRR-NF would be located at TA-55 and would also be vulnerable to releases during severe earthquakes, although these releases are expected to be much smaller than those estimated for the 2004 CMRR-NF due to the increased structural integrity of the Modified CMRR-NF. For the SEIS scenario, Table C–3 indicates that the MEI doses for the seismically induced spill or seismically induced spill plus fire are estimated to be about 0.3 rem. For the MEI closest to TA-55, the doses from the Modified CMRR-NF would add directly to those from the other TA-55 facilities. The dose from the Plutonium Facility, with its larger inventory, is still expected to be the major contributor to the MEI dose. When the updated TA-55 facility doses are combined with the projected doses from the Modified CMRR-NF in the event of a severe earthquake, the dose to the MEI would be about 19 rem (19 rem from the TA-55 Plutonium Facility and other facilities at TA-55 as discussed above and 0.3 rem from the Modified CMRR-NF) and the 2030 estimated population dose within 50 miles (80 kilometers) of LANL would be about 4,500 person-rem. Given a severe seismic event, these doses represent a probability of the MEI developing a fatal cancer of 0.023 or approximately 1 chance in 44, and the likelihood of up to 3 LCFs in the population surrounding the site.

C.8 Analysis Conservatism and Uncertainty

The analysis of accidents is based on calculations relevant to postulated sequences of accident events and models used to calculate the accident's consequences. The models provide estimates of the frequencies, source terms, pathways for dispersion, exposures, and the effects on human health and the environment that are as realistic as possible within the scope of the analysis. In many cases, the rare occurrence of postulated accidents leads to uncertainty in the calculation of the consequences and frequencies. This fact has promoted the use of models or input values that yield conservative estimates of consequences and frequency.

Due to the layers of conservatism built into the accident analysis for the spectrum of postulated accidents, the estimated consequences and risks to the public represent the upper limit for the individual classes of accidents. The uncertainties associated with the accident frequency estimates are enveloped by the conservatism in the analysis.

The numerical estimates of LCFs presented in this *CMRR-NF SEIS* were obtained using a linear extrapolation from the nominal risk estimated for lifetime total cancer mortality that results from a dose of 10 rad. Other methods of extrapolation to the low-dose region could yield higher or lower numerical estimates of LCFs. Studies of human populations exposed to low doses are inadequate to demonstrate the actual level of risk. There is scientific uncertainty about cancer risk in the low-dose region below the range of epidemiologic observation. However, comprehensive review of available biological and biophysical data supports a "linear-no-threshold" risk model—in which the risk of cancer proceeds in a linear fashion at lower doses without a threshold—and that the smallest dose has the potential to cause a small increase in risk to humans (National Research Council 2006). Because the health risk estimators are multiplied by conservatively calculated radiological doses to predict fatal cancer risks, the fatal cancer values presented in this *CMRR-NF SEIS* are expected to be conservative estimates.

C.9 Fukushima Daiichi Nuclear Power Plant Accident Implications

Beyond-design-basis earthquakes have the potential to result in loss of offsite power and the potential to disrupt emergency or backup power as was the case in the Fukushima Daiichi Nuclear Power Plant. Except for the fire suppression system, the safety-class structures, systems, and components at the CMRR-NF are passive engineered features. The fire suppression system is independent of the regional electrical power system for providing its safety-class function. As discussed in Section C.4, severe seismic events have the potential to result in substantial damage to storage containers and enclosures, such as gloveboxes, and result in the release of radioactive material through the building equipment, damaged structures, and rubble to the environment. In such severe events, it is expected that all power, including backup power, could be unavailable for hours or days. This could cause operational problems and hinder damage assessment and cleanup, but is not expected to result in additional release of radioactive material to the environment.

Unlike the Fukushima Daiichi Nuclear Power Plant reactors and spent fuel pools, plutonium materials stored within LANL plutonium facilities or in ongoing operations are generally stable in their configuration and would not require active cooling systems to keep them stable and prevent additional releases to the environment. These materials would require a large energy source, such as an external, fuel-fed fire or a large plane crash into the facility, to disperse them into the environment. Plutonium oxides behave much like sand and would require additional energy, such as high-pressure air or an explosion, to disperse them into the environment. The stability of plutonium metal varies depending on the size of the piece. Fine metal turnings from a lathe oxidize immediately, much like iron does in sparklers. Larger pieces of plutonium metal oxidize slowly and form an oxide crust. The rapid oxidation of plutonium metal requires a large energy source, such as an external, fuel-fed fire. Otherwise, the oxidation is slow and self limiting. Plutonium in liquid form would typically be a plutonium nitrate. This would also be stable and require an external energy source to disperse the liquid.

The only forms of plutonium that generate enough heat to require long-term cooling are plutonium-238 heat sources. No plutonium-238 is stored in the CMR Building or would be stored in the proposed CMRR-NF.

C.10 MACCS2 Code Description

The MACCS2 computer code is used to estimate the radiological doses and health effects that could result from postulated accidental releases of radioactive materials to the atmosphere. The specification of the release characteristics, designated a "source term," can consist of up to four Gaussian plumes that are often referred to simply as "plumes."

The radioactive materials released are modeled as being dispersed in the atmosphere while being transported by the prevailing wind. During transport, whether or not there is precipitation, particulate material can be modeled as being deposited on the ground. If contamination levels exceed a user-specified criterion, mitigating actions can be triggered to limit radiation exposures.

There are two aspects of the code's structure basic to understanding its calculations: (1) the calculations are divided into modules and phases, and (2) the region surrounding the facility is divided into a polar-coordinate grid. These concepts are described in the following sections.

MACCS is divided into three primary modules: ATMOS, EARLY, and CHRONC. The three modules correspond to three phases of exposure from an accident, defined as the emergency, intermediate, and long-term phases. The relationship among the code's three modules and the three phases of exposure are summarized below.

The ATMOS module performs all of the calculations pertaining to atmospheric transport, dispersion, and deposition, as well as the radioactive decay that occurs before release and while the material is in the atmosphere. It uses a Gaussian plume model with Pasquill-Gifford dispersion parameters. The phenomena treated include building wake effects, buoyant plume rise, plume dispersion during transport, wet and dry deposition, and radioactive decay and in-growth. The results of the calculations are stored for use by EARLY and CHRONC. In addition to the air and ground concentrations, ATMOS stores information on wind direction, plume arrival and departure times, and plume dimensions.

The EARLY module models the period immediately following a radioactive release. This period is commonly referred to as the "emergency phase." The emergency phase begins at each successive downwind distance point when the first plume of the release arrives. The duration of the emergency phase is specified by the user and can range between 1 and 7 days. The exposure pathways considered during this period are direct external exposure to radioactive material in the plume (cloud shine); exposure from inhalation of radionuclides in the plume (cloud inhalation); exposure to radioactive material deposited on the ground (ground shine); inhalation of resuspended material (resuspension inhalation); and skin dose from material deposited on the skin. Mitigating actions that can be specified for the emergency phase include evacuation, sheltering, and dose-dependent relocation.

The CHRONC module performs all of the calculations pertaining to the intermediate and long-term phases (not used in the current analysis). CHRONC calculates the individual health effects that result from both direct exposure to contaminated ground and from inhalation of resuspended materials, as well as indirect health effects caused by the consumption of contaminated food and water by individuals who could reside both on and off the computational grid.

The intermediate phase begins at each successive downwind distance point upon the conclusion of the emergency phase. The user can configure the calculations with an intermediate phase that has a duration as short as zero or as long as 1 year. In the zero-duration case, there is essentially no intermediate phase and a long-term phase begins immediately upon conclusion of the emergency phase.

Intermediate models are implemented on the assumption that the radioactive plume has passed and the only exposure sources (ground shine and resuspension inhalation) are from ground-deposited material. It is for this reason that MACCS2 requires the total duration of a radioactive release be limited to no more than four days. Potential doses from food and water during this period are not considered.

The mitigating action model for the intermediate phase is very simple. If the intermediate phase dose criterion is satisfied, the resident population is assumed to be present and subject to radiation exposure from ground shine and resuspension for the entire intermediate phase. If the intermediate phase exposure exceeds the dose criterion, then the population is assumed to be relocated to uncontaminated areas for the entire intermediate phase.

The long-term phase begins at each successive downwind distance point upon the conclusion of the intermediate phase. The exposure pathways considered during this period are ground shine, resuspension inhalation, and food and water ingestion.

The exposure pathways considered are those resulting from ground-deposited material. A number of protective measures, such as decontamination, temporary interdiction, and condemnation, can be modeled in the long-term phase to reduce doses to user-specified levels. The decisions on mitigating action in the long-term phase are based on two sets of independent actions: (1) decisions relating to whether land at a specific location and time is suitable for human habitation (habitability), and (2) decisions relating to whether land at a specific location and time is suitable for agricultural production (ability to farm).

All of the calculations of MACCS2 are stored based on a polar-coordinate spatial grid with a treatment that differs somewhat between calculations of the emergency phase and calculations of the intermediate and long-term phases. The region potentially affected by a release is represented with a (r, θ) grid system centered on the location of the release. The radius, r, represents downwind distance. The angle, θ, is the angular offset from north, going clockwise.

The user specifies the number of radial divisions as well as their endpoint distances. The angular divisions used to define the spatial grid are fixed in the code. They correspond to the 16 points of the compass, each being 22.5 degrees wide. The 16 points of the compass are used in the United States to express wind direction. The compass sectors are referred to as the "coarse grid."

Since emergency phase calculations use dose-response models for early fatalities and early injuries that can be highly nonlinear, these calculations are performed on a finer grid basis than the calculations of the intermediate and long-term phases. For this reason, the calculations of the emergency phase are performed with the 16 compass sectors divided into three, five, or seven equal, angular subdivisions. The subdivided compass sectors are referred to as the "fine grid."

Two types of doses may be calculated by the code, "acute" and "lifetime." Acute doses are calculated to estimate deterministic health effects that can result from high doses delivered at high dose rates. Such conditions may occur in the immediate vicinity of a nuclear facility following hypothetical severe accidents where confinement and/or containment failure has been assumed to occur. Examples of the health effects based on acute doses are early fatality, prodromal vomiting, and hypothyroidism.

Lifetime doses are the conventional measure of detriment used for radiological protection. These are 50-year dose commitments to either specific tissues (for example, red marrow and lungs) or a weighted sum of tissue doses defined by the International Commission on Radiological Protection and referred to as "effective dose." Lifetime doses may be used to calculate the stochastic health effect risk resulting from exposure to radiation. MACCS2 uses the calculated lifetime dose in cancer risk calculations.

APPENDIX D
CONTRACTOR DISCLOSURE STATEMENTS

NEPA DISCLOSURE STATEMENT FOR PREPARATION OF A SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT FOR THE NUCLEAR FACILITY PORTION OF THE CHEMISTRY AND METALLURGY RESEARCH BUILDING REPLACEMENT PROJECT AT LOS ALAMOS NATIONAL LABORATORY, LOS ALAMOS, NEW MEXICO (CMRR-NF SEIS)

CEQ regulations at 40 CFR 1506.5(c), which have been adopted by DOE (10 CFR 1021), require contractors who will prepare an EIS to execute a disclosure specifying that they have no financial or other interest in the outcome of the project. The term "financial interest or other interest in the outcome of the project," for the purposes of this disclosure, is defined in the March 23, 1981 guidance "Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations," 46 FR 18026-18038 at Question 17a and b.

"Financial or other interest in the outcome of the project 'includes' any financial benefit such as a promise of future construction or design work in the project, as well as indirect benefits the contractor is aware of (e.g., if the project would aid proposals sponsored by the firm's other clients)," 46 FR 18026-18038 at 18031.

In accordance with these requirements, the offeror and any proposed subcontractors hereby certify as follows: (check either (a) or (b))

(a) ____X____ Offeror and any proposed subcontractor have no financial interest in the outcome of the project.

(b) __________ Offeror and any proposed subcontractor have the following financial or other interest in the outcome of the project and hereby agree to divest themselves of such interest prior to award of this contract.

Reader's Guide

This Comment Response Document (CRD) portion of the *Final Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR-NF SEIS)* consists of four sections:

- **Chapter 1 – Overview of the Public Comment Process**

  This section describes the public comment process for the *Draft CMRR-NF SEIS*; the format used in the public hearings on the draft SEIS; the organization of this CRD and how to use the document; and the changes made by the National Nuclear Security Administration (NNSA) to the *Final CMRR-NF SEIS* in response to the public comments and recent developments that occurred since publication of the *Draft CMRR-NF SEIS*.

- **Chapter 2 – Major Issues**

  This section presents summaries of the major issues identified from the public comments received on the *Draft CMRR-NF SEIS* and NNSA's response to each issue.

- **Chapter 3 – Public Comments and NNSA Responses**

  This section presents a side-by-side display of all of the comments received by NNSA on the *Draft CMRR-NF SEIS* and NNSA's response to each comment. The comments were obtained at four public hearings on the *Draft CMRR-NF SEIS* and via telephone, fax, e-mail, and U.S. mail.

- **Chapter 4 – References**

  This section contains the references cited in this CRD.

To Find a Specific Comment and NNSA Response

Refer to the "List of Commentors" immediately following the Table of Contents. This list is organized alphabetically by commentor name and shows the corresponding page number(s) where commentors can find their comment(s).

NNSA has made a good faith effort to interpret the spelling of names that were either hand-written on comment forms and letters, or transcribed from oral statements made during public hearings.

SECTION 1
OVERVIEW OF THE PUBLIC COMMENT PROCESS

1.0 OVERVIEW OF THE PUBLIC COMMENT PROCESS

This section of this Comment Response Document (CRD) describes the public comment process for the *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR-NF SEIS)*, as well as the procedures used to respond to those comments. Section 1.1 describes the public comment process and the means through which comments on the *Draft CMRR-NF SEIS* were received. It also identifies the comment period and the locations and dates of the public hearings on the *Draft CMRR-NF SEIS*. Section 1.2 addresses the public hearing format. Section 1.3 describes the organization of this document, including how the comments were categorized, addressed, and documented. Section 1.4 summarizes the changes made to the supplemental environmental impact statement (SEIS) that resulted from the public comment process. Section 1.5 summarizes the next steps the National Nuclear Security Administration (NNSA) will take after publication of this *Final CMRR-NF SEIS*.

Comment Document – A communication in the form of a transcript from a public hearing, a letter, an electronic communication (e-mail, fax), or a transcription of a recorded phone message that contains comments from a sovereign nation, government agency, organization, or member of the public regarding the *Draft CMRR-NF SEIS*.

Comment – A statement or question regarding the draft SEIS content that conveys approval or disapproval of proposed actions, recommends changes, or seeks additional information.

1.1 Public Comment Process

NNSA prepared the *CMRR-NF SEIS* in accordance with the National Environmental Policy Act of 1969 (NEPA) and Council on Environmental Quality (CEQ) and the U.S. Department of Energy (DOE) NEPA regulations (40 CFR Parts 1500 – 1508 and 10 CFR Part 1021, respectively). An important part of the NEPA process is solicitation of public comments on a draft EIS and consideration of those comments in preparing a final EIS. NNSA distributed copies of the *Draft CMRR-NF SEIS* to those organizations, government officials, and individuals who were known to have an interest in the Los Alamos National Laboratory (LANL), as well as those organizations and individuals who requested a copy. Copies also were made available on the Internet and in regional DOE public document reading rooms and public libraries.

On April 29, 2011, NNSA published a notice in the *Federal Register* (76 FR 24018), concurrent with the U.S. Environmental Protection Agency's Notice of Availability (76 FR 24021), announcing the availability of the *Draft CMRR-NF SEIS*, the duration of the comment period, the location and timing of the public hearings, and the various methods for submitting comments. NNSA announced a 45-day comment period, from April 29 to June 13, 2011, to provide time for interested parties to review the *Draft CMRR-NF SEIS*. In response to requests for additional review time, the comment period was extended by 15 days, through June 28, 2011, giving commentors a total review and comment period of 60 days (76 FR 28222). In addition, because of the Las Conchas wildfire, NNSA also accepted and responded to all comments submitted after the June 28, 2011, deadline through July 31, 2011.

Three public hearings were held at regional venues near LANL from May 24 through May 26, 2011 (Los Alamos, Española, and Santa Fe, New Mexico). In response to requests for additional public hearings, NNSA held a fourth public hearing in Albuquerque, New Mexico, on May 23 (76 FR 28222), as well as informational meetings elsewhere. Newspaper advertisements related to the public hearings, including the Albuquerque hearing, began to run in local newspapers on May 8 and continued through May 19, 2011.

Table 1–1 lists the locations, estimated numbers of attendees, and number of commentors at each hearing. The attendance estimates are based on the number of registration forms completed and returned, as well as a rough "head count" of the audience.

Table 1–1 Public Hearing and Informational Meeting Locations, Attendance, and Comments Received

Location	*Date*	*Estimated Attendance*	*Number of Commentors*
Albuquerque, New Mexico	May 23, 2011	47	35
Los Alamos, New Mexico	May 24, 2011	39	11
Española, New Mexico	May 25, 2011	75	40
Santa Fe, New Mexico	May 26, 2011	70	34
Total		231	120

In addition, Federal agencies, state and local governmental entities, Native American tribal governments, and members of the public were encouraged to submit comments via the U.S. mail, e-mail, a toll-free telephone number, and a toll-free fax line. NNSA considered all comments, including those received after the comment period ended.

Although many e-mails were received through the e-mail address provided for receiving comments on the *Draft CMRR-NF SEIS*, there were approximately 4,500 submittals that were attempted, but not successfully received by that method. These submittals were initially transmitted by commercial e-mail servers capable of sending up to two million e-mails per hour, which were blocked for a period of time by DOE Internet security features. Paper copies of these comments were later transmitted to NNSA and were fully considered in preparing this *Final CMRR-NF SEIS*. Responses to these comments can be found in Campaign AA in Section 3 of this CRD. NNSA gave equal weight to spoken and written comments. **Table 1–2** lists the number of comment documents received by each method of submission.

Table 1–2 Numbers of Comment Documents Received by Method of Submission

Method of Submission	*Number of Comment Documents*
Toll-free telephone number	1
E-mail	1,185
Toll-free fax line	4
U.S. mail (including 4,522 signatories to Campaign AA)	4,555
Petition A (signed by 607 individuals) (Hand-delivered)	607
Input via computer at Public Hearings	2
Input via voice recording at public hearings	0
Total	6,354

Upon receipt, all written comment documents were assigned a document number for tracking during the comment response process. Oral comments received by toll-free telephone, as well as those transcribed by the court reporter or entered into a computer at the public meetings, were assigned document numbers. The transcript from each public hearing also was assigned a document number. All comment documents were then processed through the comment analysis and response sequence for inclusion in this document, and the originally submitted documentation was maintained. The text of each comment document was analyzed to identify individual comments, which were numbered sequentially. The comments were re-evaluated throughout the course of the response process as new information became available and as the *Final CMRR-NF SEIS* was developed. All comments received by NNSA through July 31, 2011, were considered in preparing this *Final* C*MRR-NF SEIS*. Comments determined not to be within the scope of the SEIS were acknowledged as such in this CRD. The remaining comments were then reviewed and responded to by policy experts, subject matter experts, and NEPA specialists, as appropriate. **Figure 1–1** illustrates the process used for collecting, tracking, and responding to the comments.

The comments and NNSA responses were compiled in a side-by-side format, with each identified comment receiving a separate response. All comments and responses are numbered with a comment identification number to facilitate matching a comment with its response

Integration of the comment response process into preparation of this *Final CMRR-NF SEIS* served to focus revision efforts and ensure consistency throughout the final document. The comments assisted in determining whether the alternatives and analyses presented in the *Draft CMRR-NF SEIS* should be modified or augmented; whether information presented in the draft SEIS needed to be corrected or updated; and whether additional clarification was necessary to facilitate better understanding of certain issues. Change bars are presented alongside the text in Volume 1 of this *Final CMRR-NF SEIS* to indicate where substantive changes were made and where text was added or deleted. Editorial changes are not marked.

1.2 Public Hearing Format

NNSA representatives were available to respond to questions and comments on the NEPA process and the *Draft CMRR-NF SEIS* at the hearings and informal meetings. A court reporter was present at each hearing to record the proceedings and prepare a transcript of the oral public comments. These transcripts are available on the *CMRR-NF SEIS* website at http://nnsa.energy.gov/nepa/cmrrseis.

The format used for each hearing included a presentation about the NEPA history of the CMRR project and a public comment period. The hearing opened with a welcome from the facilitator, followed by a presentation by an NNSA representative summarizing the evolution from the 2003 *CMRR EIS* to the *Draft CMRR-NF SEIS*. The facilitator next opened the public comment session, during which attendees were given an opportunity to provide oral comments. Following the public hearings, comments were identified from the transcripts of each hearing.

To facilitate participation from hearing attendees, NNSA provided a number of other ways to submit comments at each hearing: a court reporter to record individual comments, computers for entering comments into a computer database, a voice recorder to receive oral comments, and comment forms that could be received at the hearing or mailed by the commentor at a later date. For those unable to attend the hearings, NNSA indicated that comments could be submitted by U.S. mail, e-mail, a toll-free phone line, and a toll-free fax line.

1.3 Organization of this Comment Response Document

This CRD is organized into the following sections:

- Section 1 describes the public comment process, the public hearing format, the organization of this document, and the changes made to the *Draft CMRR-NF SEIS* before publication of the *Final CMRR-NF SEIS*.

- Section 2 presents summaries of major issues raised in the comments and NNSA's responses. Major issues include comment topics that required a detailed response or appeared frequently in the comments.

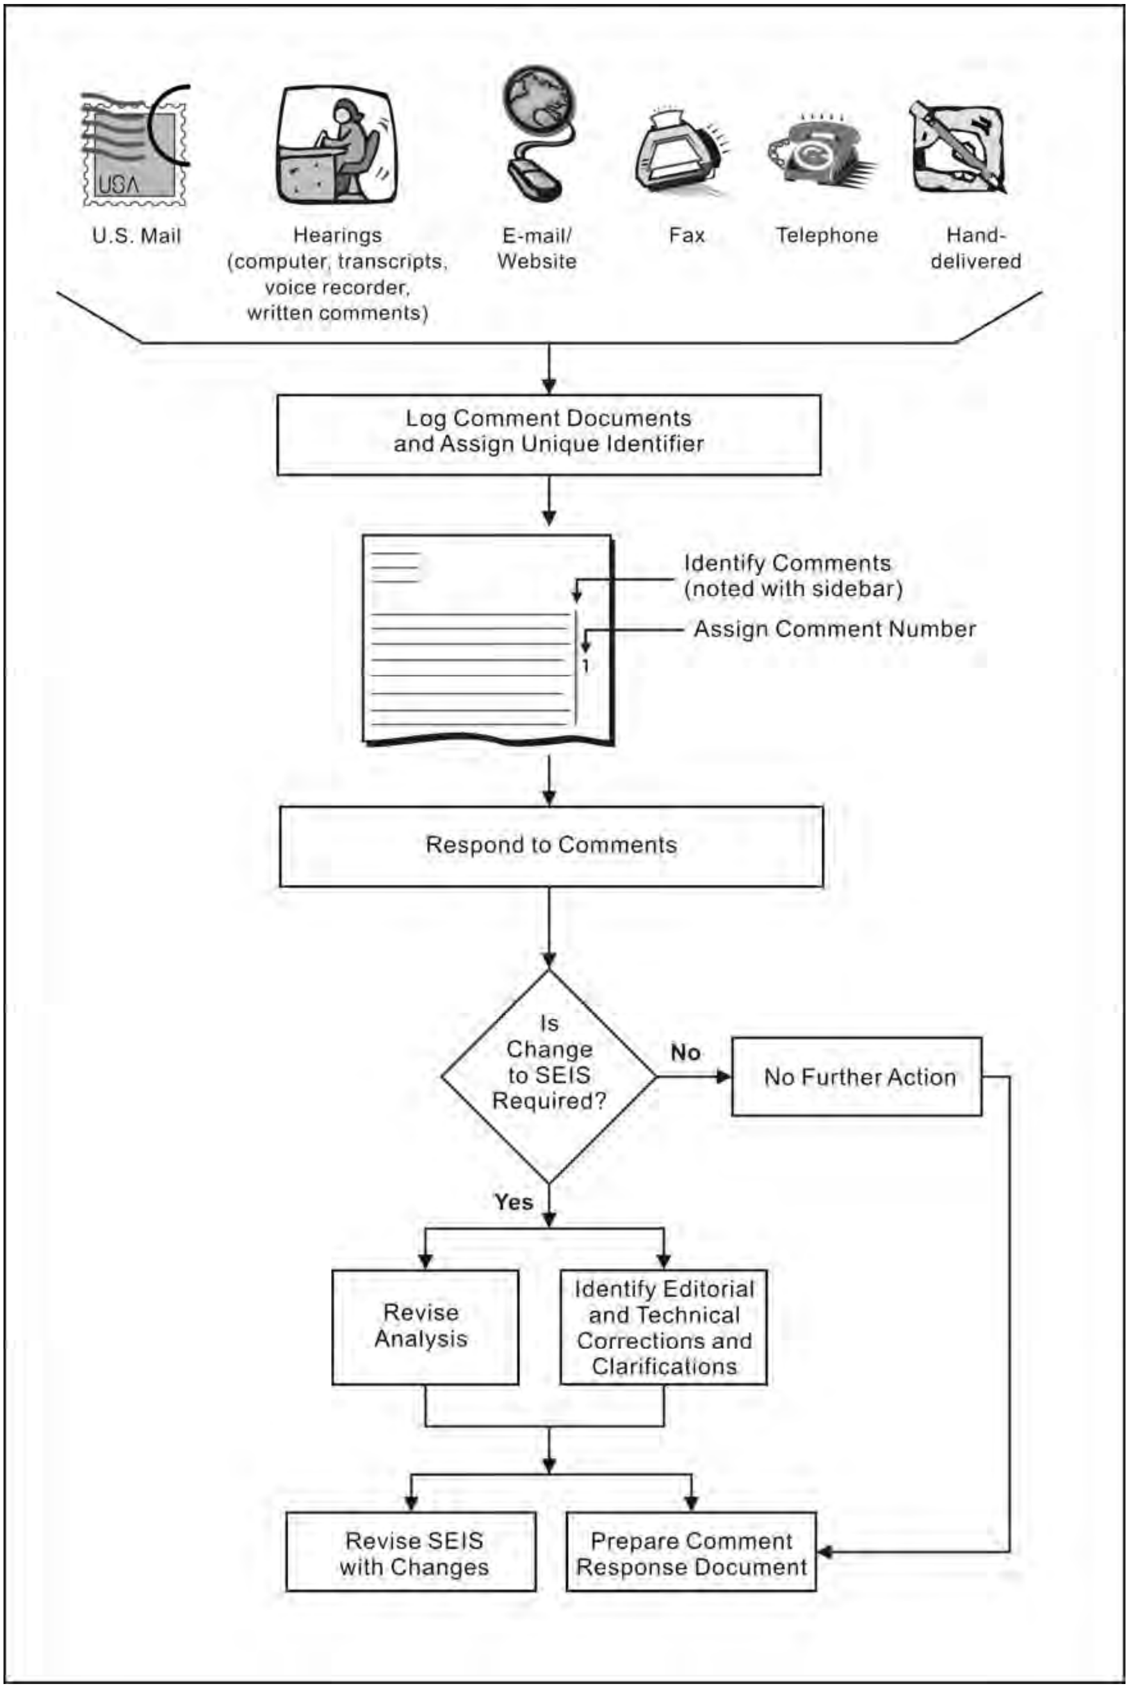

Figure 1–1 *CMRR-NF SEIS* Comment Response Process

- Section 3 presents transcripts of the oral comments, the computer-recorded comments and scanned copies of the comment documents received during the four public hearings, as well as additional comments received via U.S. mail, e-mail, toll-free telephone number, and toll-free fax line, side-by-side with NNSA's comment-specific responses.

- Section 4 lists the references cited in this volume.

1.4 Changes from the Draft Supplemental Environmental Impact Statement

In preparing this *Final CMRR-NF SEIS,* NNSA made revisions in response to comments received from other Federal agencies, state and local government entities, Native American tribal governments, and the public. In addition, the *Final CMRR-NF SEIS* was changed to provide additional environmental baseline information, include additional analyses, correct inaccuracies, make editorial corrections, and clarify text. The following summarizes the more-important changes made to the *CMRR-NF SEIS.*

Chapter 1, "Introduction and Purpose and Need for Agency Action," was updated to discuss the reason why the design of the Chemistry and Metallurgy Research Building Replacement Nuclear Facility (CMRR-NF) needed to be modified and how this change resulted in the need to develop an SEIS. Section 1.7, Public Involvement, was modified to summarize the comments received during the scoping period and to include information related to the public comment period and public hearings on the *Draft CMRR-NF SEIS*. Section 1.8, Changes from the *Draft CMRR-NF SEIS*, was added to summarize the changes that have been made. Section 1.9, Organization of this *CMRR-NF SEIS*, was modified to include a paragraph on the addition of this CRD as Volume 2 of this *Final CMRR-NF SEIS*.

Chapter 2, "Project Description and Alternatives," was updated to include additional project-related information. Section 2.4, Proposed Chemistry and Metallurgy Research Building Replacement Project Capabilities, was updated to include additional information on the analytical chemistry and materials characterization capabilities that would be present in the proposed facility. Section 2.6.2, Modified CMRR-NF Alternative, was updated to include additional information on the evolution of the Deep and Shallow Construction Options and to add propane to the construction requirements associated with this alternative. Propane would be used to heat the building during the winter months for 3 to 6 years. The addition of propane use resulted in small changes in the air quality and greenhouse gas impacts under this alternative, as shown in Chapter 4, Section 4.3.4, Air Quality and Noise, as well as changes in Section 4.3.3, Infrastructure. Information was added in Section 2.6.2 regarding the weight of the proposed CMRR-NF and the ability of the ground beneath the proposed facility to support this weight. A bus parking lot that would be constructed on the boundary of Technical Area 48/55 (TA-48/55) was also added to this alternative to provide room for buses from the proposed construction workers parking lot in TA-72 to remain near the proposed construction site. This change resulted in a small increase in land use for this alternative, as discussed in Chapter 4, Section 4.3.2, Land Use and Visual Resources. The description of potential power upgrades associated with this alternative was modified to indicate that the potential power upgrades from TA-5 to TA-55 to support the Modified CMRR-NF could be temporary or permanent, depending on future power requirements. This does not change the amount of land that may be affected, but could change the impacts from temporary to permanent, as indicated in Chapter 4, Section 4.3.2. Section 2.7, Alternatives Considered and Dismissed, was revised to describe in more detail the alternatives that NNSA considered and determined not to be reasonable for meeting the purpose and need for continuing Chemistry and Metallurgy Research (CMR) operations into the future. Section 2.7.4 was added to describe other alternatives and proposals considered and to explain why they were not analyzed further in this *CMRR-NF SEIS*. Section 2.10, Summary of Environmental Consequences, was modified to show how the environmental impacts associated with the Modified CMRR-NF Alternative and Continued Use of CMR Building Alternative have changed as a result of the changes discussed in Chapter 4. These changes are all relatively small and do not significantly change any of the environmental consequences presented in the *Draft CMRR-NF SEIS*. Section 2.10 has also been modified to include a summary of the intentional destructive acts sections of Chapter 4 (Sections 4.2.10.3, 4.3.10.3, and 4.4.10.3).

Chapter 3, Affected Environment, was updated in a number of sections. Information was updated in this *Final CMRR-NF SEIS* to reflect the most recent environmental data from the 2009 *SWEIS Yearbook* (LANL 2011d). Information was included in Section 3.2, Land Use and Visual Resources, and Section 3.7, Ecological Resources, on the Las Conchas wildfire. None of this information affects the impacts analyses presented in Chapter 4. Section 3.3 was updated to include new estimates of the amount of electricity available to LANL and Los Alamos County. The amount of peak power was reduced from 150 megawatts to 140 megawatts, reflecting the unavailability of two steam-driven turbine generators in TA-3 and increased power available from the Abiquiu Turbine Hydropower Project. These changes resulted in a change in the estimated amount of available electricity and are reflected in changes in the infrastructure sections in Chapter 4, Sections 4.3.3 and 4.4.3, for the Modified CMRR-NF Alternative and Continued Use of CMR Building Alternative, respectively, as well as in Section 4.6, Cumulative Impacts. The availability of electricity continues to cover expected requirements under any of the alternatives. However, peak demand could theoretically exceed available power under the Modified CMRR-NF Alternative, as discussed in the draft SEIS, but this is not expected to occur because actual LANL peak demand has consistently been lower than the estimate included in the 2008 *Final Site-Wide Environmental Impact Statement for Continued Operation of Los Alamos National Laboratory, Los Alamos, New Mexico* (DOE 2008a) and used in future forecasts. Additional information was included in this *Final CMRR-NF SEIS* to better describe the seismic studies and information developed for the proposed CMRR-NF site and LANL. This information is included in Chapter 3, Section 3.5, Geology and Soils, and includes information from the 2009 update (LANL 2009) to the 2007 probabilistic seismic hazards analysis (LANL 2007). An error in the reported vertical peak ground acceleration at LANL (0.3 *g*) was corrected to 0.6 *g*. This typographical error in the Executive Summary of the source document (LANL 2007) is not reflective of information presented elsewhere in the probabilistic seismic hazard analysis and was not used in the design of the proposed Modified CMRR-NF. The 2009 update changed the peak horizontal and vertical ground accelerations for the proposed CMRR-NF site in TA-55The updated factors were lower than the factors included in the 2007 analysis (0.47 *g* [gravitational acceleration] compared to 0.52 *g* for peak horizontal ground acceleration and 0.51 *g* compared to 0.6 *g* for peak vertical ground acceleration). The updated values were factored into the design of the proposed Modified CMRR-NF, as described in the *Draft CMRR-NF SEIS*, and do not change any of the analyses presented in this *Final CMRR-NF SEIS*. (This updated information was not available for unlimited public distribution when the draft SEIS was issued.) Information was included in Section 3.5, Geology and Soils, describing the volcanic history in the region. This information is factored into a revised discussion of potential accidents included in Appendix C. Section 3.9, Socioeconomics, was updated to include the latest information from the 2010 census on the region of influence and to show later unemployment data for the region. These changes did not result in any significant changes to the socioeconomics impacts sections in Chapter 4.

The 2010 census data were used to update the population projections to 2030 for total population, minority populations, and low-income population. As a result of slower than previously projected growth through 2010, the 2030 population projection for the 50-mile (80-kilometer) radius area surrounding TA-55 was reduced from about 545,000 to 511,000, and for the area surrounding TA-3, from about 536,000 to 502,000. Chapter 3, Section 3.10, Environmental Justice, was updated to include changes as a result of 2010 census data and to break the information down into smaller areas for evaluation (5-, 10-, and 20-mile [8-, 16-, and 32-kilometer] radii) in addition to the area within 50 miles (80 kilometers) of TA-55 and TA-3, as requested by the U.S. Environmental Protection Agency (EPA). The distribution of the population over the 50-mile (80-kilometer) radius was also updated using the latest census data, and more refined data were used (block data versus block group data; see Appendix B) to estimate the population within 10 miles (16 kilometers) of TA-55 and TA-3. As a result, more people are located closer to LANL (within 5 miles [8 kilometers]) than previously projected. The updated population projections and distributions were used to re-estimate the human health impacts associated with the No Action Alternative (2004 CMRR-NF) (Chapter 4, Section 4.2.10.2, for accidents); the Modified CMRR-NF Alternative (Section 4.3.10); and the Continued Use of CMR Building Alternative (Section 4.4.10), as well as the environmental justice analysis presented in Sections 4.3.11 and 4.4.11. The projected population doses from normal operations and the population accident doses changed slightly as a result of these changes, but not to the extent that the assessment from the draft SEIS would change. Similarly, the doses included in the environmental justice analysis changed, but not significantly. Additional information was included in Chapter 3, Section 3.11, Human Health, on historical health effects studies that have been done on the area surrounding LANL. This information is presented for background and does not affect any of the impacts analyses presented in Chapter 4.

In addition to the updates to Chapter 4 discussed above, other changes were made to Chapter 4 since the *Draft CMRR-NF SEIS* was issued. Information was added in Section 4.2.10.2 on the accident analysis that was performed for this *CMRR-NF SEIS*, as presented in Appendix C, as well as the changes in the accident analysis since the *Draft CMRR-NF SEIS* was issued. These changes do not significantly change the results, with the exception of significantly higher doses to the maximally exposed individual (MEI) and noninvolved worker under the seismically induced spill and fire accident at the CMRR-NF. In this *Final CMRR-NF SEIS*, this accident assumes that the earthquake initiates a radioactive material spill that is followed shortly thereafter by a fire, instead of both accidents occurring simultaneously, as was assumed in the *Draft CMRR-NF SEIS*. This change in assumptions results in a larger dose to the MEI and noninvolved worker because the radioactive materials associated with the assumed spill are not immediately lofted by the fire, which would lessen doses to persons close to the accident site. Additional discussion also was added to the accident analysis section for the Modified CMRR-NF Alternative (Section 4.3.10.2) regarding the potential for a wildfire affecting the facility and the effects of a seismic event that damages the CMRR-NF and other plutonium facilities in TA-55.

A special pathways consumer analysis was added to the environmental justice sections in Chapter 4, Sections 4.3.11 and 4.4.11, to show the potential impacts of the alternatives on individuals who may subsist on fish and wildlife caught within the vicinity of LANL. This analysis shows that special pathway consumers would not be exposed to significant risks as a result of implementing either of these alternatives. Section 4.6, Cumulative Impacts, was updated to account for newly acquired information about other projects in the vicinity of LANL, but these projects do not change the impacts discussions presented in this section.

Appendix B was updated to include a revised Section B.3, Air Quality, which factors in the requirement for propane use during construction at the Modified CMRR-NF and a revised number of emergency backup generators associated with the proposed CMRR Facility. Section B.5, Geology and Soils, was modified to eliminate Table B–9, which was related to the Modified Mercalli Intensity Scale. The Modified Mercalli Intensity Scale is not considered in the design of buildings. The design of the CMRR-NF is influenced by peak ground acceleration factors, as discussed in Chapter 3, Section 3.5. Section B.10, Environmental Justice, was modified to include a discussion of changes related to the use of 2010 census data in projecting the affected population to the year 2030, as well as an evaluation of a special pathways receptor.

Appendix C, Evaluation of Human Health Impacts from Facility Accidents, was updated to include a discussion of the Fukushima Daiichi Nuclear Power Plant accident (Section C.9) and wildfires and volcanic activity in the LANL vicinity (Section C.4.1) as they relate to the proposed action in this *CMRR-NF SEIS*. Section C.6 was added to discuss the potential for offsite land contamination in the event of a severe earthquake that results in the release of radioactive materials. Appendix C was also updated to include a discussion of the impacts of a severe earthquake on the multiple plutonium facilities in TA-55 should the CMRR-NF be built there (Section C.7). In the event of such an earthquake, it is expected that the consequences would be dominated by releases from the TA-55 Plutonium Facility, which is currently being upgraded to address seismic concerns.

The population consequences and risks shown in Appendix C have been re-estimated using the latest population projections and distributions, as discussed above. The estimated consequences for some accidents have changed as a result of these changes, but the risks associated with these accidents are not significantly different from those presented in the *Draft CMRR-NF SEIS*. The accident with the largest changes is the seismically induced spill, followed by a fire accident scenario for the CMRR-NF that was changed, as discussed above. This accident scenario was changed from that presented in the *Draft CMRR-NF SEIS* to reflect changes in the understanding of how it would progress and to present a more conservative accident scenario with respect to doses to the MEI and noninvolved worker.

1.5 Next Steps

No decision will be made any sooner than 30 days after EPA issues the Notice of Availability for this *Final CMRR-NF SEIS.* The decision will explain all factors considered by NNSA, including environmental impacts. The decision also will identify the environmentally preferred alternative or alternatives. If mitigation measures, monitoring, or other conditions are adopted as part of NNSA's decision, these would be described and summarized in the decision, as applicable, and would be included in the Mitigation Action Plan that would be prepared following issuance of the decision. The Mitigation Action Plan would explain how and when any mitigation measures would be implemented and how NNSA would monitor the mitigation measures over time to judge their effectiveness.

SECTION 2
MAJOR ISSUES

2.0 MAJOR ISSUES

Several topics raised by the public comments on the *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR-NF SEIS)* were of broad interest or concern or required a more detailed response than could be effectively presented in the side-by-side format in Section 3 of this Comment Response Document (CRD). The following topics were therefore characterized as major issues and are addressed in this section:

- Opposition to the Chemistry and Metallurgy Research Building Replacement Nuclear Facility (CMRR-NF), Nuclear Weapons, and Nuclear Technology
- National Environmental Policy Act (NEPA) Process
- Programmatic Direction and Decisions
- Chemistry and Metallurgy Research (CMR) Mission
- Cleanup and Waste Management
- Seismic and Geologic Concerns
- Economic Impacts
- Nuclear Accidents
- Treaty Compliance
- Water Resources and Usage
- Alternatives Considered

2.1 Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology

Issue:

Many commentors indicated opposition to constructing a new nuclear facility such as the proposed CMRR-NF at Los Alamos National Laboratory (LANL); additionally, commentors suggested cessation of other nuclear activities at LANL. Commentors expressed opposition to nuclear weapons in general and pit production specifically, stating that nuclear weapons are unnecessary, immoral, unethical, or illegal, and should be eliminated. Some commentors also expressed their opposition to nuclear power.

Response:

These comments pertain to subjects beyond the scope of this *CMRR-NF SEIS* and also of the 2003 *Environmental Impact Statement for the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR EIS)* (DOE 2003b) that is being supplemented, each of which was developed under the scope of analyzing the potential environmental impacts of reasonable alternatives for providing the analytical chemistry, materials characterization, and plutonium research capabilities required to support National Nuclear Security Administration (NNSA) mission requirements at LANL. U.S. national security policies and the mission of NNSA at LANL are not within the scope of these NEPA documents.

Since the end of the Cold War, the U.S. Department of Energy (DOE) and NNSA have made modifications and changes to site missions and activities to be consistent with national security policies and to reflect changes in the national nuclear security posture, including maintaining a smaller enduring stockpile. In October 2008, NNSA completed its *Complex Transformation Supplemental Programmatic Environmental Impact Statement (Complex Transformation SPEIS)* (DOE 2008b), which analyzed the potential environmental impacts of alternatives for transforming the nuclear weapons complex into a smaller, more-efficient enterprise that can respond to changing national security challenges and ensure the long-term safety, security, and reliability of the nuclear weapons stockpile. In a subsequent Record of Decision (ROD) issued in December 2008 (73 FR 77644), NNSA announced its programmatic decision to retain manufacturing and research and development capabilities involving plutonium at LANL. In support of these activities, LANL must continue to maintain existing nuclear capabilities, such as those performed at the existing CMR Building. These capabilities are required to ensure NNSA's ability to safely maintain and manage the Nation's nuclear stockpile. The proposed CMRR-NF would replace the aging CMR Building at LANL and provide NNSA with the continued capability to perform the analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Nuclear weapons pit production does not occur in CMR and would not occur in the proposed CMRR-NF facility. Please see Section 2.4 of this CRD and Chapter 1 of this *CMRR-NF SEIS* for more information regarding the CMR Mission and the programmatic direction and decisions that led to the need for the proposed CMRR-NF.

NNSA acknowledges that there is substantial opposition to the nuclear weapons mission. However, even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. The President and Congress continue to hold DOE, and specifically NNSA, responsible for ensuring the safety and reliability of the nuclear weapons stockpile. LANL is one of three national laboratories engaged in activities that are necessary for NNSA to meet this national security obligation. A cessation of these activities would be counter to national security policy as established by the President and Congress.

2.2 NEPA Process

Issue:

Commentors expressed a variety of concerns related to implementation of the NEPA process for this *CMRR-NF SEIS*. Comments addressed the type of document that NNSA should prepare, calling for a new environmental impact statement (EIS) rather than a supplemental environmental impact statement (SEIS). Commentors also expressed great concern for the dramatic increase in cost for the project. Many commentors cited the large overall project cost increase as a reason for NNSA to prepare a new EIS.

Commentors felt that the review process was inadequate, including the format of the public hearings. Concerns were expressed regarding the amount of time allowed to speak at the public hearings, a need for a more-detailed presentation, wider distribution of information, and the facilitator's role. In addition, commentors expressed frustration regarding their ability to access references. Commentors also expressed the opinion that NNSA does not pay attention to comments received from the public.[1]

[1] *Los Alamos Study Group (LASG) submitted a comment requesting that NNSA incorporate by reference all of its pleadings, evidence submitted, and both actual and prepared testimony in* Los Alamos Study Group v. Department of Energy, *Case No. 10-Civ-0760-JH-ACT. Much of this material involves legal contentions and does not comment on the draft CMRR SEIS. More important, LASG did not identify the specific issues in this very large amount of material to which it wanted NNSA to respond. Commentors are required to present their comments in a way that reasonably permits a reviewing agency to examine their contentions, and this comment by LASG does not do so.*

Response:

NNSA prepared this *CMRR-NF SEIS* as a result of changes in the design and construction of the CMRR-NF that were based on additional seismic and safety requirements and information. Council on Environmental Quality (CEQ) NEPA regulations and DOE implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a)-(b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. An SEIS may also be prepared to further the purposes of NEPA. NNSA determined that a supplement to the *CMRR EIS* was prudent and appropriate, even though the changes would affect the structural aspects of the building, but not its purpose.

In commissioning the SEIS, NNSA sought to understand the environmental consequences associated with the proposed changes in construction of the CMRR-NF from those analyzed in the 2003 *CMRR EIS* (DOE 2003b). These construction changes are needed as a result of updated seismic information and the integration of enhanced safety requirements – including more robust fire suppression systems – into the design concept of the CMRR-NF. Project costs were not germane to NNSA's decision to prepare a supplemental EIS, as project costs are not generally included as part of the environmental impact analysis and do not, in and of themselves, form the basis for compelling any level of NEPA review.

NNSA appreciates the value of public comments in the NEPA process. Consistent with the purpose and intent of NEPA and DOE's implementing regulations, public comments assist NNSA in determining the scope of the analysis to be included in a NEPA document, improving the analysis and range of alternatives evaluated, and making decisions regarding the action under consideration. Accordingly, NNSA has provided several forums and methods for public comment submittal.

As with previous LANL NEPA documents, the public hearings were held at regional venues near LANL (Los Alamos, Española, and Santa Fe, New Mexico). In response to requests for additional public hearings, NNSA also held a fourth public hearing in Albuquerque, New Mexico (76 FR 28222). Announcements for the May 23, 2011 Albuquerque public hearing were made in the *Albuquerque Journal* on May 8 and 19, 2011, along with a notice in the *Federal Register* on May 16, 2011. The format of the public hearings was intended to give all participants ample opportunities to comment. To accommodate each commentor that asked to speak, NNSA allocated time within the period scheduled for each meeting based on the anticipated number of speakers. After all registered speakers had a chance to speak, as time allowed, those who had not registered and previous speakers wanting to provide additional comments were given an opportunity to speak. To further facilitate participation from hearing attendees, NNSA provided a number of other ways to submit comments at each hearing: a court reporter to record individual comments, computers to directly input comments, a voice recorder to leave oral comments, and comment forms that could be filled in and submitted at the hearing or mailed by the commentor at a later date. For those unable to attend the hearings, NNSA indicated – in the April 29, 2011, *Federal Register* (76 FR 24018) notice announcing the availability of the draft SEIS; in letters transmitting the document to interested parties; in advertisements placed in Albuquerque, Santa Fe, Española, and Los Alamos newspapers; and again in the May 16, 2011, *Federal Register* notice (76 FR 28222) announcing the 15-day extension of the comment period – that comments could be submitted by U.S. mail, e-mail, a toll-free phone line, and a toll-free fax line. In response to reported issues with sending large volumes of e-mails through commercial mail servers and to facilitate the receipt of a petition, NNSA also coordinated with commentors to receive the comments by U.S. mail and to pick up a hard copy of the petition to ensure their receipt.

NNSA made the SEIS references available in five DOE public reading rooms located in New Mexico, as well as an additional room in Washington, D.C., throughout the comment period. Except where limited by copyright or security concerns, NNSA also made the SEIS references available on the Internet. These efforts were consistent with NNSA's past practices for other LANL NEPA documents.

NNSA considers every comment received at the public hearings or by U.S. mail, e-mail, or toll-free phone or fax lines during the public comment period. All comments submitted to NNSA during the public comment period, as well as late comments submitted after the June 28, 2011 deadline through July 31, 2011, were considered in preparing this *Final CMRR-NF SEIS.* Chapter 1, Section 1.8, of this SEIS addresses the changes that have been made in this SEIS between the draft and final documents.

During the public review and comment period for this *CMRR-NF SEIS*, NNSA received a large number of comments from the public. Two unexpected events occurred during the final days of the extended comment period for this *CMRR-NF SEIS* that affected some commentors: (1) some commentors attempting to transmit large volumes of e-mails through commercial mail servers had their comments blocked for a period of time by DOE Internet security features, and (2) the Las Conchas wildfire affected many in the immediate vicinity of LANL. In response to these events, NNSA reiterated its practice of accepting late comments to the extent practicable. NNSA also coordinated with affected commentors who informed NNSA of their problems to ensure the receipt of their comments through U.S. mail or through couriers sent to retrieve hard copies of their comments. All comments submitted to NNSA during the public comment period, as well as late comments, were considered in preparing this *Final CMRR-NF SEIS*.

2.3 Programmatic Direction and Decisions

Issue:

Commentors submitted a variety of comments regarding NNSA's programmatic direction of work performed at LANL and of the work that would be performed at the CMRR-NF. Specific comments included the following requests for NNSA: stop all work using radioactive materials at LANL; stop nuclear work related to weapons production at LANL; direct LANL scientists to perform other work, including research on alternative energy production sources and other energy research activities; or use congressional funding to meet various community needs, such as feeding the hungry, education, reducing the debt, or similar needs.

Response:

These comments pertain to subjects that are beyond the scope of this *CMRR-NF SEIS* and also of the 2003 *CMRR EIS* that is being supplemented, each of which was developed with the scope of analyzing the potential environmental impacts of reasonable alternatives for providing the analytical chemistry, materials characterization, and plutonium research capabilities required to support NNSA mission requirements at LANL. Examining congressional budget decisions, U.S. national security policies, or the mission of NNSA at LANL is not within the scope of these documents. National security and mission issues were more appropriately discussed in the *Complex Transformation SPEIS* (DOE 2008b) and the *Final Environmental Impact Statement for the Continued Operation of Los Alamos National Laboratory, Los Alamos, New Mexico,* issued in 2008 *(LANL SWEIS)* (DOE 2008a).

The *2010 Nuclear Posture Review Report* (DoD 2010), prepared by the U.S. Department of Defense in consultation with DOE and the U.S. Department of State, sets out the following five key objectives of current U.S. weapons policies and posture:

1. Preventing nuclear proliferation and nuclear terrorism
2. Reducing the role of U.S. nuclear weapons in U.S. national security strategy

3. Maintaining strategic deterrence and stability at lower nuclear force levels
4. Strengthening regional deterrence and reassuring U.S. allies and partners
5. Sustaining a safe, secure, and effective nuclear arsenal

The President and Congress expect DOE, primarily through NNSA, to play a central role in Objectives 1 and 5. These expectations are manifested by recommendations in the President's proposed annual budget and in congressional budget appropriations. DOE and NNSA have no discretion to use monies specifically provided by Congress for these objectives, at LANL or elsewhere, to meet community needs or to perform other non-mission-related activities.

NNSA has developed a comprehensive program of stockpile stewardship and management that maintains essential capabilities for stockpile safety and reliability. LANL is one of three national laboratories engaged in a broad range of technical activities that are necessary for NNSA to meet its national security obligations. LANL's role in enabling NNSA to fulfill its national security responsibilities defines the need for analytical chemistry and materials characterization capabilities at LANL, as described in Chapter 1, Section 1.3, of this SEIS, to support NNSA's core mission as directed by Congress and the President. This core mission specifically includes ensuring a safe and reliable nuclear stockpile. A cessation of these activities would be counter to national security policy as established by Congress and the President. Therefore, ending these activities is not considered in this SEIS.

2.4 CMR Mission

Issue:

A number of commentors suggested that a capacity study or a "plutonium infrastructure" study should be conducted. Commentors made a variety of comments related to the need for and function of the CMRR-NF. Commentors stated directly or implied that the CMR Building, the proposed CMRR-NF, or both, were the location at which plutonium pits or "triggers" are manufactured. Some commentors questioned the need for CMRR-NF, indicating that the production rate of 20 pits per year supported by current facilities and the number of pits in storage should be sufficient. Commentors also questioned the need for pit production, as pits are reported to have a greater-than-100-year lifespan. Other commentors asked what pit production rate the CMRR-NF was intended to support, and whether the increased size of CMRR-NF was related to a change in pit production.

Response:

The need for the CMRR-NF is not connected to a specific level of operations. The CMR Building and the proposed CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular production level of activity that would take place at the TA-55 Plutonium Facility. As described in Chapter 1, Section 1.2, of this *CMRR-NF SEIS*, NNSA's capability to perform a full range of analytical chemistry and materials characterization functions is currently constrained because of safety restrictions at the existing CMR Building; some types of materials characterization work have been suspended because of these limitations.

NNSA and the site contractor have considered a number of ideas for providing analytical chemistry and materials characterization at LANL, such as distributing the capabilities among multiple facilities at the site. Further discussion of this subject is included in Section 2.11, Alternatives Considered, of this CRD.

As discussed in Chapter 1, Section 1.5, of this *CMRR-NF SEIS*, NNSA is not planning at this time to revisit relocating the CMR capabilities to another site. Construction of a new CMRR-NF at LANL was previously evaluated in the *CMRR EIS* (DOE 2003b) and the 2008 *LANL SWEIS* (DOE 2008a). Regarding commentors' requests for a capacity study or a "plutonium infrastructure" study, the *Complex Transformation SPEIS* (DOE 2008b), which addressed transforming the nuclear weapons complex into a smaller, more-efficient enterprise was such a "plutonium infrastructure" study and addressed the location for manufacturing and research and development involving plutonium. NNSA announced its decisions to maintain the plutonium mission at LANL and to construct and operate the CMRR Facility in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644).

Some commentors believe that pits (which are sometimes erroneously called triggers) would be manufactured in CMRR-NF. As indicated in Chapter 2, Section 2.4, of this *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in CMRR-NF. Similarly, the manufacture of "triggers" for nuclear weapons does not occur in the CMR Building, nor would it occur in CMRR-NF. As stated above, the CMR Building and the proposed CMRR-NF analytical chemistry and materials characterization capabilities would continue to support the plutonium mission (stockpile stewardship, maintenance, and pit production).

Pit production capabilities, including analytical chemistry and materials characterization support for fabrication of new pits, modifying the internal features of existing pits, and recertifying or requalifying existing pits, are essential components of NNSA's stockpile stewardship mission. NNSA reviewed pit lifetime studies and concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a). It should be noted that plutonium aging is only one of the variables affecting nuclear weapon system reliability; other variables can control the overall life expectancy of nuclear weapon systems. It is not the purpose of this *CMRR-NF SEIS* to address a change in the level of pit production, and NNSA will not make a decision on the level of pit production in the ROD following completion of this *CMRR-NF SEIS*.

Commentors noted the increase in size of the Modified CMRR-NF over the structure analyzed in the 2003 *CMRR EIS* and under the No Action Alternative in this *CMRR-NF SEIS* (from 200,000 square feet [18,600 square meters] to 344,000 square feet [32,000 square meters] of usable floor space). The amount of laboratory floor space where analytical chemistry and materials characterization operations would occur would be about the same in both facilities (22,500 square feet [2,100 square meters]). The footprint of the Modified CMRR-NF (342 feet long by 304 feet wide [104 meters long by 93 meters wide]) is larger than that of the 2004 CMRR-NF (300 by 210 feet [91 by 64 meters]) due to the space required for engineered safety systems and equipment, such as an increase in the size and quantity of heating, ventilation, and air conditioning ductwork and the addition of safety-class fire-suppression equipment, plus the associated electrical equipment. This equipment added 42 feet (13 meters) to the building in one dimension. The addition of 94 feet (29 meters) in the other dimension was to provide corridor space for movement of equipment, to avoid interference between systems (mechanical, electrical, piping), and to allow enough space for maintenance, repair, and inspection, as well as mission support activities (maintenance shop, waste management areas, and radiological protection areas). Part of the increase in the building footprint over the 2004 CMRR-NF is due to thicker walls and other structural features required by current seismic and nuclear safety requirements.

2.5 Cleanup and Waste Management

Issue:

Commentors expressed a desire for funds to be spent on cleanup activities at LANL, rather than on a new nuclear facility. Commentors also expressed concerns that the Compliance Order on Consent (Consent Order) signed with the State of New Mexico would not be honored if a new nuclear facility were constructed at LANL. Commentors also were concerned about potential release sites such as Material Disposal Area (MDA) C, which could be in the vicinity of proposed construction activities, and were doubtful that the cleanup of MDA G in TA-54 would be implemented by December 31, 2015, as required by the Consent Order. Commentors were further concerned about the availability of disposal capacity for the projected waste quantities and questioned the practice of burying low-level radioactive waste in unlined pits.

Response:

Funding decisions on major Federal programs and projects at LANL, such as cleanup activities, are made by Congress and the President and are beyond the scope of this *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. It may be noted, however, that NNSA does not consider compliance with the Consent Order optional and is not linking Consent Order compliance with decisions about constructing and operating the proposed CMRR-NF. NNSA intends to continue conducting the environmental restoration program at LANL in parallel with its stockpile stewardship mission.

DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites at LANL that were known or suspected to be contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between the New Mexico Environment Department (NMED) and DOE. In 2005, DOE, the State of New Mexico, and the University of California (the management and operating contractor for LANL at the time) negotiated a Consent Order that governs cleanup efforts on the site (http://www.nmenv.state.nm.us/hwb/lanl/OrderConsent/03-01-05/Order_on_Consent_2-24-05.pdf). The Consent Order requires a site-wide investigation and cleanup to be conducted at LANL pursuant to stipulated procedures and schedules. The Consent Order also requires installation of wells, piezometers, and other subsurface technologies to provide site characteristic or environmental information; collection and investigation of sample data; and preparation and submittal of investigative reports for various potential release sites.

Chapter 2, Section 2.2.6, of the 2008 *LANL SWEIS* summarized progress made in environmental restoration since 1999 (DOE 2008a). Progress since publication of the 2008 *LANL SWEIS* is summarized in annual SWEIS yearbooks (LANL 2010a, 2011d). A total of 1,446 potential release sites are regulated under the Consent Order. From the March 1, 2005, effective date of the Consent Order through the end of 2009, the total number of corrective action sites remaining in the investigative process was reduced to 1,407 due to certificates of completion issued by NMED. In addition, over this same time period, corrective actions were completed for 94 sites, further reducing the number of corrective action sites remaining in the investigation process to 1,313. During 2008 and 2009, numerous investigation and remediation activities were conducted across the LANL site, including those for the Upper Mortandad Canyon Aggregate Area, Pajarito Canyon, MDA C, MDA G, and TA-21. The results of a Phase II investigation for MDA C, for example, concluded that, although further investigation activities were required, MDA C did not pose an unacceptable present-day risk to human health under the industrial and residential scenarios and to ecological receptors. During 2009, NNSA continued to monitor volatile organic compounds and hydrogen-3 (tritium) in subsurface pore gas at MDA G and submitted a revised Corrective Measures Evaluation Report to NMED addressing corrective remedy alternatives for MDA G.

Several buildings were demolished at TA-21 and contamination was removed (LANL 2011d). For more information on LANL's ongoing environmental restoration program, refer to the SWEIS yearbooks referenced above or the latest environmental surveillance report, which can be accessed at http://www.lanl.gov/environment/all/docs/reports/.

The CMRR-NF would be designed, constructed, and, along with RLUOB, operated to accommodate the projected waste volumes generated at the facilities. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives analyzed in this *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. The projected transuranic and mixed transuranic waste from operations at RLUOB and the proposed CMRR-NF would be disposed of at the Waste Isolation Pilot Plant (WIPP) or a similar facility. The waste volumes projected over the 50-year life of the new facilities would require up to 12 percent of the current unsubscribed WIPP disposal capacity. Decisions about disposal of any significant quantities of transuranic waste, however, would be made within the context of the entire DOE complex. It was assumed for analysis in the *Waste Isolation Pilot Plant Disposal Phase Final Supplemental Impact Statement* (DOE 1997) that transuranic waste would be received at WIPP over about a 35-year period, through approximately 2033. However, because the total quantity of transuranic waste that may be disposed of at WIPP is statutorily established by the Waste Isolation Pilot Plant Land Withdrawal Act, the actual operational period for WIPP will depend on the volumes of TRU waste received at WIPP from all DOE waste generators. Waste minimization efforts across the DOE complex would extend the WIPP operating period. If waste disposal capacity at WIPP is no longer available over the operating life of the CMRR-NF, then any transuranic waste generated at the CMRR-NF or elsewhere at LANL would be safely stored until additional disposal capacity becomes available.

Sufficient disposal capacity for low-level radioactive waste is expected to be available. Low-level radioactive waste would be transported off site to the Nevada National Security Site or licensed commercial facilities for disposal or would be disposed of on site at Area G at TA-54. The methods being used to dispose of low-level radioactive waste at Area G are beyond the scope of this *CMRR-NF SEIS*. It may be noted, however, that Area G includes a 63-acre (25.5-hectare) site that contains MDA G, as well as waste disposal units that are not subject to the Consent Order and are currently used for low-level radioactive waste disposal. NNSA plans to close the entire 63-acre (25.5-hectare) site and to transition low-level radioactive waste management and disposal activities to other locations at Area G.

Sufficient offsite treatment, storage, and disposal capacity is expected for all the mixed low-level radioactive waste; chemical wastes; and solid waste projected from CMRR-NF and RLUOB construction and/or operations. Mixed low-level radioactive waste management capacity is available at offsite commercial facilities or the Nevada National Security Site. Hazardous, toxic, and solid waste management capacity is available at numerous permitted facilities located within New Mexico and nearby states. The projected liquid radioactive waste generation rates from CMRR-NF and RLUOB have been considered in LANL forecasts for annual receipt of liquid waste at the Radioactive Liquid Waste Treatment Facility (RLWTF), and no impacts on radioactive liquid waste treatment and discharge capacity are expected from their operation.

2.6 Seismic and Geologic Concerns

Issue:

Many commentors expressed concerns and made statements about geologic features of the area in general, as well as the proposed construction site specifically. Commentors noted that LANL is located in a seismic fault zone between a rift valley and a dormant volcano. Many commentors noted that the proposed construction site is near a geologic fault line or earthquake fault; some commented that it is about two-thirds of a mile from the fault, and others indicated that the CMRR-NF would be built on the fault. Commentors also referred to the area as "geologically unstable." Additionally, commentors stated that an updated probabilistic seismic hazard analysis (PSHA) from May 2007 showed a potential huge increase in seismic ground motion and activity. In addition to concerns expressed regarding the nearness of a fault and the potential for a seismic event, it was also noted that the construction site is located over a layer of soft volcanic ash that can be compacted by the building's weight. Commentors expressed opinions that building in a geologically unstable area or near a fault was a principal factor in the increased cost of the project. Some commentors expressed concern regarding the potential for volcanic activity in the LANL area.

Response:

All proposed new DOE facilities are required to be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards established to protect public and worker health and the environment. DOE Order 420.1B, *Facility Safety*, requires nuclear or nonnuclear facilities to be designed, constructed, and operated so that the public, the workers, and the environment are protected from the adverse impacts of natural phenomena hazards, including earthquakes. The order stipulates the natural phenomena hazards mitigation requirements for DOE facilities. DOE Standard 1020-2002, *Natural Phenomena Hazards Design and Evaluation Criteria for Department of Energy Facilities* (DOE 2002a), implements DOE Order 420.1B and provides criteria for the design of new structures, systems, and components (SSCs) to ensure that DOE facilities can safely withstand the effects of natural phenomena hazards.

Per DOE Order 420.1B, facility SSCs must be designed, constructed, and operated to withstand natural phenomena hazards and to ensure confinement of hazardous materials; protection of occupants of the facility, as well as members of the public; continued operation of essential facilities; and protection of government property. The facility design process incorporates an iterative interaction with safety analyses to categorize SSCs into performance categories based on natural phenomena hazard considerations. The role of the safety analyses in this iterative approach is to yield insights into the preventive and mitigative functions of the SSCs that are needed for determining appropriate natural phenomena hazard categories. Each SSC is assigned to one of five performance categories, depending on its safety importance, and each performance category is assigned a target performance goal in terms of the probability of unacceptable damage due to natural phenomena. The performance categories are:

- PC-0: SSCs for which no consideration of natural phenomena is necessary
- PC-1: SSCs for which the primary concern is preventing major structural damage, collapse, or other failure that would endanger personnel
- PC-2: SSCs meant to ensure the operability of essential facilities or to prevent physical injury to in-facility workers
- PC-3: SSCs for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment because radioactive or toxic materials are present and could be released from the facility as a result of that failure
- PC-4: SSCs for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment because radioactive or toxic materials are present in large quantities and could be released as a result of that failure

Specific criteria applicable to seismic hazard assessment are provided in DOE Standard 1023-95, *Natural Phenomena Hazards Assessment Criteria*, including criteria for determining ground-motion parameters for the design-basis earthquake (DBE) and criteria for determining the acceptable design response spectral shape. In accordance with DOE Standard 1020-2002, *Natural Phenomena, Hazards Design and Evaluation Criteria for Department of Energy Facilities,* the DBE spectra shall be a site-specific shape anchored to the appropriate ground-motion parameters. Sites containing facilities with SSCs in performance categories PC-3 or PC-4 must perform a site-specific seismic hazard assessment to determine the DBE; the assessment methodology must also be reviewed at least every 10 years. CMRR-NF is projected to contain SSCs with performance categories ranging from PC-0 to PC-3.

The potential seismic hazards at LANL have been the subject of numerous studies performed in the past 30 years. Since the early 1990s, it has been recognized that LANL is situated within and over the seismically active Pajarito fault system. The surface trace of the main Pajarito fault is the western boundary of LANL and dips underneath LANL, whereas subsidiary strands of the fault system, including the Rendija Canyon fault, extend into portions of LANL. The Pajarito fault system has been mapped in detail in the northern and western portions of LANL property, as well as in the vicinity of LANL. These detailed fault data include fault mapping from a variety of projects that were performed using conventional and high-precision geologic mapping, surveying, drilling, and trenching.

Previous geologic studies used methods such as aerial photographic lineament mapping, geophysical techniques, and fracture studies of rock outcrops in canyons to postulate that the southern ends of the Rendija Canyon and Guaje Mountain faults may continue as surface faults south of the Los Alamos townsite and trend through sensitive LANL sites. Ensuing site-specific studies at and near TA-55 used geologic field investigative techniques such as conventional geologic mapping, trenching, borehole studies, and innovative high-precision mapping to recognize vertical fault displacements so small that they would be overlooked and unmapped by conventional geologic mapping techniques. Results from these studies have greatly improved the understanding of the location of fault traces at LANL. These investigations found that the surface trace of the Rendija Canyon fault trends southerly to Los Alamos Canyon, where it splays southwesterly and extends into TA-3. The surface expression of the Guaje Mountain fault is not visible south of Pueblo Canyon (north of LANL). Additionally, other small faults are found in parts of LANL, as discussed below.

At TA-67 (south of TA-55), investigations found small, complex faults with activity older than 50,000 to 60,000 years and found no correlation between increased fracture density and surficial faulting. At TA-3, a fault with approximately 8 feet (2.4 meters) of displacement was identified. In contrast, around TA-55 and the CMRR-NF site, stratigraphic markers in the 1.25-million-year-old Bandelier Tuff were found to be continuous and high-precision total-station mapping showed no evidence of surface-rupturing faults. This is consistent with findings of a subsequent subsurface excavation at the CMRR-NF site that also used high-precision mapping techniques. Although some fractures and small faults were observed to be confined within units of the tuff, it was concluded that fractures and faults exposed at the proposed CMRR-NF site formed very shortly after emplacement of the tuff as a result of cooling and compaction, and the structures identified at the proposed CMRR-NF site pose no independent surface faulting hazard.

In 1991, a state-of-the-art comprehensive earthquake ground-shaking hazard evaluation of LANL was initiated using the latest information on the Pajarito fault system and ground-motion prediction models. One of the main purposes of the evaluation was to develop design-basis ground motions to be used at LANL in accordance with DOE Order 420.1 and DOE Standard 1020-2002 (previous revisions of the current documents). A significant program of geological, geophysical, and geotechnical investigations was performed to provide input into the probabilistic seismic hazard analysis. Based on the assessment of the seismic hazard, DBE ground motions were developed and adopted for use at LANL to evaluate existing facilities, as well as to design new facilities. After 4 years of investigations and analyses, a final report was issued in 1995 (Wong et al. 1995). This report was reviewed and approved by an internationally recognized external review panel and DOE, with oversight from the Defense Nuclear Facilities Safety Board (DNFSB).

DOE Order 420.1B stipulates that "[a]n NPH [natural phenomena hazards] assessment review must be conducted at least every 10 years and must include recommendations to DOE for updating the existing assessment based on significant changes found in the methods or data." In 2004, LANL began to look at the changes in the data and methods used in the probabilistic seismic hazard analysis process and decided to update the work that was last completed in 1995. This update was prompted in part by new paleoseismic information on the Pajarito fault system that had been collected since the 1995 study, as well as new advances in ground-motion prediction. In 2007, a final report describing and summarizing the updated evaluation was released (LANL 2007). The updated seismic hazard analysis indicated an increase in the expected level of ground motion for a DBE and provided a better understanding of the probable seismic behavior of various geological material layers occurring at LANL. As a result, DBE ground motions increased significantly over the 1995 values due largely to the use of updated site-specific ground-motion models and higher than previously recognized activity rates of the Pajarito fault system based on the new paleoseismic data. This report was also reviewed by an external review panel, DOE, and DNFSB. The report represented the best knowledge at the time and also included a thorough treatment of the uncertainties in the knowledge of both seismic sources, including the Pajarito fault system, and ground-motion prediction models as specified by U.S. Nuclear Regulatory Commission guidelines developed by the Senior Seismic Hazard Analysis Committee (NRC 1997). This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a DBE without major damage (see Chapter 2, Section 2.6.2, of this *CMRR-NF SEIS*).

The 2007 DBE ground motions for LANL were reviewed and revised in 2009 to incorporate very recent ground-motion prediction models (LANL 2009). The vertical ground-motion estimation was also re-evaluated using a more refined approach. The analyses were again reviewed and accepted by an external review panel, DOE, and DNFSB. The results of the 2009 update recommended a slight reduction in the DBE ground motions for TA-55 and the CMRR-NF construction site compared to the 2007 study.

DOE has been very proactive in the assessment of the potential seismic hazards at LANL, and the resulting design-basis ground motions for modified CMRR-NF reflect the best science and engineering available to date. That said, as future studies are performed on the geology and seismology of LANL, there may be new information that becomes available that should be evaluated for potential impacts on the assessment of the seismic hazards. In the 1995, 2007, and 2009 LANL seismic hazard evaluations, a concerted effort was made to properly capture the uncertainties in input parameters and, hence, it is anticipated that new information will not have a significant impact on the current assessment of the seismic hazard or DBE ground motions for LANL.

In addition to the assessment of seismic hazards at the CMRR-NF site, site-specific geotechnical investigations have been completed for both the Shallow Excavation Option and the Deep Excavation Option. A geotechnical report prepared for the Shallow Excavation Option provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy, which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation (Kleinfelder 2007a). The report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]). The proposed modified CMRR-NF would be designed and constructed in accordance with geotechnical data and recommendations provided in *Geotechnical Engineering Report, Chemistry and Metallurgy Research Facility Replacement (CMRR) Project, Los Alamos National Laboratory* and *Geotechnical Data Report, Chemistry and Metallurgy Research Facility Replacement (CMRR) Project, Los Alamos National Laboratory* (Kleinfelder 2007a, 2007b). Similarly, the Deep Excavation Option would be completed in accordance with recommendations resulting from the geotechnical reports, *Phase I Ground*

Modification Alternatives Feasibility Study, Chemistry and Metallurgy Research Replacement (CMRR) Nuclear Facility, Los Alamos National Laboratory, and *Work Plan, Excavation Support Design, Chemistry and Metallurgy Research Facility Replacement (CMRR) Project, Los Alamos National Laboratory* (Kleinfelder 2010a, 2010b). To meet the seismic design requirements, the Modified CMRR-NF would require large amounts of structural and reinforcing concrete and steel for the construction of the building's walls, floors, and roof.

In response to comments regarding volcanic hazards, additional information was included in the *Final CMRR-NF SEIS*. Appendix C was revised to discuss the recurrence rate of the volcanic hazards in the LANL region. While the recurrence rate for silicic eruptions is about 1×10^{-5} per year, this is not the same as the probability of future eruptions. While eruptions cannot be ruled out, it would be an unlikely event within the lifetime of the CMRR-NF. The greatest hazard from a volcanic event would be ash loading on the roof. Conservative damage ratios and respirable release fractions used to analyze seismic events would be applicable to a volcanic ash fall event. Chapter 3, Section 3.5.1, and Chapter 4, Section 4.3.5 were also revised to include information regarding volcanic hazards, as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c).

Some commentors submitted very technical comments regarding the seismic hazard of the LANL region as presented in the *CMRR-NF SEIS* and supported by the seismic hazard analyses (LANL 2007, 2009) and other geotechnical reports. Readers interested in these detailed technical comments and responses are referred to commentor numbers 241 and 315 in Section 3 of this CRD.

2.7 Economic Impacts

Issue:

A number of commentors were in favor of the project, expressing a view that construction of the new nuclear facility would be a source of increased jobs and revenue for the region at a time of economic hardship. Commentors were concerned that the construction industry in New Mexico has a high unemployment rate and has been particularly hard hit by the ongoing economic downturn.

Other commentors noted that the *Draft CMRR-NF SEIS* indicated there would be a small economic benefit in the region from the increased direct and indirect employment. Information from the *Draft CMRR-NF SEIS* was cited as evidence that the Modified CMRR-NF would not create a large number of jobs at LANL because virtually all of the workers would relocate to the facility from other locations on the site. Other commentors stated that more jobs would be created if, instead of building a new nuclear facility, the contamination at LANL were cleaned up or the resources at LANL were applied to other pursuits, such as alternative (green) energy.

Response:

Economic benefits connected with the continued operation of LANL are felt throughout the state of New Mexico. Although this *CMRR-NF SEIS* focuses on the four counties most directly affected due to the large number of LANL employees that reside in them (Los Alamos, Rio Arriba, Santa Fe, and Sandoval), benefits accrue throughout New Mexico, including the other counties of northern New Mexico, as the income of LANL workers spreads through the community and LANL purchases are filled through local businesses. The socioeconomics sections of this *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in this *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or Modified CMRR-NF Alternative would require a construction workforce for up to 9 years. These jobs are expected to result in the creation of a number of indirect jobs within northern New Mexico during the construction period. As stated in Sections 4.2.9

and 4.3.9 of this *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison with the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico.

As discussed in this *CMRR-NF SEIS*, operation of the new CMRR-NF, if built, is not expected to result in any increase in LANL employment. The people expected to work in the new facility would be transferred from other facilities at LANL where CMR-related activities are currently being accomplished (such as the CMR Building).

With regard to the opinion of some commentors that the funds needed to construct the CMRR-NF would be better spent on other efforts at LANL that may create more jobs, this subject is not within the scope of this *CMRR-NF SEIS*, which evaluates the environmental impacts of alternatives related to the construction and operation of the proposed CMRR-NF. Please refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for additional information related to this issue.

2.8 Nuclear Accidents

Issue:

Commentors expressed concerns that an accident similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. Some commentors expressed a belief that the Fukushima Daiichi Nuclear Power Plant accident was a result of the earthquake, not the tsunami, and that similar consequences could be experienced in the surrounding area if an earthquake were to occur at LANL. Specific comments referenced other nuclear accidents, such as those at the Rocky Flats Plant, the Church Rock spill, and the accidents at Three Mile Island and Chernobyl. Many commentors expressed a desire to ensure that similar accidents would not occur at LANL by not building the proposed CMRR-NF or by shutting down other nuclear facilities at LANL.

Response:

The types of radiological accidents that occurred at the Fukushima Daiichi Nuclear Power Plant, Three Mile Island, and Chernobyl all require a large source of energy that is produced from the fissioning of nuclear fuel. Nuclear reactors are carefully designed to harness the energy produced from a controlled nuclear reaction. Even with an accident that results in a nuclear reactor shutdown, as occurred at the Fukushima Daiichi Nuclear Power Plant and Three Mile Island Unit 2 nuclear power plant, thousands of megawatts of heat continue to be produced from the decay of the fission products for a number of days following shutdown. The generation of decay heat must be managed with the use of active cooling systems or the associated water will boil off and cladding around the radioactive materials can be damaged, resulting in the release of radioactive materials. At the Fukushima Daiichi Nuclear Power Plant, the earthquake and the subsequent tsunami eliminated the ability to provide active cooling to the reactors, resulting in failures of the reactor fuel cladding and the release of radioactive gases and volatile materials such as cesium to the environment.

The plutonium metal and oxide used at the existing CMR Building and in the proposed CMRR-NF cannot produce a nuclear reaction by themselves and do not produce the large amounts of decay heat associated with nuclear reactors, which require the use of active cooling systems. A number of factors related to the configuration of the material, purity, temperature, and density must be met before an uncontrolled nuclear reaction involving these materials could begin. The programs and facilities at LANL are designed to prevent such an accident from occurring. For facilities like the existing CMR Building, the proposed CMRR-NF, and the other plutonium facilities at LANL, the general safety strategy does not require active cooling systems to prevent major disasters, but instead requires (1) plutonium materials to be contained at all times within multiple layers of confinement designed to prevent the materials from reaching a critical mass and from reaching the environment in the event of an accident that could cause one or more layers of confinement to fail, and (2) energy sources that might disperse plutonium and threaten confinement to be minimized (for example, the proposed CMRR-NF would not have any natural gas pipelines in the facility).

This basic strategy means that operational accidents, including spills, impacts, fires, and operator errors, would not normally have sufficient energy to threaten the multiple levels of confinement that are always present within a plutonium facility. For plutonium facilities, the final layer of confinement is the building structure and the system of barriers and multiple stages of HEPA filters that limit the amount of material that could be released to the environment, as evaluated in the documented safety analysis process.

For plutonium facilities, the operational events that present the greatest threats to confinement are large-scale fires that, if they did occur, could present excessive heat and smoke loads on the building HEPA filter systems. The old Rocky Flats facilities (now torn down) did not have the modern safety systems that are in place at LANL for plutonium operations, and large fires did occur that resulted in plutonium releases to the environment. For modern plutonium facilities, such as the proposed CMRR-NF, the safety strategy is to prevent large fires by controlling their propagation at the source. This is done by limiting the energy sources and controlling the propagation with the use of combustible materials limits, fire barriers, and fire-suppression systems. For modern plutonium facilities, it is straightforward to design and operate the facilities such that the estimated frequency of any large fire within the facility would fall into the “extremely unlikely” category (less than one chance in a million) and would require multiple violations of safety procedures to introduce sufficient flammable materials to support such a fire. Any postulated large-scale fire in a modern plutonium facility would clearly be categorized as a “beyond-design-basis” event and is never expected to occur in the life of the facility.

Even in an earthquake so severe that major structural damage occurred throughout the Los Alamos area, including the plutonium facilities at LANL, the accident risks to the public from the plutonium facilities would be many times smaller than those posed by nuclear reactors and spent fuel pools like those at the Fukushima Daiichi Nuclear Power Plant. The proposed CMRR-NF may be damaged in an earthquake, but such an accident would not result in a nuclear reaction or nuclear explosion even if a fire were to occur. Unlike the Church Rock spill, flooding due to severe rain events or dam breaks does not present a significant threat to the plutonium facilities at LANL which are located on mesa tops.

Design-basis and beyond-design-basis earthquakes would have the potential to result in loss of offsite power. Except for the fire-suppression system, the safety-class structures, systems, and components at CMRR-NF are passive engineered features. The fire-suppression system is independent of the regional electrical power system for providing its safety-class function. CMRR-NF would have emergency backup generators that would automatically start if the offsite power source were interrupted. For plutonium facilities like the proposed CMRR-NF, a beyond-design basis earthquake could potentially result in substantial damage to containers, enclosures, and building structures and result in the release of material to the environment. It is possible that all offsite power, including backup power, could be unavailable for hours or days as a result of a beyond-design-basis earthquake. This could cause operational problems and hinder damage assessment and cleanup, but is not expected to result in the additional release of radioactive material to the environment solely because power is not available.

Plutonium materials stored within these facilities or being used in operations are generally stable and would not require cooling to keep them stable and prevent additional releases to the environment. Plutonium oxides that would be used at CMRR-NF behave much like sand and would require additional energy, such as high-pressure air or an explosion, to disperse them into the environment. The stability of plutonium metal varies, depending on the size of the piece. Fine metal turnings from a lathe oxidize immediately, much like iron does in sparklers. Larger pieces of plutonium metal oxidize slowly and form an oxide crust. The rapid oxidation of plutonium metal requires a large energy source, such as an external, fuel-fed fire. Otherwise, the oxidation is slow and self-limiting. Plutonium in liquid form that is present in CMRR-NF would typically be a plutonium nitrate. This liquid form would also be stable and would not be dispersed without the application of an external energy source to disperse it.

The only form of plutonium that generates enough heat to require long-term cooling is plutonium-238 heat sources in the form of ceramic oxide pellets. The vault that is part of the proposed CMRR-NF would not store plutonium-238, so this possible energy source would not be present.

2.9 Treaty Compliance

Issue:

Commentors expressed the concern that (1) pit production at LANL violates nonproliferation treaties, particularly the Treaty on the Non-Proliferation of Nuclear Weapons (NPT) and the New Strategic Arms Reduction Treaty (New START), and (2) CMR activities would support pit production and are, therefore, illegal.

Response:

The United States is not in violation of the NPT or any other nonproliferation treaty to which it is a signatory. In 1968, the President signed the NPT, which Congress ratified in 1970. The NPT is a landmark international treaty designed to prevent the spread of nuclear weapons and weapons technology, to promote cooperation in the peaceful uses of nuclear energy, and to further the goal of achieving both nuclear and general disarmament. Under the NPT, the parties agreed not to transfer nuclear weapons or other devices, or control over them, and not to assist, encourage, or induce nonnuclear states to acquire nuclear weapons; the parties also agreed to "pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control" (Article VI). The treaty does not mandate disarmament or specific stockpile reductions by nuclear states, and it does not address actions of nuclear states in maintaining their stockpiles.

The United States has worked for many years to help establish an international security environment conducive to progress toward disarmament. The United States has also made significant progress toward achieving the nuclear disarmament goals set forth in the Preamble and Article VI of the NPT and has a strong record of compliance with its Article VI obligations. The United States has taken dramatic steps toward the goal of nuclear disarmament, including working to resolve destabilizing global and regional tensions; reducing its nuclear forces and nuclear weapons stockpile, through both unilateral and bilateral initiatives; and working cooperatively with allies and partners to reduce nuclear threats. The United States is also signatory to several treaties with goals of reducing the size of nuclear weapons arsenals. Most recently, in February 2011, the President signed the New START. Through this treaty, the United States and Russia agreed to further reduce their numbers of warheads and deployment systems within 7 years.

NNSA acknowledges that there is substantial opposition to the nuclear weapons mission. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Since the end of the Cold War, DOE has changed site missions and activities consistent with changing national security policies that reflect the new national security posture, including maintaining a smaller nuclear weapons stockpile. However, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Therefore, along with its obligations to reduce its nuclear weapons stockpile and promote the nonproliferation of nuclear weapons to nonnuclear states, the United States must also ensure that its nuclear weapons stockpile remains safe, secure, and reliable.

NNSA has developed a comprehensive program of stockpile stewardship and management that maintains essential capabilities for stockpile safety and reliability. The proposed CMRR-NF would replace the existing CMR Building at LANL and provide NNSA with the capability to continue with the analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Pit production would not take place in the proposed CMRR-NF. The proposed CMRR-NF would provide analytical chemistry and materials characterization capabilities critical to continuing to provide research in support of arms control technology development and other nonproliferation program activities that would help support treaty compliance activities.

2.10 Water Resources and Usage

Issue:

Commentors expressed concerns that construction and operation of the proposed CMRR-NF would use a significant amount of water that could be used for other purposes such as watershed restoration or irrigation. Commentors expressed concern about Los Alamos County rights to San Juan-Chama Transmountain Diversion Project water and how LANL may use that water. Commentors were also concerned about the impact the proposed CMRR-NF would have on surface-water and groundwater quality. These concerns included buried contamination migrating to groundwater and surface water and contamination being detected in a Buckman Well, the Rio Grande, and Elephant Butte, as well as the canyons that flow from LANL property to the river. Some commentors expressed concern that the project would violate the Clean Water Act.

Response:

NNSA takes its resource stewardship and conservation responsibilities seriously and continues to work with Los Alamos County to implement water conservation measures. Chapter 3, Section 3.3.4, of this *CMRR-NF SEIS* describes current water use and the water utility infrastructure for LANL and the Los Alamos region. NNSA is now a county water customer; as such, NNSA is billed and pays for the water it uses in accordance with a water service contract. For water-use planning purposes, NNSA has established a target ceiling quantity for water use equal to the water rights it still owns (542 million gallons [2,050 million liters] per year). In 2010, LANL used 412 million gallons (1,600 million liters) of water or about 76 percent of LANL's target ceiling quantity.

Water usage estimates related to the proposed CMRR-NF are included in Chapter 4, Sections 4.2.3 and 4.3.3. As discussed in these sections, the proposed CMRR-NF is expected to use up to about 5 million gallons (19 million liters) of water per year to support construction of CMRR-NF. If built, CMRR-NF, combined with RLUOB, would use up to 16 million gallons (61 million liters) of water per year to support facility operations. When the CMRR-NF requirements are combined with other LANL site-wide projected water requirements, LANL water usage would increase to up to 428 million gallons (1,620 million liters) annually or about 79 percent of LANL's target ceiling quantity. Chapter 4, Section 4.6, of this SEIS examines the cumulative impacts of this projected requirement along with Los Alamos County's estimated water use and estimates that, between LANL and the county, about 92 percent of the county's available water would be used annually.

Los Alamos County has completed the conversion of its water contract with the Bureau of Reclamation to access San Juan-Chama Transmountain Diversion Project water, which enables the county to access another 390 million gallons (1,480 million liters) annually. The county is studying options for making this water accessible to the county and its customers. LANL operational water demands are estimated to remain within DOE's current water use target ceiling quantity and, therefore, would not necessitate LANL using any of the San Juan-Chama Transmountain Diversion Project water that the county may access in the future.

As discussed in Chapter 3, Section 3.6, of this SEIS, LANL has an extensive groundwater and surface-water monitoring program in place to monitor the impact of LANL operations on water quality in the surrounding area. Groundwater monitoring has been performed at numerous locations within and around LANL for many decades. Monitoring locations include natural springs, drinking-water supply wells, shallow monitoring wells, intermediate-depth monitoring wells, and a variety of regional aquifer-monitoring well types.

LANL implemented the Outfall Reduction Program to reduce the total number of outfalls discharging to the environment. From January 1 through December 31, 2009, there were 15 wastewater outfalls (14 industrial outfalls and one sanitary outfall) at LANL that were regulated under a National Pollutant Discharge Elimination System (NPDES) permit that establishes limits on the volume and quality of the discharges. These outfalls are sampled weekly, monthly, or quarterly, as specified in the permit, to analyze effluents for compliance with permit limits. As part of a comprehensive LANL Outfall Reduction Project, the NPDES-permitted outfall serving the CMR Building in TA-3 (outfall #03A-021) was closed as of September 2010. All nonradioactive liquid effluent from the CMR Building is now sent to the Sanitary Wastewater Systems Plant.

The proposed CMRR-NF would not discharge nonradioactive liquid effluent directly to the environment, as discussed in Chapter 4, Section 4.3.6, of this SEIS. All nonradioactive liquid effluent would be sent to the Sanitary Wastewater Systems Plant, where the effluent would be treated and discharged in accordance with LANL's NPDES permit and in compliance with the Clean Water Act. All radioactive liquid effluent would be sent to RLWTF, where the effluent would be treated and discharged in accordance with LANL's NPDES permit and in compliance with the Clean Water Act. Released treated wastewater from NPDES-permitted outfalls at LANL rarely leaves the site (LANL 2011d).

LANL is performing monitoring of all wells required by the NMED Consent Order. This monitoring is conducted in accordance with an NMED-approved *Interim Facility-Wide Groundwater Monitoring Plan* (LANL 2006). As watershed monitoring continues, LANL, in consultation with NMED, will continue a phased approach to determining which wells are needed and in what locations to satisfy long-term monitoring needs. The process is established by and in compliance with the Consent Order. The annual LANL site environmental report provides detailed information on LANL's water quality monitoring program, including analytical results (see http://www.lanl.gov/environment/all/esr.shtml).

Contamination detected in various environmental media reflects worldwide fallout of radioactive particles from nuclear weapons testing; nuclear accidents such as Chernobyl; releases from industrial, commercial, medical, and household uses of chemicals and radionuclides; and releases from decades of activities at LANL. Samples from some locations show that contaminants are present on site at levels above applicable standards and guidelines. Elevated levels are investigated to confirm the validity of the results, determine the source and extent of the contamination, and evaluate needed control and cleanup actions.

To assess LANL's impact on the Rio Grande, samples of sediment, water, and foodstuffs are collected both upstream and downstream of LANL and tested for a variety of contaminants, including metals, organic compounds, and inorganic compounds. Natural stream flow and sediment-loading in the

Rio Grande are quite large compared with Los Alamos area streams. These factors reduce the possibility of identifying significant impacts from LANL in the Rio Grande. Daily average flow in the Rio Grande at the Otowi gage in 2009 ranged from about 500 to 5,900 cubic feet (14 to 170 cubic meters) per second. In contrast, the estimated combined flows from all the Los Alamos area canyons exceeded 5 cubic feet (0.14 cubic meters) per second only on July 30 (7 cubic feet [0.2 cubic meters] per second). Similarly, the average annual amounts of suspended sediment and bed sediment passing the Otowi gaging station have been calculated to be 1,000 and 100 times, respectively, the amount contributed by Los Alamos Canyon (LANL 2010b).

Surface-water samples were collected from three locations along the Rio Grande in 2009 for analysis of inorganic and organic chemicals and radionuclides. These locations are upriver of Los Alamos Canyon and LANL at Otowi Bridge, at the planned surface-water diversion site for Santa Fe at Buckman (at the mouth of Cañada Ancha, downriver from Los Alamos, Sandia, and Mortandad Canyons) and at the mouth of Frijoles Canyon in Bandelier National Monument (downriver from all canyons draining LANL) (LANL 2010b).

Nine radionuclides were detected in the Rio Grande water samples: radium-226, radium-228, thorium-228, thorium-230, thorium-232, tritium, uranium-234, uranium-235/236, and uranium-238. No screening levels were exceeded in these samples. All of these radionuclides are naturally occurring except for hydrogen-3 (tritium), which is associated with atmospheric fallout. The highest concentrations for radium-226, the thorium isotopes, and tritium were measured at Otowi Bridge, upriver from LANL, demonstrating non-LANL sources. For the uranium isotopes, the maximum concentrations downriver of the Otowi Bridge were 1 to 13 percent of the maximum concentrations measured upriver, also indicating little or no LANL impacts (LANL 2010b).

In a previous LANL press release about the concentration of plutonium in the sediments of Cochiti Reservoir, a comparison was made with the concentration in sediments in other reservoirs. It was stated that the "plutonium levels in Rio Grande Reservoir, located at the headwaters of the Rio Grande in Southern Colorado, and Elephant Butte Reservoir in southern New Mexico were similar to those found in Cochiti" (LANL 1997). The information further indicated that the levels were less than 0.1 percent of the screening action levels that would prompt further investigation.

As part of the monitoring program, in 2006, LANL staff collected groundwater samples from Buckman Well #1 as part of routine quarterly sampling that is conducted at three water-supply wells in the Buckman Well Field. This sampling is performed pursuant to a cooperative agreement with the City of Santa Fe. The samples were sent to an independent laboratory for radiochemistry analysis where it was reported that they detected plutonium-238 at a level about 3 percent of the DOE concentration guide for water ingestion. However, after reviews of legacy data by LANL staff and further discussions with the analytical laboratory, the laboratory has confirmed that computer analyses of the results were incorrect. The laboratory concluded that plutonium-238 was not present in the sample from Buckman Well #1. No further reports of plutonium detection have occurred since this occurrence in 2006 (LANL 2011e).

For more information on LANL's ongoing water monitoring program (surface water and groundwater), please see the latest environmental surveillance report, which can be accessed at http://www.lanl.gov/environment/all/docs/reports/.

2.11 Alternatives Considered

Issue:

Commentors expressed concerns regarding the alternatives in the *Draft CMRR-NF SEIS*. Some commentors thought the No Action Alternative should be a "no build" alternative that would involve ceasing CMR missions completely. Other commentors felt that the *Draft CMRR-NF SEIS* lacked sufficient alternatives because the No Action Alternative (2004 CMRR-NF) and Continued Use of CMR Building Alternative could not really be considered viable alternatives for implementation. They claimed that no "reasonable" alternatives to construction of the Modified CMMR-NF were considered in this SEIS. Commentors suggested a number of alternatives that should be included in the NEPA evaluation, including extensive upgrades to the CMR Building needed to sustain operations for another 20 to 30 years; use of RLUOB and/or the TA-55 Plutonium Facility for analytical chemistry and materials characterization activities, or relocating this capability to another NNSA site; and construction of a vault for secure storage of nuclear materials that would make sufficient space available in RLUOB and the TA-55 Plutonium Facility for CMR missions.

Response:

As indicated in Chapter 1, Section 1.3, of this SEIS, NNSA has a continuing purpose and need to provide analytical chemistry and metallurgical characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and not proceed with the CMRR-NF, such an alternative is not consistent with meeting NNSA's mission need nor does it reflect the status quo at LANL. The No Action Alternative in this *CMRR-NF SEIS* is based on the decision announced in the 2004 ROD for the original *CMRR EIS*. This is consistent with CEQ recommendations that, for proposed changes to an ongoing activity, "no action" can mean continuing with present plans (51 FR 15618). NNSA determined that a supplement to the *CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in design and construction of the CMRR-NF and has addressed alternatives consistent with previous analyses and decisions.

NNSA considered a series of alternatives in the development of this *CMRR-NF SEIS*. Chapter 2, Section 2.7, has been revised to describe these alternatives and why they are unreasonable and were not analyzed further in this *CMRR-NF SEIS.* These alternatives include alternatives suggested by commentors, including extensive upgrades to the existing CMR Building in whole or in part and construction of the CMRR-NF vault for use in conjunction with the TA-55 Plutonium Facility and RLUOB. As stated in Chapter 1, Section 1.5, of this *CMRR-NF SEIS*, NNSA does not intend to revisit decisions previously made concerning the level of operations at LANL, including the decision regarding maintenance of CMR operational capabilities to support critical NNSA missions. Additionally, after analyzing alternative locations across the NNSA National Security Enterprise Complex, NNSA selected LANL for the plutonium mission in the *Complex Transformation SPEIS* ROD. Thus, relocation of the CMR missions to another NNSA site was not reconsidered.

The proposal to construct a new facility at LANL to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2003 *CMRR EIS*, DOE considered the proposal to complete extensive upgrades to the existing CMR Building's structural and safety systems to meet current mission support requirements for another 20 to 30 years of operations and dismissed it from detailed analysis (DOE 2003b). Beginning in 1997 and continuing through 1998, a series of operational, safety, and seismic issues surfaced regarding the long-term structural viability of the CMR Building. In the course of considering these issues, DOE determined that the extensive facility-wide upgrades originally planned for the CMR Building would be less technically feasible than had been anticipated and would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Structurally upgrading the entire structure to a significant extent would require construction of new walls and other building components adjacent to the existing ones that have utilities and structural building features already in place. In addition, the floors of the building would need to be significantly upgraded. This work would have to occur while continuing to provide mission-essential operations in the CMR Building using nuclear materials and hazardous chemicals.

The technical challenges of implementing extensive seismic upgrades to the entire CMR Building, as discussed in the 2003 *CMRR EIS,* remain and are exacerbated by the findings of the subsequent probabilistic seismic hazard analysis and the magnitude of the current DBE (LANL 2007). However, in response to comments regarding upgrading the CMR Building, NNSA has considered undertaking a more limited, yet intensive, set of upgrades to a single wing of the CMR Building, Wing 9, to meet current seismic design requirements so that this wing could be used for a limited set of Hazard Category 2 analytical chemistry and materials characterization operations. CMR Building operations and capabilities are currently restricted due to safety and security constraints. Although the limited Wing 9 upgrade would allow the current operational restrictions on material quantities to be relaxed somewhat so that larger quantities of special nuclear material could be used within the laboratories, the size of Wing 9 would limit the amount of laboratory space that could be developed to less than half of that required to meet NNSA's purpose and need for mission support work. After careful consideration of the complex engineering and operational issues, as well as the CMR Building site's seismic issues, this potential Wing 9 upgrade alternative was also determined not to be a reasonable alternative for meeting NNSA's purpose and need for action.

Construction of only the proposed CMRR-NF vault at TA-55 and use of the TA-55 Plutonium Facility was also considered by NNSA to determine whether that proposed combination, together with the planned future use of RLUOB, would provide adequate space for analytical chemistry and materials characterization operations over the long term. However, augmenting the existing TA-55 Plutonium Facility with only additional vault storage space would not alleviate the need for additional work space for analytical chemistry and materials characterization laboratory operations. Space does not exist in the TA-55 Plutonium Facility to support this work, and these operations cannot be accomplished within RLUOB because RLUOB is not able to support the level of radiological operations required to support the work needed. As discussed in Chapter 2, Section 2.5, of this *CMRR-NF SEIS*, RLUOB contains a radiological laboratory capable of handling less than Hazard Category 3 radioactive materials per DOE Standard 1027, *Hazard Categorization and Accident Analysis Techniques for Compliance with DOE Order 5480.23, Nuclear Safety Analysis Reports* (DOE 1992). It is currently authorized to handle gram quantities of plutonium-239 equivalent. The CMRR-NF is being designed as a Hazard Category 2 facility capable of using kilogram quantities of plutonium-239 equivalent. This alternative was, therefore, not analyzed further in this *CMRR-NF SEIS*.

SECTION 3
PUBLIC COMMENTS AND NNSA RESPONSES

3.0 PUBLIC COMMENTS AND NNSA RESPONSES

This section presents a side-by-side display of the comments received by the National Nuclear Security Administration (NNSA) during the public comment period, as well as late comments received through July 31, 2011, on the *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR-NF SEIS)* and NNSA's response to each comment. To find a specific commentor or comment in the following pages, refer to the "List of Commentors" immediately following the Table of Contents. This list is organized alphabetically by commentor name and shows the corresponding page number(s) where commentors can find their comment(s).

If a commentor provided comments through a postcard, form letter campaign, or petition, that commentor is referred to a copy of that postcard or form letter. This section only contains one representative copy of each postcard, form letter, or petition.

This page left blank intentionally.

Commentor No. 1: Tara Somerville

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, NNSA Los Alamos Site Office, 3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico, 87544 or fax: (505) 667-5948); or e-mail : NEPALASO@doeal.gov

Deadline June 28, 2011

Dear Mr. Tegtmeier,

I am writing to express my opposition to the construction of new Chemical and Metallurgical Research Replacement - Nuclear Facility at Los Alamos National Labs. For the following reasons:

1-1

1. I am not in support of the construction of new nuclear weapons by the United States (or any country for that matter.) Their ability to cause such horrific killings and massive long-lasting environmental damage make their use an unwise, self-defeating choice and their construction an irresponsible waste of precious financial resources that could be used for the betterment of our state and nation, ~~such as~~ for instance for education programs & scholarship programs for underprivileged youth, research into renewable energy resources like solar and wind power.

1-2

2. I also have great concern about the proximity

CMRR-NF Hearings:

Mon. May 23, 5 to 9 p.m., Albuquerque Marriott, Salon F, 2101 Louisiana NE (Louisiana & 140) Albuquerque
Tues, May 24, 5 p.m. to 9 p.m., Holiday Inn Express, 60 Entrada Dr., Los Alamos
Wed. May 25, 5 p.m. to 9 p.m., Santa Claran Hotel, 464 N. Riverside Dr., Espanola.
Thur. May 26, 5 p.m. to 9 p.m., Santa Fe Community College, Jemez Rooms, 6401 Richards Ave, Santa Fe.
View or download SEIS document : http://www.nepa.energy.gov *or* http://www.nnsa.energy.gov/nepa/cmrrseis

1-1 NNSA acknowledges the commentor's concerns about construction and operation of the CMRR-NF. NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

1-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 1 (cont'd): Tara Somerville

of the new building to a seismic fault TS zone (the Pajarito Plateau.) The recent and current tragedy surrounding the Fukushima nuclear power plant in Japan is a dreary case in point TS and reminder of the repercussions surrounding areas can suffer when nuclear facilities are built on shaky ground. **1-2 cont'd**

I have been a resident of Taos County since 2005 and a business owner since 2008.

Thank you very much for your time.

Sincerely,

Tara Somerville

Commentor No. 2: Kenny Quinn

Submit Questions or Comments about the Draft CMRR–NF SEIS to:

Mr. John Tegtmeier, CMRR–NF SEIS Document Manager, NNSA Los Alamos Site Office,
3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico, 87544
or fax: (505) 667-5948); or e-mail : **NEPALASO@doeal.gov**. **Deadline June 28, 2011**

I am in complete agreement that a New (EIS) is needed & not a Supplemental (EIS) for the proposed CMRR-NF. The main reasons I am in support ~~opposed~~ to having a ~~the~~ New ~~Supplemental~~ (EIS) is the increased financial Cost, addressing the health & well being of people affected by the project, and finally the hidden cost of dealing w/ the nuclear waste. The initial (2004) EIS was assessed for a 500 million dollar project. Today 7 years latter the project cost has increased 9 times to a figure of 4.5 Billion. How can the original w/ a Supplement address the issues & concerns of a ~~pro~~ dangerous project of this magnitude & Scope. ~~Since~~ The initial EIS addressed concerns for the health & Saftey of people affected by the project. The 2004 EIS & a supplemental would not adequatly address the health & safety of the much larger proposed project. ~~When dealing with making a nuclear bomb, there are many steps (Process)~~ I am reminded of the ongoing legacy of the mining of uranium on the Navajo Reservation of New Mexico & Arizona. I have a nurse friend who provides health care to the uranium miners. These men are now in their 80's & suffer from such diseases as cancer & nurological diseases directly related to mining of uranium. In essence we are still paying for the health of these impacted humans from up to 50 years ago.

CMRR-NF Hearings:

Mon. May 23, 5 to 9 p.m., Albuquerque Marriott, Salon F, 2101 Louisiana NE (Louisiana & I40) Albuquerque
Tues. May 24, 5 p.m. to 9 p.m., Holiday Inn Express, 60 Entrada Dr., Los Alamos.
Wed. May 25, 5 p.m. to 9 p.m., Santa Claran Hotel, 464 N. Riverside Dr., Espanola.
Thur. May 26, 5 p.m. to 9 p.m., Santa Fe Community College, Jemez Rooms, 6401 Richards Ave. Santa Fe.
View or download SEIS document : http: www.nepa.energy.gov or http: www.nnsa.energy.gov/nepa/cmrrseis

2-1

2-1 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than a supplement to the *CMRR EIS*. NNSA determined that a supplement to the *CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Commentor No. 2 (cont'd): Kenny Quinn

I am curious to know if the EIS & Supplement is addressing the process & cost of dealing with disposal (Containment) of the nuclear waste produced & properly containing the nuclear waste of the old outdated, unsafe nuclear bombs. ***2-2***

Truly No action for the proposed project is the only Sane Sollution.

Kenny Quinn
P.O. Box 183
Carson, N. Mex 87517

2-2 NNSA notes the commentor's concern about the waste and containment issues surrounding nuclear weapons. The *CMRR-NF SEIS* does address the disposal of waste generated by facilities included in the alternatives evaluated in the SEIS. However, issues related to waste from retired nuclear weapons are beyond the scope of this SEIS.

Commentor No. 3: Joanne Forman

69 Maestas Rd\Ranchos de Taos NM 87557
23 May 2011

Sir:

This citizen is opposed to ANY expansion, including pit production, at Los Alamos. The last thing this world needs is more weaponry!! 3-1

As for the canard that it brings "prosperity" to our state, NM is, in many areas, down there with Mississippi. SHAME. 3-2

Sincerely,

Joanne Forman

3-1 NNSA notes the commentor's opposition to any expansion of operations, including pit production, at LANL. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the CMRR-NF SEIS, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, and Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

3-2 The socioeconomics sections of the CMRR-NF SEIS present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the CMRR-NF SEIS, construction of a new CMRR-NF under the No Action Alternative and the Modified CMRR-NF Alternative would require a construction workforce that would be needed for up to 9 years. As stated in the CMRR-NF SEIS, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico, as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 4: Leslie Elgood, CEO
New Mexico Community Capital

May 24, 2011

Mr. John Tegtmeier, CMRR-NF SEIS
U.S. Department of Energy
National Nuclear Security Administration
Los Alamos Site Office
3747 West Jemez Road,
TA-3, Building 1410
Los Alamos, NM 87544

Dear Mr. Tegtmeier:

I am writing in support of the construction of the CMRR project primarily because of its critically important economic impact, particularly for the hard-hit New Mexico construction industry. The building industry in this state has been hit with an extended three year one-two punch, no new housing and no new commercial constructions. This makes the need for large construction projects critically important ones to job retention and creation. I think this is a project important for job creation and retention in a state with almost 8% overall unemployment and over 15% unemployment in parts of Northern New Mexico. **4-1**

Los Alamos National Laboratory has managed other projects of this size and have a track record of responsibility and inclusion.

LANL itself is crucial to New Mexico's economic health, creating a $2.9 billion impact on the state's economy and supporting about 24,000 jobs, according to the University of New Mexico.

Not only does the Lab create jobs, but they also support initiatives that promote economic development independent of the Laboratory. My organization has been a partner with the LANS Northern New Mexico Connect program. As a result, hundreds of small businesses in the northern and north-central part of the state have received high-end technical assistance.

Should you have any questions at all, please do not hesitate to call me.

Sincerely,

Leslie Elgood

4-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative and the Modified CMRR-NF Alternative would require a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico, as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 5: Darren M. Cordova, Mayor

John A. Tegtmeier
Department of Energy
National Nuclear Security Administration
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

Mr. Tegtmeier:

The Town of Taos is in receipt of a form letter from your office, dated April 21, 2011, wherein it informs the reader that your office will be holding three public hearings on May 24, 25, and 26, in Los Alamos, Española, and Santa Fe (respectively). The purpose of these hearings is to discuss the findings of the environmental impact analysis contained within the Draft CMRR SEIS.

5-1 Given that the Town of Taos, as a representative agency of its citizens, considers the greater Taos community as an interested party, we respectfully request that a formal hearing, similar to those afforded to other communities in the affected region, be held within the Town of Taos. There is a considerable number of citizens in our area that have taken positions of interest on this matter, so much so that the Town Council took a similar position regarding its view of the SEIS pertaining to the Nuclear Facility portion of the CMRR Project by passing Town of Taos *Resolution 11-03* on January 25, 2011. In support of this request for a formal hearing in Taos, the Town is willing to provide the meeting space necessary to accommodate such a hearing.

We ask that your office seriously consider our request and hope you will grant said request as soon as possible to allow for adequate notification to our public. Please feel free to contact me or the Town Manager, Daniel Miera, directly at (575) 751-2003 should you have any questions or wish to discuss this request in more detail. Thank you.

Regards,

Darren M. Cordova
Mayor

"La Ciudad de Don Fernando de Taos"
Incorporated May 7, 1934

5-1 NNSA notes the Mayor's request for a public hearing on the *Draft CMRR-NF SEIS* in Taos, New Mexico. After further discussions with the Mayor, NNSA decided to hold an informational meeting in Taos. In addition to a poster session similar to that associated with a hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos.

Commentor No. 6: Scott Kovac, Operations and Research Director Nuclear Watch New Mexico

Mr. John Tegtmeier
CMRR-NF SEIS Document Manger

Roger Snyder
Deputy Manager Los Alamos Site Office

Gentlemen,

Thank you for adding the hearing in Albuquerque. I believe you will find this to be a worthwhile addition. (Your response Friday had to have been the quickest response I've ever received.)

This response is a preliminary response that does not represent all the groups, yet. But I wanted to respond as quick as I could with what I know.

Unfortunately, we find the lack of response to our request for a hearing in Taos, which your response on Friday did not even mention, unacceptable.

Since then, the Mayor of Taos, Mr. Darren M. Cordova, has requested a hearing in Taos. A copy of that letter is attached. As you stated in your reply, any environmental impacts from the proposed CMRR Nuclear Facility would most appreciably involve those in Northern New Mexico, where Taos is located. Please plan a hearing in Taos or at least let us know why not. *6-1*

The Nuclear Facility is a national issue. It is part of the national nuclear weapons complex. Hearings for the Complex Transformation and Greater than Class C EISs, to name a couple, were scheduled for DC, even though neither of these EISs covered facilities that were located in DC. These examples must be followed for the CMRR-NF SEIS.

The draft CMRR-NF SEIS is proving to be problematic to provide comments on.

For instance, we cannot find what is the plutonium pit production rate that the EIS is covering. Does this EIS cover a pit production rate of 20, 50, or 80 pits? This is an important question and not knowing the answer makes it impossible to compare *6-2*

6-1 After consideration of the request for a public hearing, NNSA held an decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with a hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. DOE determined that holding a public hearing in Washington, D.C., is not appropriate for the *CMRR-NF SEIS* because construction of the CMRR-NF is specific to LANL missions.

6-2 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF.

The waste generation rates shown in Chapter 4, Sections 4.2.12 and 4.3.12, are estimates for operating the 2004 CMRR-NF and RLUOB or the Modified CMRR-NF and RLUOB over a typical year assuming the facility accomplishes the type of work planned for this facility as described in Chapter 2, Section 2.4. As explained above, this work does not include the production of plutonium pits.

Problems with links to references that may have been experienced during the public comment period were corrected as soon as they were identified. In addition, the references were placed in a number of libraries in the area surrounding LANL as identified in Chapter 9 of the *CMRR-NF SEIS* and the Notice of Availability for the *Draft CMRR-NF SEIS* (76 FR 24018) published on April 29, 2011.

Commentor No. 6 (cont'd): Scott Kovac, Operations and Research Director, Nuclear Watch New Mexico

this EIS to the 2003 CMRR EIS and other documents. We also do not know the what the waste volumes generated are based upon.

This question should have been a answered, for example, in "Table 434 Modified CMRR-NF Alternative ‹ Operational Waste Generation Rates Projected for Modified CMRR-NF, RLUOB, and Los Alamos National Laboratory Activities."

The second column, "Projected Modified CMRR-NF Generation Rate" has a footnote "a" that leads to the footnote - " From CMRR-NF Project and Environmental Description Document (LANL 2010d) and other sources (LANL 2011)."

(LANL 2010d) is a link -

http://nnsa.energy.gov/sites/default/files/seis/LANL%202010d%20CMRR-NF%20 Pro

ject%20Env%20Desc.doc - that leads to a page error.

And (LANL 2011) does not exist in the reference document list.

We are completing a survey of reference document issues, but problems like these are impeding the public comment process. And, really, the public comment timeframe should not start until all problems like these are taken care of. **6-2 cont'd**

We do appreciate your attempts to be sensitive to our workload concerns, but extending the comments period only 15 days, respectfully, does not help. (We have yet to see the Federal Register notice yet.) Having the GTCC and the CMRR-NF one day apart is an impossible request. We need to have only one EIS event per month. For instance, one set of hearings or one public comment period that ends is plenty of work load for one month.

Thank you for your consideration,

Scott

Subject: Proposed CMRR Project Los Alamos New Mexico

To whom it may concern,

I am sending this e-mail to show my support for the proposed CMRR project. I believe it is in the Nations best interest to move forward with this project for the following reasons, the current facility was built if memory serves in the early 1960s. If there were any changes made to the design, they were only to enhance the seismic up grades for the facility. After the recent issue in Japan I don't understand how anyone could object to that. *8-1*

Thank you,

R. Daniel Beavers
Business Representative
Plumbers and Pipefitters
Local Union No. 412

8-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

All proposed new facilities would be designed, constructed, and operated in compliance with applicable DOE orders, requirements, and governing standards, established to protect public and worker health and the environment. DOE Order 420.1B (DOE 2005) requires that nuclear or nonnuclear facilities be designed, constructed, and operated so that the public, the workers, and the environment are protected from the adverse impacts of natural phenomena hazards, including earthquakes. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for a description of some of the recommendations regarding enhancement of the CMRR-NF to address issues related to nearby seismic faults.

Subject: Public Scoping Comments: CMRR Project & Plutonium Pit Production
May 24, 2011

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
Department of Energy
Los Alamos Site Office
3747 West Jemez Road
Los Alamos, NM 87544

Re: Public Scoping Comments – Chemistry & Metallurgy Research Replacement (CMRR) Project as Part of the Plutonium Complex at Los Alamos National Laboratory (LANL)

Need for a New Environmental Impact Statement

Dear Mr. Tegtmeier:

I am writing to provide you with my scoping comments about the CMRR Project, which includes the Nuclear Facility (NF), the proposed addition to LANL's nuclear weapons production complex. The alternatives proposed in the 2003 final CMRR environmental impact statement (EIS) are no longer applicable today. It's time to start over and re-examine the purpose and need for the Project by preparing a new EIS. Further, it is premature to begin the scoping process when Secretary Chu has asked for an independent expert committee to review the need for the CMRR-NF. *9-1*

The Costs of Trying to Build a Plutonium Pit Production Complex in a Geologically Unstable Area Are Just Too High - The total original estimate for the CMRR Project, including the recently completed $363 million Radiological Laboratory Utility and Office Building (RLUOB), was around $600 million in 2004. The current estimate is $4.5 billion. The estimate, no doubt, will continue to climb. *9-2*

LANL is located between a rift valley (the Rio Grande in that area) and a volcanic range (the Jemez Mountains) in a seismic fault zone (the Pajarito Plateau). An updated seismic hazards analysis was published in May 2007. It showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the over $3 billion in cost estimate increases since 2008 are due to efforts to address the increased seismic hazards. DOE must analyze whether $3 billion *9-3*

9-1 NNSA notes the commentor's support for the preparation of a new EIS rather than a supplement to the *CMRR EIS*. NNSA determined that a supplement to the *CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information. In regards to an "independent expert committee" reviewing the need for the CMRR-NF, in November 2010, the Secretary of Energy invited experts to provide him with their individual assessment of program requirements for the CMRR-NF and the Uranium Processing Facility at the Y-12 National Security Complex in Oak Ridge, Tennessee (DOE 2010). In addition, the U.S. Department of Defense is conducting a review, with support from an independent group of experts, to consider safety, security, and program requirements and to develop an independent assessment of estimated cost range data for the CMRR-NF and the Uranium Processing Facility. Analyses and recommendations from these independent assessments, information in the *CMRR-NF SEIS*, and other programmatic considerations will be weighed as NNSA moves toward a final decision on the construction and operation of a CMRR-NF.

9-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

9-3 Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior

Commentor No. 9 (cont'd): Angela Werneke

is too high a premium to pay for a new NF. In order to address these increased seismic hazards, DOE now plans to excavate 225,000 cubic yards of earth under the proposed NF and fill the hole with concrete. DOE must address the following questions: Is the surrounding geology robust enough to support all that concrete? Would a seismic event cause the concrete "slab" to sink or shift? ***9-3 cont'd***

Cleanup of the Existing Mess Must Be the Priority – Not a New Nuclear Facility - DOE made a commitment to clean up the legacy waste sites at LANL when it signed the Consent Order with the New Mexico Environment Department on March 1, 2005. The Order requires cleanup of certain sites by December 31, 2015, including the Area G dump site at Technical Area 54. Construction activities for a new NF will interfere with cleanup activities, including those at the nearby Material Disposal Area C. DOE must make compliance with the Order the priority – not a new NF. ***9-4***

New Alternatives Are Required – DOE must return to the drawing board in order to develop more alternatives, including not building the NF; stop operations at the old, dangerous CMR Building; and conduct a "capacity study" to determine whether the existing facilities – as they have since 1999 when DOE limited plutonium pit manufacturing to 20 per year - can be used instead of building the proposed NF. All analyses of alternatives must incorporate the new 200,000 square foot RLUOB in the review. Operations for the RLUOB are scheduled to begin in less than two years. ***9-5***

<u>Requisite Analyses for the New Environment Impact Statement</u>:

1. Environmental Justice – Both Economic and Ethnicity Analyses Must Be Done - Los Alamos County is one of the richest counties in the U.S.A. It is surrounded by some of the poorest and most ethnically diverse counties in the country. Therefore, shipping any type of waste to anywhere else is an inherent environmental justice issue. Such analyses must be completed in the new draft EIS. ***9-6***

2. Health Effects for Those Most at Risk - Many federal standards for protection of human health, such as limits on emissions from the proposed CMRR-NF industrial stacks, are based on "Reference Man," a hypothetical Caucasian male 20 to 30 years old weighing 154 pounds. All analyses must address the risk to a pregnant woman farmer, her fetus, and her other children under age 18, rather than Reference Man. As a matter of reproductive and environmental justice, the most potentially vulnerable human beings must be protected. Such analyses must be completed in the new draft EIS. ***9-7***

to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

9-4 NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

9-5 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

9-6 Chapter 3, Section 3.10, provides a description of the composition of the 50-mile (80-kilometer) region of influence surrounding LANL, including minority and low-income populations. Analysis of specific impacts to populations in close proximity of LANL at additional radial intervals of 5, 10, and 20 miles (8, 16, and 32 kilometers) has been added to the *Final CMRR-NF SEIS* in Chapter 3, Section 3.10, and Chapter 4, Sections 4.3.11 and 4.4.11. Impacts from transportation are presented in Chapter 4, Sections 4.2.13.1, 4.3.13.1, and 4.4.13.1. Both radiological and nonradiological risks from transportation would be small under all alternatives.

9-7 The radiological dose and impact estimates are based on national and international standards that do consider both sexes and a range of ages. These techniques were developed by the world's experts to try to accurately address the potential impact on the population as a whole from radiation. These techniques are considered appropriate for use in EISs.

Commentor No. 9 (cont'd): Angela Werneke

3. Waste Disposal - To Use DOE Terminology: What is the "Path Forward?" - Given the anticipated lack of disposal facilities for low-level radioactive, toxic, and hazardous waste at LANL, DOE must detail where its legacy and newly generated waste will be disposed and how it will be transported to off-site facilities. DOE must detail the proposed transportation modes and routes and the impacts to the communities along the routes and those surrounding the dumps. What emergency preparedness capabilities exist along the proposed routes? *9-8*

4. Water Usage in the Face of Stricter Limits Asked By DOE – DOE estimated in the 2003 Final CMRR EIS that waste generation may double and the annual water consumption may increase by 10.4 million gallons. Why should a Leadership in Energy and Environmental Design (LEED) certified building generate any waste, emit contaminants into the air, or discharge contaminated water into the canyons? DOE must explain these contradictions in the new draft EIS. *9-9*

5. Climate Change Impacts Required – "Just-Do-It" - On February 18, 2010, the Council on Environmental Quality (CEQ) released draft guidance for public comment about how "Federal agencies can improve their consideration of the effects of greenhouse gas GHG emissions and climate change in their evaluation of proposals for Federal actions under the NEPA." While the guidance is being finalized, the CEQ recommends "just-doing-it." DOE must conduct such analyses in the new draft EIS. *9-10*

6. Methods for Decontamination, Decommissioning and Demolition (DD&D) of the Existing CMR Building and the Proposed New NF - The 2004 Record of Decision (ROD) for the CMRR Project stated the existing CMR building would be DD&D in its entirety. However, the actual implementation of these decisions is dependent on DOE funding levels and allocations of the DOE budget across competing priorities, including construction of a new NF. The DD&D Work Plan must be part of the new draft EIS in order to ensure that it becomes part of the complete National Environmental Policy Act (NEPA) analyses. Further, the new draft EIS that will analyze the impacts of building a new NF must also examine the impacts of removing it. *9-11*

Thank you for your consideration of my comments.

Sincerely,

Angela Werneke
awerneke@earthlink.net
3466 Cerrillos Road J1
Santa Fe, NM 87507-3014
505.988.2099

9-8 Radioactive waste generated by construction and operation of the proposed CMRR-NF would be managed through the LANL waste management program, as described in Chapter 3, Section 3.12.4.1, Solid Radioactive Waste Management. Low-level and mixed low-level radioactive waste would be disposed of off site at either the Nevada National Security Site or the commercial facility in Clive, Utah. Transuranic waste would be disposed of at the Waste Isolation Pilot Plant in New Mexico. Impacts associated with management and transport of these wastes are evaluated in the waste management and transportation sections of Chapter 4. Radioactive waste would be transported by truck. The transportation routes that are analyzed are shown in Appendix B, Figure B-1. The level of emergency preparedness would vary along the transportation routes. DOE uses DOE Order 151.1, Comprehensive Emergency Management System, as a basis to establish a comprehensive emergency management program that provides detailed, hazard-specific planning and preparedness measures to minimize the health impacts of accidents involving loss of control over radioactive material or toxic chemicals. DOE contractors are responsible for maintaining emergency plans and response procedures for all facilities, operations, and activities (including transportation) under their jurisdiction and for implementing those plans and procedures during emergencies. The Transportation Emergency Preparedness Program was established by DOE to ensure its operating contractors and state, tribal, and local emergency responders are prepared to respond promptly, efficiently, and effectively to accidents involving DOE shipments of radioactive material.

9-9 LANL approaches sustainability on a site-wide basis, knowing that new facilities will require the use of limited resources. LEED certification ensures that new projects such as the proposed CMRR-NF are executed sensibly, while other efforts, such as decommissioning of unused space and large-scale infrastructure projects are aimed at improving the efficiency of energy and water use site wide. LEED certification has become an industry standard for achieving more efficiency in buildings in terms of energy and water use. Using a tiered approach, the LEED program educates and encourages selection of strategies and products that reduce water consumption and waste compared to buildings that do not incorporate such measures (see Chapter 4, Section 4.6, for additional information related to LEED-related efforts at LANL). Efforts like these are focused on achieving continual resource use reductions for the entire LANL site, as set out in DOE regulations and Executive orders.

Commentor No. 9 (cont'd): Angela Werneke

9-10 The *CMRR-NF SEIS* includes an analysis of the impacts of the proposed alternatives with respect to greenhouse gas emissions. Refer to Chapter 4, Sections 4.2.4.2, 4.3.4.2, and 4.4.4.2 of the SEIS. For all alternatives, annual greenhouse gas emissions during construction and operation would be below the draft CEQ guidance threshold that would require a more-detailed evaluation.

9-11 The projected environmental impacts associated with decontamination, decommissioning, and demolition of the existing CMR Building and the proposed CMRR-NF are considered to the extent possible at the current time in the *CMRR-NF SEIS* (see Chapter 4, Section 4.5, of the SEIS).

Commentor No. 10: Glenn McMaken

Subject: CMRR comment

I only want to say the CMRR is a necessary project and I support continuing forward with construction of it. The current CMR is beyond its life expectancy, and the new building is needed to continue to process materials the old facility handled. Concerns over the safety of the building are unfounded. ***10-1***

Thank-you,

Glenn McMaken

10-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

Subject: CMRR Supplemental EIS
To Whom It May Concern:

I am writing in support of moving forward with the Los Alamos National Laboratory Chemistry and Metallurgy Research Replacement Project.

First and foremost, I believe it to be crucial and Instrumental to preserving our national security, and second, I support it from an economic boost perspective for both Northern New Mexico, and the State as a whole. *11-1*

I hate it that we have to spend billions of dollars for a facility such as the CMRR, and I pray we never have to actually deliver the products it produces, but I can't see any other option. We can say the Cold War is over, and I think from one perspective it is, but even as good as our foreign intelligence is, I'm not convinced we know where the next threat to the United States will come from. We need to be prepared on the highest level.

I stand with the often quoted school of "Walk softly, but carry a big stick".

Please insure that I am counted in support of this project .

Respectfully,

Bart Davis

bdavis@jbhenderson.com

11-1 NNSA notes the commentor's support for the proposed CMRR-NF project. The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative and the Modified CMRR-NF Alternative would require a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico, as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 12: Margaret Powers

From: makpowers@aol.com

To: NEPALASO@doeal.gov
Subject: CMRR SEIS comments

I support the proposal to relocate activities from the existing CMR facility to a new facility on Pajarito Rd. The new facility would be within a more secure area, will be more stable in the event of a seismic event, and would reduce the movement of radioactive materials across LANL, thus reducing the likelihood of a release from a vehicle accident. In addition, LEEDS certification should be pursued to demonstrate a commitment to energy savings and long-term sustainability. The *12-1* environmental impacts of constructing the new facility do not greatly exceed those analyzed in the 2003 EIS. It appears that the shallow excavation option provides some measure of savings in transportation, energy, water, etc. I believe that DOE should select that option, since it appears to have the least environmental costs, assuming it has the same safety and security provisions as the deep option. *12-2*

Margaret Powers
3 Rocking Horse Rd
Santa Fe, NM 87506

12-1 NNSA notes the commentor's support for the proposed CMRR-NF project. The CMRR-NF is registered under the U.S. Green Building Council LEED-NC rating system, as discussed in Chapter 2, Section 2.5, Description of Actions Taken to Date Related to the Chemistry and Metallurgy Research Building Replacement Project.

12-2 NNSA notes the commentor's preference for the Shallow Option for constructing the CMRR-NF.

Subject: DRAFT CMRR SEIS

Attn: Mr. John Tegtmeier, CMRR–NF SEIS Document Manager

I would like to express my support for the construction of the new CMRR facility in Los Alamos, New Mexico. It is imperative that US science and technology are provided state of the art facilities with capabilities to advance research and support the stockpile stewardship of the US. As a Northern New Mexico resident and US citizen this will not only bring economic growth to the region but also economic benefits to small and large business across the US. The US needs this, New Mexico needs this, the National Laboratory needs this. Thank you for taking my comments into consideration. *13-1*

Respectfully submitted,

Jerry Bonn

Subject: CMRR-NF SEIS

Continuation of nuclear production and enriched plutonium is unthinkable at Los Alamos, or anywhere else. It is incompatible by its very nature with the concept of Environmaental Impact. The environmental consequences of production, distribution, utilazation, and waste containment are all unaccepatable on this planet. Specifically, the consequences from earthquake has not been provided for properly. ***14-1***

Nuclear weapons are unjustiafiable as defense strategies or offensive weapons in today's world and are no longer needed, if in fact, they were ever needed.

Please cease and desist your plan to operate or "improve" these facilities. It is unsafe and utter folly.

Cheers,

Michael 'Ike' Levy

Skype: icarus8888

14-1 The CMRR-NF SEIS does consider the unlikely event of a severe earthquake that results in the release of radioactive material.

Detailed discussion of accidents is presented in Appendix C; potential impacts related to each alternative are presented in Chapter 4, Sections 4.2.10.2, 4.3.10.2, and 4.4.10.2.

Site-specific geotechnical investigations have been completed for the proposed CMRR-NF project site for both the Shallow Excavation Option and the Deep Excavation Option and recommendations issued related to the design of the CMRR-NF. The *CMRR-NF SEIS* has been revised to include this information. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Subject: my comments about the proposed new CMRR building
Attachments: Personal statement addressed to the hearing about the LANL plan for the new CMRR Building.doc

Please see the attachment, which has my thoughts about the proposed new CMRR building. I am praying that whoever actually reads any of this, might really begin to question this proposal, if not even look into their own heart to decide where the truth lies.

Sincerely,

Ann Hendrie—living downwind, in Ojo Sarco, NM

Response side of this page intentionally left blank.

Commentor No. 15 (cont'd): Ann Hendrie

Personal statement addressed to the hearing about the LANL plan for the new CMRR Building…

First of all, I want to thank the Greg Mello's of the world, the Concerned Citizens for Nuclear safety, the Los Alamos Study Group, Nuclear Watch and all those here who have voluntarily dedicated some, if not a LOT, of their energy and lives to questioning the viability of our nuclear present and future. This presence of conscience in the face of seemingly insurmountable odds is the only re-assuring glimpse of sanity in this room.

I have 2 questions for the representatives of the nuclear (defense and energy)industry, which I would like to resurrect from the drowning of industry propaganda to which we are all subjected. These 2 questions are: Why do we need more nuclear warheads?

To answer that first question, we need only to look at Who profits from them. As for really deploying them, any 1 of them, I believe the U.S. has already made its point to the world in 1945.

The second question is: Does the nuclear industry have the incentive, much less the means, of assessing the true risks and costs of nuclear?

I suggest that economics, psychology and history might provide some answer.

Psychologically speaking, we do a bad job in managing risks when they are so enormous and unpredictable. We have little empirical basis for judging rare events, so it is difficult to arrive at good estimates. After Chernobyl, and now, Japan, there has not been even the resources nor the means to collect that data accurately. And when corporations run the show, there might be few incentives to think hard at all. On the contrary, when others bear the cost of mistakes, the incentives favor self-delusion.

Experts assure us that New Technology all but eliminates the risk of catastrophe. Events prove them wrong: not only do risks exist, but their consequences are so enormous that they easily erase all the supposed benefits of nuclear technology. What insurance company is willing to be liable in case of a nuclear catastrophe? NONE. Thanks to the US 1957 Price-Anderson Nuclear Industries Indemnity Act, Bechtel(in this case) passes off liability to the public. Is the nuclear industry lobby willing to rescind that Act?? ….So, we can conclude: a system that socializes losses and privatizes gains is doomed to mismanage Risk. ***15-1***

Compounding this self-delusion of the industry, is the secrecy surrounding the nuclear industry, which prevents the public from gaining much information about risks arising from their operations, much less in knowing how to protect themselves in the event of a crisis. What are the so-called escape routes—for Espanola residents, much less for the Japanese? What escape route exists, when it affects the whole planet? And if university professors are hindered in their research programs to study the toxicological effects of long-term, low level exposure to radionuclide contamination, how can we adequately trace the effects back to the source? ***15-2***

15-1 The accident analyses in the *CMRR-NF SEIS* rely on conservative assumptions that over-estimate the potential impacts of severe events to ensure that NNSA has an understanding of the impacts of beyond-design-basis events. In response to concerns following the earthquake and subsequent tsunami that damaged the Fukushima Daiichi Nuclear Power Plant, NNSA revised the *Final CMRR-NF SEIS* to include additional information about the geologic and seismic environment at LANL, additional analysis of extreme events, and a discussion of critical differences between a nuclear power plant (like the Fukushima Daiichi Nuclear Power Plant) and a nuclear materials research laboratory. NNSA believes that the final *CMRR-NF SEIS* presents a rigorous analysis and thorough understanding of the potential environmental consequences that each of the alternatives presents.

15-2 The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10.

Chapter 3, Section 3.11.6, Emergency Preparedness, of the *CMRR-NF SEIS* addresses emergency response preparedness. Emergency response facilities and equipment, trained staff, and effective interface and integration with offsite emergency response authorities and organizations support NNSA's emergency management system at LANL. LANL personnel maintain the necessary apparatus, equipment, and a state of the art Emergency Operations Center to respond effectively to virtually any type of emergency, not only at LANL, but throughout the local community as well. Additional information on the Emergency Operations Center can be found in the 2008 *LANL SWEIS* (DOE 2008a).

Radioactive waste generated by construction and operation of the proposed CMRR-NF would be managed through the LANL waste management program, as described in Chapter 3, Section 3.12.4.1, Solid Radioactive Waste Management. Low-level and mixed low-level radioactive waste would be disposed of off site at either the Nevada National Security Site or the commercial facility in Clive, Utah. Transuranic waste would be disposed of at the Waste

Commentor No. 15 (cont'd): Ann Hendrie

And who pays(and will pay for the next 100,000+ years!!!)for the still-unmanaged disposal of nuclear waste? After 50 years of trying, no acceptable solutions for long(and I mean LONG) term storage of nuclear waste has been found. That, even by good business standards, should be unacceptable, unless, as I said, it is paid for by the public. If the costs are hidden, who's to blame?? And we can conclude again: vested interests cause the nuclear industry to compulsively Underestimate these costs and risks.

15-2 cont'd

I do not think that there is any doubt left in the public mind that our political institutions are too weak to stand up to the Nuclear Lobby in terms of safety. So, who is to lobby for the environment, for the uranium miners, for the populations down-wind? Only the few Greg Mello's, Joni Arends',Jay Coglan's and us, that's who.

Even though the nuclear industry has put millions into propaganda to assure us that the risks are all but non-existent, there are historical facts and geological uncertainties which unquestionably DO exist. What political institution do you consider secure after witnessing our Arab Spring? –after acknowledging who's profiting and who's paying for nuclear? Are nuclear proliferation or terrorism part of the Environmental Impact Statement?? They should be, because they, too, are part of the hidden costs of our nuclear folly.

And if the experts want to argue that we need the weapons industry to supply the fuel for nuclear energy to combat global warming, that so-called solution would be—at best—only transitional. The deployment of new nuclear energy plants cannot be done quickly enough to mitigate climate change. It takes 10 years to build one, and even then, their output would only take care of a frction of the energy demand. Not to mention, the cost of dealing with one meltdown is sufficient to move the entire world to solar power over a 20 year period. Once the transition to solar is achieved, guess what—the fuel is free.

And, while I'm on the subject, it's worth noting that the Nuclear Industry has suppressed renewable energy development for decades. In addition, ironically, as these hidden costs of nuclear power are rising astronomically, the cost of wind and solar is falling fast.

So, in conclusion, it is logical that our nuclear industry, so embedded with the defense and energy interests of this country as they are, is deaf to all our pleas to rationality and morality, as their present existence depends on the continued funding of this insanity. But, if you, dear LANL employees, are so enamored with nuclear energy, that you cannot grasp the scale of the disaster in Japan and the ongoing threat of all our nuclear adventures to the Entire Planet, then you lose all moral credibility and any claim to rationality.

Isolation Pilot Plant in New Mexico. Impacts associated with management and transport of these wastes are evaluated in the waste management and transportation sections of Chapter 4.

Subject: plutonium pit facility eis

Gentlemen: I am a laboratory retiree. As such, I know the nonsense that did go on at the laboratory and continues to go on. I know it is much easier to continue with bomb "research" than it is to go out and do something meaningful for civilization. I know it is much easier to get money from reactionairies in government than to produce something that will bring money. When I began working at the laboratory in 1975, I worked for the solar energy division. We were on the verge in 1975 of actually solving energy problems. However, that would not suit the powers that control this country, as you well know. After Reagan was elected, the money that went for such "insignificant" projects went to star wars -- welfare for Ph.Ds. Very little came out of star wars "research." There was so much waste at the laboratory then, and I am assured by my colleagues who still work for, now, Bechtel, that the waste continues. In the case of the pit factory, there is not only waste, there is extreme danger. I have already had cancer. I have seen in Oak Ridge, TN the water pollution caused by the governmental chemical and radiological activities.

Is it your intent to destroy all forms of life in your greed? I know from experience that you "scientists" say we mere human beings just do not understand, that everything is under control. Tell that to the people who have cancer after Three Mile Island, Chernobyl, and Fukushima. Stop the insanity. I know you will not. I know those of us protesting are spitting into the wind. It might benefit you to get cancer yourselves, thus finding out what your insanity is causing.
Susan Noel, 820 Zia lane, Espanola, NM 87532

16-1

16-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The accident analyses in the *CMRR-NF SEIS* rely on conservative assumptions that over-estimate the potential impacts of severe events to ensure that NNSA has an understanding of the impacts of beyond-design-basis events. In response to concerns following the earthquake and subsequent tsunami that damaged the Fukushima Daiichi Nuclear Power Plant, NNSA revised the *Final CMRR-NF SEIS* to include additional information about the geologic and seismic environment at LANL, additional analysis of extreme events, and a discussion of critical differences between a nuclear power plant (like the Fukushima Daiichi Nuclear Power Plant) and a nuclear materials research laboratory. NNSA believes that the final *CMRR-NF SEIS* presents a rigorous analysis and thorough understanding of the potential environmental consequences that each of the alternatives presents.

Re: Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR-NF SEIS) (DOE/EIS-0350-S1)

Dear Mr. Tegtmeier:

The San Miguel County Board of Commissioners (BOCC) appreciates the opportunity to submit comments concerning the draft CMRR-NF SEIS. Given the potential impacts to those downstream from proposed facility and national importance of decision, we request that the comment period on the draft CMRR-NF SEIS be extended seventy five (75) days until on August 26, 2011.

The BOCC is requesting this extension for the following reasons:

18-1

1. The proposed scale of the CMRR-NF SEIS has grown dramatically, with the addition of a second modified construction alternative – the "Shallow Excavation Option." Further, the Project has seriously grown in complexity in order to address seismic issues, with, for example, added related subprojects, such as the concrete batch plant and the pouring of a 250,000 yd3 foundation of a lean concrete basement to mitigate concerns about increased seismic risks. Because the CMRR-NF SEIS provides no preferred construction option at this time, research and technical review to prepare informed comments will have to be performed on multiple construction options.

2. The "extensive Upgrades to the Existing CMR Building" (CMR Alternative 2) was removed as an alternative in the draft CMRR-NF SEIS from the alternatives provided in the October 1, 2010, Notice of Intent. Those members of the public who believe this to be the best alternative will still have to do research and technical review for this important omission. It will require even more work from the public because the baseline impacts have not been provided by NNSA.

P.O. BOX 1170 • Telluride, Colorado 81435 • (970) 728-3844 • FAX (970) 728-3718
www.sanmiguelcounty.org

18-1 On April 29, 2011, NNSA published a notice in the *Federal Register* (76 FR 24018) announcing the availability of the *Draft CMRR-NF SEIS*, the duration of the comment period, the location and timing of public hearings, and the various methods for submitting comments. NNSA's implementation of public participation activities for review of the *Draft CMRR-NF SEIS* was consistent with past practices for other NEPA documents prepared for LANL. NNSA announced a 45-day comment period to provide sufficient time for interested parties to schedule their review of the *Draft CMRR-NF SEIS* around other commitments. In response to requests for additional review time, the comment period was extended by 15 days to a total review time of 60 days (76 FR 28222). NNSA believes this allows a sufficient period of time to provide comments on the *Draft CMRR-NF SEIS*. The Las Conchas wildfire affected many in the immediate vicinity of LANL. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*. Other NNSA EIS processes were delayed to respond to concerns regarding multiple NEPA public involvement opportunities (for example, the Sandia SWEIS scoping meetings and the BSL-3 Draft EIS public review period).

Commentor No. 18 (cont'd): Joan May, Chair
San Miguel County, Colorado Board of County Commissioners

San Miguel County Comments
Page 2 of 2

3. Further, the CMRR-NF is not scheduled to be completed any earlier than FY 2022. Given all of this a 75-day extension, which we argue is the right thing to do, is inconsequential compared to the Project's increased scope and long schedule. Consequently, we thing granting the extension places no significant burden on NNSA, while not granting the extension would place a significant burden on the public.

4. Public Scoping hearings are currently scheduled to be held May 24 – 26 which will provide the public with an opportunity to interact with NNSA personnel, ask questions, discuss concerns, and likely become better informed. The unfortunately the proposed comment period would end just 18 days letter. We believe that is not sufficient time for the general public to research, prepare and submit informed comments on the draft CMRR-NF SEIS after having the benefit of interacting with NNSA officials.

18-1 cont'd

5. A separate but additional Department of Energy (DOE) NEPA process involving the LAB is being held concurrently with the scoping comment period for the CMRR-NF SEIS. This is the draft Greater Than Class C EIS (GTCC EIS), which provides a 120-day comment period (the same we are requesting for the draft CMRR-NF SEIS) with comments due on June 27 – a mere two weeks after the CMRR-NF comments are due. This limited timeframe places an undue hardship on governments, private groups and the public who are providing DOE with informed comments about both important matters at LANL. A 75 day extension would make the comments on the draft due August 26, 2011 which is a more reasonable time after the draft GTCC EIS comments are due.

Thank you again for the opportunity to comment and for your consideration to our request for a 75 day extension.

Sincerely,

SAN MIGUEL COUNTY, COLORADO
BOARD OF COUNTY COMMISSIONERS

RE: Draft Supplemental Environmental Impact Statement for the Nuclear Portion of the Chemistry and Metallurgy Research Building Replacement Project, Los Alamos National Laboratory (NMED File No. 3451ER)

Dear Mr. Tegtmeier:

Your letter regarding the above named project was received in the New Mexico Environment Department (NMED) and was sent to various Bureaus for review and comment. Comments were provided by the Hazardous Waste Bureau, Surface Water Quality Bureau, Ground Water Quality Bureau and the Air Quality Bureau and are as follows.

Hazardous Waste Bureau
The Hazardous Waste Bureau provides the following comments.

1. **Section 1.4.1, Scope and Alternatives, page 1-10:**
The use of term "No Action Alternative" to indicate construction of CMRR-NF according to the 2004 Record of Decision (ROD) based on the final Environmental Impact Statement (EIS) issued in 2003 is misleading. The "No Action Alternative" suggests continued use of the existing Chemistry and Metallurgy Research (CMR) Facility at Technical Area (TA) 3, rather than the construction and use of a new building at TA-55 based on 2004 ROD. *19-1*

2. **Section 1.4.2, Modified CMRR-NF Alternative, page 1-11:**
Under the National Nuclear Security Administration's (NNSA) Modified Alternative proposal, a new Chemistry and Metallurgy Research Building Replacement Nuclear Facility (CMRR-NF) would be constructed and operated at TA-55 adjacent to the already constructed Radiological Laboratory/Utility/Office Building (RLUOB). The Modified CMRR-NF (modified from the alternative selected in the 2004 ROD) would have certain design and construction modifications and additional support activities that address *19-2*

19-1 The No Action Alternative included in the CMRR-NF SEIS is to implement the decision made following preparation of the original CMRR EIS in 2003 (that is, to take no action that differs from the previous decision).

19-2 The *Final CMRR-NF SEIS* was revised to include more information on the evolution of the Shallow Excavation Option. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option. Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b). The human health and environmental impacts for both the Shallow and Deep Excavation Options have been analyzed to the same level in the *CMRR-NF SEIS*. The potential impacts of the proposed alternatives for construction and operation of the CMRR-NF are discussed in Chapter 4 and summarized in Chapter 2, Section 2.10, of the *CMRR-NF SEIS*. The Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

Commentor No. 19 (cont'd): Julie Roybal, Environmental Impact Review Coordinator, New Mexico Environment Department

seismic safety, infrastructure enhancements, nuclear safety-basis requirements, and sustainable design principles. NNSA believes that, based on new seismic information available since 2004, the alternative selected previously will not meet the standards for a Performance Category 3 structure required to conduct NNSA mission work.

Implementing the Modified CMRR-NF Alternative requires the use of additional concrete and reinforcing steel for the construction of the building's walls, floor, and roof; additional soil excavation, soil stabilization, and special foundation work also would be necessary. Also, a set of fire suppression water storage tanks would be located within the building rather than connecting with the existing fire suppression system at TA-55. The estimated building footprint will be larger than that of the 2004 CMRR-NF due to requirements for engineered safety systems and equipment for the modified CMRR-NF.

The Modified Alternative includes two construction options: the Deep Excavation Option and the Shallow Excavation Option. Under the Deep Excavation Option, NNSA would excavate the building footprint area down to a depth below the poorly welded tuff layer (that lies from 75 ft-130 ft below ground surface), then fill the excavated site partially with low-slump concrete to form a 60-ft thick engineered building site. Three of the building's four floors would be located below ground. The Shallow Excavation Option would avoid the poorly welded tuff layer by constructing the basement well above that layer in the stable geologic layer, which would allow the building to "float" over the poorly welded tuff layer. Engineered backfill would be used to partially bury the building.

The SEIS states that the preferred construction option has not been selected at this time. There is uncertainty associated with the Shallow Excavation Option and it needs additional technical review. The information provided is not adequate for NMED to comment on the proposed two construction options.

19-2 cont'd

3. **Section 2.6.2.1, Construction Activities Associated with the Modified CMRR-NF, page 1-22 to 1-25**:
The section lists the technical areas that would be affected by the Modified Alternative analyzed in the CMRR-NF SEIS. TA-50 would be one of the areas affected by the alternative. Since 2004 ROD, additional investigations have been conducted at Material Disposal Area (MDA) C at TA-50. Several new boreholes were drilled and subsurface pore-gas data was collected at MDA C to evaluate the potential effect of subsurface fractures on vapor-phase contaminant concentrations and transport. Similarly, investigations have been conducted at other technical areas since 2004 ROD. The CMRR-NF-SEIS should utilize data collected since 2004 to evaluate potential effects of susbsurface contamination and transport on the construction of the Modified CMRR-NF.

19-3

4. **Section 2.10.1, Comparison of Potential Consequences of Alternatives, page 2-33 to 2-34**:
The SEIS states that larger amounts of land will be affected under the modified CMRR-NF proposal than previously estimated during 2003 EIS. Additional land is needed to provide space for additional laydown and spoils area due to larger amounts of construction material needed to support construction of larger building and to store greater amount of excavated material due to larger excavation needed. The modified CMRR-NF would require up to three concrete batch plants. TAs -5, -36, -46, -51, -52, -

19-4

19-3 As discussed in Chapter 2, Section 2.6.2.1, the activities included in TA-50 in the proposed action would involve use of the parking lot that was developed during construction of RLUOB, and the construction of a small stormwater detention pond and possible construction of an electrical substation across Pajarito Road from Material Disposal Area C. Also, there is the potential for temporary power to be run through TA-50 alongside Pajarito Road, but outside of Material Disposal Area C. None of these activities would infringe upon Material Disposal Area C and no excavation would take place that could affect the area down slope from Material Disposal Area C.

19-4 As described in Chapter 4, Section 4.3.12, acreage would be disturbed in several technical areas (in addition to TA-55) under either construction option. There are known Potential Release Sites (PRSs) located within the affected technical areas (for example, Material Disposal Area C in TA-50), and the potential for contact with contaminated soil or other media would be appropriately considered throughout the construction process. For example, PRS-48-001 is being evaluated for potential impacts resulting from actions in the TA-48/55 laydown and concrete batch plant area. Proper precautions would be taken as needed to minimize the potential disturbance of this or other PRSs. If necessary and as appropriate, contaminant removal would be provided by LANL Environmental Restoration staff in accordance with applicable requirements.

Commentor No. 19 (cont'd): Julie Roybal, Environmental Impact Review Coordinator, New Mexico Environment Department

54, -63, -64, and -72 would be affected either temporarily for construction support or permanently for road realignments (TA-55), stormwater detention ponds (TA-50 and -63), and the electrical substation (TA-50).

These activities may potentially cause adverse impacts to the Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) located at these technical areas.

19-4 cont'd

Surface Water Quality Bureau
The U.S. Environmental Protection Agency (USEPA) requires National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP) coverage for storm water discharges from construction projects (common plans of development) that will result in the disturbance (or re-disturbance) of one or more acres, including expansions, of total land area. Because this project exceeds one acre (including staging areas, etc.), it may require appropriate NPDES permit coverage prior to beginning construction. This project includes construction and/or use of several permanent and temporary facilities including the CMRR-NF site, laydown areas/concrete batch plants, spoils areas (Deep Excavation Shallow Excavation Options), parking lot, temporary power upgrades, Pajarito Road realignment, storm water detention ponds, and TA-50 electrical substation. It also includes decontamination, decommissioning and demolition of the Chemistry and Metallurgy Research Building. These activities represent a "common plan of development" and all activities described will require permit coverage whether or not each individual component exceeds the threshold acreage limit.

Among other things, this permit requires that a Storm Water Pollution Prevention Plan (SWPPP) be prepared for the site and that appropriate Best Management Practices (BMPs) be installed and maintained both during and after construction to prevent, to the extent practicable, pollutants in storm water runoff from entering waters of the U.S. This permit also requires that permanent stabilization measures (revegetation, paving, etc.), and permanent storm water management measures (storm water detention/retention structures, velocity dissipation devices, etc.) be implemented post construction to minimize, in the long term, pollutants in storm water runoff from entering these waters. In addition, permittees must ensure that there is no increase in sediment yield and flow velocity from the construction site (both during and after construction) compared to pre-construction, undisturbed conditions (see Subpart 10.D.1.b).

19-5

You should also be aware that EPA requires that all "operators" (see Appendix A) obtain NPDES permit coverage for construction projects. Generally, this means that at least two parties will require permit coverage. The owner/developer of this construction project who has operational control over project specifications, the general contractor who has day-to-day operational control of those activities at the site, which are necessary to ensure compliance with the storm water pollution plan and other permit conditions, and possibly other "operators" will require appropriate NPDES permit coverage for this project.
The CGP was re-issued effective June 30, 2008. The CGP, Notice of Intent (NOI), Fact Sheet, and Federal Register notice can be downloaded at:
http://cfpub.epa.gov/npdes/stormwater/cgp.cfm

In addition, operation of these types of facilities may require Storm Water Multi-sector General Permit (MSGP) coverage. It is unclear whether activities at this site meet the USEPA definition of "industrial activities," and thus require coverage under the MSGP. This permit also requires preparation of a SWPPP, and installation of appropriate storm water runoff control practices (per the SWPPP).

19-5 NNSA intends to comply with all applicable laws and regulations. NNSA will obtain the appropriate permits as the project progresses.

Commentor No. 19 (cont'd): Julie Roybal, Environmental Impact Review Coordinator, New Mexico Environment Department

An industrial SWPPP should include such things as:

- **A description of potential pollutant sources** - includes such things as a site map, an identification of the types of pollutants that are likely to be present in storm water discharges, an inventory of the types of materials handled at the site that potentially may be exposed to precipitation, a list of significant spills and leaks of toxic or hazardous pollutants, sampling data, a narrative description of the potential pollutant sources from specific activities at the facility, and identification of specific potential pollutants; and

- **A description of appropriate measures and controls** - includes the type and location of existing and proposed non-structural and structural best management practices (BMPs) selected for each of the areas where industrial materials or activities are exposed to storm water. A SWPPP must contain a narrative evaluation of the appropriateness of storm water management practices that divert, infiltrate, reuse, or otherwise manage storm water runoff so as to reduce the discharge of pollutants. Non-structural and structural BMPs to be described and implemented include such things as minimizing exposure, good housekeeping, preventive maintenance, spill prevention and response procedures, periodic inspections, employee training, record keeping, non-storm water evaluations and certifications, sediment and erosion control, as well as implementation/maintenance of traditional storm water management practices, where appropriate. A combination of preventive and treatment BMPs will yield the most effective storm water management for minimizing the offsite discharge of pollutants via storm water runoff.

The MSGP was re-issued effective September 29, 2008. The MSGP, Notice of Intent (NOI), Fact Sheet, and Federal Register notice can be downloaded at: http://cfpub.epa.gov/npdes/stormwater/msgp.cfm

Ground Water Quality Bureau
GWQB staff reviewed the above-referenced document as requested, focusing specifically on the potential effect to ground water quality in the area of the proposed project.

LANL is proposing to construct and operate a new Chemistry and Metallurgy Research facility within Technical Area 55 (TA-55) to replace the existing Chemistry and Metallurgy Research facility located in TA-3. The new facility will consist of two buildings: a building for administrative and support functions and a building for Hazard Category 2 special nuclear material.

The existing Chemistry and Metallurgy Research facility at TA-3 sends non-radioactive wastewater to the sanitary wastewater system for treatment and radioactive wastewater to the radioactive liquid waste treatment facility for treatment. Operation of the new Chemistry and Metallurgy Research facility at TA-55 would continue the same practice of segregating non-radioactive and radioactive wastewater and sending them to the sanitary wastewater system and radioactive liquid waste treatment facility, respectively, for treatment. The GWQB regulates discharges of treated effluent from the sanitary wastewater system under Discharge Permit 857 (DP-857) and is presently drafting a renewed and modified permit for this facility. The GWQB is processing a Discharge Permit application for the radioactive liquid waste treatment facility and expects to propose a Discharge Permit for approval in the near future. The Discharge Permits for both treatment facilities will include requirements and conditions to ensure that discharges from these facilities will not result in the exceedance of ground water quality standards or the presence of toxic pollutants in ground water as defined by the Water Quality Control Commission Regulations, 20.6.2 NMAC.

19-5 cont'd

Response side of this page intentionally left blank.

Commentor No. 19 (cont'd): Julie Roybal, Environmental Impact Review Coordinator, New Mexico Environment Department

Construction of the new Chemistry and Metallurgy Research facility will likely involve the use of heavy equipment, thereby leading to the possibility of contaminant releases (e.g., fuel, hydraulic fluid, etc.) associated with equipment malfunctions. The GWQB advises all parties involved in the project to be aware of discharge notification requirements contained in 20.6.2.1203 NMAC. Compliance with the notification and response requirements will ensure the protection of ground water quality in the vicinity of the project.

19-5 cont'd

Air Quality Bureau
The Quality Bureau has evaluated the proposal you have submitted with respect to the proposed Nuclear Facility portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory in the City of Los Alamos, Los Alamos County. Los Alamos County is currently considered to be in attainment with all New Mexico and National Ambient Air Quality Standards.

Construction activities identified in this proposal will create increases in pollutant emissions due to combustion-related construction equipment usage and the disruption of earth. It is important that all facilities and contractors utilized in the proposed project have current and proper air quality permits. For more information on air quality permitting and potential modeling requirements, please refer to 20.2.72 NMAC.

For the duration of the project, dust associated with increased vehicular use may also impact local air quality. Dust control measures should be considered to minimize the release of particulates due to vehicular traffic and ground disturbances. If activities result in significant ground disturbance, the project area should be reclaimed to avoid long-term problems with soil erosion and fugitive dust.

Activities identified in this proposal will impact air quality in the area. It is important that all county and local ordinances are followed for the duration of this project. Negative impacts associated with construction activities identified in this proposal will be minimized if regulations and guidelines identified in this document are followed.

19-6

I hope this information is helpful to you.

Sincerely,
Julie E. Roybal
Julie Roybal
Environmental Impact Review Coordinator
NMED File #3451 ER

19-6 All facilities and contractors utilized in the proposed project would have current and proper air quality permits, in accordance with 20.2.72 NMAC. As noted in the *CMRR-NF SEIS*, Chapter 4, Section 4.7, Mitigation, activities would follow standard procedures for minimizing construction impacts on air quality. These practices are required by Federal and state licensing and permitting requirements, as discussed in Chapter 5 of the *CMRR-NF SEIS*. As applicable, all county and local ordinances affecting air quality would be followed to minimize impacts associated with construction activity.

Los Alamos, NM 87544

Subject: Draft Supplemental Environmental Impact Statement (DSEIS), Nuclear Facility of the Chemistry and Metallurgy Research Replacement Project (Draft CMRR-NF SEIS) (DOE/EIS-0350-S1) to address New Geologic Information regarding Seismic Conditions at the Site, Los Alamos National Laboratory, Los Alamos, New Mexico

Dear Mr. Tegtmeier:

The U.S. Department of the Interior has reviewed the subject DSEIS. In this regard, we have no comment. 20-1

Thank you for the opportunity to review this document.

Sincerely,

Stephen R. Spencer
Regional Environmental Officer

20-1 Comment noted.

Commentor No. 21: Dr. Christopher Chancellor

I would like to offer my full support to the construction of the CMRR. In terms of responsibility to the environment, stockpile stewardship, employee safety, and advancing actinide research this facility is necessary. Contrary to the goals of the anti's, if it is not built here it will be built elsewhere. Hurdles that prevent construction of this facility will be to the detriment of Los Alamos National Laboratory and the communities that support it. Please consider this an investment in the next fifty years in the excellence produced by Los Alamos National Laboratory. ***21-1***

Dr. Christopher Chancellor
5402 S. Thomason Rd.
Carlsbad, NM 88220
chancellor-1@hotmail.com

21-1 NNSA notes the commentor's support of the construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the proposed CMRR-NF would support this effort.

Commentor No. 22: Bob Walsh

Subject: Comment on Draft SEIS

June 2, 2011

Mr. John Tegtmeier
U.S. DOE/NNSA
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico, 87544
by email to: nepalaso@doeal.gov

I respectfully submit this comment on the *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico*, DOE/EIS-0350-S1, April 2011. I would appreciate its serious consideration by the National Nuclear Security Administration (NNSA) and look forward to the agency's comprehensive response.

About 20 years ago, I was the lead on the safety analysis for a proposed plutonium storage arrangement at Pantex. We found that aircraft accidents from overflights were a significant contributor to risk, with possibly horrendous consequences. Last November, I commented on the scope of the Supplemental EIS, pointing out that the EIS should consider both accidents and intentional acts.

The Draft SEIS includes the following response to that and similar comments:

"The accident analyses … present the impacts of a range of possible accidents. … A classified appendix was prepared to address the impact of intentional destructive acts, which include terrorism. Substantive details are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks."

22-1

In the appendix that evaluates accident impacts, Section C.3 states that the selection and evaluation of accidents was based on the Nonreactor SAR Preparation Guide. In that guide, Section 3.4 states, "External events … will be … analyzed … if frequency of occurrence is estimated to exceed 10-6/yr conservatively calculated, or 10-7/yr realistically calculated…. The analysis that substantiates frequency need only be referenced."

22-1 In response to similar comments, the text in the *Final CMRR-NF SEIS*, Appendix C, Section C.3.2, has been revised to more clearly reflect the consideration of an airplane crash into the CMRR-NF. The largest aircraft that is considered to have a conservative probability greater than 1 in 1 million per year of accidentally crashing into the CMRR-NF is a general aviation aircraft. References were added to support this conclusion, including the *DOE Standard: Accident Analysis for Aircraft Crash into Hazardous Facilities* (DOE 2006) and a site-specific technical evaluation of the potential for aircraft crashes (LANL 2011a).

Commentor No. 22 (cont'd): Bob Walsh

In the Draft SEIS, Chapter C.3.2 states, "The probability of an airplane crash during overflight is less than 10-6." There are two deficiencies in the paragraph,

1. We assume that this was intended to be 10-6/yr.
2. No analysis is referenced to support this statement.

Having discovered these two oversights upon examination of only one section suggests that this document has not been subjected to rigorous independent review. The general public is neither technically qualified nor adequately funded to perform a comprehensive review.

I now provide the following four comments on the Draft Supplemental EIS:

22-1 cont'd

1. **Please provide a reference to an analysis that substantiates that the probability of an airplane crash during overflight does not exceed 10-6/yr conservatively calculated.**
2. **Please provide a rigorous independent review of this document by an independent professional organization in order to increase public confidence in the conclusions.** **22-2**
3. **Please provide an unclassified overview of the classified appendix, omitting details, but including at least answers to the following questions:**
   a. **Does the appendix include consideration of attacks using aircraft?**
   b. **In determining risks from terrorist attacks, does the appendix assume continued funding for government agencies other than NSA, such as the Transportation Security Administration?**
   c. **Does the appendix estimate the consequences of a successful terrorist attack? If so, have these potential consequences been brought to the attention of the President and Congress for consideration in decisions on nuclear weapons policy?**

   22-3
4. **Please provide a rigorous independent review of the classified appendix by an independent professional organization with appropriate clearances and include in the SEIS an unclassified summary of that assessment. Please include the identity of the organization and the amount budgeted for the review as an assurance that the review is independent and thorough.** **22-2 cont'd**

Thank you for your consideration,

Bob Walsh
1553 Camino Amado
Santa Fe, NM 87505

22-2 NNSA and DOE engage their own technically qualified staff and subject matter experts to prepare the SEIS along with qualified contractors. The analyses include the evaluation of accidents and intentional destructive act impact analyses. NNSA does not intend to pursue an independent external review of the analysis in the *CMRR-NF SEIS*.

22-3 As indicated in Chapter 4, Section 4.2.10.3 of the *CMRR-NF SEIS*, substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. NNSA considered a range of possible terrorist or intentional destructive acts and performed a detailed analysis of selected scenarios. Selected scenarios provide a reasonable range of events, including those with the largest expected impacts.

NNSA has an extensive program related to preventing terrorist threats. This includes ongoing evaluations of facilities and security forces to prevent successful attacks. In evaluating intentional destructive acts, the probability of a given scenario occurring is not a factor in the analysis. Therefore, the programs and funding of other entities, such as the Transportation Security Administration is not a relevant factor. The intentional destructive acts appendix presents consequences projected to occur in the event of a successful attack. The results of these analyses will be reviewed and considered by NNSA in making its decision on the CMRR-NF and are shared, as appropriate, with senior Administration officials and Congress.

Subject: comments on new nuclear bomb factory at LANL

To whom it may concern,

I am horrified and enraged that our nation is engaged in the production of yet another generation of nuclear bombs, and here in our own backyard no less. There is NO TIME LEFT for this prodigious waste of resources when our planet, our society, and our economy are facing imminent, interrelated crises. The funneling of so much wealth into the hands of military contractors has devastated our civil society and is rapidly creating a rigid tiered-class system that outstrips anything ever seen anywhere on earth. I grieve and tremble for our nation and the future of my beloved daughter, Under no circumstances will I sit by and allow this crime against humanity to be committed in my name. **23-1**

Commentor No. 27: Margarita Denevan

From: Margarita Denevan [micuaro@taosnet.com]
Sent: Saturday, June 04, 2011 4:14 PM
To: NEPALASO@doeal.gov
Subject: CMRR-NF SEIS

President Obama called for "a world free of nuclear weapons". Why then does the United States need to build a new CMRR-NF any where let alone spend over 5 billion dollars of tax payers' money to build such a complex on a recognized and acknowledged seismic fault ? *27-1*

The Non-Proliferation Treaty forbids the building of new nuclear weapons. To say that plutonium pit production is "maintenance" of existing weapons is so obviously disingenuous since it is a known fact that each pit has a life of 100 years and that there are at least 14,000 pits available now. And why do we need to "maintain" nuclear weapons in "a world free of nuclear weapons" in the first place? *27-2*

On the subject of "national security" the argument that we need to "maintain existing weapons" as a deterrent to possible attack is again, disingenuous. On 9/11 the entire world was aware that the US had the largest nuclear arsenal and yet we were attacked.

And again considering national security, how secure are we when the plan is to store tons of plutonium over a seismic fault? *27-3* The plan to fill the fault (by the way, which one, there are five? in that area) with tons of concrete certainly threatens our safety since the production of that concrete will also produce green-houses gases which then pollute the very air we breath *27-4*

A major concern for our country today is JOBS. That 5-6 billion tax dollars can be better spent on renewable energy research. New Mexicans would still be employed at a Los Alamos Renewable Energy Research Laboratory (ALRERL). In fact, opportunities for employment would be greater if Los Alamos became a Renewable Energy Lab due to the spin-off industries. The nuclear weapons production industry is very limited. *27-5* Actually, the only ones to benefit from continued nuclear industry are corporations, such as Bechtel. They produce something we can never use. Who doesn't understand that in a nuclear war there can be no winners, every one loses, even those who do not use the weapons. To continue paying Bechtel and their ilk to produce something that actually can harm, even destroy, us is a waste of money . . . it is called corporate welfare.

Respectfully submitted by Margarita Denevan, Arroyo Hondo, NM

June 4, 2011

27-1 A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

27-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

27-3 Refer to the response to Comment 27-1 and see Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

27-4 The emplacement of concrete referred to by the commentor is not for filling a fault. Its purpose is to replace a poorly welded tuff layer under the Deep Excavation Option (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*).

There would be a minimal and temporary increase in greenhouse gases from the construction of the Modified CMRR-NF. The greenhouse gases emitted by operations under the Modified CMRR-NF Alternative would add a relatively small increment to emissions of these gases in the United States and the world. The impacts on greenhouse gas emissions due to construction and operation CMRR-NF are analyzed in Chapter 4, Sections 4.2.4.2, 4.3.4.2, and 4.4.4.2, of the SEIS.

Commentor No. 27 (cont'd): Margarita Denevan

27-5 Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 28: Gene Schmidt, Superintedent, Los Alamos Public Schools

Los Alamos Public Schools

Mr. John Tegtmeier, CMMR SEIS Document Manger
U. S. Department of Energy
National Nuclear Security Administration
Los Alamos Site Office
3747 West Jemez Road, TA-3, Building 1410
Los Alamos, New Mexico 87544

Mr. Tegtmeier:

As superintendent of Los Alamos Public Schools, our school system stands ready to provide a high quality education for children of future CMMR employees. In stating this, it is important to note that Los Alamos Public Schools also looks to develop an educational partnership with CMMR, which could lead to solutions of real world problems in a school setting. Since its inception, LANL has been on the forefront of many important discoveries. There is every reason to expect that this incredible legacy of discovery will increase at an even faster velocity when construction of the facilities is completed and the operational function of CMMR is underway.

When this occurs, Los Alamos Public Schools seeks to tap into CMMR's brain trust via guest lectures, potential student apprenticeships, and, if possible, student internships. In addition, opportunities for science/mathematics teachers to meet and discuss potential classroom applications through lessons learned with CMMR staff offers the type of real world problem solving that energizes and brings relevance to our students' studies. For example, I foresee an opportunity for instructional staff to serve alongside CMMR staff in a summer exchange. Similarly, the use of CMMR staff as guest lecturers for school classroom is very enticing to our future. ***28-1***

I look forward to working closely with CMMR to ensure that our school system provides the type of high quality of education which makes it possible for Los Alamos National Laboratory to recruit and retain the highest quality staff in the nation and world. Also in closing, there is no doubt in my mind that students/staff throughout northern New Mexico stand to gain from the instructional opportunities as well. For example, school systems throughout our region will benefit from the high caliber of scientist, physicists and mathematicians that will be employed at CMMR.

In closing, I would like to thank you for this investment in our future. ***28-2***

Gene Schmidt
Superintendent

28-1 NNSA notes the commentor's support for construction of the CMRR-NF and the commentor's interest in developing an educational partnership with the CMRR-NF project. NNSA is dedicated to science education in northern New Mexico. There is an active program for education outreach at LANL; activities are coordinated through LANL's Community Programs Office.

28-2 NNSA's decision will be announced in a ROD that will appear in the *Federal Register*. In accordance with NEPA regulations, the ROD cannot be issued any earlier than 30 days after publication of the *Final CMRR-NF SEIS*.

Commentor No. 29: Robert Velasco

Tuesday, June 07, 2011 6:15 PM
Robert Velasco

I strongly believe the CMRR project is vital to our nation's interest. It is critical that we as a nation embrace the reality that nuclear weapons exist in the world and that the US stockpile provides a viable and positive deterrent to their continued proliferation. The only way that our nation can lead the march towards a nuclear-free world is to have a viable and fail-safe deterrent of our own. This is ONLY possible with investment into new nuclear facilities and infrastructure. If not in Los Alamos, then where? ***29-1***

29-1 NNSA notes the commentor's support of the construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the proposed CMRR-NF would support this effort.

Commentor No. 30: Billy M. "Mike" Brazile

Wednesday, June 08, 2011 10:33 AM
Billy M. "Mike" Brazile

Nuclear weapons and nuclear materials are dangerous. We all know that. Since we can't "put the Genie back in the bottle" and nuclear weapons and nuclear materials ARE here it seems that common sense would dictate that we have 21st century facilities, systems, and processes to protect these weapons and materials to ensure the weapons work as part of the United States' overall system of deterrence against current and future enemies maintain our capabilities to produce these weapons and components and maybe even make them safer and smaller and reduce the number we need for deterrence and that we stay in control of these weapons and materials so they are never able to be used against us or anyone else. Or we can use outdated, 20th century facilities (some in shocking states of disrepair) outdated systems and processes and "hope for the best?" I put my faith in the new CMRR facility, new systems, and new processes so we do maintain control of our nuclear weapons and materials. Maintain our nuclear deterrence posture using 21st century facilities, systems, and processes , and continue the "Pax Americana" that we and the rest of the world enjoys and prospers from. While not perfect, we haven't had a world war in over 60 years. *30-1*

30-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

Mr. John Tegtmeir
U.S. DOE/NNSA

I am a permanent resident of New Mexico and I oppose locating the CMRR Building in Los Alamos. It is 2/3 mile from a geologic fault line and could cause a disaster as well as contaminate the water table. ***31-1***

Shelley Waxman
1613 Villa Strada
Santa Fe, NM 87506

31-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 32: Eddie Archuleta, Business Manager, LIUNA Local 16

From: eddie_a@comcast.net
Sent: Wednesday, June 08, 2011 2:28 PM
To: NEPALASO@doeal.gov
Subject: CMRR PROJECT
Attachments: CMRR Letter June 8.docx

AS LABORERS UNION LEADER IN FAVOR A THIS PROJECT, I'M FORWARD THIS LETTER IN APPROVAL *32-1*

EDDIE ARCHULETA
BUSINESS MANAGER
LIUNA LOCAL UNION 16
ALBUQUERQUE, NEW MEXICO
(505) 265-7933

32-1 NNSA notes the commentor's support of the construction and operation of a new CMRR Facility at LANL.

The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 32 (cont'd): Eddie Archuleta, Business Manager, LIUNA Local Union 16

1030 San Pedro Dr. NE
Albuquerque, NM 87110

June 8, 2011

TO WHOM IT MAT CONCERN:

I am writing this letter in regards to the CMRR project in Los Alamos. Local #16 is fully in favor of this project and I have been asked to give testimony as to why I feel undertaking the project would be beneficial. After much thought, consideration and discussion with my staff, I feel confident in moving the project forward, keeping the following points in mind:

- With the addition of this project, we would nearly double the workforce being utilized in that area. As of now, Northern New Mexico has a very large out-of-work-list, but it is filled with highly skilled workers.
- The project would provide long-term, family-sustaining jobs in Northern New Mexico. The project is expected to last 12 years. This would give our Laborers an excellent outlook for both the near and more distant future.
- Local #16 currently has a training curriculum in place that would provide these workers with the necessary construction-focused training they would need for success on the project. In the past, the positions in that area have primarily been maintenance-based. This would mean more members with more varied skills.

With the above reasons, we hope that you are able to feel comfortable in approving this project, and, in doing so, providing hope and sustainability to a great number of our members.

32-1 cont'd

Fraternally yours,

Eddie Archuleta
Business Manager/Secretary-Treasurer

June 8, 2011

Mr. John Tegtmeler
CMRR-NF Seis Document Manager
3747 West Jemez Road, TA-3, Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeler:

I am writing this letter in regards to the CMRR project in Los Alamos. The Laborers International Union of North America and Laborers Local 16 are fully in favor of this project and I have been asked to give testimony as to why I feel undertaking the project would be beneficial. After much thought, consideration and discussion we urge you to move the project forward.

33-1

- The CMRR project would nearly double the workforce being utilized in the area. As of now, Northern New Mexico has a high unemployment rate and Local 16 has a list filled with highly skilled workers ready to go to work.
- The project would provide long-term, family-sustaining jobs in Northern New Mexico. The project is expected to last 12 years. This would give our Laborers excellent employment opportunities for both the near and more distant future.
- Laborers Local 16 currently has training curriculum in place that would provide all Laborers with the necessary construction-focused training they would need for success on the project. In the past, the jobs in this area have primarily been maintenance-based. This project would mean more members having a wider variety of skills based on the available training once they complete the classes.

With the above reasons, we hope that you are able to feel comfortable in approving this project, and, in doing so, providing hope and sustainability to a great number of our members and their families.

Fraternally yours,

Rocco Davis

Rocco Davis
LIUNA Special Assistant to the General President, Vice President at Large

Feel the Power

33-1 NNSA notes the commentor's support of the construction and operation of a new CMRR Facility at LANL.

The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF would require a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico, as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 34: Kevin C. Krank

Friday, June 10, 2011 9:36 AM
Kevin C. Krank

The CMRR project is necessary for our national security. It is good for the national economy, for New Mexico, and Los Alamos. ***34-1***

34-1 NNSA notes the commentor's support of the construction and operation of a new CMRR Facility at LANL.

Commentor No. 35: Laura Watchempino
Multicultural Alliance for a Safe Environment

A new Environmental Impact Statement (EIS) is needed. The Supplemental EIS cannot adequately assess the impacts of a completely redesigned Chemical and Metallurgical Research Replacement (CMRR) Nuclear Facility building for plutonium processing at Los Alamos National Lab (LANL). An updated seismic hazards analysis and final building design should be completed and analyzed in a new EIS. A new EIS should analyze the costs of a new CMRR Complex in a geologically unstable area as well as the need for new nuclear weapons in **35-1**

the face of terrorist threats and climate change. The United States should not violate its obligations under non-proliferation treaties which are the law of the land under our Constitution. **35-2**

The issue of nuclear hazardous waste disposal has yet to be dealt with by President Obama's Blue Ribbon Commission on America's Nuclear Future. The Commission's recommendations are also likely to result in the need for a new EIS. **35-3**

New alternatives which consider the need for cleanup of LANL's legacy waste sites and LANL's compliance with its 2005 Consent Order with the New Mexico Environment Department should be evaluated. **35-4**

Downstream and downwind communities will continue to suffer disproportionate environmental and health risks from LANL's dangerous activities. All communities which rely on the Rio Grande to supply their domestic water needs will be at risk, especially the northern Pueblo and Hispanic communities adjacent to LANL. Principles of environmental justice require an evaluation of the cumulative impacts of this project and LANL's past activities on these communities and their water supplies. **35-5**

Ms. Laura Watchempino
Multicultural Alliance for a Safe Environment
P.O. Box 407
Pueblo of Acoma, NM 87034
5000wave@gmail.com

35-1 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 35 (cont'd): Laura Watchempino
Multicultural Alliance for a Safe Environment

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA acknowledges that there is substantial opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

35-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

35-3 The Blue Ribbon Commission is addressing the disposition of high-level radioactive waste; this waste type is not associated with operations at the proposed CMRR-NF. Radioactive wastes to be generated at the CMRR-NF include low-level radioactive waste, mixed low-level radioactive waste, and transuranic waste. There are treatment and disposal facilities available for these waste types. See Chapter 3, Section 3.12.4, for more information regarding LANL operations associated with these waste types.

35-4 Activities related to environmental cleanup are not within the scope of the *CMRR-NF SEIS*. However, NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

35-5 Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives. As summarized in Chapter 2, Table 2-3, there would be no impacts on surface-water or groundwater resources during operations, with any small impacts due to construction activities being minimized through the use of standard erosion and sediment control measures and spill prevention practices.

Mr. John Tegtmeier
CMRR-NF SEIS Document Manger

Roger Snyder
Deputy Manager Los Alamos Site Office

Gentlemen,

Thank you for your call yesterday with the "heads-up" concerning your facilitation meeting for Taos suggestion. While we await those details and subsequent responses from the residents of the Taos area, I am sending you the signatures from this weekend and reiterating our previous requests.

Please find attached more than 60 signatures from Taos area residents requesting a hearing in Taos for the Chemistry & Metallurgy Research Facility Replacement (CMRR) Nuclear Facility Project Supplemental Environmental Impact Statement (SEIS).

The request for a hearing by the Mayor of Taos and so many signatures clearly shows the large interest in the CMRR-NF project in the Taos area.

It is unacceptable to not have a hearing when there is such interest or to require that people travel 50 miles or more to a hearing in another location.

Please schedule the hearing promptly and provide public notice as soon as possible, including a Federal Register notice at least 15 days in advance of the dates of the hearings.

In addition to the additional hearing in Taos we remind you of our request for a hearing in DC. Our colleagues there believe that a hearing there would have a good turnout.

We appreciate your efforts this week to complete making the reference documents available, which will aid in making comments, but the comment period is too short.

36-1

36-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and no previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with a hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. DOE determined that holding a public hearing in Washington, D.C., was not appropriate for the *CMRR-NF SEIS* because construction of the CMRR-NF is specific to LANL missions. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

As discussed in Section 2.2, NEPA Process, of this CRD, in response to requests for additional review time, the comment period was extended by 15 days to a total review time of 60 days. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*. In addition, other NNSA EIS processes were delayed to respond to concerns regarding multiple NEPA public involvement opportunities (for example, the Sandia SWEIS scoping meetings and the BSL-3 Draft EIS public review period). NNSA determined this allows a sufficient period of time to provide comments on the *Draft CMRR-NF SEIS*.

Commentor No. 36 (cont'd): Scott Kovac, Operations and Research Director, Nuclear Watch New Mexico

We are still requesting a 60 day extension. It seems to me that the BSL-3 EIS could be delayed to make room to extend the CMRR-NF comment period until the end of July. **36-1 cont'd**

Thank you,

Scott

Commentor No. 36 (cont'd): Scott Kovac, Operations and Research Director, Nuclear Watch New Mexico

To Senator Jeff Bingaman, Senator Tom Udall, and Representative Ben Ray Lujan:

We, the undersigned, agree with Taos Mayor Darren Cordova on the need for a hearing on the CMRR-NF SEIS in Taos, New Mexico. Taos is a substantial downwind community of Los Alamos National Laboratory (LANL). Thus LANL decisions affect Taos County residents. We request that you demand that the NNSA schedule a CMRR-NF SEIS public hearing in Taos.

Commentor No. 37: Anna Katherine

From: Anna Katherine [annakath@earthlink.net]
Sent: Saturday, June 11, 2011 5:01 PM
To: nepalaso@doeal.gov

I am a long-time permanent resident of New Mexico. I oppose locating the CMRR building in Los Alamos. It is too close to a geologic fault line. Also, the contents of this building could contaminate our drinking water. ***37-1***

Anna Katherine
210 Gonzales Road
Santa Fe, N.M. 87501

37-1 NNSA notes the commentor's opposition to locating the new CMRR Facility in Los Alamos.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information. As discussed in Chapter 4, Sections 4.3.6, operation of the Modified CMRR-NF would not impact water resources around LANL.

Subject: CMRR Comments

Mr. John Tegtmeir
U.S. DOE/NNSA
Los Alamos Site Office
3747 West Jemez Rd.
TA-3 Building 1410
Los Alamos, NM 87544

After attending the recent presentation given by Mr. John Tegmeir, et.all., which was disrespectful to the well informed residents of Northern New Mexico. in that you refused to include our public comments for the record. ***38-1***

So I will briefly state the reasons for my opposition:

1. The health effects now and in the future of uranium and plutonium are lethal. You refuse to provide truthful information to the public regarding the health effects. ***38-2***

2. Despite efforts after the fact, to clean up current toxic waste (which is still not complete), the contamination to our environment has not been adequately factored into your "plan" in regard to the "cost" to the life and the eco-system. you will be producing more toxic waste, that has a half life of 500 thousand years. IF you really considered just these facts, with the simple knowledge that water, air and earth are necessary for life...then continuing to produce such toxic waste would be considered contrary to the mission of "keeping" the public "safe". ***38-3***

3. Knowingly building a CMRR on a seismic fault is nothing but foolishness, in that thinking that anything that is man made can with stand the power of the Earth. Fukushima and Cernobyl are clear examples, no matter what your "best" scientific up grades are. ***38-4***

4. BUilding a facility to increase the capability of nuclear weapon manufacturing from 20 pits to 80 pits per year, is in fact a contradiction in terms of the non=proliferation treaty START. ***38-5***

5. The great scientific minds of LANL would be put to better use in the research and development of solar and wind power technologies.

6. The military industrial complex budget, now in the trillions, and the CMRR alone is now in the BILLIONS, I can think of many far better ways to spend our time, money and energy. ***38-6***

38-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

38-2 The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The danger of uranium and plutonium has long been recognized. The awareness and knowledge of the health effects related to exposure to uranium and plutonium has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

38-3 NNSA is aware of the risks associated with the operation of its current and future facilities. These risks are mitigated through compliance with Federal, state and local laws and regulations that protect the public and environment, and through process design and operational procedures.

38-4 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 38 (cont'd): April Mondragon

7. It is not intelligent nor factually adequate to have war profiteers influencing the decisions made for our health and well being.

8. This is not about jobs in New Mexico, this is about the military industrial complex run a muck. There are other industries to invest in, ie: education, film, healthcare, etc... **38-6 cont'd**

Sincerely,

--
April Mondragon
Live Peace

The accident analyses in the *CMRR-NF SEIS* rely on conservative assumptions that over-estimate the potential impacts of severe events to ensure that NNSA has an understanding of the impacts of beyond-design-basis events. In response to concerns following the earthquake and subsequent tsunami that damaged the Fukushima Daiichi Nuclear Power Plant, revised the *Final CMRR-NF SEIS* to include additional information about the geologic and seismic environment at LANL, additional analysis of extreme events, and a discussion of critical differences between a nuclear power plant (like the Fukushima Daiichi Nuclear Power Plant) and a nuclear materials research laboratory. NNSA believes that the final *CMRR-NF SEIS* presents a rigorous analysis and thorough understanding of the potential environmental consequences that each of the alternatives presents.

38-5 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

38-6 Funding decisions regarding major Federal programs (for example, health care and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 39: Melvin Turcanik

turcanik@yahoo.com

Mr John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 W. Jemez Rd.
TA-3 Bldg. 1410
Los Alamos, NM 87544

6/12/11

Dear Mr. Tegtmeir,

It has come to my attention that there is a proposal to build what is called "Chemistry and Metallurgy Research Replacement" project in Los Alamos, NM. I am told this project would increase our ability to produce the Plutonium PIts, which are the heart of a thermonuclear device, from 20 per year in the current facility to 80+ per year. We may already have 15,000 of these devices in storage. *39-1*

I believe this to be in violation of the nuclear non-proliferation treaty. International treaties are supposed to be, according to the constitution, the highest law of the land. *39-2*

This was originally budgeted to cost $550 million. Currently the budget is $5.86 billion. Congress has already rejected the need for "reliable replacement warheads" which was the purpose for this production facility. While we have real serious needs for government resources in this country to improve the lives of people, why would we expend these resources on a project to destroy the world????? I believe this to be an insane use of the power and resources of this country. *39-3*

If the fundamental concept wasn't completely nuts, the site is 2/3 mile from a geologic fault line. *39-4*

Please do everything possible to save us from this extension of cold war insanity. *39-5*

Sincerely,

Melvin Turcanik

39-1 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

39-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

39-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

39-4 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

40-1 Comment noted.

Commentor No. 41: Jeff Sharp

Monday, June 13, 2011 11:10 AM
Jeff Sharp

There is no viable reason to hinder the construction of CMRR. this has been studied and evaluated and discussed to the point of ridiculousness, we as a Nation need this facility so that our national security is maintained, the what if's and could happens are the tools the environmentalist use to intimadate the general public , along twith the lie of "cheap " solar windbio-fuels this facility will consolidate, focus and expedite our ability as a nation to safety and effectively build and maintain our nuclear options into the future. *41-1*

41-1 NNSA notes the commentor's support of the construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the proposed CMRR-NF would support this effort.

575-613-5778 cell
strujillo@c21success.com

42-1 NNSA notes the commentor's position that the CMRR-NF project should be stopped and reevaluated because of concerns about natural hazards. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapters 3 and 4 (Sections 3.5.1 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). Based on the report, future planning will be performed to consider CMRR-NF structural requirements for ash-loading.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in Appendix D of the 2008 *LANL SWEIS* (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials, including vegetation, are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources). If a wildfire disrupted the power provided to the CMR Building or the proposed CMRR-NF, emergency backup power would be provided locally to maintain the most important systems. As discussed in Appendix C, plutonium materials stored within LANL plutonium facilities or used in ongoing operations are generally stable in their configuration and would not require active cooling systems to keep them stable. Therefore, maintenance of power is not necessary to prevent significant releases to the environment. Because the CMRR-NF would be located on a mesa top rather than in a canyon, severe flooding is not a credible event.

Sent: Tuesday, June 14, 2011 7:48 PM
To: nepalaso@doeal.gov
Subject: CMRR project

Mr. Tegtmeir

I ask that you cancel the CmRR project and that a study be done of LANL's plutonium infrastructure. The cost involved is immoral with all the country's human needs not being met and the Federal budget still unknown for coming years. We need to be down scaling our nuclear weapons. The fact that this is being considered in a location very close to a fault line makes this so easy to say NO to. ***43-1*** ***43-2***

I live in Minnesota but am concerned for my fellow citizens in New Mexico and for the over all welfare and safety of our country.

Thank you for your service.

Please seriously consider my thoughts on this matter and do the right thing for our country.

Jane Warren

43-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

43-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 44: William Reddy

From: Tony Reddy [tony.oldnhappy@gmail.com]
Sent: Tuesday, June 14, 2011 7:51 PM
To: nepalaso@doeal.gov
Subject: Facility

This proposal appears to be an error of cataclysmic proportions. There are apparently many lifetimes of "pits" already in storage in Texas. We don't need more! And the proposed location is near a fault line - ??????

So we here in New Mexico and the United States could be looking at our own nuclear disaster maybe much worse than Fukushima or Chernobyl. *44-1*

We have a budget crisis - why are we spending billions of dollars that could be used to reduce our debt and prevent collapse of our current economic system. *44-2*

William Reddy

--
only the invisible is real

44-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. See Section 2.8, Nuclear Accidents, of this CRD, for more information.

44-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 45: Frank Prideaux

From: Frank Prideaux [sirfrank10@gmail.com]
Sent: Tuesday, June 14, 2011 7:54 PM
To: nepalaso@doeal.gov
Subject: CMRR

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

The CMRR was designed to replace the existing Chemistry and Metallurgy Research Building and serve as the site where they would manufacture “Plutonium Pits”, the fissile “triggers” capable of nuclear capability that initiate the destruction of modern thermonuclear weapons. In other words, they are the heart of every nuclear weapon. The Lab already has the ability to produce 20 pits a year at the CMR building, but if they move ahead and build the new CMRR, they will have the ability to produce 80+ a year. (Currently the Department of Energy has 15,000 pits stored at the Pentax Facility in Texas.) ***45-1***

WHAT YOU NEED TO KNOW:

The original cost of the project: FY2004 Preliminary Full Total Estimated Cost Projection was $400-550 million with a completion date of 2011.

The current cost: The “Details of Project Cost Estimate” table in the FY2012 budget puts CMRR’s current projected cost at $5.86 billion and a completion date of FY2023 - **this is more than ten times the original forecast** - and who knows what the final cost would be if they are given the green light on this project. ***45-2***

Built near a fault line: The worst part of all is that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity.
In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to LANL’s weapons manufacturing complex in a geologically unstable area are just too great.

So we here in New Mexico and the United States could be looking at our own nuclear disaster maybe much worse than Fukushima or Chernobyl. Supposedly the new CMRR building will be able to withstand an earthquake of 7 ***45-3***

45-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL’s pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

45-2 Comment noted.

45-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

45-4 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other

Commentor No. 45 (cont'd): Frank Prideaux

on the Richter scale, but Japan has already had an aftershock from their recent earthquake measuring 7.1. **45-3 cont'd**

None of this even takes into account whether the nuclear weapons work presently done at LANL and our other nuclear weapons facilities violates the Nuclear NonProliferation Treaty. **45-4**

PLEASE STOP!!

Subject: Stop the CMRR

Sir:

I understand we have many thousand "pits" in storage in Texas. Can you imagine any foreseeable future where we would have used all of them? What would be left of the world? *47-1*

Please stop this insanity. The cost of this project would be better spent on needed programs for those in need of better health care, education, unemployment benefits or reducing the federal deficit. *47-2*

Mary C. Weeks
Iowa Falls, IA 50126

47-1 NNSA notes the commentor's statement about the plutonium pits in storage at the Pantex Plant. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

47-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Sent: Tuesday, June 14, 2011 8:26 PM
To: nepalaso@doeal.gov
Subject: Chemistry and Metallurgy Research Replacement (CMRR) Project in **Los** Alamos, New Mexico

John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office

Dear Mr. Tegtmeir,

The Chemistry and Metallurgy Research Replacement (CMRR) project in Los Alamos, New Mexico should be cancelled.

I oppose all preparations for nuclear weapons, and I ask that the United States begin nuclear disarmament immediately. *49-1*

I'm also concerned about the tremendous cost of this project. The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and a completion date of FY2023 - this is more than ten times the original forecast - and who knows what the final cost might be. *49-2*

It's also disturbing that this facility is sited near a fault line. This raises important safety concerns and no doubt is responsible for the tremendous cost increase. *49-3*

Sincerely,

Ayman Fadel
3503 Lost Tree Ln
Augusta, GA 30907
(xxx) xxx-xxxx

49-1 NNSA notes the commentor's opposition to the CMRR-NF project and concern about nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

49-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

49-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

To: Mr. John Tegtmeir, U.S. DOE/NNSA Los Alamos Site Office, 3747 West Jemez Road, TA-3 Building 1410, Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir,

Inspired by the International Pax Christi movement, and as an American citizen, I urge you to cancel preparations for the Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico. Before anymore advancement is made, you and your team must commission a study of LANL's plutonium infrastructure- including existing and future capability needs, and submit to our government a realistic cost for maintaining and upgrading safety features at the existing CMR. *52-1*

It has become widespread news that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great. The potential damage to the earth itself and the health of the American people is certainly not worth the benefits of either national security or scientific advancement. *52-2*

I am writing to my US Senators and Congressional representative as well. I hope that by receiving thousands if not million more letters such as these you and our elected officials will halt imminent plans and discern far more carefully all that it at stake in the CMRR project. Thank you.

Sincerely,

Rev. James M. DiLuzio, New York, NY

52-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

52-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at

Commentor No. 52 (cont'd): Rev. James M. DiLuzio

LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 53: Bill Uebelher

From: mbu11@q.com
Sent: Tuesday, June 14, 2011 9:21 PM
To: nepalaso@doeal.gov
Subject: New Research Building

Dear Mr. Tegtmeir,

I recently learned about plans to build a new Chemistry and Metallurgy Research Building on your campus where you will increase this nation's ability to produce more fissile triggers for nuclear weapons. I believe that the creation and use (whether potential or real) of nuclear arms is immoral and an act against our common humanity, and think it is an unconscionable use of tax dollars to spend the projected almost six billion dollars to construct this new facility.

I say NO! to erecting this building and ask that you please ground this project before it gets going. I believe strongly that both I personally and we as a nation (and world) must "turn our swords into plowshares and our spears into pruning hooks" to effect things that build us up as a people, not bring us down.

What are ways that you think we could use almost six billion dollars on plowing and pruning activities rather than preparations for bombing and destroying?

53-1

Thank you very much for your thoughts about what I -- and many others -- feel and believe. I look forward to hearing from you.

Sincerely,

Bill Uebelher

2766 South Lamar Street
Denver, Colorado 80227
mbu11@q.com

53-1 NNSA notes the commentor's opposition to nuclear weapons and to the CMRR-NF project. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Dear Sir:

I am writing to urge you to cancel the CMRR project. A study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. *55-1*

The cost of this project is absolutely unthinkable and the location near a majot fault makes it look too much like Japan'e recent catastrophe or Chernobyl's. *55-2*

As a concerned citizen I feel the need to urge you to STOP this project!

Sincerely,

Sister Constance Charette
131 Puritan Ave.
Worcester MA 01604
Member of Pax Christi International

55-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed, and concern about proximity to a major fault. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

55-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the

Commentor No. 55 (cont'd): Sister Constance Charette

existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. See Section 2.8, Nuclear Accidents, of this CRD for more information.

Commentor No. 56: John E. Glenski

From: Jeglenski@aol.com
Sent: Tuesday, June 14, 2011 9:37 PM
To: nepalaso@doeal.gov
Subject: New CMRR Building @LANL

John; If the new CMRR facility current projected cost is $5.8 billion to produce 80 pits/yr surely this facility should not be built. If presently we have 15,000 pits already in storage, common sense would says this is a tremedous misuse of government funds being used to produce pits that are not needed. If projected use of pits is 80/yr it will take 15,000\80 or almost 200 years to use up what we have already on hand. Please do not request funding for this project. ***56-1***

Sincerely,

John E. Glenski
6500 N. Grand Ave.
Gladstone, MO 64118

56-1 NNSA notes the commentor's concern about plutonium pit production and the large number of pits in storage. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 57: Tina H. Blackburn

From: NEPALASO@doeal.gov on behalf of Tina Blackburn [tinahb7@yahoo.com]
Sent: Tuesday, June 14, 2011 9:51 PM
To: NEPALASO@doeal.gov
Subject: Plutonium plant

My information may be limited, but having attended a lecture about what is going on at the Los Alamos labs, I want to register my horror at the seemingly senseless and thoughtless continuation of building on a site where an earthquake fault exists, and on a layer of soft volcanic ash which can be compacted by the weight of the building. *57-1*

The idea of having plutonium stored within a very short distance of Santa Fe, Albuquerque and Los Alamos is upsetting to say the least. I do not know why we even need plutonium if we are going to cut back on nuclear weapons. *57-2*

STOP IT! You are continuing an outmoded idea and setting up a whole state for disaster.

Tina H.Blackburn
4 Joya Court
Santa Fe, NM 87508

57-1 NNSA notes the commentor's opposition to the CMRR-NF project, and concerns about the proximity to geologic faults. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. A geotechnical report prepared for the Shallow Excavation Option provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy, which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation (Kleinfelder 2007a). The report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]). The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

57-2 NNSA notes the commentor's opposition to the production of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Subject: CMRR

The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great. So we could be looking at our own nuclear disaster ***60-1***

None of this even takes into account whether the nuclear weapons work presently done at LANL and our other nuclear weapons facilities violates the Nuclear NonProliferation Treaty. ***60-2***

The CMRR project should be canceled, a study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. ***60-3***

60-1 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

60-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. See Section 2.9, Treaty Compliance, of this CRD for more information.

60-3 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Subject: CMRR PROJECT SHOULD BE CANCELLED.....

The CMRR project should be canceled,

and a study of LANL's plutonium infrastructure should be required

- including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. *61-1*

PLEASE....PLEASE

With hope for a planet free of nuclear weapons......let us pray and work..........

Kenneth A. Lerczak

61-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 62: ppattiplcsam@aol.com

From: ppattiplcsam@aol.com
Sent: Wednesday, June 15, 2011 5:42 AM
To: nepalaso@doeal.gov
Subject: ARE YOU KIDDING?

LESS GOVERNMENT UNTIL IT BENEFITS THE CORPORATION? YOUR KIDDING RIGHT? OF COURSE NOT. NOT WITH SUCH CORRUPTION GOING ON IN GOVERNMENT. ITS NOT WE THE CORPORATION, ITS WE THE PEOPLE. GET IT RIGHT. AND STOP THIS VERY KIND OF WASTE. REVOLUTION COMING YOUR WAY.

The original cost of the project: FY2004 Preliminary Full Total Estimated Cost Projection was $400-550 million with a completion date of 2011.

The current cost: The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and a completion date of FY2023 - **this is more than ten times the original forecast** - and who knows what the final cost would be if they are given the green light on this project.

Built near a fault line: The worst part of all is that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great. ***62-1***

62-1 NNSA notes the commentor's opposition to the CMRR-NF project and concerns about geologic faults and earthquake hazards. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 63: Fred Goddard

From: Fred Goddard [fcgoddard@gmail.com]
Sent: Wednesday, June 15, 2011 6:21 AM
To: nepalaso@doeal.gov
Subject: Chemistry and Metallurgy Research Replacement Project

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir,

I am writing to you with regard to the Chemistry and Metallurgy Research Replacement (CMRR) Project. I understand that ehe CMRR was designed to replace the existing Chemistry and Metallurgy Research Building and serve as the site for manufacturing "Plutonium Pits", the fissile "triggers" capable of nuclear capability that initiate the destruction of modern thermonuclear weapons. ***63-1***

I have read that the original cost of the project: FY2004 Preliminary Full Total Estimated Cost Projection was $400-550 million with a completion date of 2011, while the current projected cost is now at $5.86 billion and a completion date of FY2023. At a time of economic crisis, this is unacceptable. ***63-2***

I also have read that is it built near a fault line. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to Los Alamos Nuclear Lab's weapons manufacturing complex in a geologically unstable area are just too great.

So we could be looking at our own nuclear disaster. Supposedly the new CMRR building will be able to withstand an earthquake of 7 on the Richter scale, but Japan has already had an aftershock from their recent earthquake measuring 7.1. ***63-3***
None of this even takes into account whether the nuclear weapons work presently done at LANL and our other nuclear weapons facilities violates the Nuclear NonProliferation Treaty. ***63-4***

63-1 NNSA notes the commentor's concern about plutonium pit production, cost, seismic hazards, and nuclear proliferation. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

63-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Regarding funding priorities, decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

63-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the

Commentor No. 63 (cont'd): Fred Goddard

For economic, safety and compliance with the Nuclear NonProliferation Treaty, I believe the CMRR project should be canceled, a study of LANL's plutonium infrastructure should be required—including existing and future capability needs—and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. *63-5*

Thank you for your attention to this matter.

Sincerely,

Fred Goddard
499 Fort Washington Ave Apt 3D
New York NY 10033

public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

63-4 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. See Section 2.9, Treaty Compliance, of this CRD for more information.

63-5 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 64: Barbara DePue

From: Barbara DePue [democatsx2@att.net]

To: nepalaso@doeal.gov
Subject: CMRR

I am writing to ask you to reconsider building the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico. The potential for destruction to humanity and the environment is a price too high to pay. *64-1*

64-1 NNSA notes the commentor's opposition to the CMRR-NF project and their concern for humanity and the environment. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapon stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This does not entail adding more nuclear weapons, but rather maintaining the existing stockpile. Chapter 4 of the *CMRR-NF SEIS* presents the potential human health and environmental impacts of the proposed alternatives.

Commentor No. 65: Myrt Rollins

From: Myrt Rollins [mrollins@ezeeweb.com]
Sent: Wednesday, June 15, 2011 8:54 AM
To: nepalaso@doeal.gov
Subject: The Los Alamos Replacement Project

Dear Mr Tegtmeir, Please cancel or postpone the nuclear project. Its costs to the suffering American people of over $5 Billion dollars is not and may never be needed. And it is to be located on a fault line that could lead to future catastrophic consequences for our country. Moreover, it is not in the interest of humanity as a whole and may even add to consideration of additional nuclear armaments. For the good of our people and the good of humanity, Please stop this project. *65-1*

Very sincerely, Mr. Myrt Rollins Breese, Illinois

65-1 NNSA notes the commentor's opposition to the CMRR-NF project and their concerns about cost, proximity to a fault line, and nuclear weapons. See Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology and Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapon stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This does not entail adding more nuclear weapons, but rather maintaining the existing stockpile.

Cancel CMRR project! The cost is too great!

The CMRR was designed to replace the existing Chemistry and Metallurgy Research Building and serve as the site where they would manufacture “Plutonium Pits”, the fissile “triggers” capable of nuclear capability that initiate the destruction of modern thermonuclear weapons. *67-1*

As a Catholic nun--I oppose war & uphold the sacredness of life. The following reasons support my plea to Cancel CMRR:
This project is to cost Billions of dollars--a drain on our economy--when there are poor in our own country lacking food, health-care etc. *67-2*

It is a Brain-drain - taking from jobs in life-enhancing fields.

The proposed building site is on a geologic fault--give me a break--Brain drain, already! This will not only endanger others with threatened use of nuclear weapons, but ourselves with a possible disaster like Fukushima or Chernobyl. *67-3*

Does work in our nuclear weapons facilities violate the Non-Poliferation Treaty? *67-4*

I urge you--Reconsider

Cancel CMRR project! The COST is too great!

Peace--to all people!

In Christ,

Sister Mary David, OSB

67-1 NNSA notes the commentor’s opposition to the CMRR-NF project and their concerns about plutonium pit production and nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL’s pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology and Section 2.4, CMR Mission, of this CRD for more information.

67-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

67-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF

Commentor No. 67 (cont'd): Sister Mary David

cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

67-4 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. From: Kathy Smith [kathy@ihmwestallis.com]
Sent: Wednesday, June 15, 2011 10:17 AM
To: nepalaso@doeal.gov
Subject: New CMMR Project in New Mexico

Dear Sir (Mr. John Tegtmeir of the US DOE/NNSA Los Alamos Site Office)

I have just learned about a project that is proposed for your State of Mexico. I reside in Wisconsin, far away from your state, but this project caught my attention for a number of reasons, 3 of which I listed below.

1. This project is about "weapons of destruction"
2. The cost of the project is enormous (in the billions)
3. Our government is in a fiscal crisis of a scope that is historic

I don't usually write politicians - I speak with my vote. There are millions of people on this precious earth of ours, that are starving, without the means to obtain relief. In my conscience this issue is far more important and needs to be addressed now. People who have their needs met (food, shelter, education) are happy people and do not want to war against each other. Please think about this before you work to approve this project. *70-1*

In addition, my understanding is that the project is proposed for an area near a major fault line. Please consider the numerous natural disasters that have occurred in the past 12 months around the world. I'm not a scientist, but this doesn't seem to make sense to me. *70-2*

Thank you for taking the time to read this.

Kathy Smith

Kathy Smith
kathy@ihmwestallis.com
Young Adult & Adult Ministry Director
Immaculate Heart of Mary Parish

70-1 NNSA notes the commentor's concerns about nuclear weapons and U.S. government funding priorities. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

70-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 71: Margaret A. Flanagan

To: nepalaso@doeal.gov
Subject: new plant building and funding

I believe the CMRR project should be canceled, a study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined.

You can already produce 20 pits a year at the existing CMR building, the Department of Energy has 15,000 stored in Texas, there is no need for more. We need less nuclear weapons, not the ability to produce more. *71-1*

The fault lines under the buildings are already a problem, we don't need more! *71-2*

Please consider all this before continuing.

Sincerely yours,

Ms Margaret A. Flanagan
177 East 3rd St. #4A
New York, NY 10009

71-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed, and concerns about plutonium pit production, and proximity to geologic fault lines. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

71-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 72: Linda De Sitter, MD

From: Linda De Sitter [desitter@gorge.net]
Sent: Wednesday, June 15, 2011 10:30 AM
To: nepalaso@doeal.gov
Subject: Don't build expensive new CMRR

Dear Mr. Tegtmeir,

Please don't spend money that we need (for education and health) on building nuclear pits that we don't need. Furthermore, building it near a fault line is just plain irresponsible. As a physician, I can't imagine how anyone with a concern for the public welfare would conceive of this project as being a good idea. ***72-1***

Linda De Sitter MD
Hood River, Oregon

72-1 NNSA notes the commentor's concerns about funding choices and building nuclear weapon pits. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 73: Elaine Hagopian, Ph.D.

Sent: Wednesday, June 15, 2011 10:43 AM
To: nepalaso@doeal.gov
Subject: Chemistry and Metallurgy Research Replacement (CMRR) Project

Please be responsible and do not build this plant. Placing it on a fault line, and paying billions of dollars for it equal another Fukushima. Have we learned nothing from the Japanese tragedy? Is there not better social use for all that money? *73-1*

Listen to the public, listen to conscience.

Elaine Hagopian, Ph.D.
Professor Emeritus of Sociology
Simmons College, Boston

73-1 NNSA notes the commentor's request that the CMRR-NF not be built, and their concerns about proximity to a fault line, and U.S. Government funding priorities. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 74: Rosemary English

From: rce6770@aol.com
Sent: Wednesday, June 15, 2011 10:44 AM
To: nepalaso@doeal.gov
Subject: Chemistry and Metallurgy Research Replacement Project

Dear Mr. Tegtmeir,

I am concerned about what I have learned about the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico. The current cost of the project far exceeds the original cost; it is being built near a fault line; and it is questionable whether the work done in this facility adheres to our obligations under the Nuclear NonProliferation Treaty. I believe you should consider these conditions in determing whether or not to go ahead with this project. *74-1*

Rosemary English

74-1 NNSA notes the commentor's concerns about the cost of the CMRR-NF, its proximity to a fault line, and its compliance with the Nuclear Nonproliferation Treaty. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. See Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 75: Ken Fredgren

From: K. Fredgren [fredgren.k@gmail.com]

To: nepalaso@doeal.gov
Subject: Cancel the CMRR

Please cancel the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico.

Not only is it a dangerous location, but it is about war and it has a current price tag of 5.86 billion and a completion date of FY2023 - this is more than ten times the original forecast. ***75-1***

Ken Fredgren
Reston, VA

75-1 NNSA notes the commentor's request that the CMRR-NF project be cancelled, and the concern that it is in a dangerous location. The site location and environmental hazards are factored into and accounted for in the design, construction, and operation of the CMRR-NF. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, and Section 2.8, Nuclear Accidents, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. The decision will be announced in a ROD that will appear in the *Federal Register*. In accordance with NEPA regulations, the ROD cannot be issued any earlier than 30 days after publication of the *Final CMRR-NF SEIS*.

Commentor No. 76: Beth Olson

Cc: NEPALASO@doeal.gov
Subject: Comments RE: CMRR

Kevin,

This correspondence is intended to serve as my public comment concerning the proposed construction of a new CMRR building at LANL. I am Douglas R. MacDonald, residing at 193 Piedra Loop, Whiterock/Los Alamos, New Mexico. I have been in attendance of one "Public Hearing", reviewed numerous technical documents and read several newspaper articles relating to the construction of a new CMRR building proposed to be located within the Pajarito Corridor at LANL. From what I have gathered, most of the comments in support of the CMRR proposal are specific to short-term economic gains for Northern New Mexico, which will be created by the construction project, such as jobs and dollars into the community and surrounding area. The majority of the dissenting comments seem to center around opposition to the weapons program; certainly valid concerns, however, the construction of a new CMRR building really becomes secondary to that point of dissension and frankly, moot.

With respect to the economic gain discussion, building this new CMRR facility will certainly be of tremendous benefit to Northern New Mexico, actually all of New Mexico's labor force as well as the business folks, however, it will be a short-term gain. With respect to the "weapons" philosophy perspective, perhaps our nation does need to re-evaluate our weapons programs. However, by building this new CMRR complex, I suspect that re-evaluation of the weapons program will in fact become one of the prime objectives of this facility.

I see at minimum, two very important and critical areas negatively impacted if this construction project is not built; namely the long-term negative impacts on the future of nuclear science/associated scientific disciplines and secondly, our national security. The mission of "National" security and "World" security could, no, would, be compromised without this new CMRR facility. The multitude of scientific discoveries resulting from the construction of this state of the art research facility will not be limited to nuclear alone, those associated discoveries will without question transcend the intended mission, stimulate and challenge other science research programs and create new cultures of scientific exploration for the future science pathfinders of generations to come.

77-1

77-1 NNSA notes the commentor's support for the proposed CMRR-NF project. NNSA believes that the 60-year-old CMR Building needs to be replaced in order to address safety, reliability, consolidation, and safeguards and security issues related to performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production). Due largely to seismic and safety concerns, the existing CMR Building operates at a reduced level that does not fully support the NNSA plutonium mission. The proposed Modified CMRR-NF would provide the capability to fully meet the mission need in a modern structure that meets all seismic safety and security standards.

The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative and the Modified CMRR-NF Alternative would require a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. However, NNSA recognizes that the creation of any construction jobs during the current economic difficulties would have a positive effect on the construction industry in northern New Mexico, as was stated by a number of commentors during the public comment period. See Section 2.7, Economic Impacts, of this CRD for more information.

Commentor No. 77 (cont'd): Douglas R. MacDonald

In conclusion, I support the CMRR construction project. I have confidence that the appropriate safety considerations of the workers and citizens of the surrounding communities, along with the environment, will continue to be a DOE and LANS priority, and I truly believe this project is in the best interest of our nation from a security, as well as a scientific perspective. 77-1 cont'd

Thanks,

Douglas R. MacDonald

Dear mr. Tegtmeir: We are residenets of New York and are letting you know we are very much against building you CMRR's current buildings 2/3s of a mile from a geologic fault line. Let's learn from the disaster in Japan. Please do not do this. Sincerely, Patricia and Hugh Goley ***78-1***

rie | PA | 16502

78-1 NNSA notes the commentors' request that the CMRR-NF not be built and their concern about the proximity to a geologic fault. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

Please do NOT build this facility. It is not needed, extremely dangerous and too expensive. Sincerely, Lloyd E. Opoka, Kansas City, MO. ***79-1***

79-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 80: Deacon Jim McFadden

From: Jim McFadden [macfam500@att.net]
Sent: Wednesday, June 15, 2011 2:16 PM
To: nepalaso@doeal.gov
Subject: "Plutonium Pits" & Nuclear stockpiling

Dear Mr. Tegtmeir,

As an American Catholic, I object to the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, NM.

According to the "Compendium of the Social Doctrine of the Church," the Church's social teaching proposes the goal of "general, balanced and controlled disarmament. The enormous increase in arms represents a grave threat to stability and peace. The principle of sufficiency, by virtue of which each State may possess only the means necessary for its legitimate defense, must be applied both by States that buy arms and by those that produce and furnish them. Any excessive stockpiling...in arms cannot be morally justified" (#508). ***80-1***

The move to build 80+ "Plutonium Pits" is a movement towards stockpiling rather than disarmament and cannot be morally justified.

Peace and good will,

Deacon Jim McFadden

80-1 NNSA notes the commentor's objection to the CMRR-NF and concerns about excessive stockpiling. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 81: Elizabeth Rogers

From: Elizabeth Rogers [srbetty@cenaclesisters.org]
Sent: Wednesday, June 15, 2011 2:26 PM
To: nepalaso@doeal.gov
Subject: CMRR et al

I am writing to urge you to cancel the CMRR project, LANL's plutonium infrastructure should be required, and a realistic cost for maintaining and upgrading safety features at the existing CMR should be determined.

The CMMR project goes against the official position of the present administration that nuclear weapons should be gradually done away with. In addition, it has become way too costly in a time when our debts are so great that we are asked to raise the debt ceiling even though it will diminish our credit around the world.

A study of the LANL plutonium structure is needed and should include existing and future capability needs.

The main expense that can be justified, in my opinion, is that of upgrading safety features at the existing CMR. *81-1*

Deliver us and the whole world from the constant threat of a nuclear holocaust or another Fukushima! Now is the time. *81-2*

Respectfully,

Elizabeth Rogers
Gainesville, FL 32601

81-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed, and concern about nuclear weapons. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

81-2 The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 82: Elizabeth Brockway

To: nepalaso@doeal.gov
Subject: CMRR Project in Los Alamos, New Mexico

Mr. John Tegtmeir,

I would like to share my feelings with you about this project. It is my belief that the CMRR project should be cancelled, a study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. We need to have a high value for human lives and based on the information I have obtained regarding this project, I do not feel that the value of human lives is being considered. *82-1* Building a nuclear facility close to a geological fault line would be very risky, especially considering the earthquake that occurred in Japan a few months ago. Please reconsider going forward with this project. Thank you for your time. *82-2*

Elizabeth Brockway
430 W. 5th St.
Perrysburg, OH 43551

82-1 NNSA notes the commentor's opposition to the CMRR-NF project and suggestion that a plutonium infrastructure study be performed, and their concerns about human health and proximity to a geologic fault. The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

82-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. Subject: CMRR building

Hello,

I have learned about the proposed construction of a new CMRR building at the Los Alamos National Laboratory and would like to register my disapproval of this project because of safety reasons, cost and increased proliferation of nuclear weapons. This project needs to be cancelled. ***84-1***

Sally Chappell
Bridgton, ME

84-1 NNSA notes the commentor's opposition to the CMRR-NF project and concerns about safety, cost, and nonproliferation. The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapon stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This does not entail adding more nuclear weapons, but rather maintaining the existing stockpile.

Commentor No. 85: Sister Janice Thome

From: Janice Thome [presence@odsgc.net]
Sent: Wednesday, June 15, 2011 8:26 PM
To: nepalaso@doeal.gov
Subject: please STOP

I wish to voice my vote that the CMRR not be built.

The Nuclear NonProliferation Treaty still stands and I want my country to live up to it. *85-1*

The geographic fault line that is less than a mile away shouts out for caution less we cause another nuclear disaster even worse than that in Japan. *85-2*

Why would we ever need to make 80 or more pits a year? We already have 15,000 and make 20 more each year. Why polute our earth with the capability to destroy us many times over?

In our economic crisis, I think it immoral to waste so much time, money and human energy on something that will not feed or give necessities to anyone. Furthermore it is set only to destroy us. *85-3*

PLEASE STOP THE PLAN ALL TOGETHER AND FOCUS ON THE HEALTH OF OUR EARTH.

Sister Janice Thome
1002 Gillespie
Garden City KS. 67846

85-1 NNSA notes the commentor's request that the CMRR-NF not be built, and their concerns about nonproliferation, proximity to a geologic fault, pit production, and funding priorities. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. See Section 2.9, Treaty Compliance, of this CRD for more information.

85-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

85-3 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in

Commentor No. 85 (cont'd): Sister Janice Thome

Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Subject: Common Sense

June 15, 2011

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544
Fax: 505-667-5948

Dear Sir:

86-1 If the US government has 15,000 Plutonium pits already in storage and the ability to add 20 per year to this inventory, why does the government need a new Chemistry and Metallurgy Research Building (CMRR) to build 80 plus Plutonium pits per year?

Common sense, in my opinion, would suggest that a new CMRR is not needed.

Especially since, the new enemy facing the security of our country is our national debt. Please pray on this issue. Help our country balance our budget with sound finical decisions in order to control the national debt if not for us then our grandchildren and great grandchildren.

Our prayers are with you on this issue.

Paul Helbling
T606 St. Rt. 109
Liberty Center, Ohio
43532-9720

xxx-xxx-xxxx

86-1 NNSA notes the commentor's concern that the CMRR-NF may not be needed, and concerns about pit production and funding priorities. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 87: Rev. Ronald A. Richardson

From: RONALD RICHARDSON [raidan@prodigy.net]
Sent: Wednesday, June 15, 2011 9:45 PM
To: nepalaso@doeal.gov
Subject: CMRR building

Dear Sir,

I am a member of Pax Christi USA, a Catholic peace group. We have heard from our New Mexico affiliate that the US Government is planning to replace the original CMR building with an updated version costing over five billion dollars.

87-1 Sir, I oppose this effort and urge you to enter into dialogue with your superiors in the government in an effort to educate them in the concerns and fears of ordinary citizens as our country moves forward in this direction while giving mixed signals to the world about our peaceful intentions in regard to the control of nuclear weapons.

I'm sure you are in a difficult spot. You'll be in my thoughts and prayers as you deliberation this issue and opposition to it.

Sincerely,

(Rev.) Ronald A. Richardson
Southold, NY

87-1 NNSA notes the commentor's opposition to the CMRR-NF project and concerns about the United States giving mixed signals regarding nonproliferation. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. See Section 2.9, Treaty Compliance, of this CRD for more information.

Subject: Replacing the Chemistry and Metallurgy Research Bldg

We need fewer nuclear capability products, rather than more and more. A new and larger building for creating these nuclear products, especially so near a fault zone, is unwise and irresponsible. *88-1*

Please, rethink what course to take on this. Thank you.

Carolyn Modeen Sun City AZ 85351

88-1 NNSA notes the commentor's concerns about construction of additional nuclear products capabilities near a fault zone. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapon stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This does not entail adding more nuclear weapons, but rather maintaining the existing stockpile. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Subject: Proposed Chemistry and Metallurgy Research Replacement Project

Hello.

I was recently informed about the Proposed Chemistry and Metallurgy Research Replacement Project in Los Alamos.

The information I have received has been largely negative; I was hoping you could direct me to information that would speak to the benefits of such a project? ***89-1***

Thank you for your time,

Rebecca

89-1 Benefits of the proposed project are described in the *CMRR-NF SEIS* Summary, in the Overview, and Sections S.1, Introduction; S.2, Background; and S.3, Purpose and Need for Agency Action. The CMR is almost 60 years old and near the end of its useful life. Many of its utility systems and structural components are aged, outmoded, and deteriorated. Recent geological studies identified a seismic fault trace located beneath two of the wings of the CMR Building, which raised concerns about the structural integrity of the facility. Over the long term, NNSA cannot continue to operate the mission-critical CMR support capabilities in the existing CMR Building at an acceptable level of risk to worker safety and health. NNSA has already taken steps to minimize the risks associated with continued operations at the CMR Building. To ensure that NNSA can fulfill its national security mission for the next 50 years in a safe, secure, and environmentally sound manner, NNSA has proposed to construct a CMR replacement facility, known as the CMRR, as a necessary step in maintaining critical analytical chemistry and materials characterization capabilities at LANL. For further detail, refer to Chapter 1, Introduction and Purpose and Need for Agency Action, of the *CMRR-NF SEIS*.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapon stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This does not entail adding more nuclear weapons, but rather maintaining the existing stockpile

Commentor No. 90: Patricia and Daniel Driscoll-Shaw

To: nepalaso@doeal.gov
Subject: CMRR PROJECT: LOS ALAMOS

Sir,

Please halt the construction of the Chemistry and Metallurgy Research Building in Los Alamos. I say this for two reasons.

First, we need to move towards nuclear disarmament as President Obama has said. Producing more parts for these weapons makes no sense. *90-1*

Second, this project is way over budget and as we talk about stopping the deficit bleeding, how can we possibly continue to spend money on this project?

Thank you for taking these ideas into consideration.

Patricia & Daniel Driscoll-Shaw

90-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 91: Kathleen Bovello

From: JRC20815@aol.com
Sent: Thursday, June 16, 2011 10:14 AM
To: nepalaso@doeal.gov
Subject: CMRR

The current cost: The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and a completion date of FY2023 - this is more than ten times the original forecast - and who knows what the final cost would be if they are given the green light on this project.

Built near a fault line: The worst part of all is that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great. ***91-1***

So we here in New Mexico and the United States could be looking at our own nuclear disaster maybe much worse than Fukushima or Chernobyl. Supposedly the new CMRR building will be able to withstand an earthquake of 7 on the Richter scale, but Japan has already had an aftershock from their recent earthquake measuring 7.1. ***91-2***

None of this even takes into account whether the nuclear weapons work presently done at LANL and our other nuclear weapons facilities violates the Nuclear NonProliferation Treaty. ***91-3***

Let's not go ahead with this. ***91-1 cont'd***

sincerely

Kathleen Bovello
Chevy Chase MD

91-1 NNSA notes the commentor's opposition to building and operating the CMRR-NF and that the commentor is concerned that building in a geologically unstable area or near a fault was a principal factor in the increased cost of the project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*).

Commentor No. 91 (cont'd): Kathleen Bovello

91-2 NNSA notes the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

91-3 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Please, for the sake of our children and grandchildren, for all of us, cancel the CMRR project. We do not need weapons of mass destruction in the U.S. andy more than they should have them in Iraq. What a double standard. ***92-1***

Sue Becker
9870 W. Highwood Ct.
Sun City, AZ 85373

92-1 NNSA notes the commentor's opposition to the CMRR-NF project and addresses such concerns in Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD.

Commentor No. 93: Anne J. Van Lanen

From: AJ [sraj@charter.net]
Sent: Thursday, June 16, 2011 11:51 AM
To: nepalaso@doeal.gov

Mr. Tegtmier,

Please, be aware and discontinue the efforts at further nuclear development by the fault line in New Mexico!! Please, let these monies go to feeding and educating the hungry of the world!

Let Japan be an example and warning to us here in the U.S. Thank you.

Anne J. Van Lanen

93-1

93-1 NNSA notes the commentor's opposition to the CMRR-NF project.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA also notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, education and welfare) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The commentor's concerns that an accident (similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant) could happen at LANL is addressed in Section 2.8, Nuclear Accidents, of this CRD. There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant or Chernobyl) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information

Commentor No. 94: Marietta Charbonneau

To: nepalaso@doeal.gov
Subject: CMRR PROJECT IN NEW MEXICO

To Mr. John Tegtmeir,

I stand with all Americans who protest the proposed Chemical and Metallurgy Replacement Project in Los Alamos. After seeing the Fukushima disaster, I feel that this site is too unstable to support this type of project. Also, I strongly object to the amount of money being spent when so many Americans are out of jobs at this time.

I hope all involved will stop and reconsider LOCATION and COST.

94-1

Sincerely,

Marietta Charbonneau, MA, SFO

94-1 NNSA notes the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant nuclear reactor site could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 94 (cont'd): Marietta Charbonneau

Lastly, the commentor's concern regarding the funding priorities of the U.S. Government is noted. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

To: nepalaso@doeal.gov
Subject: CMRR Project

Dear Mr.Tegtmeir,

I am writing to express my most emphatic opposition to the CMRR project.

First, on the grounds that the new CMRR building is 2/3 mile from a fault line.

Secondly, on the grounds the expense is outrageous and unjustifiable. *95-1*

Third, and most important of all, it is time to be spending our human, financial and material resources finding ways to halt the threat that the nuclear industry in total creates. In summary, this is morally unacceptable.

Thank you for your time and consideration.

Sincerely,

Mrs. Joy Aspenall
San Jose, CA
jaea@aol.com

95-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Regarding cost and funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. .

Commentor No. 96: Dr. Finian D. Taylor

To: nepalaso@doeal.gov
Subject: CMRR

Friends:

I understand from the national press that a new CMRR bulding is being planned.

This is abominable.

1. The CMRR is not needed.
2. The cost is outrageous.
3. The project is a violation of the Non-Proliferation Treaty.

96-1

Dr. Finian D. Taylor
412 Marsh Pt.
Hilton Head SC 29926

96-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Lastly, current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 97: Carol Stenger

From: Carol Stenger [carolstngr@yahoo.com]
Sent: Thursday, June 16, 2011 3:38 PM
To: nepalaso@doeal.gov

To Whom It May Concern,

The proposed Chemistry and Metallurgy Research Replacement (CMRR) Project in Los Alamos, New Mexico should be canceled. First, a study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. The CMRR was designed to replace the existing Chemistry and Metallurgy Research Building and serve as the site where they would manufacture "Plutonium Pits", the fissile "triggers" capable of nuclear capability that initiate the destruction of modern thermonuclear weapons. In other words, they are the heart of every nuclear weapon. The Lab already has the ability to produce 20 pits a year at the CMR building, but if they move ahead and build the new CMRR, they will have the ability to produce 80+ a year. (Currently the Department of Energy has 15,000 pits stored at the Pentax Facility in Texas.) *97-1*

With the cost astronomical, I believe that this is another reason why it should be cancelled. *97-2*

Please consider this request as a way to save our planet and protect the environment and our people.

Thank you for your consideration in this matter.

Sincerely,

Sr. Carol

Eph 3: 20 "Glory be to God whose power working in us can do infinitely more than we can ask or imagine."

97-1 NNSA notes the commentor's opposition to the CMRR-NF project. Regarding the commentor's request to perform a plutonium infrastructure study, the proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF.

97-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 98: Mary Smith
Church Women United in New York State

From: Mary Smith [smithmarym@yahoo.com]
Sent: Thursday, June 16, 2011 6:57 PM
To: nepalaso@doeal.gov
Cc: Barbara Williams
Subject: We don't need/want more nuclear plants

The original cost of the project: FY2004 Preliminary Full Total Estimated Cost Projection was $400-550 million with a completion date of 2011.

The current cost: The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and a completion date of FY2023 - this is more than ten times the original forecast - and who knows what the final cost would be if they are given the green light on this project.

Built near a fault line: The worst part of all is that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great. ***98-1***

Sent on behalf of Church Women United in New York State

98-1 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA notes the commentor's concern about the cost of the new facility. Cost of constructing and operating the CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 99: Daniel Heuer

From: Daniel Heuer [heuerdg@comcast.net]

To: nepalaso@doeal.gov
Subject: Chemistry and Metallurgy Research Replacement

To: Mr. John Tegtmeir

I live in Windsor , Connecticut and am writing regrading the Chemistry and Metallurgy Research Replacement (CMRR) that is proposed for expansion in Los Alamos.

I am writing to urge that the CMRR project be canceled, a study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. The project is slated to cost much more than the original proposal. *99-1*

The worst part of all, however, is that the proposed site for the new CMRR building is only 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. *99-2*

Once again, I urge you to cancel this expansion project. The United States needs to learn from the recent nuclear disaster in Japan. We need to take appropriate measures to avert future disasters. At this time with the extremely depressed economy in our we cannot afford to spend large sums of taxpayer funds to create dangerous new project. *99-3*

Daniel Heuer.
520 Stillwater
Windsor, CT. 06095

99-1 NNSA notes the commentor's opposition to the CMRR-NF project. Regarding the commentor's request to perform a plutonium infrastructure study, the proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

99-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground

Commentor No. 99 (cont'd): Daniel Heuer

motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*).

99-3 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Regarding project cost and funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Subject: New energy needed

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir,

I'm writing to you in the beginning of a gorgeous summer. I'm so grateful for the trees, the soft wind, the glory of this green planet.

Please don't blow it!! The current CMRR project in Los Alamos needs to be curtailed and safety mechanisms need to be explained to the public. I live far away in New England and I'm extremely concerned. Do not place your hopes on nuclear weapons. No more building at CMRR plutonium pits and triggers. Please cancel your proposed building project. Please explain to me and other citizens your best practices for safety at the existing site. *102-1*

Thank you for your good works,

Minga Claggett-Borne, LMFT
xxx xxx-xxxx
www.pedalseeds.net
Donde hay la Verdad y amor , siempre hay libertad.

102-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Safety is a high priority for NNSA. NNSA requires its contractors to manage and operate NNSA sites and perform work in accordance with regulations, DOE Orders, and standards that include requirements to ensure protection of workers, the public, and the environment.

Commentor No. 103: Eleanor MacLellan

From: Eleanor MacLellan [elmac185@yahoo.com]
Sent: Friday, June 17, 2011 12:41 PM
To: nepalaso@doeal.gov
Subject: CMRR

Your Lab already has the ability to produce 20 plutonium pits a year at the CMR building, but i f you move ahead and build the new CMRR, you will have the ability to produce 80+ a year. The Department of Energy already has 15,000 pits stored at the Pentax Facility in Texas. This is not acceptable. The danger of a U.S. Fukushima or Chernobyl is too great. AND the danger of using the plutonium for nuclear weapons is too great!! *103-1* *103-2*

The original cost of the project for FY2004 Preliminary Full Total Estimated Cost Projection was $400-550 million with a completion date of 2011. The "Details of Project Cost Estimate" table in the FY2012 budget puts CMRR's current projected cost at $5.86 billion and a completion date of FY2023 - this is more than ten times the original forecast - and who knows what the final cost would be if they are given the green light on this project.

The worst part of all is that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. An updated seismic hazards analysis from May 2007 showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the more than $3 billion added to cost estimates since 2008 result from efforts to address the heightened seismic hazards. The costs of adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area are just too great. *103-3*

Therefore, I beg you NOT to go ahead with this project. Thank you, *103-1 cont'd*

Eleanor MacLellan, Cambridge, MA.

103-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

103-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10 of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

103-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the CMRR-NF SEIS. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building

Commentor No. 103 (cont'd): Eleanor MacLellan

location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*).

Commentor No. 104: Sister Danat Marie Brysch

From: S Danat Marie Brysch [sdanatmarie@feliciansisters.org]
Sent: Friday, June 17, 2011 1:26 PM
To: nepalaso@doeal.gov
Subject: Los Alamos plutonium pits

The Chemistry and Metallurgy Research (CMRR) project planned for Los Alamos is designed to produce "Plutonium Pits" which is used to trigger nuclear weapons. The chosen site is seismologically unstable. In fact, there is no truly safe place on this active planet to store such materials. As a country we need to be more responsible regarding handling all nuclear materials whether raw material, products, or waste. ***104-1***

Sincerely,

Sr. Danat Marie Brysch
Felician Sisters

104-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

All radioactive waste generated as part of activities at the CMRR-NF and elsewhere at LANL will be managed in a manner that is protective of public health and safety and the environment, and in compliance with Federal and state standards. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Dear Mr. Tegtmeir:

I wanted to write to let you know that I oppose the construction of the CMRR (Chemistry and Metallurgy Research Replacement) Project in Los Alamos, New Mexico. It is ludicrous to believe that the 15,000 stockpiled Plutonium Pits, in addition to your current production capacity, in addition to the fully armed nuclear weapons the US has deployed around the world, are insufficient to the cause of destroying the earth many times over. What possible benefit can Americans, or anyone else, expect to derive from your plan to create even more fissile triggers? *105-1*

No good can come from this project. Billions of dollars that could be better spent on nearly anything will be turned into more weapons than could ever be used. Please cancel this project.

Yours sincerely,

John August Swanson

The Studio of John August Swanson
8417 Holy Cross Place
Los Angeles, CA 90045
xxx.xxx.xxxx

May God bless us with enough foolishness to believe that we really can make a difference in this world, so that we are able, with God's grace, to do what others claim cannot be done.

- Four-fold Franciscan Blessing

105-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Regarding project cost and funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 106: Patrick Grace

Sent: Sunday, June 26, 2011 12:28 AM
To: NEPALASO@doeal.gov
Subject: LANL

to whom it may concern,

i am a taos county resident who opposes the expansion of LANL. First of all, the continued production of nuclear armaments defies logic. the cold war is over. nuclear weapons represent all that is wrong with humanity. it is one thing to annihilate human life, and another to annihilate ALL LIFE. This is unacceptable. Nobody wins in a nuclear war. *106-1*

The continued threat posed by the LANL facility to the residents of northern new mexico is serious. i live downwind from the laboratory, and find the reality of an accident sobering. nuclear material does not go away. it stays in the environment for decades and decades to come. The lab is a great source of income for our otherwise poor region, but i find that the short-term gains are outweighed by the consequences of a simple miscalculation or mistake. do we really need to manufacture nukes? can't we spend our money more wisely? I personally feel that the spirit of the American people is transcendent to our current state of affairs. We do not need nukes. If a conflict arises i believe that we are capable of resistance. But are we the aggressors? If there was a need for physical force, if the situation arose where folks were needed to defend our great country I would gladly answer the call. I believe in our commonwealth, i believe in the good of humanity. i do not believe in the continued production of nuclear weapons. *106-2*

please see beyond the short-term economic growth, and invest my money in something worthwhile, like a future for america, for example education. if we managed our federal money more wisely we wouldn't be in this state of affairs. thank you for your time, and i hope you do not continue with the proposed expansion *106-3*

-sincerely, patrick grace

106-1 NNSA notes the commentor's opposition to the CMRR-NF project at LANL and the continued production of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the CMRR-NF SEIS, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

106-2 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

106-3 Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 107: Sister Aquinas

To: nepalaso@doeal.gov
Subject: cmmr project

Dear Sir,

I am writing to ask you to cancel the CMMR project in New Mexico for the sake of the common good of humanity. I know little of politics and the nuclear world but I support human life and care for the earth and its inhabitants. ***107-1***

God bless you as you work for the good of all.

Sister Aquinas

107-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 108: John Witham

From: John Witham [7john3@gmail.com]

Subject: CMRR-NF SEIS Comments

6/24/2011

Mr. John Tegtmeier, CMRR-NF SEIS Document Manger, USDOE, NNSA, Los Alamos Site Office, 3747 West Jemez Rd., Los Alamos, NM 87544

108-1

1. A Complete, New Environmental Impact Statement is Needed, Not A Supplemental Environmental Impact Statement. The original Environmental Impact Statement in 2004 assessed a building designed to withstand only mild seismic events. A 2007 updated seismic hazards analysis showed a potential huge increase in seismic ground motion and activity. Los Alamos National Lab sits between the Rio Grande rift and the volcanic Jemez Mountains in a seismic fault zone. Only a full Environmental Impact Statement can adequately study the full consequences of increased possibility seismic events might have on the proposed bomb plant.

108-2

- A new business case is needed. Decisions made in 2004 EIS are outdated. Choice of NF is based on 2007 costs before NF ballooned to $6B.
- The wrong Question is being asked. Should be – What is the most efficient way to take care of NNSA's stockpile needs? Not - What size and where shall the NF be built?

108-3

2. Real Alternatives Must Be Considered in the Supplemental Environmental Impact Statement. DOE must develop and consider new alternatives, including a true "No Action" alternative--not building the Nuclear Facility; and upgrading the existing plutonium production building.

- Two of the Alternatives given in this draft are so bad that they cannot really be considered alternatives
- The current "No Action" Alternative is to construct and operate a new CMRR-NF at TA-55, adjacent to RLUOB, as analyzed in the 2003 CMRR EIS. But based on new information learned since 2004, the 2004 CMRR-NF would not meet seismic standards to safely conduct mission work. "Therefore, the 2004 CMRR-NF would not be constructed". (Pg. S-8)
- So this is not really an alternative.
- The Continued Use of CMR Building Alternative In this current EIS states: Do not construct a replacement facility to house the capabilities planned for

108-1 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*). See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

108-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions, which were based on a number of considerations including cost, in two Records of Decision published in the *Federal Register* on December 19, 2008 (73 FR 77644 and 77656). The first ROD addresses operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and includes the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building. Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault

Commentor No. 108 (cont'd): John Witham

the CMRR-NF, but continue to perform operations in the CMR Building at TA-3, with normal maintenance and component replacements at the level needed to sustain operations for as long as feasible. Certain operations would be restricted. Administrative and radiological laboratory operations would take place in RLUOB at TA-55. But this alternative does not completely satisfy NNSA's stated purpose and need to carry out operations at a level to satisfy the entire range of DOE and NNSA mission support functions. (Pg. S-19)

- So this is not really an alternative, either.
- That leaves only the Modified CMRR-NF Alternative as the only real alternative. Under the Modified CMRR-NF Alternative, which is NNSA's Preferred Alternative, NNSA would construct the new CMRR-NF at TA-55 next to the already constructed RLUOB, with certain construction enhancements and additional associated construction support activities.
- Obviously, two of the alternatives are unworkable, which stacks the deck in favor of the preferred alternative.

108-3 cont'd

3. This draft SEIS should be withdrawn until the details of the Seismic Risks are better understood.

- The cost-saving Shallow Option, in which the foundation would be constructed in a geologic layer above a poorly welded tuff layer, is not a mature concept, and it is not yet known if this option is safe. The draft SEIS fails to accurately analyze how impacts to the environment from this option may be different.
- There are more new seismic investigations currently underway at the Lab. This draft SEIS must be withdrawn and rewritten after the results of these new investigations are known. Proceeding with design before seismic risks are better known will only repeat the process that led to the need for this Supplemental EIS.

108-4

4. A New Nuclear Facility Will Detract from Cleanup of the Existing Mess. DOE made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant, which will only add to the pollution.

- Materials Disposal Area C (MDA C), a large chemical waste dump, is located in the middle of the proposed construction support areas. Large pore gas contaminant plumes exist under areas where construction offices and warehouses are planned. Cleanup at MDA C must be completed before any new construction.

108-5

trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*.

108-3 Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, of the SEIS, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions and issued through the 2008 *Complex Transformation SPEIS* ROD. Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and not proceed with the CMRR-NF, such an alternative does not meet NNSA's stated purpose and need (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). Thus, an alternative of ceasing CMR operations is not addressed in the *CMRR-NF SEIS*. The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

108-4 NNSA understands the seismic risks of the CMRR-NF construction site sufficiently to proceed with design. See the response to 108-1.

The concerns expressed by the commentor about the Shallow Excavation Option not being a mature alternative appear to refer to statements in Chapter 1 and Chapter 2, Section 2.6.2.1, of the *Draft CMRR-NF SEIS* indicating that there was more uncertainty in the design of the Shallow Excavation Option because that design had not reached the same level of maturity as the Deep Excavation Option. The *CMRR-NF SEIS* has been revised. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain

Commentor No. 108 (cont'd): John Witham

5. The Costs to Build a Plutonium Pit Production Complex Are Just Too High. The total original estimate for constructing the new nuclear weapons complex at Los Alamos National Laboratory was approximately $600 million in 2004. The current estimate is $5.8 billion. DOE must analyze whether this growing price tag is too high and examine simply upgrading the existing facilities to address seismic concerns and worker safety would cost less. **108-2 cont'd**

6. The US does not need 80 new plutonium pits per year. DOE must conduct a "capacity study" to determine whether the existing facilities can be used instead of building the proposed NF, which would increase pit-manufacturing capacity to at least 80 per year. Existing facilities have sufficed since 1999 when DOE limited plutonium pit manufacturing to 20 per year. **108-6**

- So what are these needed new or expanded capabilities, if indeed we are seeking a future world free of nuclear weapons? If these needs exist, NNSA must explain why plutonium pit production must be expanded? If expanded production is not needed, then why is the CMRR-Nuclear Facility needed?

Just as new seismic information has forced a re-evaluation of the construction, new cost information must force a re-evaluation of the cost. **108-2 cont'd**

The No-build alternative that was offered in the scoping must be reconsidered. **108-3 cont'd**

- Do not construct a replacement facility to house the capabilities planned for the CMRR–NF. Continue to perform analytical chemistry, material characterization, and actinide research and development activities in the CMR Building, making the extensive facility upgrades needed to sustain CMR programmatic operations for another 20 to 30 years.

John Witham
Santa Fe, NM 87505

close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option. Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b). The Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

108-5 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

108-6 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 109: Nodia Brent-Lux

From: Nodia [Nodia@goldeneyesantafe.com]

To: NEPALASO@doeal.gov
Subject: plutonium production in Los Alamos

To Whom It May Concern,

I am absolutely opposed to plutonium production in Los Alamos and I am appalled that our tax dollars are going towards the creation of new weapons. How many people will have to get sick and die from nuclear accidents before we decide to place people before profits? *109-1*

Nodia Brent-Lux

109-1 NNSA acknowledges that there is substantial opposition to the development of nuclear weapons. Plutonium is not produced at LANL and could not be produced there. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 110: Claire Kugelman-Kropp

From: Claire Kugelman-Kropp
To: nepalaso@doeal.gov
Sent: Friday, June 17, 2011 7:27 AM
Subject: Responding to the CMRR SEIS

I recently heard about the proposed new plutonium facility at the Los Alamos National Laboratory, and I have a few concerns.

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. ***110-1***

The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. ***110-2***

Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth.

Claire Kugelman-Kropp
15985 41st Avenue
Clearlake, CA 95422

110-1 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

110-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

sweat, tears, or the sea.

~ Isak Dinesen

111-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD.

Commentor No. 112: Anne DeMers

From: Anne Demers [Anne.Demers@bhshealth.org]
Sent: Saturday, June 18, 2011 11:25 PM
To: nepalaso@doeal.gov
Subject: CMMR replacement building

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

I urge you to cancel the replacing the existing Chemistry and Metallurgy Research Building for many reasons:

1) We already have the ability to produce 20 pits a year at the CMS building and currently have 15,000 pits stored at the Pentax Facility in Texas. ***112-1***

2) This violates the Nuclear NonProliferation Treaty in existence. ***112-2***

3) This building is located in a seismic fault zone between a rift valley and a dormant volcano. A recent seismic hazards analysis showed a potential huge increase in seismic ground motion and activity. We seem to be courting our own nuclear disaster -- maybe much word than Fukushima or Chernobyl. Supposedly the new building will be able to withstand an earthquake of 7 on the Richter scale, but Japan has already had an aft3ershock from their recent earthquake measuring 7.1. ***112-3***

Also, a study of the Los Angeles National Laboratory's plutonium infrastructure needs to happen -- including existing and future capability needs, and it would be good if a realistic cost for maintaining and upgrading safety features at the existing CMR would be determined. I would rather see federal money spent for this purpose. ***112-4***

Again, I urge you to cancel this project.

Sincerely,

A. DeMers
Crookston, MN

112-1 NNSA notes the commentor's opposition to the CMRR-NF project. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

112-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

112-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated

Commentor No. 112 (cont'd): Anne DeMers

seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The types of radiological accidents that occurred at Chernobyl and the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. Plutonium metal and oxide used at the existing CMR Building and that would be used in the proposed CMRR-NF cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems like those used at commercial nuclear reactor plants. For more information on this issue see Section 2.8, Nuclear Accidents, of this CRD.

112-4 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 113: Emily Sadow

From: Emily Sadow [snowmaven@gmail.com]
Sent: Sunday, June 19, 2011 11:06 AM
To: nepalaso@doeal.gov
Subject: Comments CMRR-NM SEIS

I am writing to oppose the new Chemical and Metallurgical Research Replacement Nuclear Facility building proposed in Los Alamos. Here are some reasons:

1. A SEIS is not sufficient to assess the impacts, only a complete NEW EIS would be sufficient *113-1*

2. Focus on cleaning up the existing mess before building something new *113-2*

3. There must be other alternatives considered *113-3*

4. Increasing the capacity to build nuclear bombs could compromise the US efforts for nuclear arms reduction, for the completion of non-proliferation treaties and for persuading non-nuclear nations to abstain from acquiring their own nuclear weapons. *113-4*

5. Nuclear weapons are obsolete *113-5*

6. Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream *113-6*

7. Money spent on Unusable Nuclear Waste does NOT support economic growth. *113-7*

Thank you for taking comments.

Sincerely,

Emily Sadow
PO Box 352
El Prado, NM 87529

113-1 NNSA notes the commentor's support for the preparation of a new environmental impact statement to the *CMRR-NF SEIS*. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information regarding the decision to prepare an SEIS.

113-2 In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

113-3 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

113-4 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

113-5 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 113 (cont'd): Emily Sadow

113-6 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

113-7 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 114: Sheila Croke

From: Sheila Croke [scroke@verizon.net]
Sent: Sunday, June 19, 2011 11:17 AM
To: nepalaso@doeal.gov
Subject: Chemistry and Metallurgy RCMRR Project in Los Alamos, New Mexico

Dear Mr. Tegtmeir,

I am writing to express my deep concern and alarm about the proposed facility in New Mexico.

First, the location is known to be close to a fault line. We know from Japan that the best laid plans are no guarantee for success;the strength of an earthquake can exceed expectations . To build so close to a fault line seems far from prudent. *114-1*

Second, the cost is out of control. How can our country justify such an expense considering the basic needs such as education , nutrition and health care for our youth? What are our priorities? *114-2*

What about the effects on the environment? Why do we want to risk damaging the region to say nothing of those who live downwind or downstream from the facility? *114-3*

I urge you to do all in your power to put a stop to this project for the good of all our citizens. *114-4*

Sheila Croke
Greenlawn, NY 11740

114-1 NNSA notes the commentor's concerns about the proposed CMRR-NF. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

114-2 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

114-3 Chapter 4 of the *CMRR-NF SEIS* presents the potential impacts of the proposed alternatives on the environment, including the populations downwind or downstream of the facility. As indicated in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, the estimated human health impacts from normal operations are expected to be small.

114-4 Comment noted.

Commentor No. 115: Marliss Rogers

From: marjayrog [marjayrog@milwpc.com]
Sent: Monday, June 20, 2011 11:31 AM
To: nepalaso@doeal.gov
Subject: CMRR New Mexico

We don't want New Mexico to turn into a Fukishima! Please cancel the CMRR project. Instead, make a study of LANL's plutonium infrastructure, including existing and future capacity needs. A realistic cost for maintaining and upgrading safety features at the existing CMR should also be determined.

The cost of nuclear power, in terms of radiation illness, pollution, lives and funds is far too dear. We need to make an effort to use renewable energy (non-nuclear) to provide energy needs for our cities.

115-1

Thank you for your consideration.

Marliss Rogers

115-1 NNSA notes the commentor's opposition to the CMRR-NF project and nuclear power. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, for more information.

Regarding the commentor's request to perform a plutonium infrastructure study, the proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 *FR* 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 116: Linda Thompson

From: Linda Thompson [lindat@taosnet.com]
Sent: Sunday, June 19, 2011 11:46 PM
To: NEPALASO@doeal.gov
Cc: Senator@tomudall.senate.gov; NM03BLIMA@mail.house.gov
Subject: My Comments about the Draft CMRRNF SEIS

For Mr. John Tegtmeier, CMRRNF SEIS Document Manager, NNSA Los Alamos Site Office, 3747 West Jemez Road, TA3 Building 1410, Los Alamos, New Mexico, 87544; and any others accepting comments from residents of the affected area.

I attended a recent meeting in Taos, NM, about the proposed project.

My family and I are very concerned about the proposed plutonium pit production complex at Los Alamos. We feel that a complete, new EIS should be required for this potentially very harmful expansion. The location is seismically active, and after the horrible environmental disaster affecting nuclear power plants in Japan, we know that our current scientific knowledge about the safety of such a project in a seismic zone is woefully inadequate. The proposed Supplemental EIS is not good enough to support building such a facility in a seismic zone that is not well understood. Furthermore, the building's design is not final, so any environmental studies should not be begun until the design is final. *116-1*

We need to continue addressing the existing problems of clean-up at LANL, not begin new contamination and highly hazardous activities there. *116-2* The American people are tired of living under the threat of nuclear warfare, terrorism, facility accidents, transport accidents, and economic downturns caused, in part, by the huge expense of waging several long-lasting wars in a number of countries overseas. We do not need more ramp-ups to war that cost billions of dollars and present unforeseen problems. We do not need 80 new plutonium pits (bomb triggers) a year. We need to respect our nonproliferation treaties and goals.

We do not need (and strongly oppose) more environmental degradation caused by making war weapons, especially nuclear bombs. Los Alamos does not need an economic boost; but other parts of New Mexico do need environmentally friendly industries that aim to put this country and state back into prosperity--a peace-oriented prosperity. Let's stop the war machine and begin to address cleaning up the messes that we have and building self-sustaining energy industries such as wind power and solar power facilities. We live in a beautiful part of a beautiful state with a fascinating history and culture; let's not turn it into a wasteland unfit *116-3*

116-1 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information regarding the decision to prepare an SEIS.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

116-2 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent.

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 116 (cont'd): Linda Thompson

for life--just to keep our military machine expanding. Please listen and respect our point of view. Begin with a brand-new complete EIS that applies the most current knowledge to all of the proposed, final-design features of this project. ***116-1 cont'd***

Sincerely,

Linda Thompson
HCR 74 Box 22273
El Prado, NM 87529

116-3 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA acknowledges that there is substantial opposition to nuclear weapons and their components. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 117: Edward J. Thompson

Subject: No nuclear facility near a fault line or anywhere

Mr. John Tegtmeir,

We here in the US do not need a Chemistry and Metallurgy Research Replacement facility anywhere in the US , least of all near a geological fault line.

I hope you will reconsider this project especially in light of Fukushima disaster ,resulting from an earthquake. Accidents happen without earthquakes and why should we put our children in harms way? Why should we make anything so deadly for our world? We have enough weapons now to destroy the world many times over. When I was a teenager I was aware we had enough nuclear weapons to destroy each city over 700 times. There is no reasoning that would convince us this makes sense. *118-1*

Thank you.

Paul Troyano
New Orleans,LA

118-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD.

NNSA notes the commentor's concern about building in a geologically unstable area or near a fault. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). Commentor No. 119: Hope Buechler

From: Hope Büechler [hopeb@taosnet.com]
Sent: Friday, June 24, 2011 6:18 PM
To: NEPALASO@doeal.gov
Subject: Draft CMRR-NF SEIS

Dear John Tegtmeier,

The redesigned CMRR-NF if built, surely fits the definition of a boodoggle, i.e. an unnecessary and expensive piece of work paid for by public funds.

Is the planned facility really necessary? The factory will be used to store plutonium and to process the plutonium into "pits," the softball sized explosive core of nuclear warheads. But the US already has 2468 active nuclear warheads containing pits that are reliable for at least 81 years. *119-1*

Is this project expensive? The projected cost is $4.5 billion and rising. *119-2*

Futhermore, a boondoggle though costly and unnecessary generally does no harm, but this one is very risky. Stored plutonium can ignite spontaneously releasing dangerous radiation. Or the plutonium could ignite after a seismic event - the facility will be set in a seismic fault zone between a rift valley and a volcanic range. In any risk taking there are two considerations: how likely is something to happen, and what are the consequences if something does happen. An earthquake or volcanic eruption may not be very likely, but if it does happen, if the earth shakes at Los Alamos under a facility containing 6 metric tons of stored plutonium, the consequences are dire. *119-3*

Thank you for considering my comments,

Sincerely,

Hope Buechler
P.O. Box 665, Arroyo Seco,
NM 87514
xxx xxx xxxx

119-1 NNSA notes the commentor's position regarding plutonium pit production. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

119-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

119-3 NNSA notes the commentor's concern about building in a geologically unstable area. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that

Commentor No. 119 (cont'd): Hope Buechler

is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 120: Jan Soleau

Subject: CMRR Project

Dear Sir:

Please do all in your power to close the CMRR project--a very scary situation. Also research and study should be done about maintaining the existing CMR and its cost. ***120-1***

Thank you for your consideration.

Jan Soleau

120-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the proposed CMRR-NF would support this effort.

As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. Funding decisions regarding major Federal programs (for example, energy and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 124: Phoebe Sorgen

From: Phoebe Sorgen [phoebeso@earthlink.net]
Sent: Friday, June 24, 2011 12:47 AM
To: nepalaso@doeal.gov
Subject: CMRR proliferation+pollution is unacceptable!

Plans for a CMRR Nuclear Facility at Los Alamos are unacceptable, as is nuclear proliferation. Want REAL national security? Wake up and become sane. Here's why I oppose the plans:

Manufacturing plutonium pits is extremely dangerous to the health and safety of those living downwind. Plutonium is a very potent carcinogen. My next door neighbor died in the prime of health from lung cancer tho she never smoked nor worked w/ carcinogens. Another dear friend is now dying-ditto, ditto-lung cancer, never smoked. Why? Because 2.1 lbs of plutonium 238 were released into the air from a U.S. navigational satellite in an accident on April 21, 1964. It's been detected on all continents and all latitudes/longitudes. It could be you, if you happen to breathe in one imperceptible speck of it, or your grandchild. Enough! *124-1*

The United States does not need ANY, let alone 80, new plutonium pits per year. Do you want to re-ignite the nuclear arms race?! *124-2*

Also, the Supplemental Environmental Impact Statement is totally inadequate. Start over with a new, realistic Environmental Impact Statement. After all, the Los Alamos National Lab is in an earthquake-prone area, LIKE FUKUSHIMA. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild shaking, but a 2007 study indicated a potential huge increase in ground motion activity. *124-3*

Chernobyl caused a million cancers, and so will Fukushima. Nuclear weaponry is even more deadly. *124-4*

Stop this madness NOW!

Phoebe Sorgen
1053 Cragmont Av
Berkeley, CA 94708

124-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

124-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

124-3 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand

Commentor No. 124 (cont'd): Phoebe Sorgen

a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*). See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

124-4 NNSA acknowledges the commentor's concern that an accident similar to those that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant or that occurred at Chernobyl could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

NNSA Los Alamos Site Office
3747 West Jemez Road
TA–3 Building1410
Los Alamos, New Mexico, 87544,

Dear CMRR-NF SEIS Document Manager John Tegtmeier,

I am writing to express my deep concern with your plans at Los Alamos National Laboratory for a Chemistry and Metallurgy Research Replacement (CMRR) Nuclear Facility. I am incredibly upset by this new project for a variety of reasons:

* As proposed, the CMRR project will cost close to $6 billion, a 1,000% increase over initial cost estimates. *125-1*

* The Department of Energy now recognizes that there is a greater risk of damage to such a facility from earthquakes. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. *125-2*

* Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. *125-3*

* Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. *125-4*

* Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material. *125-5*

The draft Supplemental Environmental Impact Statement is premature and I strongly urge the Department of Energy to withdraw it. *125-6*

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,

Christopher Lish
PO Box 113
Olema, CA 94950

125-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Regarding cost concerns, the cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making a decision in the ROD.

125-2 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

125-3 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

125-4 As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

Commentor No. 125 (cont'd): Christopher Lish

125-5 Although the commentor expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

125-6 NNSA determined, consistent with CEQ regulations and DOE Implementing Procedures, that it was appropriate to prepare an SEIS at this time due to changes that have occurred since the 2003 CMRR EIS was prepared. NNSA maintains that a supplement is appropriate and that there is no reason to withdraw the *CMRR-NF SEIS* at this time.

Commentor No. 126: Patricia Birnie

From: Patricia Birnie [patbirnie@greenbicycle.net]

To: nepalaso@doeal.gov
Subject: STOP the CMRR new nuclear weapons facility!

I strongly oppose the NNSA plan to build a new plutonium pits factory at the Los Alamos Labs. ***126-1***

It would be a far more efficient use of money, time, resources, and environmental stewardship to upgrade the old facilities. ***126-2***

The estimated cost of completion of the new complex has become astronomical compared to its original estimate. ***126-3***

In addition, according to a 2007 seismic study, the site is located too close to an earthquake prone area with far more dangerous than originally understood. It is foolish to continue with such a seriously flawed plan. ***126-4***

The Los Alamos site is presently in the middle of toxic waste removal, and needs to have that completed before doing further environmental damage there. ***126-5***

The draft Supplemental Environmental Impact Statement should be withdrawn.

No further work should be done at this site toward a new plutonium pit factory. Use common sense, and utilize taxpayer dollars more wisely, and still provide for our national security. ***126-2 cont'd***

Thank you,

Patricia Birnie

USA

Patricia Birnie
5349 W. Bar X Street
Tucson, AZ 85713-6402

126-1 NNSA notes the commentor's opposition to a "new plutonium pits factory" at LANL. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

126-2 Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. Renovations needed to upgrade the existing CMR Building would be extensive. Although this alternative was considered in the *CMRR-NF SEIS*, it was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*.

126-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

126-4 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region

Commentor No. 126 (cont'd): Patricia Birnie

were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*). Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for additional information.

126-5 Regarding commitment to clean up legacy waste, NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

To: nepalaso@doeal.gov
Subject: Ouch! What a waste of money

The new plans for a CMRR Nuclear Facility at the Los Alamos Lab are downright insane. As a citizen who is concerned about nuclear proliferation and national security, I would argue that the United States does not need 80 new plutonium pits per year. Without a nuclear arms race, the 20 pit per year production limit implemented by DOE in 1999 should suffice. ***127-1***

If plutonium -- a deadly poison -- were not a curse on generations yet unborn, I would not be so worried. ***127-2***

Thomas Heck
592 Rosa Linda Way
592 Rosa Linda Way
Santa Barbara, CA 93111

127-1 NNSA notes the commentor's opposition to the CMRR-NF project. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for additional information.

127-2 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Commentor No. 128: Grant Weherley

From: Grant Weherley [grantweherley@gmail.com]
Sent: Friday, June 24, 2011 9:51 AM
To: nepalaso@doeal.gov
Subject: There are many more beneficial areas to allocate government **spending**

128-1 The idea that the U.S. government is throwing billions of dollars at nuclear weapons, regardless of whether it is in the form of development, production, or maintenance, is both appalling and irresonsible in countless ways. Nuclear weapons are a "deterrent", yet every time our nuclear capabilities expand, this is clearly a threatening move to other countries, likely causing a corresponding increase in their nuclear abilities, leaving no competetive edge to the U.S. and resulting only in a significant waste of time and capital.

128-2 Which leads me to my next point that in the current status of this country economically, as just one example as there are plenty of others, spending this money on R & D of cheaper sources of energy would be much wiser. There are no problems currently or in the near future stemming from a shortage of nuclear weapons or a lack of nuclear weapon maintenance, so it is a waste to allocate billions where there is no need, when there are so many other problems in this contry. Don't do this. You are screwing over everybody and everything, even the local environment, and it's completely senseless.

Don't just do your job. Do what you know is right, so when you die you know that you left the world a better place, not worse.

Grant Weherley
1408 Jandymar Court
Lexington, KY 40517

128-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

128-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, for alternative energy sources) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for additional information.

Commentor No. 129: Christine Curry

From: Christine Curry [christinecurry.pna@gmail.com]

To: NEPALASO@doeal.gov
Subject: Stop New Nuclear Weapons Plant, Earthquake Zone by 6/28

Dear Department of Energy,

I'm concerned about the construction of the CMRR plutonium reprocessing and storage facility in New Mexico. It will store six tons of the most highly toxic substance on Earth, plutonium, at the government's facility. Second, the costs have ballooned by 1000%, from $600 million to $6 billion.

Finally, this facility can be used to reverse the program, from President Obama's pledge to end nuclear weapons, to produce as many as 80 nukes each year. This is going one step forward, 3 steps back, with plutonium—the most deadly, toxic substance in the world.

129-1

Sincerely,

Christine

Christine Curry
PA 19061

129-1 NNSA acknowledges that President Obama has stated that a long-term goal is a world free of nuclear weapons, although the President has also stated that this goal would not be reached quickly. Even in the post-War world, international dangers remain and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA notes the commentor's concern about the cost of the new facility. Cost of constructing and operating the CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for additional information.

The toxic nature of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Commentor No. 131: Ann Suellentrop

From: Ann Suellentrop [annsuellen@gmail.com]
Sent: Thursday, June 23, 2011 1:51 PM
To: nepalaso@doeal.gov
Subject: Stop Building for Nuclear War!!!

I am very upset about the proposed new plutonium facility at the Los Alamos National Laboratory!!! Nothing justifies the preparation for the annhilation of millions of civilians in a single flash of light!!

It is immoral and evil, outrageously wasteful, and threatens the survival of all life on earth! Nuclear weapons must be banned entirely and nuclear waste will have to be guarded FOREVER against poisoning our health and environment! It's time to STOP THIS MADNESS!!! *131-1*

We do not need any more nuclear bombs!! We have enough already to blow the world up many times over!! The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. *131-2*

Even a limited nuclear war, say between India and Pakistan, would send ash from burning cities into the upper atmosphere to circle the earth and block the sun, resulting in a nuclear Ice Age. There would be no growing season or crops, and billions would perish in the resulting famine. See the January, 2010, issue of Scientific American for more information.

It's time to put the genie back in the bottle; there was no plutonium in nature until humans made this deadly material. Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. *131-3* Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. *131-4*

We are in an economic crisis and can't afford this foolish, extravagant waste of money. Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth. Spend money on human needs, not human GREED! *131-5*

Ann Suellentrop
1865 S. Pyle St.
Kansas Ctiy, KS 66103

131-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

All radioactive waste generated as part of activities at the CMRR-NF and elsewhere at LANL will be managed in a manner that is protective of public health and safety and the environment, and in compliance with Federal and state standards. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

131-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

131-3 The danger of plutonium has been recognized since its first large-scale production in 1945. Plutonium must be produced, rather than mined, because it occurs in nature in only minute concentrations. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

131-4 As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

131-5 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, health care, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 132: Nancy Enright, Ph.D.

From: Nancy Enright [Nancy.Enright@shu.edu]
Sent: Wednesday, June 22, 2011 8:54 AM
To: nepalaso@doeal.gov
Subject: nuclear site

Dear Mr. Tegtmeir, U.S. DOE/NNSA Los Alamos Site Office:

I am very concerned about the proposed nuclear project in Los Alamos, New Mexico. First, it is frightfully expensive in very difficult economic times. The original cost of the project was estimated at $400-550 million with a completion date of 2011. The current projected cost at $5.86 billion and a completion date of FY2023 - more than ten times the original projected cost. ***132-1***

However, the most disturbing thing of all is that the proposed site for the new CMRR building is some 2/3rds of a mile from a geologic fault line. ***132-2***

Please reconsider this ill-advised project, and consider the future of those living in the area and all of us whose taxes will be used to fund it.

Sincerely,

Nancy Enright, Ph.D.
Associate Professor of Writing
Director of First Year Writing
Seton Hall University
xxx xxx xxxx

132-1 NNSA notes the commentor's concern about the cost of the new facility. Cost of constructing and operating the CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

132-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for additional information.

SUBJECT: Action No. SPA-2011-00257-ABQ, Tegtmeier, LANL, NNSA, CMRR, CMRR-NF, DSEIS, Los Alamos County, NM

Mr. John Tegtmeier
U.S. DOE/NNSA
Los Alamos Site Office
3747 W. Jemez Road, TA-3 Building 1410
Los Alamos, NM 87544

Dear Mr. Tegtmeier:

The U.S. Army Corps of Engineers (Corps) is in receipt of your letter dated April 21, 2011, concerning the National Nuclear Security Administration, Los Alamos National Laboratory's, proposed Chemical and Metallurgy Research (CMRR) Building, CMRR-NF (nuclear facility portion), located in Los Alamos, Los Alamos County, New Mexico The activity involves a request for comments on draft supplemental EIS (DSEIS) for new building construction. We have assigned Action No. SPA-2011-00257-ABQ to this activity. To avoid delay, please include this number in all future correspondence concerning this project.

133-1 We have reviewed those portions of the DSEIS for the CMRR Building construction pertinent to Section 404 of the Clean Water Act. Based upon the information provided in the DSEIS, Section 4.2.6.1 Surface Water, Section 4.2.7.2 Wetlands, and Section 4.3.6 Surface-Water and Groundwater Quality, there does not appear to be any discharge of dredged or fill materials into a jurisdictional waters of the United States, including wetlands. Furthermore, there do not appear to be any adverse impacts on surface water quality from the construction activities if the Stormwater Pollution Prevention Plans are implemented. However, not enough information is provided on the construction of the CMRR Building to positively determine that a

133-1 Chapter 4, Section 4.3.6, has been revised to include additional information. DOE expects that a permit under Section 404 of the Clean Water Act will not be required for any of the project areas.

Commentor No. 133 (cont'd): William M. Oberle, Project Manager
Department of the Army, Corps of Engineers

- 2 -

Department of the Army permit under Section 404 of the Clean Water would not be required.

A Department of the Army permit is required under Section 404 of the Clean Water Act for the placement of dredged or fill materials into waters of the United States. If your agency or any of your contractors work, or plan to work, in a river, stream, or wetland, you may be required to obtain a Department of the Army permit.

I have enclosed a brochure describing the Corps regulatory program for your information. A series of nationwide permits are available which may be sufficient for some work, if all terms and conditions are met. Many of the nationwide permits require pre-construction notification to the Corps of Engineers and regional conditions may apply. In many cases, a water quality certification is required from the appropriate water quality authority.

133-1 cont'd

We will provide letters of determination of permit requirements on request, provided that we are furnished with information concerning any proposed projects. Summaries of the nationwide permits and information about the regulatory program are available on our web page at www.spa.usace.army.mil/reg/

If you have any questions concerning our regulatory program, please contact me at 505-342-3284 or by e-mail at William.M.Oberle@usace.army.mil. At your convenience, please complete a Customer Service Survey on-line available at http://per2.nwp.usace.army.mil/survey.html.

Sincerely,

William M. Oberle

Mr. John Tegtmeier
U.S. DOE/NNSA
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

Dear Mr. Tegtmeier:

The Pueblo de San Ildefonso (the Pueblo) Department of Environmental and Cultural Protection (DECP) has completed a review of the U.S. Department of Energy's (DOE's) *Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico*. Our comments, both general and section-specific, are enclosed.

The Pueblo is highly concerned that the Environmental Justice process is not being correctly applied in this EIS, and that the possible effects to the Pueblo from LANL activities are not being properly assessed. In our comments, we provide examples of the deficiencies which should be addressed and remedied. *134-1*

Thank you for the opportunity to interact on a Government-to-Government basis, and to have our concerns addressed.

Sincerely,

Neil S. Weber, Director
Department of Environmental and
Cultural Preservation
Pueblo de San Ildefonso

Enclosure

134-1 NNSA notes the commentor's concerns regarding how environmental justice issues were addressed in the *Draft CMRR-NF SEIS*. Rather than the EPA's guidance referenced by the commentor, which is for EPA's internal use and is not required to be used by other Federal Agencies, the environmental justice analysis presented in the *CMRR-NF SEIS* is based upon the *Environmental Justice Guidance Under the National Environmental Policy Act* (CEQ 1997). Language has been added to Appendix B, Section B.10, to further describe the methodology used for the environmental justice analysis. Chapter 3, Section 3.10 of the *Final CMRR-NF SEIS* presents a discussion on the population within the potentially affected 50-mile (80-kilometer) region of influence surrounding LANL. This discussion provides data on the minority and low-income composition within this region of influence. Tables have been added to Section 3.10 that also display the composition of the region of influence at additional radial intervals of 5, 10, and 20 miles (8, 16, and 32 kilometers) to analyze potential impacts specific to populations in closer proximity to LANL.

Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, show the impacts on an average individual of the total minority population, the total Hispanic or Latino population, the American Indian population, and the low-income population; as well as the nonminority and non-low-income populations. In addition, a special pathway analysis was added to Chapter 4, Sections 4.3.11 and 4.4.11 of the *Final CMRR-NF SEIS* to analyze the potential impacts on subsistence consumers. Human health is the focus of the environmental justice analysis because several commentors have expressed concerns about the potential for adverse impacts on human health to offsite populations due to CMRR-NF operations. These sections have been expanded to further elaborate on potential environmental justice impacts due to resource areas other than human health.

Commentor No. 134 (cont'd): Neil S. Weber, Director Department of Environmental Cultural Preservation, Pueblo de San Ildefonso

GENERAL COMMENT

There is no systematic Environmental Justice (EJ) process evident in this document. The US EPA provides guidance on what EJ is, and specific procedures for assessing sites. None of these are displayed in the EIS. The EIS simply copies conclusions from various sections and concludes that there are no EJ issues connected to this activity. The Pueblo finds this unacceptable, and requests that the final EIS include a systematic EJ assessment, using EPA or comparable methodologies. *134-1 cont'd*

COMMENTS ON SPECIFIC SECTIONS

S.8 Description of the Alternatives

S.8.1 Alternatives Evaluated

Modified CMRR-NF Alternative:

Quote: The Shallow Excavation Option would avoid the poorly welded tuff layer by constructing the basement well above that layer in the overlying stable geologic layer, which would act in a raft-like fashion to allow the building to "float" over the poorly welded tuff layer.

Question: How can this be demonstrated? What is the engineering basis of this?

Quote: At this time there is more uncertainty associated with the Shallow Construction Option. The Shallow Construction Option needs to be subjected to the same level of technical review as the Deep Construction Option so the two options can be evaluated on the same basis.

Comment: This should be done before publishing this Supplemental EIS.

S.11 Comparison of Alternatives

S.11.1 Comparison of Potential Consequences of Alternatives

Human Health Impacts – Facility Accidents

Quote: Under either the Deep Excavation or Shallow Excavation Option, the Modified CMRR-NF would be constructed to survive a design-basis earthquake without significant damage.

Comment: There is insufficient evidence presented that the CMRR-NF built to "float" on top of tuff would survive a design-basis earthquake without significant damage. *134-2*

134-2 The concerns expressed by the commentor about the Shallow Excavation Option needing more technical review are noted. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option.

The conclusions of the initial geotechnical report (Kleinfelder 2007a) recommended a sufficient portion of the overlying stable geologic layer be retained between the building and the poorly welded tuff layer to support the building. This report provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy, which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation. The report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square meter) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]).This report provided project-specific (CMRR-NF) recommendations regarding seismic design and construction techniques with respect to the Shallow Excavation Option. The final design of the building would be based on additional, more definitive soil structure and slope stability analyses. These final design calculations would be the evidence that the building survives regardless of the Deep or Shallow Excavation Option. Final design analyses are standard protocol subsequent to preparation of NEPA documents and are not considered deferred studies under NEPA.

Commentor No. 134 (cont'd): Neil S. Weber, Director Department of Environmental Cultural Preservation, Pueblo de San Ildefonso

Environmental Justice

Comment 1: Does not utilize EPA's Environmental Justice Formula. *134-1 cont'd*

Comment 2: Does not address population density. *134-3*

Comment 3: Does not address percent minority population.

Comment 4: Does not address percent of economically depressed household data. *134-4*

Comment 5: Does not calculate an EJ Index Ranking. Further, as per US EPA; "The methodology user should realize that even an index ranking of zero can have significant EJ concerns. For example, an unpopulated area will rank a zero, but if owned by minority and/or low income groups, the site may have significant EJ importance." *134-5*

Comment 6: Does not address proximity of CMRR and TA-55 to the Sacred Area of the Pueblo de San Ildefonso. *134-6*

Comment 7: Section should perform the following calculations: Degree of Vulnerability, Minority Status Variable, Economic Status Variable, Population Factor, and finally a Calculation of the Potential Environmental Justice Index. *134-1 cont'd*

Comment 8: Section addresses only dose. This is not acceptable for a section that attempts to address EJ. *134-7*

Comment 9: This section addresses only the CMRR-NF. EJ be definition addresses cumulative effects, thus this section should address the effects of the CMRR-NF and all LANL facilities as a whole, and not just the CMRR-NF as a single unit. *134-8*

CHAPTER 4

4.2.11 Environmental Justice

Comment: The comments above apply to this section also. *134-9*

B.10 Environmental Justice

B.10.2 Description of Impact Assessment

Quote: Therefore, estimates of environmental justice impacts were determined using the impacts analysis presented throughout Chapter 4 for the various resource areas to assess the potential for a minority or low-income population to disproportionately bear any adverse impacts. *134-10*

Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. See Section 2.6, Seismic and Geologic Concerns, of this CRD for additional information.

134-3 As discussed in the response to comment 134-1, Chapter 3, Section 3.10 of the *Final CMRR-NF SEIS* presents a discussion on the population within the potentially affected 50-mile (80-kilometer) region of influence. Tables have been added to Section 3.10 that display the composition of the ROI at additional radial intervals of 5, 10, and 20 miles (8, 16, and 32 kilometers) to analyze potential impacts specific to populations in close proximity to LANL. Of these areas, the area with the highest population density is the area within 5 miles (8 kilometers) of LANL. This area has a population density of about 62 persons per square kilometer compared to a population density of about 25 persons per square kilometer for the entire 50-mile (80-kilometer) region of influence. Among the areas analyzed in this *CMRR-NF SEIS*, this area also has the lowest projected percentage of minority individuals living within it, 35 percent compared to 57 percent, and low income individuals 3.2 percent compared to 13 percent over the entire 50-mile (80-kilometer) region of influence.

134-4 The Draft *CMRR-NF SEIS* in Chapter 3, Section 3.10 included estimates of the minority and low-income populations but failed to show the percentages associated with these estimates. In response to this comment, the percent minority and low-income populations for the 50-mile (80-kilometer) region of influence and the smaller radial areas has been included in Tables 3–14 and 3–15 added to Chapter 3, Section 3.10 of the *Final CMRR-NF SEIS.*

134-5 As discussed in the response to comment 134-1, environmental justice was analyzed in accordance with CEQ guidance, not EPA's internal guidance.

134-6 The proposed CMRR-NF is planned to be built in an existing industrial area (TA-55) of LANL and, as such, would not change the visual impact from the Sacred Area of the Pueblo. In addition, as discussed in Chapter 4, none of the projected environmental impacts from operation of the proposed CMRR-NF are expected to have a significant impact on the environment surrounding LANL; this would include the Sacred Area of the Pueblo. For example, the facility would not

Commentor No. 134 (cont'd): Neil S. Weber, Director Department of Environmental Cultural Preservation, Pueblo de San Ildefonso

Comment: The comments above apply to this section also. *134-10 cont'd*

have any direct liquid discharges to the environment (see Section 4.3.6) and the air quality impacts would be minimal (see Section 4.3.4).

134-7 Human health impacts are of primary concern for the environmental justice analysis due to the potential for disproportionate impacts to offsite minority and low-income populations. However, language has been added to Chapter 4, Sections 4.3.11 and 4.4.11 of the *Final CMRR-NF SEIS* to further elaborate on potential impacts to resource areas other than human health.

134-8 Section 4.6 of the *CMRR-NF SEIS* analyzes cumulative impacts of the proposed CMRR-NF operations and other activities at LANL. As shown in this section, none of these activities are expected to have significant adverse affects on the populations surrounding LANL. This would include minority and low-income populations.

134-9 Comment noted. The above responses apply to Chapter 4.

134-10 Comment noted. Appendix B, Section B.10, was revised to provide additional information on method used to project the minority and low-income populations through 2030 using 2010 census data.

Commentor No. 135: Pete Cerneka

June 15, 2011

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Re: Propsed Chemistry and Metallurgy Research Replacement (CMRR) Project

Dear Mr. Tegtmeir:

It has come to my attention that the proposed research facility for making "Plutonium Pits" will increase by fourfold those currently being made yearly at the existing facility and will add to the 15,000 pits stored at Pentax Facility in Texas. In 2004 the projected cost for building the proposed facility, to be completed this year, was approximately $550M. The new estimate is approximately $5.86B to be completed in 2023! The proposed facility will be built in a seismically active fault zone with the capability of withstanding an earthquake of a magnitude of 7 on the Richter scale. **135-1** **135-2** **135-3**

What possible need do we have for more than 15,000 "plutonium Pits"? Why do they need to be produced at an even higher yeary rate? Why the tenfold increase in costs? Why build any such facility in a seismically active fault zone? The earthquake damaging the nuclaer reactors at Fukushima, Japan was much higher on the Richter scale. As you know there has been at least one 7.1 aftershock! **135-1 cont'd** **135-3 cont'd**

Please cancel this project. The project appears to be a solution for which there is no problem; a resource for which there is no need. The costs estimates are absurd. The risk is outrageous. **135-4**

Sincerely,

Pete Cerneka
1105 Belleville St.
Lebanon, IL 62254

CC: Senator Richard Durbin
Senator Mark Kirk
Representative Jerry Costello

135-1 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for additional information.

135-2 NNSA notes the commentor's concern about the cost of the new facility. Cost of constructing and operating the CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

135-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for additional information.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that

Commentor No. 135 (cont'd): Pete Cerneka

require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

135-4 Comment noted.

Commentor No. 136: Sara Pene

I strongly oppose the CMRR-NF project. It is unnecessary + dangerous. This money could be used for much more needed projects as schools + solar + wind energy. **136-1**

I live downwind from Los Alamos +. I feel my health is endangered by living here. **136-2**

We do not want to be a party to a project that is designed to kill people. You need to listen to the concerned people who approve this project. We do not intend to stop the protests. **136-1 cont'd**

Sara Pene
Hepford N.M

136-1 NNSA notes the commenter's opposition to the CMRR-NF project. NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

136-2 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Commentor No. 137: Chris Ellis

From: Chris Ellis [chrisellis@taosnet.com]
Sent: Wednesday, June 22, 2011 5:02 PM
To: nepalaso@doeal.gov
Subject: CMRR is a major environmental threat

The CMRR Nuclear Facility proposed at Los Alamos Laboratory poses major environmental and health problems to me and my family, as we live in Taos and are directly downwind from Los Alamos. I am a chemical engineer and understand the toxicity of plutonium. It is a carcinogen in addition to being highly radioactive and has a significant half life. ***137-1***

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. ***137-2***

Nuclear weapons are obsolete. They are useless against a terrorist attack, and building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material. ***137-3***

Chris Ellis
PO Box 208
Arroyo Seco, NM 87514

137-1 NNSA notes the commentor's concerns about the environmental and health effects posed by the CMRR Facility. The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

137-2 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

137-3 Although a number of commentors have expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 138: Theo

Comments on CMRR-NF SEIS

I am against the proliferation of nuclear arms, plutonium and the mining of uranium.
I feel that the direction of Los Alamos should be away from nuclear research, development and nuclear arms. **138-1**

A little known example of a plutonium facility that created severe contamination is the Mayak facility that completely contaminated the Techa river and hundreds of lakes.
The Russians also had to relocate half a million people due to the severe radiation contamination.

There has been such a trail of severe accidents, irresponsibility and mis-information in the nuclear industry. I am not confident in the nuclear industry in the nuclear industry. **138-2**
I am an advocate of peace, communication and a world that is not contaminated.

138-1 NNSA notes the commentor's opposition to the proposed CMRR-NF, and to nuclear research and development and nuclear weapons. Since the 1940s, the President and Congress have directed DOE (including NNSA) and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Since the end of the Cold War, DOE has changed missions and activities consistent with changing national security policies that reflect the new national security posture, including maintaining a smaller enduring stockpile and helping in nonproliferation efforts. However, even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Funding decisions on Federal programs and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

138-2 NNSA acknowledges the commentor's concern that a nuclear accident could happen at LANL. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Nuclear facilities constructed at LANL must meet strict safety criteria set forth in Federal regulations and DOE orders, and criteria imposed as an outcome of safety analyses. Refer to Appendix C for a description of safety analyses performed for this *CMRR-NF SEIS*.

Commentor No. 138 (cont'd): Theo

regarding Supplemental EIS for the Nuclear Facility Portion of the Chemistry & Metallurgy Research Building Replacement Project @ Los Alamos National Laboratory, LA, NM.

Comment: I am against your proposal. I don't think I want my funds/taxpayer used in this Manner. So please take into your decision that I am against this.

138-1 cont'd

I listen to the News and the 1° World Countries are moving away from Nuclear Energy and/or Weapons. This is Old technology that has waste that will last for Years. - millions of....

So my Vote is Against... -

138-1 cont'd

Commentor No. 139: Paula Seaton

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
US DOE - NNSA
Los Alamos Site Office, 3747 West Jemez Rd, TA-3, Bd. 1410
Los Alamos, NM 87544

139-1 Please do not spend the enormous amount of money on the proposed CMRR building at Los Alamos National laboratory. At a crisis time on the earth with so many needs for positive issues please do not use money for destroying life on our planet.

139-2 The EIS was done so long ago - 2003. There needs to be a new EIS but

since we don't need more bombs,

139-3 lets use the money for cleaning up LANL instead.

Sincerely,

Paula Seaton, PO Box 144, Embudo, NM 87531

139-1 NNSA notes the commentor's opposition to the proposed CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, health care, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

139-2 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action.

139-3 Regarding commitment to clean up legacy waste, NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 140: Dee Feeney

June 13, 2011

Dear Sir,

As a downwind community member I am adamantly opposed to any further building of the CMRR building in Los Alamos, NM. I live 20 miles as the crow flies from the laboratory and am very concerned about the continued construction of this new building that will be built at a cost that is so astronomical. And why and for what? Rio Arriba County is one of the poorest counties in the country. Poverty abounds, human health compromised, addiction rampant and we are pouring money into a laboratory and weapons program that will be used for destruction of human life and property and the earth. Where will this end and we are very concerned and worried about the building of this CMRR. Please reconsider the continued building of this complex and consider another environmental impact study for this massive project. I am a farmer and very concerned about the H_2O usage this project will use and the contamination of soil, air, water very concerning. I am a nurse and very, very concerned, please contact me as soon as possible to advise me the further plans for this complex

Dee Feeney RN POB 321
Dixon NM 87527

140-1
140-2
140-3
140-4

140-1 NNSA notes the commentor's opposition to development of the CMRR-NF. Since the 1940s, the President and Congress have directed DOE (including NNSA) and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Since the end of the Cold War, DOE has changed missions and activities consistent with changing national security policies that reflect the new national security posture, including maintaining a smaller enduring stockpile. However, even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

140-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations under any of the alternatives.

140-3 There are established programs at LANL that address the monitoring of air, water, and soil contamination in the area surrounding LANL. The results of these surveillance efforts are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, for more information on cleanup of past contamination.

140-4 The commentor will be mailed a copy of the *Final CMRR-NF SEIS*. NNSA will also publish a notice in the *Federal Register* announcing the availability of the *Final CMRR-NF SEIS*. In accordance with NEPA regulations, a ROD will be issued no earlier than 30 days after publication of the *Final CMRR-NF SEIS*.

Commentor No. 141: Robert Brenden

COMMENTS ON CMRR-NF SEIS

CONSIDERING OUR GREAT NATION IS RAPIDLY BECOMING BANKRUPT, FEARFUL AND XENOPHOBIC, I ASK YOU BROTHER SCIENTISTS AND OVERPAID BUREAUCRATS — WHY SPEND SO MUCH JUST TO KILL US ONE AND ALL? YOUR SCIENTIFIC IMPARTIALITY IS TAKING US ALL TO THE GRAVE, WITH NO INDICATION THAT ANY OF YOU ARE CONCIOUS OF YOUR OWN ACTIONS. SHOW THAT YOU HAVE AT LEAST SOME COMPASSION FOR THE MILLIONS WHO WILL DIE BY YOU UNRELENTING DESIRE TO DESTROY THE PLANET AND ALL LIFE THEREON.

141-1

SINCERELY,
A CONCERNED CITIZEN
ROBERT BRENDEN
DIXON NM 87527

141-1 NNSA notes the commentor's opposition to the proposed project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 142: Maria Chilton

6/14/11

To Whom it may Concern:
Regarding the SEIS for the Nuclear Facility @ LANL.
I am Strongly opposed to any and all proliferation of nuclear weapons.
142-1 Why anyone would think it's a good idea to Spend unfathomable amounts of tax payer money on Something to Kill people and the planet is beyond Comprehension to me.
142-2 I am also out raged that So few people are informed about a decision that Can potentially ruin us, our Children and all generations.
I am a native of New Mexico I Speak for myself and all my relations.
No more Nukes!!

Sincerely,
Maria Chilton
Dixon, NM 87527

142-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, health care, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

142-2 Preparation of the *CMRR-NF SEIS*, including procedures for public participation, is compliant with DOE and CEQ regulations for preparation of NEPA documents. Public scoping meetings and public hearing on the draft SEIS were held in numerous locations around LANL. Chapter 1, Section 1.7, of the *CMRR-NF SEIS* discusses the public participation program related to the SEIS. Also, refer to Section 2.2, NEPA Process, of this CRD for more information.

Commentor No. 143: Emmy Koponen

June 14th

COMMENTS on the SEIS + more

143-1
I attended the hearing in Española, N.M. and honestly feel that there are so many points AGAINST this CM Building. It should not be built.

143-2
Why is not the the old TA-55 being made safe and will it be cleaned?

143-3
Perhaps some credibility for your past clean ups could be demonstrated.

143-4
Your plutonium facilities are outdated, unsafe, unneeded, and egregiously expensive. The dollars suck up all our social and environmental infrastuctures. Librarys, schools... where could $ be better spent?

143-5
Here in Northern N.M. our ditches crave water. Clean water! The 80 proposed pools would contaminate the groundwater + streams. The birds eat the worms. The precious water will be ruined for ever.
STOP KILLING US!

143-6
Fukashima received a short

143-1 NNSA notes the commentor's opposition to the proposed CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

143-2 Activities at the TA-55 Plutonium Facility are not within the scope of the *CMRR-NF SEIS* but were discussed extensively in the 2008 *LANL SWEIS* (DOE 2008a). Please refer to this document for a discussion of the activities under way at that facility.

143-3 NNSA intends to continue to perform environmental restoration activities at LANL. NNSA does not consider environmental restoration to be optional and progress on implementing those efforts is not linked to decisions on construction of the proposed CMRR-NF. Progress in performing environmental restoration activities at LANL is reported in the annual site environmental reports, which can be accessed at http://www.lanl.gov/environment/all/esr.shtml.

143-4 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, health care, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

143-5 There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, for more information on cleanup of past contamination.

143-6 Various U.S. government agencies, including DOE, are providing technical support and assistance to Japanese officials in addressing the situation at the Fukushima Daiichi Nuclear Power Plant. Additional information can be found at http://japan.usembassy.gov/e/p/tp-20110414-01.html.

Commentor No. 143 (cont'd): Emmy Koponen

paragraph. And how is Los Alamos helping clean up Japan or protecting the ocean and our world?

As far as the SEIS:

Supplementally adding $5,140,000,000 is obscene + the process is illegal.

not addressing a clean up strategy is unspeakable.

I support NO NEW BUILDING

Sincerely,

Emmy Koponen
(Emmy Koponen)

143-6 cont'd

143-7

143-3 cont'd

143-1 cont'd

143-7 NNSA notes the commentor's concern about the cost of the new facility. Cost of constructing and operating the CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. The *CMRR-NF SEIS* has been prepared in compliance with DOE and CEQ regulations for preparation of NEPA documents. See Section 2.2, NEPA Process, of this CRD for more information.

Commentor No. 144: Shelley

6/14/11

We've been made aware that there is an 8 billion dollars to build modern nuclear weapons.

I doubt if anyone is ever ~~even~~ going to read this, and its the 1st letter I've ever written to share my thoughts, about a world gone crazy + going crazier.

144-1 I just don't understand how ~~we~~ anyone would want to continue this path to creating a more fearful world when it appear to me, we/are on the brink of actually changing into loving, caring Human Beings.

If you (those who are leaders) who would take these outrageous amts. of money you use for oppression, and use it instead to create wonderful Schools + to create an atmosphere of Peace everywhere. Peace + goodwill. Oh I can just imagine how fast our World would really change. Food & shelter, + respect for all Species including our Earth. There

144-1 NNSA notes the commentor's opposition to the proposed CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 144 (cont'd): Shelley

144-1 cont'd

is enough, more than enough.
You/We have the power
to create a peaceful environement.
It has to catch on with people
like you who have so much power
and you'd have tons of support.

Somehow, we have to change
this course of "power over."
And open to feeling the "Living Love"
that lives in all of us.
What joy! Imagine! A fun,
joyful loving beautiful World.

We Can!

We Can!

We Can!

Subject: Comments on the CMRR Project

June 22, 2011

Mr. John Tegtmeir
U.S. DOE/NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico 87544

Please cancel the CMRR Project. The CMRR was designed to replace the existing Chemistry and Metallurgy Research Building to manufacture "Plutonium Pits", the fissile "triggers" capable of nuclear capability that initiate the destruction of modern thermonuclear weapons, but we really don't need any more plutonium pits. Currently the Department of Energy already has 15,000 plutonium pits stored at the Pentax Facility in Texas and these should be dismantled. ***145-1***

At the very least, a study of the Los Alamos National Laboratory's (LANL's) plutonium infrastructure should be required. ***145-2***

The original estimated cost of the CMRR project in 2004 was $400-550 million with a completion date of 2011. The current cost of the CMRR project is projected at $5.86 billion with a completion date of FY2023. This is more than ten times the original forecast, and ultimately there really is no way to determine the final cost. ***145-3***

Not to mention the fact that the proposed site for the new CMRR building is about 2/3rds of a mile from a geologic fault line. The Los Alamos National Laboratory (LANL) is located in a seismic fault zone between a rift valley and a dormant volcano. Adding this enormous new facility to LANL's weapons manufacturing complex in a geologically unstable area could lead to disastrous consequences on the scale of Fukushima or Chernobyl. ***145-4***

I also believe that work presently done at LANL and our other nuclear weapons facilities violates the Nuclear NonProliferation Treaty. ***145-5***

145-1 NNSA acknowledges the commentor's opposition to the CMRR-NF project and plutonium pits. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

145-2 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

145-3 NNSA notes the commentor's concern about the cost of the new facility. Cost of constructing and operating the CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

145-4 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that

Commentor No. 145 (cont'd): Marie-Louise Jackson-Miller

Additionally, I am quite concerned about the enormous amount of water that would be needed. Residents cannot afford to lose the water they need for day to day survival. I believe that human needs should be prioritized and that water is a basic human right. ***145-6***

I respectfully ask that you consider my concerns and cancel the CMRR Project.

Thank you sincerely,

Marie-Louise Jackson-Miller
63 Gay Street
Quincy, MA 02169-6602

Pc: Senator Scott Brown

are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for additional information.

NNSA acknowledges the commentor's concern that an accident similar to those that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant or at the Chernobyl reactor site could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

145-5 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

145-6 As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Subject: No CMRR at Los Alamos

I am a resident of New Mexico: 13500 Skyline Rd NE G3, Albuquerque 87123.

I am vehemently opposed to the proposed CMRR at Los Alamos. It is within 2/3 mile of a fault line. What is the matter with government planners? Do you not consider the well-being of US citizens and the land itself. How very short-sighted! ***146-1***

It is also being built at a cost of $6 BILLION dollars, 10 times the projected cost. This, at a time when government is cutting essential services to tax payers and the economy is struggling to recover from a severe recession. This is irresponsible in so many ways. ***146-2***

Please do ALL within your power to stop this atrocity.

winona fetherolf

5/22/2011 . . . we affirm, on this beautiful day, that the Rapture must have occurred, and taken all of us into the Holy Place of Earth and the Blessedness of All That Is Our Lives. Let us live this day as if it were Heaven and, in that way, we will know Heaven, Love and Peace. Christine Robinson

146-1 NNSA notes the commentor’s opposition to the proposed CMRR-NF. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for additional information.

146-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 147: Elizabeth Michalak

John Tegtmeier,
CMRR-NF SEIS Document Mngr
NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544

Elizabeth Michalak
363 E Copper Ave
Crestone, CO 81131
719-588-0287

June 22, 2010

John Tegtmeier,

Regarding the proposed CMRR-NF, I believe that such a large and risky project as this one must be reviewed with utmost care. I believe that those involved in the decision-making process must look at the whole picture: we must think of this country as united, and view the plight of our neighbor as our own plight. I can only imagine how I would feel if I lived downstream and downwind of this project and my child began having health problems related to plutonium pollution. I can only imagine how I would feel if I was told the facility was safe and then a fire happened—as it did in Rocky Flats in Colorado—and my communithy became at risk. I can certainly imagine how angry I would be if I lived in one of the many poor counties in New Mexico and had to watch Los Alamos county receive a government windfall due to this facility. **147-1** **147-2**

Yes, most forms of progress come with a price, and in each case someone has to pay that price for the benefit of others, but my question in this case is, "What is the benefit?" A commercial break for the nuclear industry? It certainly doesn't seem that an unusable backup of plutonium should be high on our country's priority list. **147-3**

From the information I have, I believe that this facility is unnecessary. At the very least, I feel that a full new EIS is essential before the project goes any further.

Thank you for considering the potential consequences of the CMRR-NF.

Sincerely,

Elizabeth Michalak

147-1 NNSA notes the commentor's concern about the CMRR-NF Project. NNSA's congressionally assigned missions, which are a subset of the missions assigned to DOE, are identified in Chapter 1 of the *CMRR-NF SEIS*. To perform its missions, both DOE and NNSA have developed overarching programs and identified work assignments for various NNSA- and DOE-administered sites across the country. The *Complex Transformation SPEIS* (DOE 2008b), prepared by NNSA in 2008, considered the environmental impacts for managing site requirements related to transforming the nuclear weapons complex into a smaller, more consolidated nuclear enterprise to meet future national security needs. One of the decisions reached by NNSA after the *Complex Transformation SPEIS* was completed was the decision to retain manufacturing and research and development work involving plutonium at LANL. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for additional information.

147-2 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. The analysis includes the potential impacts from severe accidents at the CMRR-NF, including possible fires.

147-3 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 147 (cont'd): Elizabeth Michalak

NNSA notes the commentor's request for a new EIS. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action.

Commentor No. 148: Ron Stathis

From: RonStathis@aol.com
Sent: Friday, June 24, 2011 9:36 AM
To: NEPALASO@doeal.gov
Subject: Want you want to do

For Mr. John Tegtmeier, CMRRNF SEIS Document Manager, NNSA Los Alamos Site Office, 3747 West Jemez Road, TA3 Building 1410, Los Alamos, New Mexico, 87544; and any others accepting comments from residents of the affected area.

I have a home northwest of Taos near the airport. I was told want is planned and I do NOT agree.

I are very concerned about the proposed plutonium pit production complex at Los Alamos. We feel that a complete, new EIS should be required for this potentially very harmful expansion. The location is seismically active, and after the horrible environmental disaster affecting nuclear power plants in Japan, we know that our current scientific knowledge about the safety of such a project in a seismic zone is woefully inadequate. The proposed Supplemental EIS is not good enough to support building such a facility in a seismic zone that is not well understood. Furthermore, the building's design is not final, so any environmental studies should not be begun until the design is final. *148-1*

Ron Stathis

148-1 NNSA notes the commentor's request for a new EIS after the design is complete. NEPA documentation is typically performed while the design of a project is still underway. There is enough design information available to perform a NEPA analysis for the CMRR-NF project. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*). See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 149: R. Addison

Subject: Comments on the Draft CMRR–NF SEIS

tO Committee members:

149-1

As the sidelight to life living near a federal-pentagons facility (military bases, complexes of any military relegation) the need for "radiation-Monitoring" has been casitigated and excuse-Madeover, and negligence has set to a harshness of total pblic and humanity disparagement, one that far-far-far outstrips any necessity to or in maintaining "pit" production levels of any kinds for several reasons.

a) since the first atomic-Implosion in May 1945, there has been no "continuous" radiation-Monitoring contiguous with 'defensive measure' of protecting humans...

b) any nuclear "depleted-Uranium-238" and thermo-Nuclear munitions manufacturing is an aggression-Act not analogous with treaties, nor "defense" as that is offense...

Six billion dollars does not have to be budgeted for Defense that is offense. Billions should be spendt training monitors, maintaining Radiation monitored-Records, and implaced around all cities, counties, NPP's, military and other government buildings in and of the whole once-Waz: republic!

in Justice, thank you for change to pertinence

"R" Addison

149-1 NNSA notes the commentor's concerns about radiation monitoring. Establishing radiation monitoring networks in communities is not within the scope of this SEIS. However, LANL does monitor air and water emissions for radiation, and worker exposures.

Commentor No. 150: April Mondragon

From: April Mondragon [etasinum@gmail.com]
Sent: Wednesday, June 22, 2011 11:56 AM
To: nepalaso@doeal.gov
Subject: I oppose the CMRR-NF

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have summarized some of my concerns below.

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. .....Building on a seismic zone is foolish and ill conceived and puts lives in danger - it is gambling with past seismic records to predict the future. In a recent presentation from LANL employees, that stated that the new CMRR design would withstand from 5-7 seismic quakes, there is nothing that I have found in the EIS that states this. Again building on a known seismic zone can only be considered lethally foolish, unless the decisions to do such is really based on greed, and egomaniacs that think man can build things stronger than the earth. ***150-1***

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. MAKING MORE TOXIC WASTE IS CONTRARY TO CLEAN UP ! ***150-2***

Nuclear waste is known to be lethal to all life. It causes birth defects, cancer and makes water, earth and air un fit for human and life. To continue to fund activities disguised as being for the benefit of protecting the public, or for research, when in fact the continued mining, manufacturing and use of plutonium, and uranium for "energy", weapons production, and research is in fact one of the greatest threats to all humanity and the eco-system (all life forms). The recent LANL presentation was void of medical expertise on this issue of heath hazards. Because of this lack of information, I can only surmise that the presentation was geared to avoid this crucial issue through silence. The presentation avoided the health hazards that plutonium and uranium and waste impose on the earth, air, water, human and ecosystem with misleading, non descript, ad campaign jargon, about increased and improved safety measures. This is at best, false and misleading and at worst criminally negligent. New Mexican's are not stupid. ***150-3***

150-1 NNSA notes the commentor's concerns regarding plans at LANL. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

150-2 NNSA intends to continue to perform environmental restoration activities at LANL. NNSA does not consider environmental restoration to be optional and progress on implementing those efforts is not linked to decisions on construction of the proposed CMRR-NF. Progress in performing environmental restoration activities at LANL is reported in the annual site environmental reports, which can be accessed at http://www.lanl.gov/environment/all/esr.shtml.

150-3 All radioactive waste generated as part of activities at the CMRR-NF and elsewhere at LANL will be managed in a manner that is protective of public health and safety and the environment, and in compliance with Federal and state standards. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for additional information.

Commentor No. 150 (cont'd): April Mondragon

The costs to build a plutonium pit production complex are too high. I can only support funding for clean-up. It is time to change the mission of LANL from weapons production to sustainable energy. ***150-4***

April Mondragon
HC 74
El Prado, NM 87529

150-4 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 151: Martha Eichler

From: Martha Eichler [martha_gunn@comcast.net]
Sent: Monday, June 27, 2011 9:53 AM
To: nepalaso@doeal.gov
Subject: Quadrupling Plutonium Production: Wasteful & Dangerous

Spending $6 billion on a huge increase in plutonium production at this time of economic peril for so many in the U.S. is wasteful and dangerous. The U.S. is so strapped that many believe its debt ceiling must be raised; how can this expense be justified at this time? *151-1*

President Obama has stated a goal of a world free of nuclear weapons. Increasing plutonium production only exacerbates the fear of other countries, which will want to react in kind, potentially accelerating an international arms race. With the building of a new plutonium pit facility, the US could possibly spur nuclear weapons development elsewhere. *151-2*

The proposed nuclear facility will compromise cleanup of existing waste. The Department of Energy (DOE) has pledged to clean up the legacy waste at Los Alamos Lab by 2015. We should be cleaning up existing waste before creating more deadly nuclear materials. DOE must devote taxpayer funds to cleanup, not proliferating more plutonium that would only increase nuclear pollution. *151-3*

The alternatives considered in the Supplemental Environmental Impact Statement do not offer legitimate choice. "Taking no action" should be one of the alternatives offered by DOE to the CMRR project. All of the alternatives currently listed recommend building the Nuclear Facility. This is not a balanced offer for the welfare of the American people and jeopardizes the peace and safety of the planet. *151-4*

Martha Eichler
73 Hunter Farm Road
Peterborough, NH 03458

151 1 NNSA notes the commentor's concern regarding the cost to build and operate the CMRR- NF. The cost to build and operate the proposed CMRR- NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

151-2 NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF, nor does plutonium production occur at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and 2.4, CMR Mission, of this CRD for more information.

151-3 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

151-4 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

Commentor No. 152: Diane D'Arrigo
Nuclear Information and Resource Service

From: Diane D'Arrigo NIRS-Nuclear Information&Resource Service [dianed@nirs.org]
Sent: Tuesday, June 21, 2011 5:10 PM
To: nepalaso@doeal.gov
Subject: NIRS opposes the CMRR-NF

Nuclear Information and Resource Service opposes plans to build a plutonium pit production complex at Los Alamos National Laboratory.

Before ANY new nuclear projects are built, old ones MUST be cleaned up. Because there is really no way to "clean up," nuclear waste and contaminated resources, efforts must be undertaken to isolate the radioactivity from the public and environment. *152-1*

If we are learning anything from the ongoiing tragedy in Japan at Fukushima it is that earthquakes can be bigger than expected and do much more damage than projected. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The Supplemental and the original Environmental Impact Statement (2004) are did not consider the potential huge increase in ground motion activity (indicated in a 2007 study), requiring major changes to the building design. *152-2*

At a point in time when cleanup money is being cut at many DOE facilities, threatening commited cleanups, it is a waste of resources to build a new nuclear facility. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities physically and financially. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. *152-3*

As usual, DOE has no guaranteed method or location to isolate the many categories of nuclear waste from existing or future nuclear facilities, thus is not justified in proceeding with the Chemistry and Metallurgy Research Replacement Nuclear Facility *152-4*

Diane D'Arrigo NIRS-Nuclear Information&Resource Service 6930 Carroll Ave #340 Takoma Park, MD 20912

152-1 NNSA notes the commentor's opposition to building a plutonium pit production complex at LANL.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

152-2 The commentor's concerns that an accident (similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant) could happen at LANL is addressed in Section 2.8, Nuclear Accidents, of this CRD. There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant or Chernobyl) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a,

Commentor No. 152 (cont'd): Diane D'Arrigo
Nuclear Information and Resource Service

2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

152-3 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

152-4 Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 153: Jeanne Green

From: Jeanne Green [innerlight52@hotmail.com]
Sent: Sunday, June 26, 2011 8:38 PM
To: SEIS for CMRR-NF 10-10; Senator JeffBingaman; Representative Ben Lujan
Subject: comments on CMRR-NF

Here are my additional comments regarding the SEIS for the CMRR-Nuclear Facility:

1. We need a new EIS because there is **no demonstrated need** for a new CMRR-NF. We do not need more nuclear weapons when we have over 9000 that will each last a century and 20,000 plutonium pits in storage. We need to begin dismantling what we already have. Making more nuclear bombs does not make us safer and thus violates the missions of DOE and NNSA *153-1*

2. LANL **has not cleaned up it's mess** of chemicals and radionuclides on site, that are spilling down the canyons into our soil and water. LANL must fulfill it's Consent Order responsibilities before beginning new projects with taxpayer money. *153-2*

3. The SEIS offers **no realistic alternatives** other than building the new facility. This is a violation of the NEPA process which requires reasonable alternatives and a true No Option alternative. *153-3*

4. An option which spends over $5.8 billion and offers **not a single permanent job** is a travesty in these economic times during which unemployment is at a record high, teachers are being laid off, infants are being cut off of food coupons (WIC), and food stamps are being cut. This is immoral, unconscionable and insane. Profits to Bechtel is not a justifiable reason to build more nuclear bombs on the backs of taxpayers. *153-4*

5. The **exorbitant amount of water** to be used for this project in a desert state with continuing drought conditions under the real threat of global warming is unjustifiable. The exorbitant amount of electricity to be used for this project under the real threat of global warming and the desperate need for carbon reductions is unjustifiable. *153-5*

6. The idea of using money to build a new supposedly earthquake-proof building to facilitate making more nuclear bombs, even while the **currently used CMR is not earthquake-safe** is insane. Stop production now and make the current facility safe. As Fukushima portends we are all at great risk at this very moment. We cannot predict what mother nature will hand us and when. Building this facility on 4 earthquake faults between a rift zone and a volcano does not make sense to begin with. Wake up. Money is not all that matters. *153-6*

153-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

153-2 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

153-3 Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and not proceed with the CMRR-NF, such an alternative is not consistent with meeting NNSA's mission need nor does it reflect the status quo at LANL. The No Action Alternative in this *CMRR-NF SEIS* is based on the decision announced in the 2004 ROD for the original *CMRR EIS*. This is consistent with CEQ recommendations that, for proposed changes to an ongoing activity, "no action" can mean continuing with present plans (51 FR 15618). The *2003 CMRR EIS* offered a number of alternatives including different sites at LANL. NNSA determined that a supplement to the *2003 CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in design and construction of the CMRR-NF and has addressed alternatives consistent with previous analyses and decisions. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

153-4 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 153 (cont'd): Jeanne Green

7. The people of San Ildefonso and Santa Clara and Espanola are minorities who have suffered greatly from the effects of radiation releases in the soil, water and air, especially during the Cerro Grande fire. The Environmental Justice portion of the SEIS does not address environmental justice to populations living near LANL. Rather, it lists charts measuring minorities based on a 2030 projection. Los Alamos s primarily Caucasian. The charts assume that any accident in the area will only affect local residents. This is faulty assumption, as we see residents at Fukushima still being evacuated within 100 miles. If the LAHDRA report were to be followed-up with dose reconstruction or if local natives were inventoried for cancer rates, you would get a much more accurate picture. These charts are irrelevant and **Environmental Justice is not addressed in the SEIS**. We need a new and comprehensive EIS, not a slap in the face. *153-7*

8. Cultural and Paleontological Resources. The SEIS states, "In all cases there would be no effect through avoidance." The SEIS says that sacred cultural areas will be marked off and fenced and that anything that has to be moved will be done in consultation with the NM State Historic Preservation Office. This does not address Sacred Cultural Resources. The local tribes should be consulted on this. To put an orange plastic fence around these artifacts or to dig them up and send them to some museum is disrespectful and hurtful to local cultures. **The SEIS does not address Cultural and Paleontological impacts effectively**. *153-8*

9. The authors of the SEIS, regardless of the one signature waiver on the final page, have vested interests in approval of the building of the CMRR-NF. Science Applications International Corporation (SAIC) has contracts with Boeing in the weapons industry and contracts with the Department of Defense and Homeland Security and sells products to them. **This is a conflict of interest. This fact invalidates the entire document**. This is not science. It is corporate favors and financial interest in the outcome of the decision to be made. *153-9*

10. New Mexican citizens are not sacrificial lambs to the PRIVATIZED nuclear weapons industry. LANL has a sordid history of neglect and flagrant mismanagement. Citizens of New Mexico have been exposed without their knowledge to numerous leaks into our environment that have resulted in phenomenal cancer rates and illnesses and deaths. The significant numbers of safety violations and accidents at LANL are well documented. The LAHDRA report unveiled the enormous radiological exposures New Mexicans have experienced. To give a $6 billion check to these negligent corporate criminals who have literally poisoned our environment so that they can continue on a grand scale is insanity. And the **SEIS document with it's false assumptions and parameters and ridiculous computer models is insufficient to say the least**. *153-10*

Truly, Jeanne Green, 11 Los Padillas Rd, B, El Prado, NM 87529. 575-751-4130

153–5 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL. The comment regarding electricity usage is noted.

153-6 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The commentor's concerns that an accident (similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant) could happen at LANL is addressed in Section 2.8, Nuclear Accidents, of this CRD. There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant or Chernobyl) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems.

153-7 The *CMRR-NF SEIS* addresses possible impacts from releases to the air due to normal operations and activities to populations within a radius of 50 miles (80 kilometers). Chapter 3, Section 3.10, presents a discussion on the composition of the population within the potentially affected 50-mile (80-kilometer) region of influence. The figures referenced by the commentor display the cumulative minority populations as a function of distance from LANL. Both the distance and

Commentor No. 153 (cont'd): Jeanne Green

direction of populations surrounding the site are relevant factors to be considered when calculating potential impacts on human health. Data representing the cumulative total population have been added to these figures to clearly display the proportion of the population that is minority. In response to public comments, analysis of specific impacts to populations in close proximity of LANL at additional radial intervals of 5, 10, and 20 miles (8, 16, and 32 kilometers) has been added to the *Final CMRR-NF SEIS* in Chapter 3, Section 3.10, and Chapter 4, Sections 4.3.11 and 4.4.11. Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, show the impacts on an average individual of the total minority population, the total Hispanic or Latino population, the American Indian population, and the low-income population; as well as the nonminority and non-low-income populations.

A 50-mile (80-kilometer) radius is accepted by regulatory agencies such as the U.S. Nuclear Regulatory Commission and DOE because, at this distance, the concentration of airborne radionuclides is very small. A sensitivity analysis was performed for the preparation of the 2008 *LANL SWEIS* to determine how much of a difference there would be if an accident analysis was performed using a 100-mile (160-kilometer) radius instead of a 50-mile (80-kilometer) radius. The results showed that the population dose increased only 3 percent despite a 194 percent population increase, demonstrating the conservative nature of the methodology used in calculating the population dose (DOE 2008a).

153-8 As discussed in Chapter 3, Section 3.8.3, Traditional Cultural Properties, Native American tribes may request permission for visits to sacred sites within LANL boundaries for ceremonies or other purposes. When a project is proposed, NNSA arranges site visits with tribal representatives to solicit their concerns and to comply with applicable requirements and agreements. No paleontological resources have been identified within any of the technical areas at LANL that are addressed in the SEIS that would need to be removed.

153-9 Before DOE awards a contract to prepare an EIS, or in this case an SEIS, it reviews the contractor's proposal and makes a determination that there is no conflict of interest. The simple fact that SAIC does work for agencies or companies involved in defense work does not constitute a conflict of interest.

153-10 Releases of radioactive and other material into the environment from LANL activities are reported annually in documents such as annual site environmental reports, which may be accessed at http://www.lanl.gov/environment/all/esr.shtml.

Commentor No. 153 (cont'd): Jeanne Green

These annual site reports also estimate the radiological and nonradiological impacts that could result from these releases. In addition to an estimate of the impacts on public health that could result from implementing the actions proposed in the *CMRR-NF SEIS* (for example, see Chapter 4, Section 4.3.10), the *CMRR-NF SEIS* summarizes the existing affected human health environment in Chapter 3, Section 3.11. Section 3.11 summarizes current worker and public radiological doses from LANL activities and background sources, chemical exposures, worker industrial safety, public epidemiological studies, the CMR accident history, and emergency planning. Public and worker radiation doses have been in compliance with regulatory limits, and, as discussed in Section 3.11.3, worker-related accident rates have been well below industry averages. Section 3.11.4, Health Effects Studies, was updated for the *Final CMRR-NF SEIS*.

Commentor No. 154: Peter Wemyss-Gorman

To: nepalaso@doeal.gov
Subject: New Plutonium Facility in New Mexico

I write to express my dismay at the NNSA's plan to construct new plutonium pits at the Los Alamos Labs.

154-1 Rather than devoting funds to cleanup f existing waste to satisfy its commitment to attend to this, and improve safety, the Department of Energy has apparently decided to spend huge funds on a new bomb plant that would not only add to the dangers of building such a plant prior to satisfactory analysis of seismic risk, but contribute to the development of nuclear weapons at a time when the priority of ridding the world of them is more and more widely accepted.

Peter Wemyss-Gorman
Hickmans Lane
Hickmans Lane
Lindfield, ot RH16 2PX

154-1 NNSA notes the commentor's dismay regarding the construction of new plutonium pits and opposition to nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA intends to continue to perform environmental restoration activities at LANL. NNSA does not consider environmental restoration to be optional and progress on implementing those efforts is not linked to decisions on construction of the proposed CMRR-NF. Progress in performing environmental restoration activities at LANL is reported in the annual site environmental reports, which can be accessed at http://www.lanl.gov/environment/all/esr.shtml.

Subject: CMRR Nuclear Facility is dangerous and wasteful!

We have enough weapons and enough dangerous nuclear facilities in America as it is! We don't need more! THIS IS THE LAST THING OUR GOVERNMENT SHOULD BE SPENDING OUR MONEY AND RESOURCES ON DURING A DEPRESSION. ***155-1***

Nicole Morgan
1015 N. Raynor Ave.
Joliet, IL 60435

155-1 NNSA notes the commentor's opposition to the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 156: Carol De Marinis

From: Carol De Marinis [demarinis@taosnet.com]
Sent: Monday, June 20, 2011 5:32 PM
To: nepalaso@doeal.gov
Subject: Please stop the planned CMRR-NF

When is enough enough with the nuclear weapons?

Must we become an extinct species before we get it that we are all One and we need to give up this bad guy/enemy nonsense and the War is Wonderful mindset with its attendant business that is so profitable to a handful of Halliburtons, Blackwaters and Carlyles, while so many are devastated, wounded or ruined, or take the path of suicide to find peace, as so many American soldiers have done since America's longest war began.

My town, Taos, is downwind from the Los Alamos plutonium playpen, where the makers of fiendish weapons pull in wonderful salaries that you and I give to them in appreciation for their twisted scientific brilliance. We did not really need the first weapon Los Alamos gave the world. Germany had been defeated and Japan had been thoroughly bombed before August 1945. Hiroshima and Nagasaki began our change from Helper to the World to Biggest Bully on the Block. *156-1*

A fire that nearly wiped out the little town of Los Alamos on the rim of the Jemez caldera in 2000 sent thick awful smoke to the northeast for probably a month. I was diagnosed with bladder cancer the following year. A coincidence? *156-2*

When the trees burned that had grown in the canyons surrounding Los Alamos it was discovered that these were places where barrels of waste from Los Alamos work done long ago had been tossed off the rim. We had to wonder what was in the particles that caused the coughing and two weeks of red eyes. *156-3*

We now spend half our annual budget on war and related items such as the fear-mongering TSA that rummages through our underwear before we can board a commercial plane and the "Homeland Security" that wastes enormous amounts of money posturing and other more nefarious groups all under the name of national security.

Meanwhile, our bridges fall in the rivers they once spanned, our levees collapse, cities drown, jobs disappear and the buck is worth less every day, especially since it started going into circulation as debt.

The young and uneducated with few prospects join the military. Social Security and Medicare become burdens in the face of keeping the Department of Defense

156-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

156-2 A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. As noted in Chapter 4, Section 4.6.1.3, of the *CMRR-NF SEIS*, an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of the NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself. Additional information is provided in the 2008 *LANL SWEIS* (DOE 2008a).

156-3 Smoke from all forest fires contains hundreds of organic and inorganic combustion products. As noted in Chapter 4, Section 4.6.1.3, the risk assessment study concluded that there was some evidence of adverse health effects from breathing high concentrations of particulate matter in the smoke, but that "Such exposures are associated with any forest fire" (RAC 2002). It is estimated that nearly 7,500 tons of particulate matter were released to the atmosphere by the Cerro Grande fire, only 10 percent of which came from LANL sources. Many studies have correlated exposure to fine particles with respiratory-related emergency room visits and hospital admissions, work and school absences, premature death, asthma, emphysema, heart disease, chronic bronchitis, and acute respiratory symptoms. Children, the elderly, and people with heart or lung disease or respiratory infections are more sensitive to particulate matter. The Risk Assessment Corporation report stated that "It is probable that the calculated risk from PM_{10} is greater than the risk from all chemicals and radionuclides combined" (RAC 2002).

156-4 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take

Commentor No. 156 (cont'd): Carol De Marinis

afloat. They cannot even account for billions of their waste and fraud. Remember the suitcases of paper money our "representatives" were spreading around Baghdad buying friends in the fine old democratic way.

The numbers of lives lost or ruined thanks to the USA's mighty forces of fear at work these past dozen years have added up to some horrific crimes against humanity. We owe the world an apology and a promise to make war no more.

We can begin by giving up nuclear weapons and eventually, when we finally make friends with ourselves, perhaps we will exchange paranoia for love and give up weapons altogether.

The National Nuclear Security Administration's plan to make a space for building new plutonium pits in Los Alamos is a terrible idea. I have listed a few different reasons I think this needs to be stopped.

Expanding the United States' nuclear weapons production capabilities further undermines President Obama's stated goal of a world free of nuclear weapons. This type of contradictory message will only breed distrust of US intentions. With such actions, the US could potentially spur nuclear weapons development elsewhere. *156-4*

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. *156-5*

The Alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility. *156-6*

Carol De Marinis
27 El Tros Road
Ranchos de Taos, NM 87557

place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

President Obama stated that the goal of a world free of nuclear weapons would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

156-5 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF.

Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

156-6 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

Subject: Comments on CMRR SEIS

Have we leaned NOTHING from the horror of Fukushima? The nuclear industry is extremely vulnerable to acts of nature, like tidal waves and earthquakes. The danger to all life far outweighs the benefits of nuclear power, and there is NO REASON to produce more costly nuclear weapons-- the ones we have already serve their purpose of mutual assured destruction. We cannot afford to waste precious resources on harmful nuclear projects. ***157-1***

Please see reason and put an end to this outrageous waste of our money and our planet.

Beth Enson
PO Box 503
a, NM 87514

157-1 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 158: Janet Kinniry

Subject: I oppose the CMRR-NF

It is time for Los Alamos to change its mission. We do not need any more nuclear weapons that cause toxic nuclear waste. We have to stop making radioactive waste. The people of New Mexico do not want this and the world does not want it. *158-1*

The Supplemental Environmental Impact Statement is inadequate – a complete, new Environmental Impact Statement is needed. It is time to stop whitewashing the facts. Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. *158-2*

Stop the insanity.

Janet Kinniry
POB 154
Gardner CO 81040

Janet Kinniry
PO Box 154
Gardner, CO 81040

158-1 NNSA notes the commentor's opposition to LANL's mission and nuclear weapons. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. Also refer to Section 2.5, Cleanup and Waste Management, of this CRD for information about management of radioactive waste from CMRR-NF construction and operation.

158-2 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Subject: This idea is the pits :) Please don't...

Do we HAVE to have a new plutonium facility at the Los Alamos National Laboratory? Here is what worries me:

President Obama said he would work for a world free from Nuclear weapons - building this facility says the opposite of what he promised us and the world. If the world suspects we will continue doing the opposite of what we promise, won't THEY build nuclear weapons in defense? *159-1*

Also, the Department of Energy made a commitment to clean up legacy waste at Los Alamos Lab by 2015. Is that done? (no). Couldn't we spend the $6B on finishing that nasty business first? The public is counting on you to keep us safe, this feels like the wrong direction? *159-2*

I really don't have any political clout and I don't even know if this will be read, but it worries me that we say we are aware of the dangers of burning down the house, but we keep playing with matches any way. Thanks for reading this and anything you could do to stop the development of the new facility would please me greatly. *159-3*

KC Coburn
500 University Ave #738
Honolulu, HI 96826

159-1 NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

159-2 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

159-3 Comment noted.

Commentor No. 160: Etta Smith

TA-3 Building 1410
Los Alamos, NM 87544

Re: CMRR-NF SEIS Comment

Date: June 24, 2011

Dear Mr. Tegtmeier:

I oppose the construction of the CMRR Nuclear Facility at the Los Alamos National (LANL) for the following reasons:

ENVIRONMENT

The Nuclear Facility is designed to have the capacity to prepare plutonium for up to 80 new pits (triggers for nuclear weapons) per year. It would store six metric tons (about 13,200 pounds) of plutonium, a very potent carcinogen. ***160-1***

LANL sits on a windswept mountain top, in a seismic area, where wildfires and contaminated run-off continue to threaten the health of all who live downwind and downstream from LANL. Plutonium and other radionuclides were found in organic gardens downwind from Los Alamos after the 2000 Cerro Grande fire. There is increasing evidence of groundwater pollution from the Lab, with more "expected over a period of decades to centuries as more of the contaminant inventory reaches the water table," according to a 2005 LANL report. Radionuclides have been detected in the Rio Grande, the source of drinking water for many citizens living downstream from the Lab. ***160-2***

Plutonium has a half-life of 24,000 years (meaning it is half as potent by then). So any pollution will continue for many, many thousands of years. In addition to cancer, radioactive materials can cause serious birth defects. This disproportionately impacts New Mexico's minority populations, especially Native and Hispanic, making it an issue of environmental injustice.

The Department of Energy (DOE) estimates that the maximum amount of water needed for construction would be 4.6 million gallons per year. However, an independent analysis figured that 6.75 million gallons of water would be used in ***160-3***

160-1 NNSA notes the commentor's opposition to construction of the CMRR-NF at LANL.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA agrees with the commentor's concern about plutonium being a potent carcinogen; the danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

160-2 NNSA acknowledges the commentor's concerns regarding impacts on the environment and people living in the LANL region. Chapter 4 of the *CMRR-NF SEIS* provides the environmental impacts analysis, which evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area.

The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

Commentor No. 160 (cont'd): Etta Smith

mixing 225,000 cubic yards of concrete planned under the structure to meet safety requirements due to potential seismic hazards (and we are not convinced that will protect against a major earthquake). Another 3.9 million gallons of water would be needed for the additional 130,000 cubic yards of structural concrete.

For each year of operation after construction, DOE estimates that the Nuclear Facility would use 16 million gallons per year. We live in a dry semi-desert climate getting ever more dry with global warming, and we cannot afford to waste such a huge amount of water. Better not to put a nuclear facility in an earthquake prone zone. ***160-3 cont'd***

Taos citizens, along with Senator Udall and Representative Lujan, requested a hearing for public comment in their town so they wouldn't have to travel through the canyon to get to a hearing in other locales, but the National Nuclear Security Administration told Sen. Udall that the NNSA expected no safety consequences for Taos from operating the CMRR Nuclear Facility. Yet the smoke carrying plutonium and other radionuclides reached Taos during the 2000 Cerro Grande Fire at LANL. And they received smoke from the current Wallow Fire in AZ 200 miles away. ***160-4***

Producing more plutonium pits will create more waste. We already have 700,000 metric tons of depleted uranium waste from weapons production. Depleted uranium has a half-life of 4.5 billion years. So far, there is no viable plan for storing this waste. Because LANL did not keep good records in the early years of operation, an unknown amount of tons of radioactive waste is stored in Area G at LANL, and tritium is releasing into the air. Our environment and our health cannot tolerate any more radioactive waste.

The existing waste at LANL needs to be cleaned up before any new radioactive or toxic waste is generated there. DOE made a commitment to clean up certain legacy waste sites at LANL by 2016 when it signed the Consent Order with the New Mexico Environment Dept. on March 1, 2005. Yet the House Appropriations Committee has recommended cutting the cleanup budget for LANL by $175 million (almost half of the request to meet the need). Taxpayer funds needs to go first for cleanup, instead of cutting domestic services to fund a $6 billion project when most U.S. citizens don't want to fund any more nuclear weapons. ***160-5***

Thank you for your consideration. I would like to receive only the summary of the final EIS, not the full report.

Regarding water quality concerns, there are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. Refer to Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, of this CRD, for more information on cleanup of past contamination.

NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Storm Water Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Storm Water Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment. All radioactive liquids would be transferred to RLWTF. At RLWTF, the liquids would be treated to meet discharge criteria and released through a permitted outfall or to a zero liquid discharge facility. Other liquids would be routed to the Sanitary Wastewater Systems Plant, where they would be treated prior to discharge through a permitted outfall.

The potential impacts on environmental justice due to construction (except for the Continued Use of CMR Building Alternative) and operations are addressed in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11. These analyses show that the total minority, Native American, Hispanic, and low-income populations would not be subjected to disproportionately high and adverse impacts during implementation of any of the alternatives.

160-3 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. Tables S–2 and 2–3 indicate that the

Commentor No. 160 (cont'd): Etta Smith

shallow and deep excavation options would average approximately 4 to 5 million gallons of water usage each year. Over the 9-year construction period this would amount to about 36 to 45 million gallons of water used to support construction. The commentor is correct that the biggest difference in water usage between the 2 options would be the water needed to mix the low slump concrete needed for the deep excavation options. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

160-4 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF.

160-5 As previously noted, pit production activities would not occur in the CMRR-NF. The depleted uranium mentioned by the commentor is not stored at LANL and is not within the scope of the *CMRR-NF SEIS*. Cleanup of Material Disposal Area G is being performed in accordance with the Consent Order. NNSA does not consider compliance with the Consent Order to be optional and progress on

Commentor No. 160 (cont'd): Etta Smith

implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 161: Delores Kincaide

From: Delores Kincaide [dorieksl@yahoo.com]

To: nepalaso@doeal.gov
Subject: Responding to the CMRR SEIS

I recently heard about the proposed new plutonium facility at the Los Alamos National Laboratory, and I have a few concerns.

First, we live in tragic times of huge national debt and do not need to create further debt in "defense" of our country. We need to do only what is absolutely necessary to reduce waste in areas that could be set aside for now (and perhaps forever).

Secondly, we have thousands of pits already in storage which will last for at least 100 years. Therefore, more pits NOW are not necessary.

"Beware of the military-industrial complex" were wise words and this building project should be viewed with great suspicion.

161-1

Delores Kincaide
3 Cebolla Loop
Jemez Springs, NM 87025-9043

161-1 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 162: Ian Ford

From: Ian Ford [ilf@ianford.com]
Sent: Saturday, June 25, 2011 3:03 PM
To: nepalaso@doeal.gov
Subject: public comments on CMRR

I'm asking you to stop the CMRR on the grounds that (1) I understand it has not been proven to withstand likely eathquakes, and (2) the construction of materials that will be (or can be) used for new nuclear weapons will cause other nations to pursue more nuclear weapons, resulting a world that is more dangerous for everyone, not safer. *162-1*

Ian Ford
3110 Ninth NW
Albuquerque, NM 87107

162-1 NNSA notes the commentor's opposition to the CMRR-NF project. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*). Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

John Tegtmeier, CMRR-NF
SEIS Document Manager
Department of Energy – Los Alamos Site Office
3747 West Jemez Road
Los Alamos, NM 87544

Re: Need for the Department of Energy (DOE) to Withdraw the draft Supplemental Environmental Impact Statement (draft SEIS) for the Proposed Nuclear Facility of the Chemistry and Metallurgy Research Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL)

Dear Mr. Tegtmeier:

The draft SEIS is inadequate and technically indefensible for analysis of the risks of constructing and operating the proposed CMRR-Nuclear Facility with a capacity of quadrupling the current production of 20 plutonium triggers for nuclear weapons to up to 80 per year. I respectfully request that the DOE withdraw the draft CMRR-NF SEIS.

*** The National Environmental Policy Act (NEPA) requires a federal agency to provide a range of alternatives.** DOE has not provided workable alternatives. The "Modified CMRR-NF" Alternative would allow construction with enhancements to address the growing number of seismic issues. There are two construction options: the "Deep Construction Option" and an inadequately analyzed "Shallow Construction Option", which do not meet NEPA requirements. Assumptions were made for key parameters in the analyses of the Shallow Option. The draft SEIS fails to offer and analyze realistic alternatives and therefore must be withdrawn. ***163-1***

*** The draft SEIS misrepresents the seismic hazard at the location of the proposed CMRR-Nuclear Facility.** For example, a table in the 2007 Probabilistic Seismic Hazard Analysis reports a vertical peak ground motion acceleration of 0.6 ***163-2***

163-1 NNSA determined that a SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.2, NEPA Process, of this CRD for more information.

163-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The commenter also raises some issues that are addressed in detail in the response to comment 241.

Commentor No. 163 (cont'd): Clifton Bain

g [gravity], but the draft SEIS reports a lower g-force of 0.3 g. It is uncertain how this error impacts the overall NEPA analyses.

Further, both surface-rupturing synchronous and simultaneous earthquakes have occurred along the Pajarito Fault System. For these types of earthquakes, multiple synchronous earthquakes produce a greater seismic hazard than the simultaneous earthquakes. But the draft SEIS states the contrary that simultaneous ground-rupturing earthquakes produce a greater seismic risk. This error will have a tremendous impact on the overall NEPA analyses and must be corrected. The draft SEIS must be withdrawn.

These errors will ultimately result in the underestimation of the seismic hazard risk and the impacts to public health and the environment from releases from the proposed Nuclear Facility. The LANL scientists recommended that comprehensive field studies must be done to gather the necessary information about the seismic hazard. This must be done before a new EIS is submitted for public review and comment. ***163-2 cont'd***

* The draft SEIS demonstrates that DOE will continue to waste water for manufacturing nuclear weapons, create more radioactive, hazardous and toxic waste, spew pollution into the air, and exceed its existing electric power needs. ***163-3***

* Further, I am in solidarity with Santa Clara Pueblo Tribal Resolution No. 08-16 in which the Pueblo opposes the expansion of plutonium pit production at LANL and making that production capacity permanent. ***163-4***

Sincerely,

The response to comment 241-2 addresses the concern raised with respect to surface-rupturing and synchronous and simultaneous earthquakes. Briefly, the 2007 PSHA included both simultaneous and synchronous earthquake models in calculating design ground motions for TA-55. The PSHA did not calculate higher hazard for the simultaneous rupture, but the PSHA did estimate slightly higher maximum magnitudes for the simultaneous rupture model. Preferred maximum magnitudes for both simultaneous and synchronous ruptures were estimated using the same general approach, which has a sound technical basis. It is somewhat counterintuitive that the slightly bigger simultaneous earthquake can result in a lower ground motion hazard, but the two synchronous earthquakes result in higher ground motions for nearby sites, particularly when the site is located between the rupturing fault segments, because energy is coming from two sources.

Based on an apparent typographical error in the 2007 PSHA Executive Summary, the vertical peak ground acceleration for the CMRR-NF was incorrectly cited as 0.3 *g* instead of 0.6 *g* in the SEIS. This error has been corrected. This typographical error in the Executive Summary of the PSHA is not reflective of information presented elsewhere in the PSHA and was not used in the design of the proposed CMRR-NF.

Regarding additional field studies, it may be noted that potential seismic hazards at LANL have been the subject of numerous studies performed in the past 30 years. Additional studies are expected in the future based on priority and funding. As addressed in the response to comment 241-8, while the PSHA study acknowledges that additional data in these areas would provide a more complete understanding of the seismic hazard at LANL, NNSA believes there was sufficient information to complete the study. The uncertainties associated with these areas have been adequately captured and bounded by the results of the study.

163-3 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water

Commentor No. 163 (cont'd): Clifton Bain

Resources and Usage, of this CRD for more information on water resources at LANL.

Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. As summarized in Chapter 2, Table 2–3, no air quality standards would be exceeded. As discussed in Chapters 2 and 4, options for adding to or modifying the existing electrical distribution infrastructure at LANL to support the requirements of the proposed CMRR-NF are analyzed in the SEIS (for example, adding an electrical substation to TA-50).

163-4 Comment noted.

Commentor No. 164: Elsie Sandford

From: Elsie Sandford [lcsandford@earthlink.net]

Subject: CMRR Supplemental Environmental Impact Statement

The Supplemental Environmental Impact Statement (SEIS) for the CMR replacement facility (CMRR) at Los Alamos National Laboratory (LANL) appears to be complete and comprehensive, given the current knowledge of the local seismic geology. One thing that does not seem to have been considered in the public comment is the environmental impact that would occur if the CMRR is not completed. What would be the impact of an earthquake on the old CMR building, and the subsequent environmental damage? It's clear that LANL not only needs the new facility to continue work currently under way, but also as a safer alternative to the existing CMR building, which has virtually no earthquake resistance. ***164-1***

I live in Los Alamos, and I also work at LANL. I personally would appreciate a more robust facility than the old CMR building in which to continue work which is necessary for the security of the United States.

The SEIS for the new CMRR facility clearly addresses concerns about seismic vulnerability that the old CMR building lacks. New scientific work will also be done there that cannot be accomplished in the old facility.

Thank you for your consideration of my opinions.

Sincerely,
Elsie Sandford
Los Alamos, NM

164-1 NNSA notes the commentor's support for the new CMRR Facility. The *CMRR-NF SEIS* addresses the potential impacts of continued use of the CMR Building. Chapter 4, Section 4.4, of the SEIS presents the overall environmental impacts of continued use of the CMR Building. Section 4.4.10.2 addresses the potential health impacts on members of the public and workers from postulated accidents at the CMR Building. The potential impacts are also discussed in more detail in Appendix C. An earthquake that is severe enough to cause spills and perhaps fires and cause structural damage to the facility is evaluated and Table 4-43 of the SEIS presents the radiological impacts of a severe earthquake. With the operational and inventory constraints that are imposed on the facility by NNSA due to its age and construction, the radiological impacts of a severe earthquake on the public are not expected to cause short-term fatalities due to radiation and few, if any, latent cancers due to the radiation released. An earthquake this severe is expected to cause fatalities both at LANL and in Los Alamos due to injuries from falling debris and other direct earthquake effects.

Commentor No. 165: Ann-Nicole Cain

To: NEPALASO@doeal.gov
Subject: public comment for the proposed CMRR-NF SEIS at LANL

Dear Mr.John Tegtmeier, CMRR-NF SEIS Documnet Manager,

I am writing to express my disapproval of the DOE's plan to construct a site at Los Alamos National Labratory in Los Alamos ,N.M. to dump GTCC Waste and GTCC-like waste.

First of all, a complete new environmental impact statement (EIS) is needed, a SEIS can not adequately assess the impacts of a CMRR-NF at LANL. This is vital since the plan is to construct a site in a seismic fault zone. This is completely irresponsible to the local neighboring communities, to future generations, and to the world community. We should be looking at the events in Japan and realizing that not only do accidents naturaly occur but that they can effect the entire world. The cost of trying to build a plutonium pit production complex in a geologically unstable area are just too high, finacally and physically. People who live in the surrounding areas feel the seismic activity on a regular basis. People talk about the seismic tremors that they feel in the area. Although we are not a local that is known for earthquakes, the locals know that small ones happen and they happen regularly. Just a looking around at the local landscape from, Jemez Mountain to the Rio Grande Groge, one can tell that the earth is active here. To build any waste site here is irresponsible and reckless. ***165-1***

A new nuclear facility will detract from the cleanup of the existing mess in Los ALamos. Again, the locals know. We know that there are 50 - 60 year old sites at LANL that have never been cleaned up. We know that waste leeches out of the arroyos and down into the Rio Grande river. I even believe that there is Congressional evidence of this fact. All of that mess should be cleaned up and no new facilities should be allowed to operate and potentially further pollute the fragile ecosystem of the arid southwest. I personally live up stream from Los Alamos and feel grateful that I can take my family, my children, my pets to play in the waters of the Rio Grande. I wont touch the river after it passes Los Alamos. I was raised in Las Cruces, down stream of LANL. The river is damaged enough by damns, agriculture, the northern cities to make what was once a bountiful life force of the region into a ditch. All that waste goes into the agriculture in the south as the farmers pull the water out of the Rio Grande and into their fields. We'll have nuclear chili next. Why should we continue to poison ourselves further? The DOE has a responsibly to the people it serves not to pollute our children, our food, and our land. ***165-2***

165-1 NNSA notes the commentor's opposition to disposal of GTCC waste at LANL, but this is beyond the scope of this CMRR-NF SEIS and is the subject of another DOE EIS (DOE/EIS-0375D).

NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 165 (cont'd): Ann-Nicole Cain

The best alternative is for the DOE to develop others means of protecting and energizing our nation besides the use of nuclear devices. Poisoning the land for countless generations to come is what the DOE is really talking about when discussing plans to create anything related to nuclear energy or weapons. Despite popular ideas that nuclear anything can be clean and safe, we know that nuclear waste does not go away for thousands of years. So what if in 2099 we have an earthquake that is 5.0 or higher? What happens to the "safe" nuclear waste then? (Nuclear chili, for sure.) There are too many possibilities that can play out in the future to ever make nuclear waste "safe". It is a major sell-out to believe otherwise. Unforgivably, too many of the officials who are meant to protect us are on or have been on the payrolls of the industries that they are suppose to be protecting us from. It is the DOE's responsibly to put the public and future public's safety first. Zero nuclear activity is the only **165-3**

acceptable alternative. LANL could be turned into a facility that can create solutions for renewable energy needs, solutions for water shortages, solutions for climate control and change, solutions for the cultural devices that create terrorism. It's should be brain factory for the common good of all the peoples of the earth not the dump site for the destruction of lives through the pollution and derogation of our environment. All we really have is the future, we know it's coming and that nothing can stop it. What do we want it to look like? I, for one, would like to see the future is a place where all are welcome and safe. I would love nothing better than a nuclear free world because then I would know that no matter what my great-great-great-great granddaughter has to face in her life time that it wouldn't include cancers in her children and neighbors or mutations of food and wildlife. That she too can wake in the morning and breathe the clean air; grow her own food if she wishes, and live a life free of the stress and fear of what nuclear waste, energy and weapons can do. That she can trust in the physical world around her to provide and enliven her and not to poison her. **165-4**

Thank you for creating time for public comment. More time should be given for the public to educate themselves and create comments before action is taken . My personal information may be used to support my comment, so that it can be entered into the public comment record. **165-5**

Thank You,

Ann-Nicole Cain

xxx-xxx-xxxx
nikkicain09@gmail.com

165-2 NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, for more information on cleanup of past contamination.

165-3 NNSA notes the commentor's opposition to the existence of nuclear weapons and nuclear power plants. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

165-4 Funding decisions regarding major Federal programs (for example, defense and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA acknowledges the commentor's concern that a nuclear accident could happen at LANL. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Nuclear facilities constructed at LANL must meet strict safety criteria set forth in Federal regulations and DOE orders, and criteria imposed as an outcome of safety

Commentor No. 165 (cont'd): Ann-Nicole Cain

analyses. Refer to Appendix C for a description of safety analyses performed for this *CMRR-NF SEIS*.

165-5 Comment noted.

Subject: draft cmrr-nf seis

As a grandmother who cares deeply about our future generations..i strongly urge you to rethink this dangerous and insane project. Now is the time to end these instant gratification endeavers..there is a better way and im sure that with the so called geniouses running things out there you can come up with a better and safer and cleaner way. please think about the future of our planet and future generations..thank you.

166-1

166-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. See Section 2.3, Programmatic Direction and Decisions, and Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 167: Marta Harrison

From: Marta Harrison [sunnysandals4@comcast.net]

Subject: Please do more research on the CMRR Nuclear Facility

I am writing to tell you how concerned I am with your plans at Los Alamos National Laboratory for a CMRR Nuclear Facility. After what happened in Japan a few months ago, i consider it a warning to conduct thorough research before building any new facility.

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn Since a new seismic analysis is underway at Los Alamos Lab which will impact the results regarding the design of the building, the Supplemental Environmental Impact Statement should be withdrawn until further studies are made. ***167-1***

3.9 million gallons of water would be needed for the additional 130,000 cubic yards of structural concrete. For each year of operation after construction, DOE estimates that the Nuclear Facility would use 16 million gallons per year. Global warming and the wildfires with the current drought means that we cannot afford to waste water: it is a precious commodity here in the Southwest. ***167-2***

The current draft Supplemental EIS (SEIS) was conducted to deal with the more dangerous seismic issues revealed in 2007. But now, 5 years later, new seismic analyses are being conducted indicating even more serious potential consequences. So, it seems to me that the 2003 EIS and the Supplemental EIS are outdated and and a new full EIS written only after the results of the new current seismic investigations are known!

Think about the children and adults living in the nearby area. Our environment and our health cannot tolerate any more radioactive waste. Please take the time to do the research needed! thank you. ***167-1 cont'd***

Marta Harrison

Marta Harrison

Santa Fe, NM 87501

167-1 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

167-2 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF

Commentor No. 167 (cont'd): Marta Harrison

Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Commentor No. 168: Cynthia Piatt

To: Mr. John Tegtmeier, CMRR-NF
SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM 87544
Re: CMRR-NF SEIS Comment
Date: June 24, 2011

Dear Mr. Tegtmeier:

I oppose the construction of the CMRR Nuclear Facility at the Los Alamos National (LANL) for the following reasons:

ITS IMPACT ON OUR PRECIOUS ENVIRONMENT:

I', sure that you realize the Nuclear Facility is designed to have the capacity to prepare plutonium for up to 80 new pits (triggers for nuclear weapons) per year. It would store six metric tons (about 13,200 pounds) of plutonium, a very potent carcinogen. **168-1**

LANL sits on a windswept mountain top, in a seismic area, where wildfires and contaminated run-off continue to threaten the health of all who live downwind and downstream from LANL. Plutonium and other radionuclides were found in organic gardens downwind from Los Alamos after the 2000 Cerro Grande fire. There is increasing evidence of groundwater pollution from the Lab, with more "expected over a period of decades to centuries as more of the contaminant inventory reaches the water table," according to a 2005 LANL report. Radionuclides have been detected in the Rio Grande, the source of drinking water for many citizens living downstream from the Lab. One oncologist in Albuquerque stated that 90% of his thyroid and brain cancer patients live in Los Alamos or the downwind Espanola Valley. **168-2**

Plutonium has a half-life of 24,000 years (meaning it is half as potent by then). So any pollution will continue for many, many thousands of years. In addition to cancer, radioactive materials can cause serious birth defects. This disproportionately impacts New Mexico's minority populations, especially Native and Hispanic, making it an issue of environmental injustice.

The Department of Energy (DOE) estimates that the maximum amount of water needed for construction would be 4.6 million gallons per year. However, an independent analysis figured that 6.75 million gallons of water would be used in mixing 225,000 cubic yards of concrete planned under the structure to meet safety requirements due to potential seismic hazards (and we are not convinced **168-3**

168-1 NNSA notes the commentor's opposition to construction of the CMRR-NF at LANL.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA agrees with the commentor's concern about plutonium being a potent carcinogen; the danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

168-2 NNSA acknowledges the commentor's concerns regarding impacts on the environment and people living in the LANL region. Chapter 4 of the *CMRR-NF SEIS* provides the environmental impacts analysis, which evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area.

The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

Commentor No. 168 (cont'd): Cynthia Piatt

that will protect against a major earthquake). Another 3.9 million gallons of water would be needed for the additional 130,000 cubic yards of structural concrete.

For each year of operation after construction, DOE estimates that the Nuclear Facility would use 16 million gallons per year. We live in a dry semi-desert climate getting ever more dry with global warming, and we cannot afford to waste such a huge amount of water. We are living in the driest year since 2004 and we continually ask the citizens to use less water (as we should be doing). As the residents of Santa Fe are using less water this year than years previously, isn't it imperative that LANL do the same?

168-3 cont'd

Taos citizens, along with Senator Udall and Representative Lujan, requested a hearing for public comment in their town so they wouldn't have to travel through the canyon to get to a hearing in other locales, but the National Nuclear Security Administration told Sen. Udall that the NNSA expected no safety consequences for Taos from operating the CMRR Nuclear Facility. Yet the smoke carrying plutonium and other radionuclides reached Taos during the 2000 Cerro Grande Fire at LANL. And they received smoke from the current Wallow Fire in AZ 200 miles away.

168-4

Producing more plutonium pits will create more waste. We already have 700,000 metric tons of depleted uranium waste from weapons production. Depleted uranium has a half-life of 4.5 billion years. So far, there is no viable plan for storing this waste. Because LANL did not keep good records in the early years of operation, an unknown amount of tons of radioactive waste is stored in Area G at LANL, and tritium is releasing into the air. Our environment and our health cannot tolerate any more radioactive waste.

The existing waste at LANL needs to be cleaned up before any new radioactive or toxic waste is generated there. DOE made a commitment to clean up certain legacy waste sites at LANL by 2016 when it signed the Consent Order with the New Mexico Environment Dept. on March 1, 2005. Yet the House Appropriations Committee has recommended cutting the cleanup budget for LANL by $175 million (almost half of the request to meet the need). Taxpayer funds needs to go first for cleanup, instead of cutting domestic services to fund a $6 billion project when most U.S. citizens don't want to fund any more nuclear weapons.

168-5

THE IMPACT ON JOBS:

The few supporters of the Nuclear Facility who spoke at the hearings claimed that the construction will add jobs to New Mexicans. But those jobs are temporary, and only for a few hundred workers. After the facility is built, almost all the workers will be transferred from other buildings. Even the Environmental Impact Statement admits that the socioeconomic impact on New Mexico is minimal. At this point, we should be investing in long-term jobs that encourage

168-6

Regarding water quality concerns, there are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. Refer to Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, of this CRD, for more information on cleanup of past contamination.

NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. LANL staff manages stormwater runoff from both industrial and construction activities, such as the proposed construction of the CMRR-NF, under Storm Water Pollution Prevention Plans. These plans require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices for the control of stormwater runoff quality and quantity. Implementation of Storm Water Pollution Prevention Plans includes a number of temporary and permanent detention ponds that are included in the description of the Modified CMRR-NF Alternative. Under all three alternatives, there would be no operational discharges directly to the environment. All radioactive liquids would be transferred to RLWTF. At RLWTF, the liquids would be treated to meet discharge criteria and released through a permitted outfall or to a zero liquid discharge facility. Other liquids would be routed to the Sanitary Wastewater Systems Plant, where they would be treated prior to discharge through a permitted outfall.

The potential impacts on environmental justice due to construction (except for the Continued Use of CMR Building Alternative) and operations are addressed in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11. These analyses show that the total minority, Native American, Hispanic, and low-income populations would not be subjected to disproportionately high and adverse impacts during implementation of any of the alternatives.

168-3 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would

Commentor No. 168 (cont'd): Cynthia Piatt

the development and use of renewable energies rather than more nuclear facilities' construction!

The total cost of nuclear weapons complex across the country is estimated to be $180 billion over the next ten years. This is just too high in our failing economy. Money spent on unusable nuclear weapons do not spur economic growth. Rather than cutting domestic services to the poorest and most disadvantaged in our society in order to balance the federal budget, the $6 billion (and growing) could be used to create jobs for education, health care, mass transit, affordable housing, renewable energy, bridge upgrades, and better food distribution. ***168-6 cont'd***

Thank you for your consideration to this important matter. I would like to receive only the summary of the final EIS, not the full report. ***168-7***

Sincerely,
Cynthia Piatt
109 Camino Santiago
Santa Fe, NM 87501

exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

168-4 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

168-5 As previously noted, pit production activities would not occur in the CMRR-NF. The depleted uranium mentioned by the commentor is not stored at LANL and is not within the scope of the *CMRR-NF SEIS*. Cleanup of Material Disposal Area G is being performed in accordance with the Consent Order. NNSA does not consider compliance with the Consent Order to be optional and progress on

Commentor No. 168 (cont'd): Cynthia Piatt

implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

168-6 The socioeconomics sections of the *CMRR-NF SEIS* present an analysis of the potential effect on the local labor market related to the different alternatives under consideration (see Chapter 4, Sections 4.2.9, 4.3.9, and 4.4.9). As discussed in the *CMRR-NF SEIS*, construction of a new CMRR-NF under the No Action Alternative or the Modified CMRR-NF Alternative would result in a requirement for a construction workforce that would be needed for up to 9 years. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence. Refer to Section 2.7, Economic Impacts, of this CRD for more information.

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

168-7 Comment noted.

From: Beverly Busching [bbusching@mindspring.com]
Sent: Sunday, June 26, 2011 1:05 PM
To: nepalaso@doeal.gov
Subject: against the Nuclear Facility

Let's stop the new plutonium facility at the Los Alamos National Laboratory. Even though the first phase has been completed it is not too late to stop this facility which is a danger to us all.

The US should cease being hypocritical about nuclear weapons. If we ask other nations to cease development, we should lead the way by ppublically doing the same. I dont want my taxes funding such activities that contradict our commitment to humanity. *170-1*

Give government attention to cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE should devote my taxpayer funds to cleanup.

With hope for the future,

Beverly Busching

Beverly Busching

Santa Fe, NM 87505

170-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

As addressed in Section 2.5, Cleanup and Waste Management, of this CRD, NNSA intends to continue to implement actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional and progress in implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF.

Commentor No. 171: Therese MacKenzie

From: Therese MacKenzie [terrishcj@aol.com]
Sent: Sunday, June 26, 2011 2:26 PM
To: nepalaso@doeal.gov
Subject: building nuclear facilities

I am totally opposed to any nuclear construction, and certainly not for anything related to nuclear weapons.

No one with the slightest accurate information would ever use one. So why build more?

I realize that the industries involved had big money and much power. Is that a reason to threaten our land, our water, our security?

171-1

The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

171-2

Therese MacKenzie
7040 N. Sheridan Rd. Apt. 503
7040 N. Sheridan Road
Chicago, IL 60626

171-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. See Section 2.3, Programmatic Direction and Decisions, and Section 2.4, CMR Mission, of this CRD for more information.

The commentor's concern regarding impacts on the environment and people (land, water, and security) is noted. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 4 of the *CMRR-NF SEIS* provides the environmental impacts analysis, which evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area.

171-2 Regarding commitment to clean up legacy waste, NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

To: nepalaso@doeal.gov
Subject: Are more Nuclear Weapons really what we need?

I am incredibly concerned by the CMRR project that is going to cost #6 billion!

173-1 The costs to build a plutonium pit production complex are too high. The Department of Energy should consider simply upgrading old facilities for safety rather than spending $5.8 billion on a project that was estimated to cost $600 million at the start.

Thank you,

Anu Joshi
732 6th Street #307 SW
Washington, DC 20024

173-1 NNSA notes the commentor's concern about the CMRR-NF project and nuclear weapons. Activities that would be conducted at the proposed CMRR-NF include analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Subject: responding to making more "pits"

I have a few concerns about your making more nuclear triggers.

One--we have more than enough nuclear "deterrent" weapons.

Two--the money should be spent on more life-giving expenditures, like clean water for all, solar ovens, etc.

Three--let's clean up the nuclear mess we have already created.

Four--teachers and schools are under "attack" because of lack of money. Money to make more nuclear triggers should obviously be spent better to help our true treasure, our true security--our children.

174-1

Thank you for your consideration,

Los Alamos, NM 87544

Re: Need for the Department of Energy (DOE) to Withdraw the draft Supplemental Environmental Impact Statement (draft SEIS) for the Proposed Nuclear Facility of the Chemistry and Metallurgy Research Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL)

Dear Mr. Tegtmeier:

Please accept this as a formal public comment from Conejos County Clean Water, Inc. ("CCCW") related to the draft Supplemental Environmental Impact Statement (draft SEIS) for the Proposed Nuclear Facility of the Chemistry and Metallurgy Research Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL) .

CCCW is a 501(c)(3) non-profit citizens' group, based in Antonito, Colorado, that is incorporated under the laws in the State of Colorado.

Background of CCCW and relationship to the Affected Environment

In June of 2010, concerned citizens incorporated into a Colorado non-profit organization, called CCCW. CCCW incorporated to promote awareness around health and environmental issues that affect residents in Conejos County. In particular, to build awareness surrounding the transfer from truck to rail of radioactive, hazardous and

Response side of this page intentionally left blank.

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo Conejos County Clean Water, Inc.

toxic waste from LANL within 250 feet of the Rio San Antonio (River), a headwaters tributary to the Rio Grande (River).

CCCW is comprised of ranchers, teachers, small business owners, and concerned citizens. CCCW has a thirteen board member steering committee, and 402 general members.

The San Luis Valley (SLV) in south central Colorado is one of the largest sub-alpine Valleys in the world, encompassing over 8,100 square miles. Hemmed in on the west by the San Juan Mountains, and on the east by the Sangre de Cristo Mountains, the SLV ranges in elevation from 7,000 to over 14,000 feet, and contains the headwaters of the Rio Grande. The Rio Grande rises in the San Juan Mountains to the west of the SLV, flows south into New Mexico and Texas and empties into the Gulf of Mexico.

The SLV has many unique biological features, including areas identified as Natural Heritage areas, and is home to six endemic insect species.

The SLV is 122 miles long and 74 miles wide. This largely agrarian and ranching community is a relatively stable population. Many of the residents are eighth-generation. The oldest parish in Colorado, Nuestra Señora de Guadalupe, Our Lady of Guadalupe, lies at the southern end of Conejos County. Conejos County is part of the Sangre de Cristo National Heritage Area. About sixty percent (60%) of Conejos County's population is minority, and pride in the Hispanic heritage is evident in everything from the names of the rivers, mountains, and towns, to the local Spanish/English radio station. The median household income is less than half the national average at $24,744, and 38 percent of the children live in poverty (US Census 2000).

2

Response side of this page intentionally left blank.

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo Conejos County Clean Water, Inc.

The SLV is known for its potatoes and alfalfa, and also grows barley, lettuce, wheat, peas, and spring grains. It has been a farm and ranching community for over 150 years, and many of the residents work in agriculture, following in the footsteps of their parents and grandparents. Many of the farmers and ranchers still practice traditional methods. It is the highest irrigated mountain plateau in the world, with about 7000 high-capacity wells – over half of which are irrigation wells.

The SLV contains over 5 million acres, of which 3.1 million acres – about 59 percent -- are publicly owned (Forest Service, BLM, Fish & Wildlife Service, National Park Service, or state). Conejos County contains over 825,000 acres, of which 528,000 acres - about 64 percent – are publicly owned (Forest Service, BLM, Fish & Wildlife Service, National Park Service, or state). This creates an important relationship between the public and private sectors in dealing with air and water quality issues in the SLV and Conejos County.

There are 18 incorporated towns in the SLV, many of which are located along the Rio Grande or its many tributaries. Six counties lie within this large geographical boundary. They are Alamosa, Rio Grande, Saguache, Mineral, Costilla, and Conejos. There are 21 villages and five incorporated towns in Conejos County. Conejos County is among the poorest counties in the country, and unemployment levels run above the state and national averages (Conejos County 10.5%; as of 2008-not including the chronically unemployed).

Conejos County is a populated area within the SLV affected by the proposed actions in the draft SEIS for the Proposed Nuclear Facility of the CMRR Project at LANL.

Response side of this page intentionally left blank.

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo
Conejos County Clean Water, Inc.

Draft SEIS Document

CCCW would like to respectfully request a complete, new Environmental Impact Statement (EIS) be completed, *versus* a Supplemental Environmental Impact Statement (SEIS) for the reasons described below.

CCCW understands that a draft SEIS cannot adequately assess the impacts of a completely redesigned Chemical and Metallurgical Research Replacement-Nuclear Facility (CMRR-NF) building for processing of plutonium and nuclear materials at LANL. The original Environmental Impact Statement (EIS) of 2004, now supplemented by the draft SEIS, assessed a building designed to withstand only mild seismic events. LANL sits between the Rio Grande rift and the volcanic Jemez Mountains in a seismic fault zone (the Pajarito Plateau). A May 2007, updated seismic hazards analysis showed a potential huge increase in seismic ground motion and activity. Given the instability of its building site, the most recent vastly fortified design for this building is still in flux. It is uncertain if the building's fire suppressant systems will be designed to address the extreme combustibility of plutonium. Not only is a SEIS inadequate to the new scope of the project, it is premature, because the building's design is not finalized. Only an EIS can adequately study the full impact of this much-altered building and until the design is finalized, even an EIS would be premature. ***176-1***

The costs of trying to build a plutonium pit production complex in a geologically unstable area are extremely high. The total original estimate for the CMRR Complex Project; including, the recently completed $363 million Radiological Laboratory Utility and Office Building (RLUOB), was around $600 million in 2004. The current estimate for ***176-2***

4

176-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Per DOE Order 413.3, *Program and Project Management for the Acquisition of Capital Assets*, an EIS, or in this case an SEIS, must be completed prior to the start of the final or detailed design.

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo Conejos County Clean Water, Inc.

the Nuclear Facility alone is $45 billion and rising. Will DOE include a risk analysis as to whether this growing price tag is too high a premium to pay for a new Nuclear Facility (NF) in a geologically unstable area?

176-2 cont'd

Will the draft SEIS study whether the unstable geological strata can support the weight of the redesigned building? To address these increased seismic hazards, DOE is considering plans to excavate 225,000 cubic yards of earth under the proposed NF and fill the hole with concrete. DOE must question: Can the surrounding geology support all that concrete? Would a seismic event cause the concrete "slab" to sink or shift? The draft SEIS also suggests a "Shallow Option" (floating the building's foundation above the geologically unstable tephra layer), an option whose feasibility is unknown, needing the further study from a complete EIS.

176-3

Purpose and Need

Does the US need eighty new plutonium pits per year? Will DOE conduct a "capacity study" to determine whether the existing facilities can be used instead of building the proposed NF, which would increase pit manufacturing capacity to at least eighty per year? Existing facilities have sufficed since 1999 when DOE limited plutonium pit manufacturing to twenty per year. Since US treaty obligations forbid both new nuclear designs and increased numbers of nuclear weapons in the US arsenal, the pits to be manufactured are touted as "stockpile stewardship" for maintaining existing nuclear weapons through replacement of old pits. However, a Jason study of aging plutonium argues against the need for pit replacement within the next hundred years.

176-4

5

176-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. The correct cost estimate for the Modified CMRR-NF is about $6 billion not $45 billion as stated by the commentor. The decision will be announced in a ROD that will appear in the *Federal Register*. In accordance with NEPA regulations, the ROD cannot be issued any earlier than 30 days after publication of the *Final CMRR-NF SEIS*.

176-3 The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97,600 kilograms per square kilometer]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option. A draft slope stability analysis has been prepared and determined that indicated that global slope stability is not an issue for the Deep Excavation Option (LANL 2011a:LANL site, 028). If the Deep Excavation Option were selected, as part of the ongoing design and evaluation process, studies would be completed to verify that all geotechnical stability issues had been addressed.

The concerns expressed by the commentor about the Shallow Excavation Option not being a mature alternative appear to refer to statements in Chapter 1 and Chapter 2, Section 2.6.2.1, of the *Draft CMRR-NF SEIS* indicating that there was more uncertainty in the design of the Shallow Excavation Option because that design had not reached the same level of maturity as the Deep Excavation Option. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo
Conejos County Clean Water, Inc.

Boosting US capacity to build nuclear bombs could compromise US efforts for nuclear arms reduction, for the completion of non-proliferation treaties, and for persuading non-nuclear nations to abstain from acquiring their own nuclear weapons.

President Obama's call for a "world free of nuclear weapons" rings hollow, as he also proposes a windfall to the call for a "world free of nuclear weapons". Will this double message increase worldwide distrust of US intentions and thus ratchet up the world's nuclear tensions?

176-4 cont'd

Array of Alternatives

Will DOE develop more alternatives, including (a) a true "No Action" alternative of not building the Nuclear Facility; and (b) upgrading the existent old CMR building? CCCW understands the National Environmental Policy Act (NEPA) requires a federal agency to provide a range of alternatives. DOE has not provided workable alternatives. The "Modified CMRR-NF" Alternative would allow construction with enhancements to address the growing number of seismic issues. There are two construction options: the "Deep Construction Option" and an inadequately analyzed "Shallow Construction Option," which do not meet NEPA requirements. Assumptions were made for key parameters in the analyses of the Shallow Option.

The draft SEIS briefly considered and dismissed these alternatives as insufficient to "satisfy the entire range of DOE and NNSA mission support functions." The so-called "No Action" alternative featured in the current draft SEIS is to build a new CMRR building as projected in 2003 (a design failing to meet new seismic standards). The other featured draft SEIS alternative is to continue operations at the old, unsafe CMR

176-5

to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option. Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b). The Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

176-4 NNSA acknowledges the commentors' position regarding plutonium pit production levels and notes that decisions on the level of pit production are not within the scope of the *CMRR-NF SEIS*. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of stockpile stewardship and other functions performed at LANL. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Chapter 2, Section 2.9, Treaty Compliance, of this CRD for more information.

NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo Conejos County Clean Water, Inc.

Building, without upgrades. Both "alternatives" appear undesirable to the DOE. The draft SEIS fails to offer and analyze realistic alternatives. **176-5 cont'd**

Socio-Economics

How does money spent on unusable nuclear weapons spur economic growth? Los Alamos, the richest county per capita in the US does not need US budgetary charity, but it consumes a majority of federal funds coming to New Mexico. The rest of New Mexico, one of the nation's poorest states, needs the fulfillment of real human needs. Money for education, health care, green jobs, renewable energy, public transportation, all would keep circulating and foster sustainable economic growth. **176-6**

Natural Resources

The draft SEIS demonstrates that DOE will continue to waste water for manufacturing nuclear weapons, create more radioactive, hazardous and toxic waste, continue to pollute the air, and exceed its existing electric power needs. Furthermore, a new nuclear facility will detract from cleanup of the existing waste. DOE made a commitment to clean up the legacy waste sites at LANL when it signed the Consent Order with the New Mexico Environment Department of March 1, 2005. The Order requires cleanup of certain sites by December 31, 2015; including, the Area G dump site at Technical Area 54. Construction activities for a new NF will interfere with cleanup activities. **176-7**

Public Health

CCCW understands from the draft SEIS that manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and **176-8**

for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006e). It should be noted that plutonium aging is only one of the variables affecting nuclear weapon system reliability; other variables can control overall life expectancy of nuclear weapon systems.

NNSA acknowledges that there is substantial opposition to the nuclear weapons mission and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to CMRR-NF and Nuclear Weapons and Technology, of this CRD for more information.

176-5 NNSA acknowledges the commentor's concern regarding the No Action Alternative (2004 CMRR-NF) and Continued Use of CMR Building Alternative (i.e., the "true" No Action Alternative is continued use of the existing CMR Building at TA-3, rather than the construction and use of a new building at TA-55 based on the 2004 ROD). Refer to Section 2.2, NEPA Process, of this CRD for more information.

Chapter 2, Section 2.6, of the *CMRR-NF SEIS* provides a description of the alternatives. The Continued Use of CMR Building Alternative includes not constructing a replacement facility to house the capabilities planned for the CMRR-NF, but continuing to perform operations in the CMR Building at TA-3, with normal maintenance and component replacements at the level needed to sustain programmatic operations for as long as feasible.

The CMR Building would continue to be operated as a Hazard Category 2, Security Category III nuclear facility for as long as it could continue to be operated safely; this designation limits the amount of special nuclear material that can be used and the level of operations. These limitations do not currently support the missions that NNSA has assigned to LANL through the *SSM PEIS*, *LANL SWEIS*, and *Complex Transformation SPEIS* RODs. This alternative does

Commentor No. 176 (cont'd): Mary Alice Trujillo/Andrea Guajardo
Conejos County Clean Water, Inc.

downstream. LANL inherited the US pit manufacturing function from Rocky Flats in Colorado. Rocky Flats became so polluted and unsafe that it had to be shut down. Rocky Flats had repeated plutonium fires, two of which came perilously close to breaching containment and spreading vaporized plutonium to the environment and likely rendering Denver uninhabitable. Plutonium is a killer carcinogen. LANL's discharges disproportionately sicken Native peoples and Hispanic New Mexicans. *176-8 cont'd*

Recommendations

The draft SEIS is inadequate and technically indefensible for analysis of the risks of constructing and operating the proposed CMRR-NF with a capacity of quadrupling the current production of twenty plutonium triggers for nuclear weapons to up to eighty per year. CCCW respectfully requests that the DOE withdraw the draft CMRR-NF SEIS.

Further, we are **in solidarity** with Santa Clara Pueblo Tribal Resolution No. 08-16 in which the Pueblo opposes the expansion of plutonium pit production at LANL and making that production capacity permanent.

Thank you for your careful consideration of CCCW's comments. Please keep us informed of any upcoming public meetings. We can be reached via email at info@conejoscountycleanwater.org. *176-9*

Respectfully submitted,

Mary Alice Trujillo, Chair

Andrea Guajardo, Board Member

8

not completely satisfy NNSA's stated purpose and need to carry out AC and MC operations at a level to satisfy the entire range of DOE and NNSA mission support functions. However, this alternative is analyzed in this *CMRR-NF SEIS* as a prudent measure in light of possible future fiscal budgetary constraints. For more information, refer to Chapter 2, Section 2.6.2, of the SEIS.

In addition, Chapter 2, Section 2.7 of this *Final CMRR-NF SEIS*, was revised to better describe alternatives considered but dismissed from detailed analysis. These alternatives are: 1) alternative locations outside LANL; 2) Extensive Upgrades to the Existing CMR Building; and 3) moving capabilities to other LANL facilities. For the reasons described in Section 2.7, these alternatives are not being revisited in this *Final CMRR-NF SEIS*.

176-6 NNSA notes the commentor's concern regarding sustainable economic growth for the area and the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense, education, and health care) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

176-7 Chapter 4 of the *CMRR-NF SEIS* presents the potential environmental impacts of the proposed alternatives including impacts to waste management, air quality, and infrastructure (including water and electrical supply).

NNSA intends to continue implementing those actions necessary to comply with the Consent Order regardless of decisions made on the proposed construction of the CMRR-NF. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Chapter 2, Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

176-8 The existing human health and environmental conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human

health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect the workers and public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10 of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

176-9 NNSA notes the commentor's opposition to the CMRR-NF project and opinion that the *CMRR-NF SEIS* is inadequate and technically indefensible for analysis of the risks of constructing and operating the proposed CMRR-NF, thus requesting DOE to withdraw the draft SEIS. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. The need for CMRR-NF is not connected to a specific level of pit production.

Commentor No. 177: Jeanne Bahnson

From: jeanne [jeannebahnson@yahoo.com]
Sent: Tuesday, June 28, 2011 11:48 AM
To: NEPALASO@doeal.gov
Subject: Environmental Impact Statement Needed, Not a Supplemental

6/28/2011

To Whom it May Concern:

I would like to go on record in expressing the following comments regarding the proposed construction of the CMRR facility at Los Alamos National Laboratories.

A Complete, New Environmental Impact Statement is Needed, Not A Supplemental Environmental Impact Statement. The original Environmental Impact Statement in 2004 assessed a building designed to withstand only mild seismic events. A 2007 updated seismic hazards analysis showed a potential huge increase in seismic ground motion and activity. I understand that even Lab scientists have expressed grave concerns regarding this matter.Only a full Environmental Impact Statement can adequately study the full consequences of increased possibility seismic events might have on the proposed bomb plant. *177-1*

This draft SEIS should be withdrawn until the details of the Seismic Risks are better understood and no more funds used for planning at this time. *177-2*

Valid Alternatives Must Be Considered in the Supplemental Environmental Impact Statement. DOE must develop and consider new alternatives, including a true "No Action" alternative--not building the Nuclear Facility and upgrading the existing plutonium production building. *177-3*

The Costs to Build a Plutonium Pit Production Complex Are Just Too High. The total original estimate for constructing the new nuclear weapons complex at Los Alamos National Laboratory was approximately $600 million in 2004. The current estimate is $5.8 billion.

The US does not need 80 new plutonium pits per year. Just as new seismic information has forced a re-evaluation of the construction, new cost information must force a re-evaluation of the cost. *177-4*

Thank you for your consideration of the foregoing comments.

Jeanne Bahnson
111 East Lupita Rd.
Santa Fe, NM 87505

177-1 NNSA notes the commentor's request for a new environmental impact statement. The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare a supplement when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Please refer to Section 2.2, NEPA Process, of this CRD.

177-2 NNSA notes the commentor's concerns regarding our understanding of the seismic risks. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD.

177-3 Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644). Although many commentors expressed a preference for a No Action Alternative

Commentor No. 177 (cont'd): Jeanne Bahnson

such as not proceeding with CMRR-NF, and upgrading the existing CMR Building, such an alternative does not meet NNSA's stated purpose and need (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003.

In addition to an alternative involving constructing and modifying a Modified CMRR-NF, NNSA considers an alternative (described in Chapter 2, Section 2.6.3) in which CMRR-NF would not be constructed and the existing CMR Building in TA-3 would continue to be used for SNM operations until it was no longer considered safe to do so. This alternative, however, would not satisfy NNSA's stated purpose and need to carry out analytical chemistry and materials characterization operations at a level satisfying the entire range of DOE and NNSA mission support functions. In response to public comments, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* was revised to add more information regarding alternatives that were considered but dismissed from further analysis. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

177-4 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

To: nepalaso@doeal.gov
Subject: I oppose construction of the Nuclear Facility

I was just recently told about your possible new plutonium facility at the Los Alamos National Laboratory. I am very much against this new project.

The alternatives considered in the Supplemental Environmental Impact Statement are inadequate. The DOE should include "taking no action" as one of the alternatives to the CMRR project. All of the alternatives currently listed support building the Nuclear Facility.

Manufacturing plutonium pits are a danger in construction and God help us if they are ever used.

178-1

Roger Eaton
355 Serrano Dr Apt 4F
Apt 4F
San Francisco, CA 94132

178-1 NNSA acknowledges the commentor's opposition to the construction and operation of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

Commentor No. 179: Gordon Burghardt

From: gburghar@comcast.net
Sent: Monday, June 27, 2011 10:31 PM
To: NEPALASO@doeal.gov
Subject: Stop the bomb business

People,

I just heard about the proposed new plutonium facility at the Los Alamos National Laboratory. As a citizen who has been concerned about the wasteful and dysfunctional preoccupation with nuclear proliferation and misguided national security, I think the line must finally be drawn. Money spent on nuclear weapons does not spur economic growth and only encourages other countries to build bombs. Then we need to spend billions studying, spying, and countering them. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth. *179-1*

Manufacturing plutonium pits is also dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. *179-2* Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. *179-3* The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is underway at Los Alamos Lab and the results will impact the design of the building. *179-4*

Gordon Burghardt
Knoxville, TN 37920

179-1 NNSA acknowledges the commentor's concern with the money spent on nuclear weapons. NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

179-2 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

179-3 As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

179-4 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 180: Jack Hastert

From: Jack Hastert [jhastert@Bosco.org]
Sent: Tuesday, June 28, 2011 3:00 PM
To: nepalaso@doeal.gov
Subject: CMRR

Hello,

This email is to protest the building of a new Chemistry and Metallurgy Research Building in New Mexico.

I have 3 primary reasons for opposing this. *180-1*

#1 – The cost is too much and already much higher than projected in 2004.

#2 – We have enough plutonium pits. *180-2*

#3 – The proposed new site is too near a fault line. *180-3*

Thank you very much for your consideration.

Jack Hastert
9th/10th grade counselor and Golf Coach
(xxx) xxx-xxxx ext. xxx

Celebrating a 70 Year Legacy of Salesian Excellence.

See Don Bosco…Be Don Bosco.

180-1 NNSA recognizes the commentor's opposition to construction of the CMRR-NF due to the cost. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

180-2 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

180-3 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Re: Tri-Valley CAREs' Public SEIS Comment on the Dept. of Energy (DOE) National Nuclear Security Administration's "Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at the Los Alamos National Laboratory"(the CMRR-NF).

Tri-Valley CAREs submits these comments on the Supplemental Environmental Impact Statement (SEIS) for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory (LANL) (DOE/EIS-0375-D). As explained herein, the SEIS fails to provide an accurate, complete or legally adequate analysis as is required by the National Environmental Policy Act (NEPA).

Tri-Valley CAREs was founded in 1983 in Livermore, California by concerned neighbors living around the Lawrence Livermore National Laboratory. Tri-Valley CAREs monitors nuclear weapons and environmental clean-up activities throughout the US nuclear weapons complex on behalf of its 5,600 members. Tri-Valley CAREs also seeks to eliminate waste, fraud and abuse from the oversight and management of facilities that make up the nuclear weapons complex. Due to concerns among our community about the negative environmental, health, cost, non-proliferation, and security implications of constructing and operating the CMRR-NF as planned in this SEIS' "preferred alternative," Tri-Valley CAREs submits this comment on the draft document.

The purpose of NEPA is to ensure that every federal agency prepares a full Environmental Impact Statement (EIS) for major federal actions significantly affecting the quality of the human environment.[1] An EIS must provide a "full and fair discussion of significant environmental impacts and shall inform the decision-makers and the public of the reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment."[2]

[1] 42 U.S.C. 4332; 40 CFR 1501.
[2] 40 CFR 1502.1.

Response side of this page intentionally left blank.

Commentor No. 181 (cont'd): Marylia Kelley, Executive Director, and Scott Yundt, Staff Attorney, Tri-Valley CAREs

As described below, the SEIS is inadequate to provide a full NEPA analysis. The SEIS fails to include an adequate analysis of reasonable alternatives, fails to provide an adequate purpose and need statement, improperly segments the proposed action from other connected actions, and fails to include terrorism risk analysis. Additionally, the SEIS neglected to address many of Tri-Valley CAREs' (TVC) comments that were provided during the scoping period and only minimally addressed the comments that earned a reply in the SEIS. For these reasons, a new EIS is required and should be re-circulated for public review and comment.

I. A New, Full Environmental Impact Statement ("EIS") is Necessary.

A. Further Analysis of the Expected Costs of the Facility Must be Included.

The costs to build this new plutonium pit production complex are just too high – and estimates are still continuing to rise. The total original estimate for constructing the new nuclear weapons complex at Los Alamos National Laboratory was reported to be approximately $600 million in 2004. The current estimate is around $5.8 billion. What percent of the additional billions in recent cost estimates are due to efforts to address the increased seismic hazard? DOE must analyze whether this premium is too high and examine other options, including the alternative highlighted below and outlined in Tri-Valley CAREs' scoping comment (yet ignored in the SEIS).

181-1

The SEIS fails to address the underlying rationale for the CMRR-NF, i.e., that its construction and operation would enable the technical capability at LANL to expand plutonium pit (bomb core) production from the current allowable limit of 20 pits per year to up to 80 pits per year. The US does not need 80 new plutonium pits per year. DOE must conduct a "capacity study" to determine whether the existing facilities can be used instead of building the proposed CMRR-NF, which would increase pit-manufacturing capacity to at least 80 per year. Existing facilities have sufficed since the 1990s when DOE made the decision to allow plutonium pit manufacturing at LANL at up to 20 per year. Given that the US now has fewer deployed weapons and an articulated policy not to produce new design nuclear weapons, it is a notable deficiency that the SEIS would put LANL on the path to enabling expanded pit production with no new or updated analysis to explain why (see also purpose and need, below).

And, finally, just as new seismic information has forced a re-evaluation of the construction, new cost information must force a re-evaluation of the cost/value/need that DOE perceives. Yet, the SEIS provides none.

B. Existing Analysis of the Seismic Hazards Must be Updated.

181-2

The original Environmental Impact Statement in 2004 assessed a building designed to withstand only mild seismic events. A 2007 updated seismic hazards analysis showed a potential, major increase in seismic ground motion and activity. Los Alamos National Lab sits between the Rio Grande rift and the volcanic Jemez Mountains in a seismic fault zone. Only a full EIS can adequately study the full consequences of increased seismic events and what effect they might have on the proposed plant.

The SEIS should be withdrawn until the details of the Seismic Risks are better understood. For example, the cost-saving (comparatively speaking) Shallow Option, in which the foundation would be constructed in a geologic layer above a poorly welded tuff layer, is not a mature concept, and it is not yet fully known if this option will be safe. The SEIS fails to

2

181-1 NNSA notes the commentor's opposition to the construction and operation of the CMRR-NF. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

181-2 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 181 (cont'd): Marylia Kelley, Executive Director, and Scott Yundt, Staff Attorney, Tri-Valley CAREs

accurately analyze how impacts to the environment from the Shallow Option construction may be different from other options, and under what circumstances.

There are more new seismic investigations currently underway at LANL. This SEIS must be withdrawn and a new EIS undertaken after the results of these new investigations are known. Proceeding with a design before seismic risks are better known will only repeat the process that led to the DOE admission of need for this Supplemental EIS.

181-2 cont'd

C. Current Conditions Require Further Analysis on the Threat of Wildfires.

In the past 11 years two wildfires have come dangerously close to causing and/or caused serious problems at LANL. The Cerro Grande (2000) and the still raging Las Conchas (2011) wildfires demonstrate that fires are a real, and possibly increasing, threat to the security of radioactive materials and wastes at LANL. Current analysis of wildfires at LANL is inadequate and must be reevaluated, given the recurrent incidence of wildfires in the surrounding areas.

181-3

II. The SEIS Fails to Include an Adequate Analysis of Reasonable Alternatives.

The twin functions of the Environmental Impact Statement (EIS) are to "require that agencies take a 'hard look' at environmental consequences, and provide for broad dissemination of relevant environmental information." See *Robertson v. Methow Valley*, 490 US 332, 350 (1989). The discussion of alternatives is the legally required heart of any EIS. 40 CFR § 1502.14. The legally adequate EIS must "[r]igorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated." 40 CFR § 1502.14(a). "The existence of a viable but unexamined alternative renders an environmental impact statement inadequate…" *Southeast Alaska Conservation Council v. FHA*, 2011 U.S. App. LEXIS 9097, 16-17 (9th Cir. 2011) "Informed and meaningful consideration of alternatives — including the no action alternative — is thus an integral part of the statutory scheme." *Id*.

A. Space that can be Made Available in PF-4 is a Reasonable Alternative that Must be Rigorously Explored and Objectively Evaluated in a New/Revised EIS

In Tri-Valley CAREs scoping comments on the SEIS, we provided a reasonable alternative to the construction of the CMRR-NF. We wrote, "… Given that the CMRR Radiological Laboratory Utility and Office Building (RLUOB) is build and is slated to become operational within 2 years, its capabilities must be taken into account. Further, given that the CMRR-NF is not slated to be completed until about 2020, other relevant LANL activities between the present and 2020 must be included in the analysis. (In other words, the issue is not merely what LANL could do differently today, it is what LANL could do differently by 2020 that must be considered in the NEPA analysis. In this context, LANL's PF-4 must be considered in conjunction with the CMRR RLUOB.

"That analysis must take into account that PF-4 presently holds equipment that need not stay until 2020, such as the ARIES "pilot project," which was never supposed to be permanent there. Additionally, PF-4, we were told by LANL management, has other space that could be available in the future but which presently holds contaminated plutonium wastes in acid, a waste management issue waiting to be dealt with.

181-4

3

181-3 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources). For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

181-4 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644). Refer to Section 2.2, NEPA Process, of this CRD for more information.

NNSA disagrees with the commentor regarding its failure to analyze all reasonable alternatives. As discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, use of the TA-55 Plutonium Facility was also considered by NNSA to determine if that proposed combination, together with the planned future use of RLUOB would provide adequate space for analytical chemistry and materials characterization operations over the long term. However, augmenting the existing TA-55 Plutonium Facility with only additional vault storage space would not alleviate the need for additional work space for analytical chemistry and materials characterization laboratory operations. Space does not exist, and would not be expected to exist later, in the TA-55 Plutonium Facility to support this work and these operations cannot be accomplished within RLUOB because RLUOB is not able to support the level of radiological operations

Commentor No. 181 (cont'd): Marylia Kelley, Executive Director, and Scott Yundt, Staff Attorney, Tri-Valley CAREs

"Therefore, a reasonable alternative could be to devote a small portion of the massive resources that would have been used to construct the CMRR-NF to clean out the areas in PF-4 that could be made available and pair that capability [in PF-4] for "heavy lab" activities with the "light lab" capabilities of the already-built CMRR-RLUOB."

Since we wrote that scoping comment excerpted above, the schedule for the CMRR-NF has slipped again, to 2035. And, the CMRR-NF costs have risen yet again. And, estimates of the considerable seismic uncertainties associated with its construction have also risen. And, the RLUOB has proceeded to completion. And, there has been no NEPA decision changing the current LANL production limit of 20 pits per year. Thus, the detailed alternative we submitted, which was completely reasonable at scoping, has changed only in that it has become even more so. Yet, DOE failed to analyze this alternative in the SEIS, in violation of NEPA.

B. The SEIS Failed to Include a No Build Alternative

Instead of evaluating a no-build alternative, the SEIS included a "no-action" alternative that entailed construction and operation of a new CMRR-NF at TA-55 adjacent to RLUOB, as analyzed in the 2003 CMRR EIS**. This is not a true no-action alternative.** NEPA requires that DOE study an alternative that involves not going forward with the proposed project. A more reasonable no-action alternative that should be studied in a future EIS is not building any CMRR Nuclear Facility and maintaining the pit production at current levels. DOE failed to study meaningfully consider a true no action alternative in violation of NEPA. This deprived the public and decisionmakers of the opportunity to "make an informed comparison of the alternatives." *Animal Def. Council v. Hodel*, 840 F.2d 1432, 1439 (9th Cir. 1988)

181-4 cont'd

C. The SEIS' Purported "No Action" Alternative is Not a Reasonable Alternative and Should Have Been Eliminated from Further Study

The SEIS' "no-action" alternative is not a true no action alternative but is a sham alternative. The SEIS immediately eliminates the alternative from analysis because it "would not meet the standards for a Performance Category 3(PC-3) structure as required to safety conduct the full suite of NNSA AC and MC mission work." The SEIS summary states "the 2004 CMRR-NF would not be constructed." Therefore the SEIS does not provide this alternative for public review or comparison rendering it a sham alternative.

In fact, the entire alternatives analysis fails to provide a suite of options for an informed comparison of alternatives. The ***only*** "alternative" that DOE does not summarily rule out is the agency's "preferred alternative" (see, for example, pp S-8-9 and S-20.)

III. The Purpose and Need Statement Omits Critical Reasons for the Proposed Action.

An EIS must explain the underlying purpose and need to which the lead agency is responding with the proposed action. 40 CFR § 1502.13. NNSA made the decision to draft a supplement to the CMRR EIS due to significant new circumstances and information that is relevant to the environmental impacts of the facility. (CEQ NEPA Regulations 40 CFR 15029[c][1]). The CEQ advises that an EIS more than five years old should be carefully scrutinized to determine whether a supplement is required. As part of this scrutiny, the agency should determine whether the purpose and need for the project remains the same. Thus, in drafting the CMRR-NF SEIS, NNSA should have re-examined the purpose and need for the proposed project.

181-5

4

required to support the work needed. As discussed in Section 2.5, RLUOB contains a radiological laboratory capable of handling less than Hazard Category 3 radioactive materials per DOE-STD-1027. As a result, RLUOB is only authorized to use gram quantities up to 8.4 grams (0.3 ounces) of plutonium-239 equivalent, while the CMRR-NF is being designed as a Hazard Category 2 facility capable of using kilogram quantities of plutonium-239 equivalent. This alternative was, therefore, not analyzed further in the *CMRR-NF SEIS*.

Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and/or not proceed with CMRR-NF, or would abandon pit production at LANL, such an alternative does not meet NNSA's stated purpose and need (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). Thus, an alternative of ceasing CMR operations is not addressed in the *CMRR-NF SEIS*. The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

181-5 As discussed in Chapter 1, Section 1.5, of the *CMRR-NF SEIS*, NNSA is not planning at this time to revisit either the need for the CMRR-NF or relocating the CMR capabilities at another site. NNSA has addressed the CMRR-NF in a series of NEPA documents since the 2004 ROD for the *CMRR EIS* that announced its decision to locate a two-building CMRR Facility at TA-55. The *Complex Transformation SPEIS* (DOE 2008b), which addressed transforming the nuclear weapons complex into a smaller, more efficient enterprise, also addressed the location for manufacturing and research and development involving plutonium. In the ROD for that document (73 FR 77644), NNSA announced its decision that the mission would remain at LANL and its decision to construct and operate the CMRR Facility at LANL. Based on these decisions and the authorization for the project and appropriation of funding, NNSA intends to proceed with the CMRR-NF planning process. The need for the CMRR-NF is not connected to a specific pit production rate. As described in Chapter 1, Section 1.2, of the *CMRR-NF SEIS*, NNSA has been required to suspend some types of materials characterization work because of limitations in the CMR Building.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the

Commentor No. 181 (cont'd): Marylia Kelley, Executive Director, and Scott Yundt, Staff Attorney, Tri-Valley CAREs

Because there have been significant changes in the circumstances surrounding the purpose and need of the CMRR-NF, the stated purpose and need should have been revised. The CMRR-EIS was completed in 2004, but "project planning and design for the CMRR-NF…has progressed along a slower timeline than projected in the *CMRR EIS*." (CMRR-NF SEIS at S-2). NNSA acknowledges that "over the past 7 years, the CMRR-NF planning process has identified several design considerations that were not envisioned in 2003," and that the LANL SWEIS and the Complex Transformation SPEIS and their RODs, which included decisions on the size, scope, purpose and mission of the CMRR-NF, were issued in 2008 and 2009. Additionally, many relevant events took place over the past seven years, including President Obama's Nuclear Posture Review (2008) and The New Strategic Arms Reduction Treaty with Russia (2010), that also have direct relevance to the size, scope, purpose and mission of the CMRR-NF (CMRR-NF SEIS at S-2). However, the CMRR-NF SEIS claims that "[t]he purpose and need for the NNSA action has not changed since the issuance of the 2003 CMRR EIS and makes no assertion that it examined the purpose and need for the facility in light of the passage of time and these intervening events.

The CMRR-NF cites the Final Complex Transformation SPEIS of 2008. It analyzed the "50/80 alternative," and found that "completion of the CMRR Facility would be needed to support production of up to 80 pits per year." (FCTS PEIS at S-39). However, no Record of Decision (ROD) was ever published determining that the agency or LANL required up to 80 plutonium pits per year to support its mission. Despite the lack of decision, the CMRR-NF SEIS proposes an expanded CMRR-NF that enables this 50/80 plutonium pit per year capacity. Yet, LANL still operates pursuant to its 2009 LANL SWEIS ROD, which only allows a production capacity of 20 pits per year.

181-5 cont'd

In evaluating whether the purpose and need for the CMRR-NF remains the same as stated in the 2003 EIS, the NNSA should have examined the "needed" level of production capacity the CMRR-NF. In doing so, it must consider that LANL is currently only authorized to produce 20 pits per year despite visiting that issue in 4 NEPA documents (the SSM PEIS, the 2008 and 2009 SWEISs and the Complex Transformation PEIS). By rushing toward a CMRR-NF Record of Decision in this SEIS to meet a need - and provide the technical capability - to produce up to 80 plutonium pits per year without any underlying pit production ROD, has the agency "putting the cart before the horse."

This is a situation akin to the movie "Field of Dreams." If the DOE builds it (the CMRR-NF), they will come (increased production of pits). And, without the integrated and full NEPA review required by law.

The SEIS also should take into consideration relevant external circumstances. For example, the US is reported to have a total of approximately 40,000 plutonium pits in storage and on weapons under US control. Approximately 5,000 of those pits are deployable as nuclear weapons. In total, the US has constructed approximately 70,000 nuclear weapons and used two of the weapons more than 60 years ago.

None of the US invasions of at least 18 foreign nations, including Iraq and Afghanistan, has required the use of nuclear weapons (nor should they have). The current President's Nuclear Posture Review does not state or determine (or change) the number of plutonium pits the US requires, but does purport to reduce the nation's reliance on nuclear weapons in future military strategy and forego the production of new design nuclear weapons.

5

safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

See the response to comment 181-1 for a discussion regarding the production of plutonium pits.

Commentor No. 181 (cont'd): Marylia Kelley, Executive Director, and Scott Yundt, Staff Attorney, Tri-Valley CAREs

Additionally, the New Strategic Arms Reduction Treaty between the U.S. and Russia (ratified since the scoping period closed) calls for reductions in deployed, strategic nuclear weapon stockpiles. In considering the circumstances above, and others, how can the agency claim that the "purpose and need" for the CMRR-NF should not be scaled back greatly? (And, again, how can the agency ignore that its "preferred option" can enable a production rate of up to 80 new plutonium pits per year, which is undeniably scaling up while the arsenal scales down?) ***181-5 cont'd***

IV. The SEIS Fails to Include Analysis of Risks Associated with a Terrorist Attack.

There needs to be a thorough analysis of the risks of a terrorist attack at the CMRR-NF in the SEIS. The analysis should include the risk of both "outsider" and "insider" attacks in compliance with the DOE's Office of NEPA Policy and Compliance 2006 Guidance Memorandum," Need to Consider Intentional Destructive Acts in NEPA Documents." While general terrorism analyses have been made that cover LANL in other NEPA documents, the changes in size and scope of the CMRR-NF detailed in the SEIS propose new and unanalyzed potential threats if a terrorist act were to occur at the facility. This analysis, to the maximum extent possible, should be made public in an unclassified document for public comment during the NEPA process. This point was also raised in Tri-Valley CAREs public comment period during Scoping and was not responded to in the SEIS in violation of NEPA. ***181-6***

V. The SEIS Failed to Respond to Tri-Valley CAREs' Comments Provided During Scoping.

The SEIS failed to adequately respond to Tri-Valley CAREs' comments provided during the scoping period. Many of the comments were given a cursory reply and some were altogether disregarded. Our comments regarding a reevaluation of the purpose and need of the CMRR-NF were not addressed in the SEIS. Additionally, there was no analysis concerning the risks associated with terrorist attacks at the new facility. Furthermore, our comment regarding the impact on the nation's nuclear Non-Proliferation Treaty obligations should have yielded a response. All of these comments provided by TVC discussed significant impacts that the CMRR-NF will have on the natural and human environment, and as such, they should be addressed in a new EIS or, at a minimum, a properly completed and re-circulated new draft Supplemental EIS. ***181-7***

We did receive confirmation of your office's receipt of our scoping comments. Moreover, they have been publicly available on our website at www.trivalleycares.org under "technical letters and comments," should you have misplaced them during the production of the SEIS. And, we have not moved our office or changed our phone, fax or other contact numbers. Therefore, we can only conclude that you failed to analyze them properly in violation of NEPA.

For Tri-Valley CAREs,
/s/
Marylia Kelley, Executive Director
/s/
Scott Yundt, Staff Attorney
2582 Old First Street
Livermore, CA 94550

6

181-6 As stated in NNSA's response to the scoping comment summary in Chapter 1, Section 1.7, in the *Draft CMRR-NF SEIS*, a classified appendix was prepared to address the impact of intentional destructive acts, which include terrorism. Substantive details are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. The appendix was prepared in accordance with DOE's Office of NEPA Policy and Compliance 2006 Guidance Memorandum, "Need to Consider Intentional Destructive Acts in NEPA Documents." Refer to Chapter 4, Section 4.2.10.3, Intentional Destructive Acts, of the *CMRR-NF SEIS* for a discussion of the appendix.

181-7 As stated in Chapter 1, Section 1.7, of the *Draft CMRR-NF SEIS*, although scoping is optional for an SEIS under DOE's NEPA implementing procedures (10 CFR 1021.314(d)), public citizens, civic leaders, and other interested parties were invited to comment on these issues and to suggest additional issues that should be considered in the *CMRR-NF SEIS*. NNSA considered all scoping comments in the preparation of the *CMRR-NF SEIS.* Issues found to be relevant to the SEIS are addressed in the appropriate chapters or appendices of the *CMRR-NF SEIS*.

The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. As stated in Chapter 1, Section 1.1, of the *CMRR-NF SEIS*, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. The purpose and need for NNSA action, as stated in Section 1.3 of the *CMRR-NF SEIS*, has not changed since the issuance of the 2003 *CMRR EIS*; that is, to provide the physical means for accommodating the continuation of mission-critical analytical chemistry and materials characterization, and plutonium research capabilities at LANL beyond the present time in a safe, secure and environmentally sound manner. NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644).

Regarding the comment on the analysis concerning risks associated with terrorist attacks at the new facility, please see the response to Comment 181-6. Regarding the impact on the Nation's nonproliferation treaty obligations, please see Section 2.9, Treaty Compliance, of this CRD.

Commentor No. 182: Eleanor Krebs

From: Eleanor Krebs [elena_475@hotmail.com]
Sent: Tuesday, June 28, 2011 2:51 PM
To: nepalaso@doeal.gov
Subject: Nuclear threat from CMRR project near faultline in New Mexico

182-1 I am very upset about the chemistry and metallurgy project where you will build plutnium pits. This represents a grave nuclear threat to the United States as you can see from the forest fires which made it necessary to evacuate Los Alamos this week. There is also a nearby fault line which could cause a fukushima like catastrophe.

182-2 Another aspect to be considered is the enormous expense. Originally the cost was supposed to be $400-550 million back in 2004 with completion by 1011. I understand the cost is now estimated at 5.86 billion with a completion date of 2023. With our infrastructure falling apart and our schools losing teachers and our children doing without adequate care andcitizens on Long Island and other areas of the country losing their homes and going without enough food, we can not afford these billions for plutonium pits.

Eleanor Krebs, 25 Cheryl Lane North, Farmingdale, New York 11735

182-1 NNSA notes the commentor's concern regarding the CMRR-NF project. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

182-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, USDOE, NNSA, Los Alamos Site Office, 3747 West Jemez Rd., Los Alamos, NM 87544

NO NUCLEAR EXPANSION.

NO MORE NUCLEAR WEAPONS DEVELOPMENT OR TESTING.

TRANSITION TO SUSTAINABLE TECHNOLOGIES AND LIFE-PROMOTING TECHNOLOGIES. PROTECT WILDLIFE AND HUMAN LIFE. THIS IS LONG OVERDUE. ***183-1***

Sylvan Grey
Portland, OR 97206

183-1 NNSA notes the commentor's opposition to nuclear weapons development or testing. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, conservation or sustainability) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 184: Uomi S. Brog

From: Uomi Brog [uomibrog@gmail.com]
Sent: Wednesday, June 29, 2011 3:07 PM
To: nepalaso@doeal.gov
Subject: Opposition to new nuclear weapons facility and power

As a voting citizen who carees about the next generation of Americans, I feel obligated to voice my discontent in the continued development of nuclear power, for energy or war fare. The CMRR Nuclear Facility proposed at Los Alamos Laboratory is wrong, dangerous and unsustainable in so many ways. ***184-1***

I abhor the manufacturing of plutonium pits, they are dangerous and a threat to the environment and our health and safety. Plutonium is a very potent carcinogen. I am afraiid that Los Alamos Lab's discharges affect disproportionately Native peoples and Hispanic New Mexicans. ***184-2***

I strongly believe that nuclear weapons are obsolete. They are useless against a terrorist attack. Building more weapons will only increase proliferation and the chance that a terrorist could acquire nuclear material.

I applaud Germany in it's measures to abolish nuclear power in favor of more sustainable green energy measures in response to the meltdown of the Japanese plants.

I believe it is high time that we reverse our course and reach seriously for sustainable means of energy production and replace war fare with fair economic development support in critical countries. ***184-1 cont'd***

Sincerely,

Uomi S. Brog

Uomi Brog
132 Romero Street #2

Santa Fe, NM 87501

184-1 NNSA notes the commentor's opposition to the proposed CMRR-NF and nuclear power. Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

184-2 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, foreign aid and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

June 28, 2011

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager
USDOE/ NNSA
Los Alamos Site Office
3747 West Jemez Rd.
Los Alamos, NM 87544

I was born and raised in New Mexico and have lived in Santa Fe for more than 25 years.

I am writing today to register my opposition to the proposed construction of the new CMRR. At any point, it would be a colossal waste of taxpayer money. But considering we "won" the cold war and have no active nuclear-armed enemies, the horrible state of the U.S. economy, and the fact we have a viable nuclear arsenal that can continue to serve as a deterrent into the distant future, the CMRR is a monstrous waste of money, time and resources. *185-1*

And, in light of the fact that wildfires are now licking around the edges of LANL (and have burned through canyons where nuclear and chemical wastes were heedlessly dumped for decades--god knows what is in that smoke column!), to build a facility that will continue to generate waste, and to place plutonium and other dangerous materials in harms way, it seems insane to be discussing the need for a $4-$6 BILLION facility for building yet more nuc warheads that will never be used. The SEIS assessment of the fire danger to LANL and the CMRR is woefully inadequate. *185-2*

The no-action option should have been made a part of this discussion so we can focus a discussion and on LANL research that could truly generate lots of jobs while addressing urgent local, national and global problems. The world has changed. Our institutions must change as well. *185-3*

Sincerely,

Daniel Gibson
518 Juniper Drive
Santa Fe, NM 87501

185-1 NNSA notes the commentor's opposition to the construction of the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

185-2 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

185-3 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

June 28, 2011

John Tegtmeier
CMRR-NF SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road
TA–3 Building1410
Los Alamos, New Mexico, 87544

Mr. Tegtmeier:

I am writing to comment on the Department of Energy's Supplemental Environmental Impact Statement (SEIS) for the Chemistry and Metallurgy Research Replacement Nuclear Facility (CMRR-NF). The SEIS currently being undertaken is not adequate. We do not presently have enough information about the seismology around the CMRR-NF site to credibly design safety features and the alternatives laid out in the SEIS also raise critical policy and budget concerns.

If the CMRR-NF project is to move forward, it requires a completely new Environmental Impact Statement (EIS), not an SEIS. The original 2004 EIS was based on a radically different CMRR-NF design. Current plans are for a CMRR-NF 50% larger than the one outlined in the 2004 EIS and must take dramatic new seismic information into account. Both of these design changes significantly affect the environmental impact of the project and merit a completely new EIS. ***186-1***

While we have learned a great deal about the seismology of the Los Alamos area since the original CMRR-NF EIS in 2004, seismic data is still being gathered and analyzed for the area. Blazing ahead before we have complete seismic data for the CMRR-NF site will only result in the need for another SEIS down the road. It would be reckless to continue investing tax-payer dollars in an EIS process that we know will need to be repeated and even more reckless to begin construction before we have complete seismic and environmental data. ***186-2***

186-1 NNSA notes the commentor's concerns regarding the adequacy of the building design and several aspects of the NEPA process. NNSA considers NEPA implementation to be a vital and important part of its decisionmaking process. The *CMRR-NF SEIS* specifically addresses changes, including increased footprint, in the design of the CMRR-NF based on additional seismic information and safety requirements. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare an SEIS when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Refer to Section 2.2, NEPA Process, of this CRD for more information.

186-2 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This additional information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a sizable earthquake event without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There are no new seismic analyses under way at LANL, however seismic studies are conducted on a continuing basis. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 186 (cont'd): Katherine M. Fuchs, Program Director Alliance for Nuclear Accountability

A proper CMRR-NF EIS should include a true "no action" alternative. In these austere times, as our President strives to reduce global nuclear weapons stockpiles, we must consider the possibility of not building the CMRR-NF. Our world does not need more plutonium pits and our country cannot afford to pay for this project. ***186-3***

Quadrupling our plutonium pit production capacity sends the wrong message to other countries. Whether we are negotiating bi-lateral arms reductions with Russia or trying to stave off an Iranian nuclear bomb, plans to increase our own weapons production capacity undercut our national nonproliferation goals. The U.S. continuing with the proposed CMRR-NF displays an aggressive and hypocritical posture to the rest of the world. ***186-4***

Finally, including a real "no action" alternative in the CMRR-NF would give the DOE a fiscally responsible option. While upgrades would have to be made to the current CMR facility to make it seismically sound and safe for workers, money could be saved when comparing such a "no action" alternative to the current $5.8 billion plan for the CMRR-NF. Our tax dollars would be better invested in real efforts to reduce DOE's footprint at Los Alamos National Laboratory, including the remediation of legacy waste. ***186-3 cont'd***

The civic and scientific communities represented by the Alliance for Nuclear Accountability agree that moving ahead with the CMRR-NF SEIS would be detrimental to our national interests. We cannot afford to invest in a facility built in a seismically unstable area that would produce unnecessary weapons components. We implore you to reconsider your plans for upgrading the CMR by initiating a new EIS that includes a "no action" alternative to bring the current facility up to safety standards. Thank you for your consideration. ***186-5***

Sincerely,

Katherine M. Fuchs
Program Director

186-3 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced Section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if

Commentor No. 186 (cont'd): Katherine M. Fuchs, Program Director
Alliance for Nuclear Accountability

necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

186-4 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

186-5 Comment noted.

Subject: public comment on CMRR–NF DSEIS DOE/EIS–0350–S1

Draft Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR–NF DSEIS; DOE/EIS–0350–S1).

It is the purpose of this e-mail to provide my personal input on the alternatives presented in the above referenced Draft Supplemental Environmental Impact Statement.

Of the presented options I would prefer to see the NNSA proceed with the Modified CMRR-NF Alternative with a Deep Excavation Option. While there would be greater cost and time required for that option I think in the long run it would reduce continuing public concerns about the stability of the Nuclear Facility in the occurrence of an earth quake. It would also serve to reduce the above ground profile of the facility. In the execution of the Deep Excavation Option there would need to be great care taken not to adversely impact the structural integrity of the current PF-4 and new RLUOB facilities.

187-1

I believe the rate at which the NF is constructed should reflect both its important supporting role in a variety of national security programs and the overall national security interest in reducing our Federal budget deficit.

Until the CMRR NF is completed the NNSA should support the best integrated usage of the remaining portions of the current CMR, PF-4, and the new RLUOB facility to accomplish the entire range of national security and other programs. Relatively small continuing investments in the combination of those three facilities could allow much beneficial work to be done in the interim period until the NF is completed and operational.

Thank you for the opportunity to provide my public comments to this supplemental plan. As well the continuing public outreach effort in behalf of the overall CMRR effort is also appreciated.

Mr. Donivan Porterfield
PO Box 1417
Los Alamos, NM 87544

187-1 NNSA notes the commentor's support of the construction of the CMRR-NF as a component of our national security program. Site-specific geotechnical investigations have been completed for the proposed CMRR-NF project site for both the Shallow Excavation Option and the Deep Excavation Option. Either option of the proposed CMRR-NF would be designed and constructed in accordance with recommendations provided in the geotechnical reports (Kleinfelder 2007a, 2007b, 2010a, 2010b) and care would be taken to ensure that nothing was done that would adversely impact the structural integrity of RLUOB or the TA-55 Plutonium Facility.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information. Excavation activities would not impact PF-4 nor RLUOB.

Commentor No. 188: Mimi Darragh

From: MimiDarragh@aol.com
Sent: Tuesday, June 28, 2011 6:07 PM
To: NEPALASO@doeal.gov
Subject: "Supplemental Environmental Impact Statement" comment

To Whom it May Concern:

There are many reasons to be concerned about the seismic design under review, but as a citizen of this country and the world I am against nuclear weapons of any kind and the research and development of them as well. The ability to kill and maim massive numbers of people, even the threat of this type of killing, is immoral and does not fit anywhere in the just war criteria. ***188-1***

Sincerely,

Mimi Darragh
8018 Noblestown Rd.
McDonald, PA 15057

188-1 NNSA notes the commentor's opposition to the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 189: Aysha Massell

6-28-11

Plutonium processing at Rocky Flats in Colorado has left the site dangerously polluted for many years. Don't ruin the beauty of Northern New Mexico and the lives of its inhabitants by processing plutonium pits.

The development of new nuclear weapons is illegal by international treaty, and continuing to poison our earth with radioactivity is immoral. *189-1*

Do not build this facility.

Aysha Massell
Oakland, Ca 94609

189-1 NNSA notes the commentor's opposition to the construction of the CMRR-NF and to the development of new nuclear weapons and processing of pits.
The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4 CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 193: Donald McNeill

From: Donald McNeill [oroszlan@verizon.net]
Sent: Monday, June 27, 2011 7:33 PM
To: NEPALASO@doeal.gov
Subject: Stop New Nuclear Weapons Plant

This proposal to build a new nuclear weapons plant is a poor way to move toward nuclear arms control and nonproliferation. If the leading power, the US, continues to develop, build, and threaten to use nuclear weapons, we have to expect that other countries will follow suit-- both the old nuclear powers and, especially, aspiring nuclear powers.

193-1 The US is obligated to proceed toward reduction and elimination of its own nuclear weapons by the nonproliferation treaty and other treaties. This plant is counter to the promises made by the US in signing and ratifying those treaties. Building new nuclear weapons (when there is no serious nuclear threat) is a dangerously contradictory way to get new START treaty ratified and shows that this administration has no intention of reducing its addiction to nuclear weapons. It shows this not only to me, but also to the world.

Donald McNeill
PA 15213

193-1 NNSA notes the commentor's opposition to the construction of the CMRR-NF and concern about treaty compliance. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 194: Ron Stock

From: Ron Stock [stockontheroad@yahoo.com]
Sent: Monday, June 27, 2011 6:09 PM
To: NEPALASO@doeal.gov
Subject: CMRR-NF

It is 3:50 p.m. on Monday afternoon, June, 27th. I just stepped outside my front door and sucked in the pungent smell of the Las Conchas fire in Los Alamos, New Mexico. It is not hard for me to imagine those fumes, maybe sooner than I think, might some day be carrying dangerously high levels of radiation. That is why I am violently opposed to the construction of the Chemistry and Metallurgy Research Replacement - Nuclear Facility in Los Alamos.

You folks put twenty pounds of Plutonium into the Nagasaki bomb and now you want to bring six point six metric tons of this highly toxic substance to Los Alamos. What in the world are you folks thinking? I believe I know, and am asking you to stop thinking about your own personal financial security and start thinking about how many lives you could be impacting in an unhealthy negative way should an earthquake or fire disrupt your not very secure and efficient plans. Think solar, think wind, think what future generations will inherit if at some point you don't come to your senses and stop this "Us Against Them Dick Cheney type paranoid nuclear weapons madness."

194-1

Ron Stock, Resident of Taos New mexico

194-1 NNSA recognizes the commentor's opposition to the construction of the CMRR-NF. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 195: Luciana Vigil-Holterman

Sent: Monday, June 27, 2011 5:24 PM
To: NEPALASO@doeal.gov
Subject: Comments on the Draft Supplemental Environmental Impact Statement for the CMRR Nuclear Facility

I am writing to voice my support to replace an aging research building with a new facility that meets current standards for a nuclear facility. The current CMR facility needs a replacement that is safe, secure, and compliant. A facility that meets a category 3 structure is necessary for continued safe operations and to ensure the ability to address future issues that have yet to be identified.

I believe that the tax dollars that are used to design and build the CMRR nuclear facility should be used with spending efficiency in mind while meeting safety, compliance, and sustainability requirements for a nuclear facility. It should not be an unreasonable expectation that a replacement facility can finish design and be built in a timely manner while making sure that safety and environmental regulations are met. *195-1*

Thank you.

Luciana Vigil-Holterman
Española, New Mexico

195-1 NNSA notes the commentor's support of the construction of the CMRR-NF as a safe, secure, and compliant replacement for the existing CMR Building. NNSA understands the concerns regarding the schedule and cost of the proposed CMRR-NF project and is working hard to control schedule and cost while at the same time meeting its obligations regarding safety and environmental compliance.

Commentor No. 196: Jonathan Block

From: Jonathan Block [jblock41@gmail.com]
Sent: Monday, June 27, 2011 3:21 PM
To: NEPALASO@doeal.gov
Subject: Comments on the Draft SEIS for the CMRR project

DOE Must Withdraw the Draft Environmental Impact Statement for a Proposed Plutonium Facility at Los Alamos Because It Is Incomplete and Inaccurate

In 2003, pursuant to the National Environmental Policy Act (NEPA), the Department of Energy (DOE) completed an Environmental Impact Statement (EIS) for its proposed Chemistry and Metallurgy Research Replacement (CMRR) Project at the Los Alamos National Laboratory (LANL) at Technical Area-55 (TA-55). Simply put, CMRR is a huge new plutonium facility that will enable expanded nuclear weapons production. Because of the recognition of greater seismic risks and a proposed 50% increase in size, DOE was compelled by citizen pressure to prepare a draft supplemental EIS, which it released last April 22.

The proposed CMRR Nuclear Facility (CMRR-NF) would be located next door to PF-4, LANL's existing production facility, and the two would be physically linked to each other via underground tunnel. The proposed NF would also have a vault to store up to six metric tons of plutonium, which will supply both it and PF-4. The proposed NF would be the keystone to an expanded plutonium complex at LANL capable of quadrupling the current production capability of 20 pits per year to up to 80.

Two of the Three Alternatives Provided in the Draft SEIS Are So Unworkable that They Cannot Really Be Considered Alternatives

The current "No Action" Alternative is to construct and operate a new CMRR-NF as analyzed in the 2003 CMRR EIS. But based on new information learned since 2004, the 2003 CMRR-NF would not meet seismic standards to safely conduct mission work. "Therefore, the 200[3] CMRR-NF would not be constructed". So this is not really an alternative.

The "Continued Use of Existing CMR Building" Alternative in this current EIS states: Do not construct a replacement facility to house the capabilities planned for the CMRR-NF, but continue to perform operations in the existing CMR with normal maintenance and component replacements to sustain operations for as long as feasible. However the existing CMR is at the end of its life NOW. But this alternative does not completely satisfy DOE's stated purpose and need to carry out operations at a level to satisfy the entire range of DOE mission support functions. So this is not really an alternative, either.

196-1

196-1 Issues raised by the commentor are addressed in Section 2.2, NEPA Process, Section 2.3, Programmatic Direction and Decisions, and Section 2.4, CMR Mission, of this CRD. As discussed in Chapter 1, Section 1.5, of the *CMRR-NF SEIS*, NNSA is not planning to revisit either the need for the CMRR-NF or to relocate the CMR capabilities at another site. NNSA has addressed the CMRR-NF in a series of NEPA documents since the 2004 ROD for the *CMRR EIS* that announced its decision to locate a two-building CMRR Facility at TA-55. The *Complex Transformation SPEIS* (DOE 2008b), which addressed transforming the nuclear weapons complex into a smaller, more efficient enterprise, also addressed the location for manufacturing and research and development involving plutonium. In the ROD for that document, NNSA announced its decision that that mission would remain at LANL and its decision to construct and operate the CMRR Facility at LANL. Based on these decisions and the authorization for the project and appropriation of funding, NNSA intends to proceed with the CMRR-NF planning process.

The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare a supplement when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that a supplement to the *CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644). The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003. Another alternative addresses continuing to use the CMR Building, although its continued use would not fully meet NNSA's stated purpose and need.

Commentor No. 196 (cont'd): Jonathan Block

That leaves only the "Modified CMRR-NF" Alternative as the only alternative. Under the Modified CMRR-NF Alternative, which is DOE's Preferred Alternative, DOE would construct the new CMRR-NF at TA-55 with construction enhancements to address the seismic issues. Obviously, two of the three alternatives are unworkable, which stacks the deck in favor of the preferred alternative. Additional Alternatives Must Be Analyzed. **196-1 cont'd**

The Shallow Construction Option Is Not Mature and Must Not Be Considered As An Alternative Until Analysis of this Option Is Complete

The "Modified CMRR-NF" Alternative has two options – the "Deep" Option and the "Shallow" Option. All environmental impacts of the Shallow Option are based upon assumptions that are not defensible at this time. As this supplemental EIS itself states, "The Shallow Construction Option needs to be subjected to the same level of technical review as the Deep Construction Option so the two options can be evaluated on the same basis." Most of the environmental impacts proposed in this supplemental EIS for the Shallow Option end up being the same or similar to the Deep Option impacts. This is only speculation at this time. The Draft SEIS for the CMRR-NF fails to offer and analyze realistic alternatives. **196-2**

The Costs of Trying to Build a Plutonium Pit Factory in a Geologically Unstable Area Are Just Too High

LANL is located between a rift valley (the Rio Grande in that area) and an inactive supervolcano (the Jemez Mountains) in an active seismic fault zone (the Pajarito Plateau). An updated seismic hazards analysis was published in May 2007. It showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the over $3 billion in cost estimate increases since 2008 are due to efforts to address the increased seismic hazards. DOE must analyze whether $6 billion is too high of a premium in order to build a new NF at this location. **196-3**

Volcanic Eruption Impacts Must Be Analyzed

The Preliminary Volcanic Hazards Evaluation for Los Alamos National Laboratory Facilities and Operations Current State of Knowledge and Proposed Path Forward, September 2010 Report states, "The integration of available information on the volcanic history of the region surrounding [LANL] indicates that the Laboratory is at risk from volcanic hazards." **196-4**

Risks Due To Fire, Loss of Power, Water, and Cooling Must Be Analyzed

As of the submission date of these comments, a major wild fire has forced the evacuation areas around Los Alamos, voluntary evacuation of Los Alamos County, and closure of the Laboratory. This is the second major wild fire in less than a **196-5**

The alternative of distributing analytical chemistry, materials characterization, and plutonium research capabilities among multiple facilities at LANL was considered, but not analyzed as a reasonable alternative. Because of the quantities of special nuclear material involved, to fully perform the analytical chemistry, materials characterization, and plutonium research capabilities, facilities would need to be classified as Hazard Category 2 and Security Category 1. RLUOB was not intended as a nuclear-qualified space to handle Hazard Category 2 or 3 levels of nuclear material. Thus, NNSA would not operate RLUOB as anything other than a radiological facility, which would significantly limit the total quantity of special nuclear materials that could be handled in the building. As a result, analytical chemistry and materials characterization operations requiring Hazard Category 2 and 3 work spaces could not be carried out in RLUOB. Using space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work. Use of other locations at LANL would introduce new hazards for which the facilities were not designed and would not conform to the objective of collocating plutonium operations near the TA-55 Plutonium Facility. Performing work at a location remote from the TA-55 Plutonium Facility would necessitate periodic road closures and heightened security to enable transport of materials between the facilities. In addition, other facilities would not have the available space, vaults, and engineered safety controls and requirements for this type of work. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

The need for the CMRR-NF is not connected to a specific level of operations. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As described in Chapter 1, Section 1.2, of the *CMRR-NF SEIS*, NNSA's ability to perform these capabilities has been curtailed because of safety restrictions at the existing CMR Building; some types of materials characterization work have been suspended because of these limitations.

Commentor No. 196 (cont'd): Jonathan Block

decade. There is no credible analysis in the CMRR for risks due to fire, loss of electrical power, loss of water, cooling and loss of elecronic, digital security systems (computer, electro-mechanical and others relying on external power sources). As global warming continues unabated, extreme weather conditions will continue and have an increasing frequency. The highly hazardous substances in the CMRR need to be secure. To the extent the operating systems of the CMRR rely upon any external power sources for health, safety and security, all conditions that could cause loss of power need to be fully analyzed--and the SEIS does not do the job. ***196-5 cont'd***

All Impacts of NF Construction on the State Consent Order Must Be Analyzed

Cleanup of the existing mess must be the priority – not the proposed NF. DOE made a commitment to cleanup the legacy waste sites at LANL when it signed the Consent Order with the New Mexico Environment Department on March 1, 2005. The Order requires cleanup of certain sites by December 31, 2015. The analysis of the impacts of construction activities for the proposed NF must include those for the cleanup activities; including those at the nearby chemical dump, Material Disposal Area C. Precious taxpayer funds must be used to meet the cleanup obligations, not to build a shiny, new CMRR-NF. ***196-6***

The Draft CMRR-Nuclear Facility SEIS Is Deficient In All The Aforementioned Respects and Must Be Withdrawn.

196-2 The concerns expressed by the commentor about the Shallow Excavation Option not being a mature alternative appear to refer to statements in Chapter 1 and Chapter 2, Section 2.6.2.1, of the *Draft CMRR-NF SEIS* indicating that there was more uncertainty in the design of the Shallow Excavation Option because that design had not reached the same level of maturity as the Deep Excavation Option. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option. Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b). The Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

196-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet

Commentor No. 196 (cont'd): Jonathan Block

(1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

196-4 NNSA agrees that volcanic eruption impacts should be analyzed and has made revisions. In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapter 3 and 4 (Sections 3.5 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). Based on the report, future planning would be performed to consider CMRR-NF structural requirements for ash-loading.

196-5 Nuclear facilities at LANL undergo an extensive safety evaluation and approval process that ensures that they can be operated safely. This process is mandated by Federal Law. The details of the process are also codified and ensure that accident planning includes planning for common events, such as loss of offsite power and resources such as water, and rare events, including severe seismic and other natural phenomena, rare external events including aircraft crashes, and rare operational accidents. Unlike nuclear power plants, the CMRR-NF does not require offsite power and continuous cooling water to protect against major accidents. Refer to Section 2.8, Nuclear Accidents, of this CRD for more information.

196-6 NNSA does not consider compliance with the Consent Order optional and is not linking Consent Order compliance with decisions about constructing and operating the proposed CMRR-NF. NNSA intends to continue conducting the environmental restoration program at LANL regardless of whether it decides to construct and operate the proposed CMRR-NF as analyzed in the *CMRR-NF SEIS*. Closure of Material Disposal Area C will take place consistent with the Consent Order process, in accordance with decisions reached by NMED. Cleanup activities are not part of the scope of the *CMRR-NF SEIS* and are not analyzed. Cleanup activities are addressed in the 2008 *LANL SWEIS* (DOE 2008a).

Subject: CMRR Supplemental EIS: ADDITIONAL COMMENT

HELLO:

On Friday, June 24, 2011, I sent the comment below. Today I wish to add the following:

The fire issue: Los Alamos is already shown to be vulnerable from the seismic standpoint, more vulnerable than the SEIS takes account of. Likewise, it is obvious that the SEIS pays inadequate attention to the crucial issue for fire danger. The present Las Conchas fire is as of this writing rapidly advancing toward the LANL site at a rate much faster than the Cerro Grande fire of 2000. Given the condition of high, dry forest lands in the context os global warming, the present SEIS should be set aside and redone with close attention not only to the neglected seismic issue but also to the possibility of a disastrous fire that will have effects little understood on the proposed CMRR project. This comment urges NNSA to take the way of caution rather than careless disregard on this matter. ***197-1***

Sent on June 27, 2011, as a supplement to my June 24, 2011, comment.

LeRoy Moore

International law: At a time when the USA and other countries have committed to ending nuclear weapons proliferation by reducing and then eliminating nuclear weapons, in keeping with our obligations under Article VI of the Nuclear Nonproliferation Treaty, the proposed Chemistry and Metallurgy Research Replacement project at Los Alamos is not needed. This, a genuine No Action Alternative, needs to be the preferred alternative considered in the supplemental CMRR EIS. ***197-2***

Non-need for more plutonium pits: The intent of this facility is to make it possible for LANL to increase production of plutonium pits for nuclear warheads from the present LANL capacity of about 20 per year to 80 per year, a capacity not needed. The proposed facility promises continuation of the terror of the nuclear threat, implicitly encouraging other countries to obtain nuclear arsenals. Needed instead is a program designed to bring the US and NNSA into conformity with international law as codified in Article VI of the Nuclear Nonproliferation Treaty.

The seismic issue: The Draft SEIS is does not provide an adequate analysis of the seismic conditions at LANL. It thus is premature and should be withdrawn and redone only after seismic risks have been fully documented. ***197-3***

197-1 NNSA recognizes the commenter's concerns regarding the potential for wildfires in addition to seismicity issues. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS,* forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF (see the response to comment 197-3 regarding seismicity). Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

197-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The United States is not in violation of the Treaty on the Non-Proliferation of Nuclear Weapons or any other nonproliferation treaty to which it is a signatory. Along with its obligations to reduce its nuclear weapons stockpile and promote the nonproliferation of nuclear weapons to nonnuclear states, the United States must also ensure that its nuclear weapons stockpile remains safe, secure, and reliable. Chapter 1, Section 1.2, of the *CMRR-NF SEIS* outlines some of the steps taken to meet this objective, including the formation of NNSA.

Commentor No. 197 (cont'd): LeRoy Moore, Ph.D.
Rocky Mountain Peace and Justice Center

Cleanup: Funds should be devoted to cleanup of the Los Alamos site rather than to construction that will only increase problems in an area already contaminated. Not only will the construction redistribute contaminated soil, but increasing plutonium processing at LANL will increase contamination with plutonium, a long-lived highly toxic material. *197-4*

Cost: Projected costs for enhanced plutonium pit production activities at LANL have increased from about a $600 million estimate in 2004 to the current amount of $5.8 billion. The project should be abandoned on the basis of cost alone. Present facilities should be upgraded to provide better seismic stability and worker protection. Further, it is unwise to invest such sums in nuclear weapons, which can never be used. *197-5*

****

LeRoy Moore, Ph.D.
Rocky Mountain Peace and Justice Center
P. O. Box 1156, Boulder, Colorado 80306-1156 USA
E-mail address: leroymoore@earthlink.net

Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and not proceed with the CMRR-NF, or would abandon pit production at LANL, such an alternative does not meet NNSA's stated purpose and need (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). Thus, an alternative of ceasing CMR operations is not addressed in the *CMRR-NF SEIS*. The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003.

197-3 Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

197-4 In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design, construction, and operation of the CMRR-NF. Chapter 4,

Commentor No. 197 (cont'd): LeRoy Moore, Ph.D.
Rocky Mountain Peace and Justice Center

Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

197-5 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 198: Carl deVecchis

From: Carl deVecchis [carl_devecchis@yahoo.com]
Sent: Monday, June 27, 2011 1:01 PM
To: NEPALASO@doeal.gov
Subject: Cut Nuclear Weapons Production Not Medicare

Dear Department of Energy,

We don't need to waste $6 Billion to construct a plutonium reprocessing and storage facility in New Mexico. Please, redirect the funds to infrastructure repairs or just reduce the deficit. *198-1*

Thank you,

Carl deVecchis
Registered Voter and US Citizen from Lynbrook, NY

Carl deVecchis

Lynbrook, NY 11563

198-1 NNSA notes the commentor's opposition to the construction of the CMRR-NF due to its cost. Funding decisions on Federal programs (for example, infrastructure repairs) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 199: Jane Steinfels Hussain

From: janehussain2@aol.com
Sent: Monday, June 27, 2011 1:29 PM
To: NEPALASO@doeal.gov
Subject: EIS on Los Alamos Project

This project must go back to the drawing board! We cannot afford 1) the environmental risk given the geological data recently acquired and the lessons of Fukushima, 2) the financial drain given the imperative to draw down our deficit or 3) the military risk of encouraging arms proliferation throughout the world while we're preaching nonproliferation. *199-1*

Please reconsider this whole project in light of current knowledge and conditions.

Thank you,

Jane Steinfels Hussain
2115 Pontotoc Ave.
Nashville, TN 37206

199-1 NNSA recognizes the commentor's opposition to the construction of the CMRR-NF due to concerns regarding seismic vulnerabilities and opposition to nuclear war.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Funding decisions on Federal programs (for example, defense spending) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 200: John J. Metz

From: John Metz [METZ@nku.edu]
Sent: Monday, June 27, 2011 2:55 PM
To: NEPALASO@doeal.gov
Subject: Plutonium Factory at Los Alamos

Dear NEPALSO,

I am writing to express my dismay that LANL and DOE are merely offering a Supplementary EIS regarding the construction of the Nuclear Facility at Los Alamos. There are several points I need to make.

1. The recent nuclear catastrophe in Japan illustrates painfully how underestimating the threat of violent seismic events can be lead to disaster. The revised estimate of the seismic threat at Los Alamos demands that the entire project be much more thoroughly vetted than a mere Supplement EIS can do. Given the previous releases of plutonium from LANL, the lab cannot allow any additional releases. Of course, that is not possible – there will be some tiny amounts of Pu released in the best of circumstances, but we can't have large releases, which could occur with a severe earthquake. Working with plutonium is always extremely dangerous. ***200-1***

2. We don't need new pits – the existing pits are able to sustain our weapon arsenal for the foreseeable future. ***200-2***

3. Cost is excessive. In this time of grave concern over the nation's deficit, this is money we do not need to spend. The current estimates of the cost of the construction exceed the original 6 or 7 fold, and that is with the minimal construction changes proposed in the SEIS. ***200-3***

4. The new plant is scheduled to produce 80 pits per year, while the existing facility makes 20. We don't need more than 20 new ones per year. In fact, we don't need 20. ***200-2 cont'd***

5. The Non-proliferation Treaty article 6 commits the US to eliminating nuclear weapons. We have largely ignored that and it becomes a reason for other rogue nations to move toward weapons and for the non-nuclear signers to abandon the treaty. We cannot maintain the facade of moving toward Article 6 while building this facility. ***200-4***

200-1 NNSA notes the commentor's concerns regarding the seismic design of the CMRR-NF.

The commentor's concerns that an accident (similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant) could happen at LANL is addressed in Section 2.8, Nuclear Accidents, of this CRD. There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant or Chernobyl) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The dangers of plutonium have been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Commentor No. 200 (cont'd): John J. Metz

Thank you,

Sincerely,

John J. Metz
Geography Coordinator
448 Landrum
Northern Kentucky University
xxx.xxx.xxxx
metz@nku.edu

200-2 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Please refer to Section 2.4, CMR Mission, of this CRD for more information.

200-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

200-4 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 201: Jean Nichols

From: Jean Nichols [artstudio@kitcarson.net]
Sent: Monday, June 27, 2011 3:16 PM
To: nepalaso@doeal.gov
Subject: Opposition to LANL's new nuclear facility

I was just recently told about your new plutonium facility at the Los Alamos National Laboratory. As a citizen who is concerned with nuclear proliferation and national security, here are a number of reasons why I am concerned:

Money spent on nuclear weapons does not spur economic growth. Investments in education, healthcare, renewable energy, and public transportation would all create more jobs and spur more growth.

Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind and downstream. Plutonium is a very potent carcinogen. Los Alamos Lab's discharges disproportionately impact Native peoples and Hispanic New Mexicans. Cancer rates are elevated due to normal emissions. In 2000 the Cerroi Grande Fire caused widespread contamination. Dust from my house tested too high with Strontium 90. This year I got cancer myself. Now we have a wild fire burning that could dwarf the Cerro Grande. Los Alamos has dry forests on three sides. It is insane to do nuclear production at this facility. And all the waste already there needs to be removed. This should be a matter of national security, and needs to be done before an EIS is considered.

The draft Supplemental Environmental Impact Statement is premature and should be withdrawn. A new seismic analysis is also underway at Los Alamos Lab and the results will impact the design of the building. And we have yet to see what this fire brings us...all of northern NM may need to evacuate, but of course indigenous and poor farmers and families won't. It is an abomination that we bear this local threat from our own government facility. War is obsolete. We need all our resources focused on climate change and the catasphrophe's that are here and coming. It should immediately begin switching its mission to green projects.

201-1

Jean Nichols
PO Box 237
Peñasco, NM 87553

201-1 NNSA notes the commentor's concerns about the CMRR-NF project. NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. See Section 2.7, Economic Impacts, of this CRD for information on the economic impacts as evaluated in the *CMRR-NF SEIS*.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

A number of studies have been conducted on the potential health impacts of the 2000 Cerro Grande fire. As noted in Chapter 4, Section 4.6.1.3, of the 2008 *LANL SWEIS* (DOE 2008a), an independent assessment of public health risk associated with LANL area air contamination as a result of the fire was conducted by Risk Assessment Corporation at the request of NMED (RAC 2002). The study examined data on contaminants that were measured in air, on smoke particles, and in soil from the potential release sites and concluded that exposure to LANL-derived chemicals and radionuclides released to the air during the Cerro Grande fire did not result in a significant increase in health risk over the risk from the fire itself.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are

Commentor No. 201 (cont'd): Jean Nichols

constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 202: Alice Baker

From: Alice Baker [albakerihm@aol.com]

To: nepalaso@doeal.gov
Subject: No New Nuclear Plants Needed

The new development at the Los Alamos National Laboratory for plutonium pits is not in the best interest of our country. As a voting citizen, I feel as though there are a number of reasons to not complete this facility.

Nuclear weapons are a threat to our peace. There do not give us security in any form, but rather escalate the proliferation throughout the world. The United States MUST take a lead in ending this madness. *202-1*

You have a responsibility to cleanup our environment not make it more toxic. "Take no action" as one of the alternatives to the CMRR project. *202-2*

I do not support the building of any new nuclear plants in Los Alamos, NM and Oak Ridge, TN

Alice Baker
20811 Littlestone Apt. 5
Harper Woods, MI 48225

202-1 NNSA notes the commentor's opposition to nuclear weapons. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

202-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 203: Jim Ullrich

To: NEPALASO@doeal.gov
Subject: CMRR-NF SEIS

What should be included in the CMRR-NF SEIS are the new political, economic, social, and national security realities that show a new plant is not required. Alternative solutions like upgrading existing facilities should be included in this review. ***203-1***

Jim Ullrich
551 English Village Way
Apt 917
Knoxville, TN 37919

203-1 NNSA notes the commentor's opposition to the CMRR-NF project. Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

Commentor No. 204: Jay Coghlan, Executive Director
Nuclear Watch New Mexico

nuclear watch new mexico

July 5, 2011

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico, 87544
By e-mail to NEPALASO@doeal.gov

Nuclear Watch New Mexico (NWNM) respectfully submits these comments on the draft *Supplemental Environmental Impact Statement for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory (LANL), Los Alamos, New Mexico* (hereinafter "CMRR-NF dSEIS").

We regret that we were not able to submit our comments by the NNSA specified due date of June 28. We did however inform you of that fact on that day. Our delay was caused by *force majeur*, that is the breakout of the Las Conchas Fire on the afternoon of Sunday June 26 threatened LANL and the Los Alamos townsite. We were continuing to write our comments at that time, but from that point were not able to do so until the following Thursday. We were working overtime because of the need to monitor the fire and respond to numerous inquiries from the public and media through phone, e-mail, TV our blog and web site and Skype.

204-1 The National Nuclear Security Administration (NNSA) has stated that it will accept CMRR-NF dSEIS comments "to the extent practicable" after the deadline. We believe that we have certainly met the bar of "practicability" given the circumstances. We would appreciate their serious consideration by NNSA. We look forward to the agency's withdrawal of this draft for the reasons stated here, and look forward to further comment once NNSA puts out a serious draft without an un-predetermined outcome.

About us: Through comprehensive research, public education and effective citizen action, **Nuclear Watch New Mexico** seeks to promote safety and environmental protection at regional nuclear facilities; mission diversification away from nuclear weapons programs; greater accountability and cleanup in the nation-wide nuclear weapons complex; and consistent U.S. leadership toward a world free of nuclear weapons.

We work on current budget, environmental, and operational issues of nuclear weapons facilities, primarily the Los Alamos National Laboratory (LANL). We have publicly and vocally pressed the Lab to finally change its mission away from nuclear weapons programs and move more toward critically needed programs, such as nonproliferation efforts, other new national security priorities (for example, port security), and pure

204-1 All comments on the *Draft CMRR-NF SEIS* submitted to NNSA during the public comment period, as well as late comments, were considered in preparing this *Final CMRR-NF SEIS*.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

science and energy efficiency programs. Through detailed budget analyses, we hope to demonstrate that LANL can move towards these real national security issues and still contribute to the economy of northern New Mexico.

We appreciate public involvement in the NEPA process. We also support safe, monitored storage of radioactive wastes as a matter of national security and environmental protection. However, these should not be interpreted as support for more nuclear weapons, pit production, nuclear power, or the generation of more nuclear wastes. In our view, the best way to deal with the environmental impacts of nuclear waste is to not produce it to begin with.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Our overall recommendation: The hastily prepared draft Supplemental EIS is incomplete, inadequate and should be withdrawn until a more thorough Supplement or a completely new EIS can be prepared. *204-2*

204-2 Comment noted. Responses to specific comments follow.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Estimated CMRR costs are out of control

Graph by NukeWatch NM; budget figures from annual NNSA Congressional Budget Requests

The Nuclear Facility is the keystone to an expanded plutonium pit production complex.

The Chemistry and Metallurgy Research Replacement Project-Nuclear Facility is no mere "replacement." First of all, the CMRR Project will be larger than the old CMR Building that it is "replacing," contrary to legislation requiring no net increase.

LANL and NNSA have repeatedly claimed that the Nuclear Facility is not a plutonium pit production plant and the dSEIS itself states, "Pit production does not take place at the CMR Building and would not take place in the CMRR-NF." *(dSEIS section 2.4, p .2-6)* That is narrowly correct but nevertheless disingenuous. The Nuclear Facility will provide crucial "materials characterization" (MC) and "analytical chemistry" (AC) [1] in direct support of plutonium pit production, and will be the keystone to an expanded production complex at LANL's Technical Area-55. The Nuclear Facility will be located next door to PF-4, LANL's existing production facility, and the two will be physically linked to each other via underground tunnel. The Nuclear Facility will also have a vault to store up to six metric tons of plutonium, which will supply both it and PF-4. The Senate Armed Services Committee itself has noted that "CMRR will be a category I [the highest security level of "special nuclear materials"] facility supporting pit operations in building PF–4." [2]

204-3

[1] The dSEIS defines analytical chemistry as "the branch of chemistry that deals with the separation, identification, and determination of the components of a sample." It defines materials characterization as "the measurement of basic material properties, and the change in those properties as a function of temperature, pressure, or other factors."

[2] Senate Report 111-201 - NATIONAL DEFENSE AUTHORIZATION ACT FOR FISCAL YEAR 2011, p. 274, http://www.gpo.gov/fdsys/pkg/CRPT-111srpt201/pdf/CRPT-111srpt201.pdf

204-3 As stated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS,* NNSA needs to act to provide the physical means for accommodating the continuation of mission-critical analytical chemistry and materials characterization capabilities at LANL beyond the present time in a safe, secure, and environmentally sound manner. NNSA's capability to perform a full range of analytical chemistry and materials characterization functions is currently constrained because of safety restrictions at the existing CMR Building; some types of materials characterization work have been suspended because of these limitations. Concurrently, NNSA proposes to take advantage of the opportunity to consolidate analytical chemistry and materials characterization activities for the purpose of increasing operational efficiency and enhancing security. The increased size of the CMRR Project, specifically the CMRR-NF, is due to the space required to meet current seismic and nuclear safety requirements; despite the increased size, the CMRR Project would replace the capabilities of the CMR Building. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The commentor states that NNSA officials have said that the CMRR-NF is to be built with 22,500 square feet "of plutonium processing space;" to clarify, this is laboratory space, not a production line as implied by the term "processing." The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. The Summary was revised to indicate that the analytical chemistry and materials characterization is "in support of manufacturing, development, and surveillance of nuclear pits…"

The Modified CMRR-NF would be designated as a Hazard Category II and a Security Category I facility, as stated in Chapter 2, Section 2.6.2.1 of the *CMRR-NF SEIS*. These category designations are based on the amount of special nuclear material allowed to be present within the facility at any given time. In Chapter 1, Section 1.2, right before the statement that pit production does not occur in the CMR Building or the proposed CMRR-NF, the SEIS indicates that pit production takes place in the TA-55 Plutonium Facility.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

NNSA and LANL should amend this dSEIS and their supporting literature and media statements that claim it is not a pit production facility. Instead, the whole truth should be said that the Nuclear Facility is the keystone to an expanded plutonium pit production complex at LANL's Technical Area-55. *204-3 cont'd*

For ~six billion dollars the amount of jobs the Nuclear Facility creates is pathetic.
Local proponents of the CMRR-Nuclear Facility constantly point to the benefits of job creation. However, the dSEIS itself states the positive socioeconomic impacts of this new exorbitant facility are very limited.

Concerning construction jobs, "Peak direct (790 workers) plus indirect (450 workers) employment would represent less than 1 percent of the regional workforce and would have little socioeconomic effect." [3] The average number of construction jobs is 420 over nine years.[4]

Facility personnel would not change from existing levels, just their location, "Approximately 550 workers would be at the CMRR Facility (Modified CMRR-NF and RLUOB); they would come from the CMR Building and other facilities at LANL so the facility would not increase employment or change socioeconomic conditions in the region." [5] *204-4*

Nuclear Watch NM argues that far more jobs could be created through other efforts, and not through a ~$6 billion dollar plutonium investment that will lock in Los Alamos' future to the hopefully shrinking business of nuclear weapons research and production. In terms of new long-term jobs the Nuclear Facility offers none, and robs taxpayers' money from other programs that could do far, far more for job creation.

NEPA requirements.

What is clearly at issue in this CMRR-NF SEIS process is what NNSA is legally obliged to consider in a "supplemental" environmental impact statement. The relevant DOE NEPA Implementation Regulation (which we note has the force of law) states

> (c) Agencies:
> Shall prepare supplements to either draft or final environmental impact statements if:
> (i) The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or
> (ii) There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.[6]

204-5

[3] dSEIS, p. S-39, parentheses in the original.
[4] Ibid., Table 2-1, Summary of CMRR-NF Construction Requirements, p. 2-15.
[5] Ibid., p. S-39, parentheses in the original.
[6] 10CFR1021 §1502.9 "Draft, final, and supplemental statements," http://ceq.hss.doe.gov/nepa/regs/ceq/1502.htm#1502.9

204-4 NNSA acknowledges the comment, but notes that the purpose of the proposed project is not the creation of jobs. The purpose of the proposed CMRR-NF is to provide analytical chemistry, materials characterization, and plutonium research capabilities in support of NNSA and LANL missions. The *CMRR-NF SEIS* presents the environmental impacts of construction and operation of the facility; one area of environmental impacts is socioeconomics, including jobs. As stated in the *CMRR-NF SEIS*, the number of jobs associated with this construction project (direct and indirect) is relatively small in comparison to the total labor force in the four-county region of influence.

204-5 As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. As stated in Chapter 1, Section 1.5, NNSA of the *CMRR-NF SEIS*, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, made through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644). See also the response to comments 204-7 and 204-8 for discussion of alternatives that were considered but dismissed from detailed analysis.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to CMRR-NF and Nuclear Weapons and Technology, of this CRD for more information.

Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

"Shall" means mean mandatory, not discretionary by the agency. "Or" means that a supplemental EIS shall be prepared in either case, with the *prima facie* demand that the necessary particulars be included in that supplement. While in this case both (i) and (ii) apply, NNSA admits only that it has substantially changed the Nuclear Facility project (and therefore wisely chose to prepare this SEIS). However, we argue that NNSA is legally obliged to embrace the other half of this equation, that consideration of significant new circumstances or relevant information is mandatory, and further that NNSA cannot cherry pick the significant new circumstances or relevant information that should be considered - - it has to consider <u>all</u> such worthy items.

This is further echoed by the Department of Energy (DOE) in its own 40 FAQs on NEPA compliance, as follows:

> 32. Supplements to Old EISs. Under what circumstances do old EISs have to be supplemented before taking action on a proposal?
> A. As a rule of thumb, if the proposal has not yet been implemented, or if the EIS concerns an ongoing program, EISs that are more than 5 years old should be carefully reexamined to determine if the criteria in Section 1502.9 compel preparation of an EIS supplement.
> If an agency has made a substantial change in a proposed action that is relevant to environmental concerns, or if there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts, a supplemental EIS must be prepared for an old EIS so that the agency has the best possible information to make any necessary substantive changes in its decisions regarding the proposal. Section 1502.9(c).[7]
> Emphasis added.

204-5 cont'd

The 2003 CMRR EIS is more than seven years old, and there are major new circumstances and relevant information that the supplemental EIS <u>must</u> consider, instead of NNSA's arbitrary and capricious limitation of analysis to justify the Nuclear Facility's increased physical properties.

Some new and additional information and circumstance are the following:

- President Obama declared a future world free of nuclear weapons to be a long-term national security goal in his April 2009 Prague speech. At the same time he said that in the interim the U.S. nuclear weapons stockpile would be robustly maintained. The primary purpose of the CMRR-NF is to expand production capability of plutonium pits to up to 80 per year. [8] That is inconsistent with working toward and providing a good international example toward a nuclear weapons-free world.

- Nor is the CMRR-Nuclear Facility needed to maintain the stockpile. In 2004 Senator Bingaman, at NWNM's request, legislated a requirement that independent experts review

[8] For documentation see our Attachment 3, Additional Background on the CMRR-Nuclear Facility and Expanded Plutonium Pit Production.

Response side of this page intentionally left blank.

NNSA studies of plutonium pit lifetimes. In November 2006 that concluded that most pits last 85 years or more and that in any event mitigation measures were readily available.

• In large part as a result, Congress rejected Reliable Replacement Warheads and we maintain therefore the need for expanded plutonium pit production, hence the need for the CMRR-Nuclear Facility.

• Our nation has entered a severe and prolonged economic crisis that demands appropriate prioritization of federal taxpayers funds. The CMRR-Nuclear Facility is not clearly needed and currently has out-of-control costs. Its need should be reviewed afresh in a new draft SEIS that offers a true range of alternatives.

In our informal search for perhaps relevant NEPA case law concerning supplemental environmental impact statements we ran across the following filed by our close colleagues the Natural Resources Defense Council (NRDC):

> Plaintiffs moved for a preliminary injunction against a National Marine Fisheries Service (NMFS) regulation and a Letter of Authorization issued by NMFS to the Navy pursuant to the challenged regulation.
>
> The regulation and letter of authorization concerned the Navy's application for authorization for a five-year weapons testing program. The NMFS conducted an environmental assessment (EA). During the comment period, the NMFS received a comment that asserted that NMFS had an obligation to consider an alternative site for the testing. The final rule, when issued, was substantially the same as the proposal. It stated that NMFS had considered a very narrow range of alternatives and did not consider the possibility of testing outside the Outer Sea Test Range (OSTR), the area proposed by the Navy. Subsequently, the Navy issued its own EA which concluded that the testing would not have a significant environmental impact and that an EIS was not required, and which did contain some discussion of alternative sites both outside and within the OSTR. The NMFS later issued a Supplemental EA which also contained some discussion of alternative sites both outside and within the OSTR, and ultimately issued the Letter of Authorization.
>
> Plaintiffs alleged, in part, that defendants had violated NEPA by failing to consider alternative sites. The court found that promulgation of the Final Rule had been premised on an impermissible determination that alternatives outside the OSTR did not have to be considered. It also found that both the Letter of Authorization and the Navy's decision to proceed had relied upon a site-selection survey that had been conducted in an arbitrary and capricious manner and that **had excluded reasonable alternatives that met the requirements of the proposed action**. The court ruled that plaintiffs had demonstrated a strong likelihood of success on the merits and granted plaintiffs' motion for preliminary injunction.[9]

204-5 cont'd

[9] "Supreme Court Cases on NEPA," Natural Resources Defense Council v. U.S. Dept. of

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

204-5 cont'd

A different case brought by NRDC established that NEPA imposes a duty on Federal agencies to take a "hard look" at their proposals.[10] Crucial to that is the range of alternatives that the agency considers.

204-6

DOE's own NEPA Implementation Regulations state:

> Alternatives including the proposed action
> **This section is the heart of the environmental impact statement.** Based on the information and analysis presented in the sections on the Affected Environment (Sec. 1502.15) and the Environmental Consequences (Sec. 1502.16), it should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. In this section agencies shall:
> (a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.
> (b) Devote substantial treatment to estimated costs alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.
> (c) Include reasonable alternatives not within the jurisdiction of the lead agency.
> (d) Include the alternative of no action.
> (e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference.
> (f) Include appropriate mitigation measures not already included in the proposed action or alternatives.[11] (Bolded emphasis added.)

We can't help but make a bad pun - - the NNSA is being "heartless" in this SEIS' analysis of alternatives. This document is dead without the beating pulse of a true range of alternatives.

204-7

This draft SEIS predetermines the outcome by not offering real alternatives. This dSEIS is deficient because the NNSA constrains the range of alternatives in order to predetermine its preferred, self-interested outcome. Other than its preferred alternative, the agency offers only two NEPA straw men that are clearly nonstarters, inevitably leading to their preemptive dismissal, thus leaving only the self-interested decision to build the Nuclear Facility. Is this financially out-of-control project really in the best interests of the Nation? There is no analysis and consideration of real alternatives, as required by the National Environmental Policy Act.

Navy, 857 F. Supp. 734 (C.D.Cal. Apr. 26, 1994), http://www.markdemuth.com/law_lib/nepa/HO02courtcases.pdf Emphasis added.

[10] Natural Resources Defense Council v. Morton, 458 F.2d 827, 838 (D.C. Cir., 1972

[11] 10CFR1021 Sec. 1502.14 "Alternatives including the proposed action," http://ceq.hss.doe.gov/nepa/regs/ceq/1502.htm#1502.9

204-6 NNSA agrees that the alternatives section is the heart of an EIS. Taken together, the alternatives section of the 2003 *CMRR-EIS* and this *CMRR-NF SEIS* is the "heart" and provides the range of reasonable alternatives.

204-7 The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on requirements related to additional seismic information. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare an SEIS when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding the alternatives to be addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, announced in the 2008 *Complex Transformation SPEIS* ROD. The No Action Alternative in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967). Another alternative addresses the option of continuing to use the CMR Building, although its continued use would not fully meet NNSA's needs.

Although it was listed as one of the alternatives in the Notice of Intent, after further consideration, NNSA eliminated the alternative to upgrade the CMR Building from further consideration. In the 2003 *CMRR EIS*, DOE considered the proposal to complete extensive upgrades to the existing CMR Building's structural and safety systems to meet current mission support requirements for another 20 to 30 years of operations and dismissed it from detailed analysis. Beginning in 1997 and continuing through 1998, a series of operational, safety, and seismic issues surfaced regarding the long-term structural viability of the CMR Building. In the course of considering these issues, DOE determined that the extensive facility-wide upgrades originally planned for the CMR Building would be less technically feasible than had been anticipated and would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Structurally upgrading the entire structure to a significant extent would require

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Two of the three alternatives provided in the draft SEIS are false alternatives.

The current "No Action" Alternative is to construct and operate a new CMRR-NF as analyzed in the 2003 *CMRR EIS.* But based on new information learned since 2004, the 2003 CMRR-NF would not meet seismic standards to safely conduct mission work. "Therefore, the 200[3] CMRR-NF would not be constructed." ***So this is not really an alternative.***

The "Continued Use of Existing CMR Building" Alternative in this current dSEIS states:

> Do not construct a replacement facility to house the capabilities planned for the CMRR-NF, but continue to perform operations in the existing CMR with normal maintenance and component replacements to sustain operations for as long as feasible. However the existing CMR is at the end of its life NOW. But this alternative does not completely satisfy DOE's stated purpose and need to carry out operations at a level to satisfy the entire range of DOE mission support functions.

So this is not really an alternative, either.

That leaves only the "Modified CMRR-NF" Alternative as the only alternative. Under the Modified CMRR-NF Alternative, which is DOE's Preferred Alternative, DOE would construct the new CMRR-NF at TA-55 with construction enhancements to address the seismic issues. ***Obviously, two of the three alternatives are non-starters, stacking the deck in favor of only the preferred alternative.***

Not only that, but NNSA eliminated without explanation the one credible and reasonable alternative that it did manage to think of, and even went so far as to announce in its October 1, 2010 Notice of Intent for the CMRR SEIS. As the NOI put it, this was "CMR Alternative 2: Same as CMR Alternative 1, but includes making the extensive facility upgrades needed to sustain CMR programmatic operations for another 20 to 30 years."

This is a reasonable alternative to building the Nuclear Facility, that is continue to perform analytical chemistry, material characterization, and actinide research and development activities in the old CMR Building; and make facility upgrades to that building needed to sustain programmatic operations for another 20 to 30 years. Crucial to the validity of this alternative is an analysis of the impacts of all current and proposed projects to extend the life of the CMR, including roofing work, exhaust fans, HEPA filters, structural and safety systems, and elevator repairs.

The CMR Upgrade Alternative has particularly salience given its cost were offered in the 2003 EIS as the primary reason why it would not be considered. But given that CMRR estimated costs have exploded from $660 million in 2004 to ~$6 billion now it is eminently reasonable to believe that a business case should be undertaken for upgrading the old CMR Building while not building the Nuclear Facility. This has the added virtues of pushing back costs for decontaminating and demolishing the old CMR Building (which will be yet another considerable taxpayers expense). Moreover, the timeline of 20 – 30 years (say ending 2035) comports better with the declared national security goal of a

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 9

204-7 cont'd

construction of new walls and other building components adjacent to the existing ones that have utilities and structural building features already in place. This work would have to occur while continuing uninterrupted operations in the CMR Building using nuclear materials and hazardous chemicals. The technical challenges of implementing extensive seismic upgrades to the entire CMR Building as discussed in the 2003 *CMRR EIS* remain. However, in response to public comments regarding upgrading the CMR Building, NNSA considered undertaking a more limited, yet intensive, set of upgrades to a single wing of the CMR Building, Wing 9, to meet current seismic design requirements so that this wing could be used for a limited set of Hazard Category 2 analytical chemistry and materials characterization operations. After careful consideration of the complex engineering and operational issues, as well as the CMR Building site's seismic concerns, this potential Wing 9 upgrade alternative was also determined not to be a reasonable alternative for meeting NNSA's purpose and need for action. NNSA also has considered the possibility of renovating, upgrading, and reusing other CMR Building wings and additional wing combinations to provide the space needed for continuing analytical chemistry and materials characterization work in the building and found that the other wings and wing combinations are not reasonable alternatives for providing adequate safe and secure space for future operations in a feasible, cost-effective manner and are not considered further in the *CMRR-NF SEIS*. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

nuclear weapons-free world, in contrast to the CMRR's expected operational lifetime of half a century (2024 to 2074?). A new draft SEIS should include the CMR Upgrade Alternative, along with a supporting business case (as NNSA has done in a number of other NEPA processes).

It is somewhat of a tangent, but NNSA does offer two "options" for Nuclear Facility construction, i.e., Deep and Shallow Excavation (to be further discussed below). Key to the thread of our argument here is that these are just that, construction options, both of which obviously assume that the Nuclear Facility will be built, and hence are not true "alternatives" in the NEPA sense of the word (and to NNSA's credit it doesn't try to pass them off as alternatives). Given this and the fact that the so-called "No Action Alternative" to build the NF as planned in 2003 or continue to operate the old CMR Building without upgrades are both non-starters, there are no alternatives to NNSA's predetermination to build the Nuclear Facility.

204-7 cont'd

Nuclear Watch NM's preferred alternative, which we set forth in our CMRR dSEIS Scoping Comments, is to not build the Nuclear Facility; D&D the old CMR Building; and consolidate CMR missions in the new 185,000 square-feet Rad Lab and PF-4 (LANL's existing plutonium pit production facility). We believe this meets the test of being a reasonable alternative such that NNSA must analyze it. It is particularly reasonable given that, to repeat, the old CMR Building has two primary missions, which are the materials characterization and analytical chemistry of special nuclear materials. NNSA Administrator Tom D'Agostino wrote to the Defense Nuclear Facilities Safety Board that CMR materials characterization has already been relocated to PF-4. Thus, for this alternative to be realized, it becomes a matter of relocating CMR's other primary SNM mission, analytical chemistry, to PF-4.

That is made perhaps more possible by the pending closeout of two missions now being performed at PF-4, Mixed Oxide (MOX) fuel fabrication and the Advanced Recovery and Integrated Extraction System for dismantling pits and recovering plutonium, both of which were meant to be pilot demonstration projects for transfer to the Savannah River Site. But what is really needed, as we have argued for a few years now, is a "TA-55 Capabilities Study" that would evaluate missions needs in light of the fact that plutonium pit production capacity has not been expanded, and is uncertain to do so in the future. Obviously LANL has been operating under its currently approved level of 20 pits per year without the Nuclear Facility. Our proposed TA-55 Capabilities Study would analyze and recommend what is truly needed given broader national priorities (such as reducing the deficit), which a new CMRR dSEIS should incorporate.

One possible variant to our preferred alternative: The CMRR-NF is being designed with a vault for safe and secure storage of up to 6 metric tons of special nuclear materials (SNM). NNSA's claimed need for the Nuclear Facility should be de-linked from any possible need for a new SNM vault. NNSA should consider not building the Nuclear Facility while building a standalone vault. That vault could perhaps free up floor space at PF-4 (further obviating the need for the Nuclear Facility) and help de-inventory both it and the old CMR Building of materials at risk in a seismic event. Materials characterization and analytical chemistry could then be performed in PF-4 and the Rad Lab.

204-8

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 10

204-8 In response to public comments like these, Chapter 2, Section 2.7, of the *CMRR-NF SEIS* has been revised to describe in more detail the alternatives that NNSA considered but found would not meet the purpose and need for continuing CMR operations into the future. The alternative of distributing analytical chemistry and materials characterization capabilities among multiple facilities at LANL was considered, but not analyzed as a reasonable alternative. Because of the quantities of special nuclear material involved, to fully perform the analytical chemistry, materials characterization, and plutonium research capabilities, facilities would need to be classified as Hazard Category 2 and Security Category 1. RLUOB was constructed as a radiological facility to handle gram amounts of nuclear material and not as a nuclear-qualified space to handle Hazard Category 2 or 3 levels (kilogram levels) of nuclear material. Thus, NNSA could not operate RLUOB as anything other than a radiological facility, which would significantly limit the total quantity of special nuclear materials that could be handled in the building. As a result, analytical chemistry and materials characterization operations requiring Hazard Category 2 and 3 work spaces could not be carried out in RLUOB. Thus, an alternative of constructing only a vault to accommodate the storage of plutonium would not meet the purpose and need of fully supporting plutonium mission work. Using space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work. The commentor asserts that the analytical chemistry mission has already been relocated to TA-55 Plutonium Facility, based on a statement in Chapter 2, Section 2.4.1 of the *CMRR-NF SEIS*. The statement has been revised for clarity. Whereas some amount of materials characterization is performed at the TA-55 Plutonium Facility, analytical chemistry is not. Analytical chemistry is performed at other locations at LANL, but mainly at the CMR Building. Use of other locations for the full CMR Mission analytical chemistry at LANL would introduce new hazards for which the facilities were not designed and would not conform to the objective of collocating plutonium operations near the TA-55 Plutonium Facility. Performing work at a location remote from the TA-55 Plutonium Facility would necessitate periodic road closures and heightened security to enable transport of materials between the facilities. In addition, other facilities would not have the available space, vaults, and engineered safety controls and requirements for this type of work. Refer to Chapter 2, Section 2.7.3, of the *CMRR-NF SEIS*, for more information.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

The Draft SEIS for the CMRR-NF fails to offer and analyze realistic alternatives.
After careful reevaluation of NNSA's contemporary purpose and need for plutonium pit production, a new document should be prepared that analyses a broader set of alternatives for meeting that purpose. **To be a credible analysis the NNSA must develop a greater spectrum of reasonable alternatives.** As examples to assist NNSA, we list in bullet form in Attachment 2 various permutations of reasonable alternatives that a new dSEIS could and should consider, were NNSA to offer a genuine range of alternatives. ***204-7 cont'd***

We conclude that this CMRR-NF dSEIS does not meet legal NEPA requirements because of its failure to fully consider "significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." Related, it also fails to offer a genuine range of alternatives. Regarding the latter, we now paraphrase "The Essentials of NEPA" by Wildlaw.org:[12] ***204-9***

> Under NEPA, an EA or EIS must include a review of the environmental impacts from all reasonable alternatives. It is the duty of the agency to develop and analyze the alternatives to the proposed action… However, the existence of only one reasonable alternative that the agency failed to look at will void the agency's decision…
>
> "The alternative section is 'the heart of the environmental impact statement,' 40 C.F.R. 1502.14; hence, '[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate.' Citizens for a Better Henderson v. Hodel, 768 F. 2d 1051, 1057 (9th Cir. 1985). "As a result an agency must look at every reasonable alternative, with the range dictated by the 'nature and scope of the proposed action,' Block, 690 F.2d at 761, and 'sufficient to permit a reasoned choice.' Methow Valley Citizens Council v. Regional Forester, 833 F. 2d 810, 815 (9th Cir. 1987), rev'd on other grounds sub nom. Robertson v. Methow Valley Citizens Council, 490 U.S. 332 (1989)."
>
> "NEPA requires an EIS provide information in detail and consider every reasonable alternative to a proposed action. Citizens for a Better Henderson, supra, 768 F.2d at 1057; see 42 U.S.C. 4332(2)(c)(iii).
>
> Defendants' position is contrary to NEPA's underlying tenet, i.e., that agencies consider all reasonable alternatives so as to ensure an EIS fosters informed decision making. See Idaho Conservation League v. Mumma, supra, 956 F.2d at 1519-20.
>
> "Accordingly, the EIS' failure to address an alternative… compels this court to REMAND this matter for further administrative proceedings." - End of excerpt -

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 11

204-9 Comment noted. NNSA disagrees with the commentor's stated opinion regarding NNSA's failure to meet legal NEPA compliance requirements and the failure to sufficiently analyze a reasonable range of alternatives in NEPA documents pertaining to the proposed CMRR-NF project. Please see the response to Comment nos. 204-6 and 204-7.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

We conclude that NNSA is obliged to prepare and issue a new CMRR dSEIS that incorporates "significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts," and offers a true range of genuine alternatives. We further assert that it is not sufficient to address our concerns in a Final CMRR SEIS that will offer no opportunity for public comment. **A new CMRR-NF DSEIS should be prepared and issued by NNSA so that the agency meets its legal NEPA obligations.**

However, we don't doubt that NNSA will balk over preparing a new dSEIS. As a general rule, an agency can change an environmental impact statement based on comments, since that is the purpose of a public comment period to begin with (and, in fact, federal agencies are required to at least respond to comments). Of course, if the changes are too dramatic, the agency arguably has to issue another draft and go through another round of comment, so the question is how extensively does the next round deviate from what the public commented on. We recognize that in general federal agencies have wide discretionary latitude, and in the general rulemaking context the test is whether the changes are the "logical outgrowth" of the original proposal plus the comments on it.

204-7 cont'd

But in this case we again argue that since NNSA failed to offer a genuine range of alternatives to building the Nuclear Facility, and inappropriately constrained consideration of the dSEIS to just the physical changes of the CMRR-NF, that the agency has an obligation to withdraw this dSEIS and prepare another for public comment.

The Nuclear Facility's fundamental purpose and need must be reexamined. The Draft SEIS claims, "The purpose and need for NNSA action [to build the Nuclear Facility] has not changed since issuance of the 2003 *CMRR EIS*. NNSA needs to provide the physical means for accommodating the continuation of mission-critical AC [analytical chemistry] and MC [materials characterization] capabilities at LANL beyond the present time in a safe, secure, and environmentally sound manner." Summary page 8 ("S-8").

To reduce NNSA's argument, it is essentially that the old CMR Building AC and MC missions must continue at LANL; therefore the Nuclear Facility's mission need has not changed; therefore *ipso facto* the Nuclear Facility must be built. But that is syllogistic, a non sequitur, again offering no true range of alternatives as NEPA legally requires. At issue in this dSEIS is <u>not</u> whether or not special nuclear materials AC and MC continue at LANL, but instead their appropriate scale and how to best configure their necessary "physical means" given new information and circumstances since the 2003 CMRR Project EIS.

204-5 cont'd

NNSA's FY 2011 Strategic Plan states, "Many things have changed since the last National Nuclear Security Administration (NNSA) Strategic Plan was published in 2004," the same year that NNSA made its Record of Decision to proceed with the CMRR Project. The first thing the new strategic plan points to is President Obama's April 2009 Prague speech in which he called for a future world free of nuclear weapons. Therefore, there is an overarching need to reexamine the purpose and need of the Nuclear Facility, slated to operate as long as "toward the end of the twenty-first century" (S-16), and how it helps or obstructs reaching that lofty goal.

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

To be accurate, at the same time, Obama's Prague speech called for rigorous interim maintenance of the U.S. nuclear stockpile. His April 2010 Nuclear Posture Review (NPR) specifically endorsed constructing and operating the CMRR-Nuclear Facility as one of "the following key investments [that] were required to sustain a safe, secure, and effective nuclear arsenal." However, one thing the NPR did not do was to raise LANL's level of plutonium pit production from the currently sanctioned level of up to 20 plutonium pits per year, despite repeated major attempts by the NNSA to do so.[13]

204-5 cont'd

Nevertheless, upon questioning at public CMRR meetings NNSA officials have said that the Nuclear Facility is to be built with 22,500 sq. ft. of plutonium processing space, the size of which a 2007 NNSA-commissioned study explicitly linked to a future production rate of 50-80 plutonium pits per year.[14] That same study also assumed that new design nuclear weapons, the so-called Reliable Replacement Warheads (RRWs), would be produced, requiring expanded plutonium pit production.

204-3 cont'd

Related, in the FY 2007 Energy and Water Appropriations Bill, the Senate Appropriations Committee Subcommittee for Energy and Water Development stated:

> The Committee has reviewed the Department's Complex 2030 proposal and noted several assumptions regarding mission scope of the CMR-R facility that don't seem to match current planned activities. The Committee directs the Administrator to deliver a report by June 1, 2007, clarifying the cost and mission requirements this facility will be expected to address. [15]

In the required report NNSA stated:

> The first two Complex 2030 strategies, transforming the Nation's nuclear weapons stockpile and transforming the physical infrastructure of the nuclear weapons complex, specifically involve the CMRR. **The CMRR would contribute to the first strategy by supporting the interim production of pits for Reliable Replacement Weapons** should the Nuclear Weapons Council and Congress continue to support this concept beyond Phase 2A (which consists of developing RRW's costs, scope, and schedule). **The CMRR would support the second strategy by contributing to a modernized nuclear weapons complex**…

---

[13] These attempts to do so include: the 1996 Stockpile Stewardship and Management Programmatic Environmental Impact Statement (PEIS); the 2003 draft Modern Pit Facility EIS (never went to a final EIS); the 1999 and 2008 LANL Site-Wide Environmental Impact Statements; the 2006 "Complex 2030" PEIS; the 2008 "Complex Transformation" PEIS; and outside of NEPA processes the Obama Administration's April 2010 Nuclear Posture Review (upon which the NNSA draws heavily to justify the CMRR-Nuclear Facility).

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

> Option I: Use existing LANL plutonium facilities only and defer all new plutonium facilities, including the NF. This option does not satisfy NNSA's mission needs because it provides limited pit production capability, does not address plutonium storage needs, and offers limited ability to absorb the transfer of missions currently conducted at LLNL.
> Option II: Use existing LANL facilities, supplemented by the NF to achieve a higher pit production capability and to support transfer of LLNL plutonium mission and material to LANL.
> Option IIA: Rely on the current NF design approach, which has not been optimized for pit manufacturing capacity. This option has been NNSA's plan since its CMRR Record of Decision in February 2004 and through the CMRR's CD-1 in May 2005.
> Option IIB: Expand the NF's capabilities to achieve a somewhat higher pit production capacity.
> Option III: Use existing LANL plutonium facilities as interim assets until a new consolidated plutonium facility is operational.
> Option IV: Combine Options II and III. Option II would allow for a delay in implementing Option III, or would serve as prudent risk management by assuring national security capabilities are retained while Option III is implemented.
> Thus, the CMRR has a significant role in Complex 2030 planning in either Option II or Option IV.[16] (Bolded passages are addressed below.)

NNSA later changed its "Complex 2030" proposal to "Complex Transformation," for which a Record of Decision was published stating:

> Manufacturing and research and development (R&D) involving plutonium will remain at the Los Alamos National Laboratory (LANL) in New Mexico. To support these activities, NNSA will construct and operate the Chemistry and Metallurgy Research Replacement–Nuclear Facility (CMRR–NF) at LANL as a replacement for portions of the Chemistry and Metallurgy Research (CMR) facility, a structure that is more than 50 years old and faces significant safety and seismic challenges to its continued operation…
>
> With respect to plutonium manufacturing, NNSA is not making any new decisions regarding production capacity until completion of a new Nuclear Posture Review in 2009 or later. **NNSA does not foresee an imminent need to produce more than 20 pits per year to meet national security requirements.** This production level was established almost 10 years ago in the ROD (64 FR 50797, Sept. 20, 1999) based on the Site-wide Environmental Impact Statement for Continued Operation of the Los Alamos National Laboratory (1999 LANL SWEIS; DOE/ EIS–0238). The ROD based on the

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

2008 LANL SWEIS (DOE/EIS–0380) continued this limit on production (73 FR 55833; Sept. 26, 2008). NNSA will continue design of a CMRR–NF that would support a potential annual production (in LANL's TA–55 facilities) of 20–80 pits. The design activities are sufficiently flexible to account for changing national security requirements that could result from a new Nuclear Posture Review, further changes to the size of stockpile, or future Federal budgets. Furthermore, because **NNSA's sensitivity analyses have shown that there is little difference in the size of a facility needed to support production rates between 1 and 80 components per year**, the future production capacity is not anticipated to have a significant impact on the size of the CMRR–NF. [17]

To address the bolded passages above in sequence:

- Congress shot down the Reliable Replacement Warhead, and we contend that with it Congress also shot down the need for expanded plutonium pit production, and therefore the need for the CMRR-Nuclear Facility.
- The CMRR Project as a whole has already substantially contributed to "modernization" of the nuclear weapons complex through construction of its first phase, the 180,000 square feet the Radiological Laboratory/Utility/Office Building (RLUOB or "Rad Lab"). The Nuclear Facility still does not need to be built for all the reasons we set forth in these comments. ***204-3 cont'd***
- "Option I: Use existing LANL plutonium facilities only and defer all new plutonium facilities, including the NF" should be pursued precisely because plutonium pit production does not need to be expanded, plutonium storage needs can be met by building a new stand alone vault delinked from the claimed justification and rationale for the Nuclear Facility. We argue that a new CMRR dSEIS should examine the alternative of building a new vault without the Nuclear Facility. [18] ***204-8 cont'd***
- We are aware that some special nuclear materials (SNM) have already been transferred from the Lawrence Livermore National Laboratory (LLNL) to LANL, but not missions. In fact, the opposite seems to be true, with for example the reported delegation of leadership to LLNL for a W78 Life Extension Program when that warhead was originally designed by LANL. In any event, a new CMR dSEIS should state what LLNL missions might be moved to LANL. ***204-10***
- While the delayed April 2010 Nuclear Posture Review (NPR) did endorse construction of the Nuclear Facility it did not expand the level of plutonium pit production. NNSA's statement that there is not an imminent need to produce more than 20 pits per year to meet national security requirements still holds true. ***204-3 cont'd***
- NNSA's argument that "there is little difference in the size of a facility needed to support production rates between 1 and 80 components per year" as justification for the Nuclear Facility can be turned on its head. We can use it to argue our main point, that a ***204-8 cont'd***

---

[17] Record of Decision for the Complex Transformation Supplemental Programmatic Environmental Impact Statement—Operations Involving Plutonium, Uranium, and the Assembly and Disassembly of Nuclear Weapons, NNSA, December 19. 2008http://www.complextransformationspeis.com/Plutonium%20ROD.pdf

[18] We will be consistent throughout these comments in our demand that this draft CMRR-Nuclear Facility be withdrawn and a new one prepared. But if NNSA fails to do and goes right into a final SEIS (which we oppose), we note that NNSA should nevertheless analyze the issues we raise in the final.

204-10 The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. NNSA mission assignments are not within the scope of the SEIS.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

new dSEIS should consider the reasonable alternative of not building the Nuclear Facility, relocate the AC and MC missions of the old CMR Building between the new Rad Lab and PF-4, LANL's existing plutonium pit production facility. **204-8 cont'd**

Moreover, NNSA acknowledges that W88 pit production is coming to an end. W88 pit production was always the "camel's nose under the tent" in terms of DOE's rationale of why pit production had to be reestablished. W88 pits were in the production line at the Rocky Flats Plant when the FBI raided it in 1989 investigating environmental crimes and production was never resumed there (and a few years later the plant lost its nuclear weapons mission). DOE argued that because of the attrition of one pit type per year due to annual stockpile surveillance destructive analysis that it needed resumed production to at least take even with respect to W88 pits. Thus, in time, 6 years later than scheduled and at a cost we estimate greater than $3 billion, LANL finally managed to produce it first certified (i.e., "diamond-stamped" for the stockpile) W88 pit, and appears to be ending that production run after producing what we estimate to be under 35 pits. Between that and the rejection of the Reliable Replacement Warhead there is no apparent need for the production of new pit, and therefore the Nuclear Facility is not needed.

NNSA must justify why a new Nuclear Facility is needed.
Again, we maintain that the NF has always been about directly supporting expanded pit production. For example, from NNSA's own FY11 Stockpile Stewardship and Management Plan:

> Existing Los Alamos plutonium facilities are not sustainable and do not provide an inherent manufacturing capacity sufficient for the range of possible future scenarios…
> Path Forward…
> • Complete the design and begin construction of the Chemistry and Metallurgy Research Replacement Nuclear Facility at Los Alamos (a facility that conducts plutonium research and development and provides analytical chemistry and materials characterization to all plutonium programs such as surveillance, manufacturing, and plutonium disposition.) **Plan and program to complete construction no later than 2020, and ramp up to full operations in 2022.**
> • Increase pit processing capacity and capability at the adjoining PF-4 (part of the main plutonium facility) at Los Alamos to demonstrate pit reuse by 2017 and manufacturing by 2018-2020. **Plan and program to ramp up to a manufacturing capability of up to 80 pits per year in 2022**. Complete required investment in PF-4 infrastructure and waste processing capabilities in time to support expected plutonium capability in 2022.[19]

204-3 cont'd

It is not coincidental that those two points are presented together; in fact they are co-joined, part of the one action to expand plutonium pit production capability. Concerning whether LANL's plutonium facilities are sustainable, we agree that the old CMR Building is not, at least for operations with Hazard Category 2 special nuclear materials

---

[19] NNSA FY11 SSMP, p. 23-24, http://www.nukewatch.org/importantdocs/resources/Stockpile_Stewardship_and_Management_Plan_2010.pdf Parenthesis in the original, bolded emphasis added.)

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

(SNM). However, not only is PF-4 clearly sustainable, but it has in fact already been retrofitted with additional glovebox lines and equipment to achieve expanded production capability of up to 80 plutonium pits per year, as evidenced by the following:

> LANL 08 Performance Evaluation Report
> Pit Manufacturing Equipment
> Measure 1.13 Build Six New W88 Pits & Install Equipment in FY 2008 to increase Pit Capacity to 80 Pits per Year by the Operational Date of a CMRR-Nuclear Facility (Incentive/Base)
> Expectation Statement:
> Build six new W88 pits and install equipment in FY 2008 to increase pit capacity to 80 pits per year by the operational date of a CMRR-Nuclear facility.
> Completion Assessment:
> LANS [Los Alamos National Security, LLC] has submitted completion evidence for award of full fee. NNSA has validated appropriate and timely completion.[20]

204-3 cont'd

All that is lacking for the desired "range of possible future scenarios," that is "to ramp up to a manufacturing capability of up to 80 pits per year in 2022," are the expanded SNM materials characterization and analytical chemistry capabilities needed to directly support expanded pit production. This is where the CMRR NF comes in. But while various high-level documents have blessed construction and operation of the CMRR NF, none have allowed expanded plutonium pit production. The 1999 LANL Site-Wide Environmental Impact Statement set that level at 20 pits per year. Since that time, in one form or the other, the Modern Pit Facility EIS, the Complex 2030 Programmatic EIS, the 2008 LANL Site-Wide EIS, and the Complex Transformation Supplemental PEIS have all set out to formally expand plutonium pit production, but in each case failed to do so.

For there to be truly impartial NEPA review without predetermination there must be analysis of the fundamental need of the NF given that: 1) there has been no decision to expand beyond the currently approved production rate of 20 pits per year; and 2) there is no foreseeable decision to do so anytime soon. In effect, NNSA has predetermined that there will be expanded plutonium pit production (see SSMP above) which predetermines that the NF is necessary. A new draft SEIS should specifically examine the likelihood that there will be a formal decision to expand pit production, and the need for the Nuclear Facility in the absence of such a decision. [For more please see our Attachment 3.]

204-11

Current and proposed Life Extension Programs do not justify the Nuclear Facility.

We have repeatedly made the point that since the Reliable Replacement Warhead was rejected by Congress there is no need for expanded plutonium pit production and therefore for the Nuclear Facility. However, the NNSA 2007 report to the Senate Appropriations Committee did state that:

204-12

---

[20] LANL 08 Performance Evaluation Report**,** NNSA, http://www.doeal.gov/laso/GeneralDocs/FY%202008%20Performance%20Evaluation%20Report%20Final.pdf

204-11 As the commentor notes, a number of previous NEPA documents (some draft and some final) included alternatives that evaluated pit production levels above the selected level of 20 pits per year. A purpose of these documents was to analyze the impacts from an array of proposed actions and alternatives. NNSA decisions to date have been to retain the level of pit production at 20 pits per year in response to Congressional and Presidential directions regarding NNSA's mission requirements. NNSA disagrees with the commentor regarding the lack of an impartial NEPA analysis without "predetermination." As indicated in response to earlier comments (204-3 and 204-5), NNSA's purpose and need are to provide analytical chemistry and materials characterization operations at LANL in support of all its assigned missions and NNSA does not plan to revisit previous decisions made through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644) on the maintenance of CMR operational capabilities at LANL to support critical NNSA missions. The *CMRR-NF SEIS* considers how to construct a replacement building to replace an aging building that was constructed and used for almost 50 years before LANL was assigned the mission of pit production.

204-12 Comment noted.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

> Future Plutonium Missions:
> The need for future plutonium capabilities is well established and includes:
> • Meeting national security requirements for pit production for **life extension programs** and/or RRWs.[21] (Emphasis added.)

So it is not just a matter of RRWs. We anticipate that NNSA will now argue that in effect pretty much the same suite of production capabilities will be needed for possible future "intrusive modifications" to existing pits made during Life Extension Programs, and therefore the Nuclear Facility is needed. For starters, the Nuclear Facility will have little or no role in current and proposed "Life Extension Programs" that seek to extend the service lives of the W76 and W78 ballistic missile warheads and the B61 bomb. Those LEPs are scheduled to be completed or well underway before the NF is due to be operational in 2024.[22] We assert that taxpayer money misdirected into the CMRR-Nuclear Facility would be better used for maintenance and upgrades of existing facilities, programs and routine stockpile maintenance.

The question then becomes how is the CMRR-NF needed for Life Extension Programs beyond 2024, and further how does that comport with the Obama Administration's declared goal of a future world free of nuclear weapons? First, Life Extension Programs do not yet include virgin production of new plutonium pits, and there is no current indication that they will do so. However, NNSA has indicated that "intrusive modifications" to existing pits may be needed for the express purpose of enhanced "surety," meaning preventing the unauthorized (i.e. terrorist) use of nuclear weapons.

204-12 cont'd

We think it may be very ill-advised to intrusively modify pits for surety purposes as any modifications to the nuclear explosives package could affect nuclear weapons reliability when they can no longer be full-scale tested (and the alternative that they be tested full-scale is even worse from a global nonproliferation perspective). Moreover, our nuclear weapons will always have to be protected by "guns, guards and gates" anyway because even if they had inherent surety the loss of nuclear weapons design information and materials would be extremely serious.

We argue for a very conservative approach to maintaining the U.S. nuclear weapons stockpile, one that intentionally tries to preserve the tested pedigree and minimize changes. We understand that U.S. nuclear weapons need replacement of limited life components, but that is well understood, already routinely performed over decades, and is not rocket science. In short, the CMRR-Nuclear Facility is not needed for maintaining the safety and reliability of the U.S. nuclear weapons stockpile. To the extent (if any) that the

---

[21] *Chemistry and Metallurgy Research Building Replacement Project, Preface and Executive Summary*, NNSA, May 2007, p. 5.
[22] See chart of LEP schedules, NNSA FY 2011 Stockpile Stewardship Plan, p. 21, http://www.nukewatch.org/importantdocs/resources/Stockpile_Stewardship_Plan_Annex_A_0610.pdf. Nuclear Watch believes this question is particularly apt given that the CMRR-Nuclear Facility is scheduled to be operational in 2024; Life Extension Programs will reportedly extend service lives up to 30 years; therefore the CMRR-NF will theoretically work on nuclear weapons that will be operational until 2054. Moreover, the CMRR-NF will reportedly have a service life of up to 2075. How does that comport with a future nuclear weapons-free world?

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Nuclear Facility encourages profound changes to the already extensively test stockpile (particularly with respect to plutonium pits or the nuclear explosives package), the NF's very existence could undermine nuclear weapons safety and reliability and therefore national security. 204-12 cont'd

The appropriate configuration of LANL's AC and MC missions.
NNSA will no doubt repeatedly argue that because the materials characterization and analytical chemistry missions of the old CMR Building are needed that the Nuclear Facility is needed. Again, Nuclear Watch is not using this CMRR-NF dSEIS to argue against LANL's retention of AC and MC capabilities. To be clear, we are unwavering in our commitment to a future nuclear weapons-free world, but the question for us is how to best get there.

We actually think it would be a setback should somehow LANL theoretically lose its SNM AC and MC capabilities, certainly politically with Congress. We are not knee-jerk reflexively against LANL, and recognize that AC and MC capabilities are necessary for a number of non-weapons applications that we want to encourage.[23] But we are adamantly against the Nuclear Facility, because we know it will set us back in progress toward a future nuclear weapons-free world. Again, the question is how to best configure remaining AC and MC capabilities to best meet and be aligned with the full mix of national security needs, including greater budget accountability and eradicating nuclear weapons, which are the only military threat that can strategically threaten our very national survival. 204-13

LANL's analytical chemistry mission has already been relocated to PF-4.
We think the answer has already been largely answered. First, as the dSEIS itself notes, "Most of these capabilities are found at the [old] CMR Building, although a subset of AC and MC capabilities resides in the TA-55 Plutonium Facility and other locations at LANL." (dSEIS, sec. 2.4.1, p. 2-7.) Thus AC and MC capabilities are already present at PF-4. 204-8 cont'd

However, in a letter a few years ago NNSA Administrator Tom D'Agostino wrote to the Defense Nuclear Facilities Safety Board that:

> NNSA and LANL have made progress in consolidating capabilities within the CMR Facility and relocating capabilities to other facilities. For example, Actinide Analytical Chemistry operations have been consolidated into Wings 5 and 7 and Materials Characterization operations have been relocated to the Plutonium Facility.[24]

[23] For example, nuclear nonproliferation programs (especially we hope the development of arms control verification technologies); dismantlement efforts; and waste management
[24] Tom D'Agostino, NNSA Administrator to DNFSF Chairman A.J. Eggenberger, October 1, 2008, http://www.hss.energy.gov/deprep/2008/TB08O01A.PDF second paragraph

204-13 Comment noted.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Given no need to expand pit production, the old CMR Building's analytical chemistry mission, used mainly in quality assurance for ongoing pit production, could be transferred to PF-4 as well. This would help to achieve NNSA's goal of better SNM consolidation in highly secure areas. CMR's non-Cat I/II operations, some of which we support (e.g., radioactive waste disposal R&D, IAEA inspector training, support of nonproliferation programs), could be transferred to the CMRR light labs and office space already being equipped for operational completion. *204-14*

The bottom line is that CMRR's Nuclear Facility is simply not needed. At this point, NNSA and LANL don't really know what they want the Nuclear Facility for, other than expanded plutonium pit production. As a May 2008 DNFSB report noted, the Nuclear Facility's currently proposed design calls for a flexible, open floor plan to accommodate "as-yet unknown future missions," which the Board likened to a "hotel concept." Why spend billions on CMRR's Nuclear Facility if it has no clearly articulated mission need? *204-3 cont'd*

Nuclear Watch NM is, of course, not privy to the classified details of special nuclear materials (SNM) materials characterization and analytical chemistry. However, we have the impression that up to a hundred analytical chemistry samples may have to be analyzed while an individual pit is being produced. Thus the scale of plutonium pit production has everything to do with the scale of the needed analytical chemistry mission, since needed AC samples may be two orders of magnitude above actual production. But we have repeatedly pointed out that plutonium pit production is not being expanded anytime in the foreseeable future. It then follows that the scale of analytical chemistry operations does not have to expand (although we will concede to the fact that the quantity of needed AC samples is not necessarily linear to the amount of floor space needed for it).

A "Technical Area-55 Capabilities Study" is needed. *204-15*

The recent House Energy and Water Appropriations report stated:

> The NNSA is not prepared to award that [CMRR] project milestone since it must first resolve major seismic issues with its design, **complete its work to revalidate which capabilities are needed**, and make a decision on its contracting and acquisition strategies.[25]

Here's where we are going with this: There should be a "Technical Area-55 Capabilities Study" that examines what plutonium capabilities are truly needed under the currently sanctioned level of 20 pits per year, and how to appropriately configure those capabilities. The old CMR's analytical chemistry mission could possibly be consolidated at PF-4, particularly if other operations at PF-4 are terminated as scheduled, specifically the pilot programs for MOX fuel fabrication and the related Advanced Recovery and Integrated Extraction System for recovering plutonium oxides, all slated for transfer to the Savannah River Site. A new dSEIS should incorporate the findings of such a capabilities study, instead of just predetermining the need for a Nuclear Facility. More

[25] House Energy and Water Development Appropriations Bill, 2012, p. 131, emphasis added.

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 20

204-14 NNSA disagrees with the commentor's assessment that necessary amount of analytical chemistry mission work could be moved into the TA-55 Plutonium Facility. As discussed previously in response to Comment no. 204-7, NNSA has determined that the level of analytical chemistry and materials characterization needed to fully support the plutonium mission (stockpile stewardship, maintenance, and pit production), cannot be provided in existing facilities.

204-15 NNSA has looked at options involving the use of the TA-55 Plutonium Facility (PF-4) for performing the mission needs that would be fulfilled by the proposed CMRR-NF and concluded that the facility cannot accommodate all of the required activities. As discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, using space in this facility would interfere with existing work and reduce the space available for future NNSA mission support work. See the response to Comment 204-8 for more information regarding the use of the TA-55 Plutonium Facility (PF-4).

The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

broadly, the adverse example that building the Nuclear Facility could present to the international community also needs to be considered, especially when they fly in the face of our declared national security goal of future nuclear weapons-free world.

204-15 cont'd

The NNSA's FY 2011 Strategic Plan states:

> As requirements for new or expanded capabilities emerge, our reinvestment strategy will use accepted life cycle management standards to integrate maintenance and replacement schedules with needs for new facilities and capabilities. P. 10.

But that presumes a need for "requirements for new or expanded capabilities," which is not clear and perhaps just self-serving to NNSA and its nuclear weapons complex. What are these needed new or expanded capabilities, if indeed we are seeking a future world free of nuclear weapons? If these needs exist, NNSA must explain why plutonium pit production must be expanded. If expanded production is not needed, then why is the CMRR-Nuclear Facility needed? A new dSEIS should address all of this.

204-3 cont'd

To conclude this section:

- There is no indication that there will be a formal decision to expand future LANL production of new plutonium pits. In any event, it would require additional NEPA steps, which are not in the offing for the foreseeable future.
- The CMRR-Nuclear Facility dSEIS should be tiered off a decision to expand plutonium pit production, and not proceed before then.
- Life Extension Programs that might intrusively modify existing pits in existing nuclear weapons must be carefully reviewed by independent nuclear weapons experts as to whether they are necessary to begin with, and whether they could affect nuclear weapons reliability.
- In any event, the CMRR-Nuclear Facility will not be operational until those LEPs are completed or well underway. LEPs beyond that have not been yet proposed by the NNSA. The justification for the CMRR-Nuclear Facility should not be premised on Life Extension Programs.
- There should be a "TA-55 Capabilities Study" to determine what is truly needed to meet plutonium national security needs, including encouraging a future nuclear weapons-free world.
- We assert that the old CMR's missions of special nuclear materials characterization and analytical chemistry can be re-located between the newly built and equipped Rad Lab and PF-4.
- An option in that configuration is to build a stand-alone SNM vault, de-linked from the need to build the Nuclear Facility as a whole.
- A new dSEIS needs to offer and explore a genuine range of reasonable alternatives, such as we articulate above.

We offer further background in Attachment 3 on why PF-4's floor space could be reconfigured such that the old CMR's analytical chemistry mission could be relocated there, thereby obviating the need for the exorbitant and counterproductive Nuclear Facility. Critical to this is the fact that CMR's materials characterization mission has already been consolidated there. So why can't AC? In order to offer a full range of

204-16

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 21

204-16 NNSA acknowledges the commentor's position and suggestions. These points have been addressed in the preceding responses to comments.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

reasonable alternatives as required by the National Environmental Policy Act, NNSA needs to consider that in a new dSEIS. *204-16 cont'd*

The mission need for the CMRR-Nuclear Facility does not justify exploding costs.

An unconscionable amount of taxpayer money is typically expended anytime DOE nuclear facilities are built. The expense associated with controlling radioactive and fissile materials is astronomical. Please analyze the impacts of diverting these funds away from renewable energy and nonproliferation programs at the Los Alamos National Laboratory (LANL) for a new facility to directly support production of plutonium pits or "triggers" for nuclear weapons, called the Chemistry and Metallurgy Research Replacement (CMRR) Project, and specifically the Nuclear Facility (NF).

Does management of a very large construction project fit into LANL's mission?
Where in LANL's mission statement does it state that LANL is to be a premier construction management company? The effort required to manage a $5 billion facility can only be a distraction to the work that LANL and only LANL can do. Does the shear size of the project demand so much time from DOE and LANL management that the smaller scientific, and everything is smaller, efforts get pushed aside? Has the shear size of the effort drawn resources from essential program? *204-17*

A cost-benefit analysis is needed.
A legitimate draft SEIS would perform a cost-benefit analysis because of the Nuclear Facility's exploding costs. A relevant DOE NEPA Implementation Regulation states:

> If a cost-benefit analysis relevant to the choice among environmentally different alternatives is being considered for the proposed action, it shall be incorporated by reference or appended to the statement as an aid in evaluating the environmental consequences. To assess the adequacy of compliance with section 102(2)(B) of the Act the statement shall, when a cost-benefit analysis is prepared, discuss the relationship between that analysis and any analyses of unquantified environmental impacts, values, and amenities. For purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations. In any event, an environmental impact statement should at least indicate those considerations, including factors not related to environmental quality, which are likely to be relevant and important to a decision.[26]

Given its exploding costs, if there was ever a project that needed a cost benefit analysis it is the CMRR-Nuclear Facility, which a new dSEIS should include.

[26] 10CFR1021 1502.23 Cost-benefit analysis,"
http://ceq.hss.doe.gov/nepa/regs/ceq/1502.htm#1502.9

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
***July 5, 2011 • Page** 22*

204-17 As discussed in the response to Comment 204-4, the proposed CMRR-NF would support a range of activities at LANL including stockpile stewardship and pit production but it is not tied specifically to LANL's pit production capability. LANL construction efforts, such as the proposed CMRR-NF should it be constructed, would be managed by the LANL Capital Projects Division and overseen by NNSA. Bechtel, one of the largest construction management companies in the world, is now one of the team members operating LANL. Its expertise could be drawn upon if the CMRR-NF is built.

The costs of phases of the CMRR Project are not within the scope of the *CMRR-NF SEIS*. DOE does not typically include a cost-benefit analysis in its EISs and there is no requirement that a cost-benefit analysis be included in an EIS. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. See the responses to comments 204-7 and 204-8 regarding upgrades to the CMR Building and TA-55.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Stated Congressional concerns over CMRR costs.

For good reason, the Department of Energy has been on the GAO's High Risk List for project mismanagement and cost overruns for 19 consecutive years. A few spectacular past and present examples of exploding costs are: the National Ignition Facility (originally estimated at $1 billion, now >$5 billion), the Hanford Vitrification Plant ($3B to ~$13B), the Chemical and Metallurgical Research Replacement (CMRR) Project at Los Alamos ($660M to ~$6B), and the Uranium Processing Facility at Y-12 ($3B to $6.5B). Congress should not allow DOE construction projects to go forward until their designs are 90% complete and credible baseline cost estimates are known.

The House Appropriations Committee recently reported:

> While the importance of modernization is understood, the economic crisis requires that the NNSA proceed with its modernization activities in a responsible manner and the Committee is seriously concerned with the recent cost growth reported for construction of the Uranium Processing Facility (UPF) and the Chemistry and Metallurgy Research Replacement (CMRR) Project. The current price tag for UPF is projected between $4,200,000,000 and $6,500,000,000 and the CMRR Nuclear Facility is estimated to cost between $3,700,000,000 and $5,800,000,000. These are conceptually replacement facilities to make operations more safe and efficient, but construction will also enable the reconstitution of certain production capabilities that have been lost but are needed to meet the needs of an aging stockpile. Many gaps remain in the planning efforts, and basic capability requirements and acquisition strategies continue to be re-evaluated. Modernization will take several years and the considerable number of variables still at play argues against an excessively aggressive funding curve. The construction of the new major facilities must not force out available modernization funding for the rest of the nuclear security enterprise. Therefore, the Committee supports the adoption of cost reduction strategies to make construction more affordable and to curb continued cost escalation. Further, these projects will be closely monitored to ensure that prudent project management practices are followed, and the Committee is prepared to make adjustments to the funding profiles to ensure that taxpayer funds are not wasted.[27]

A new dSEIS should analyze the House's concerns both with respect to escalating costs and whether they would "force out available modernization funding for the rest of the nuclear security enterprise."

204-17 cont'd

The House Report further states:

[27] 112TH CONGRESS REPORT 1st Session HOUSE OF REPRESENTATIVES 112– ENERGY AND WATER DEVELOPMENT APPROPRIATIONS BILL, 2012, pp. 129 -130, http://appropriations.house.gov/UploadedFiles/FY_2012_ENERGY_AND_WATER_FULL_COMMITTEE_REPORT.pdf

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Project 04–D–125, Chemistry and Metallurgy Research Replacement (CMRR), Los Alamos National Laboratory.—The Committee recommends $200,000,000, $100,000,000 below the budget request. The Committee fully supports the Administration's plans to modernize the infrastructure, but intends to closely review the funding requests for new investments to ensure those plans adhere to good project management practices. The latest funding profile provided to the Committee indicates that over half the funding requested for the Nuclear Facility would be used to start early construction activities. The recommendation will support the full request for design activities, but does not provide the additional funding to support early construction. The NNSA is not prepared to award that project milestone since it must first resolve major seismic issues with its design, complete its work to revalidate which capabilities are needed, and make a decision on its contracting and acquisition strategies.[28]

"Report on Footprint Reduction.—Despite promises for a leaner, more efficient and streamlined enterprise, the NNSA footprint has actually been growing over the past few years. Both the Uranium Processing Facility and the Chemistry and Metallurgy Research Replacement project will have more square footage than the legacy facilities they are meant to replace, and the High Explosive Pressing Facility will occupy nearly seven times the space of current operations. While new construction is adding footprint, no funding is planned for demolition activities beyond the completion of the Facilities and Infrastructure Recapitalization Program in 2013. Costs of demolition and decontamination work are not reported alongside new construction as required, nor are they integrated into the 30- year infrastructure priority lists. The costs of demolition and decontamination work are not being taken into account when making investment decisions and the timeline for demonstrating any savings in operating costs, as regularly described in the rationale for new facility construction, is being extended to the distant future. Since the NNSA is not meeting its requirement to demolish an equal amount of square footage for eachamount added, the Committee questions whether there truly is a commitment to a leaner, more efficient nuclear security enterprise..." [29]

The Senate of course has its concerns as well. The marked up FY 2012 Senate Defense Authorization Act has the following passage on the CMRR-Nuclear Facility:

The committee continues to believe that managing the design and construction of the CMRR, the UPF, and the other new NNSA nuclear facilities will be very challenging. Managing these projects in accordance with the DOE 413 order series and project management and guidance is essential for success, as is making sure that the projects have clearly defined and validated requirements that do not change. The NNSA is also directed to conduct a true independent cost estimate for both the CMRR Nuclear Facility, which is phase III of the CMRR project, and the UPF. The committee instructs the Government

[28] Ibid., p. 131
[29] Ibid, p. 123

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

> Accountability Office (GAO) to review these independent cost estimates to ensure the accuracy of the cost estimates. The committee also directs the GAO to evaluate the NNSA's efforts to ensure that all cost savings measures have been considered. The committee continues to be concerned that the phase III project is being divided into multiple sub-projects. Not- withstanding this management approach the committee directs as it did last year, that the CMRR baseline, when developed and sub- mitted to the committee at the CD–2 phase of construction, reflect all phases and subprojects for the purpose of developing a cost and schedule baseline and to be accounted for as a single project.[30]

While obviously we don't carry the weight of Congress, we use all of its concerns stated above to underscore and buttress our own. NNSA has repeatedly stated that it won't begin construction of the Nuclear Facility until its design is 90% complete. While not condoning construction of the Nuclear Facility, we agree with that in principle as the minimum needed for responsible use of taxpayers' money (especially given DOE's history).

But what constitutes "construction"? NNSA requested $300 million in CMRR funding for FY 2012, of which ~$270 million is allocated as "TBD" [To Be Determined], in contrast to its FY 2011 request which was all allocated. Upon questioning local Los Alamos Site Office officials have stated that once the SEIS Record of Decision is released NNSA intends to quickly launch into site preparation, which for the CMRR Project is no little thing. It may include building a materials warehouse, an electrical substation, shelter for construction workers, a concrete batch plant (maybe 2), and the installation of construction trailers. Clearly this is a substantial investment of taxpayers' money, but site prep costs are still not publicly available.

204-17 cont'd

Still more site prep is planned for FY 2013 before 90% design is completed. This may include a 125' deep excavation for the facility to allow for a 225,000 cubic yard concrete "base mat" to mitigate seismic concerns, installation of utilities, rerouting an existing road, and building lay- down areas for construction materials storage. Again, costs are not known for these activities, but it could be up to $800 million for just so-called site preparation.

If allowed, this advanced site prep will snowball the CMRR-Nuclear Facility well before Congress knows final estimated costs. In the present fiscal climate Congress should exercise greater financial control over NNSA. Major site preparation should be included in a prohibition against construction before final costs are known. Site prep can be a huge investment onto itself, has immediate environmental impacts, and obviously prejudices moving forward before Congress has the total cost picture.

Taxpayer money misdirected into the CMRR-Nuclear Facility would be better put into maintenance and upgrades of existing facilities and programs. Because of its huge size

[30] 112TH CONGRESS SENATE REPORT 1st Session, 112–26, NATIONAL DEFENSE AUTHORIZATION ACT FOR FISCAL YEAR 2012, p. 271, http://www.gpo.gov/fdsys/pkg/CRPT-112srpt26/pdf/CRPT-112srpt26.pdf

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

and the Lab's institutional investment into it, inside sources say that the CMRR-Nuclear Facility is the 900-pound gorilla sucking the oxygen out of the room for more important priorities such as critically needed stockpile surveillance and maintenance.

New cost information must force a re-evaluation of the alternatives.
Just as new seismic information has forced a re-evaluation of the construction alternatives, new cost information must force a re-evaluation of the alternatives considered. Cost considerations were given as the reason that the CMR alternative (with no upgrade) was included in this dSEIS:

> Continued Use of CMR Building Alternative However, this alternative is analyzed in this CMRR-NF dSEIS as a prudent measure in light of possible future fiscal budgetary constraints. (CMRR-NF dSEIS, Pg. 2-26)

Possible budgetary constraints could come in different sizes. There could be a budget that would allow the CMR to be upgraded but that would not allow the Nuclear Facility to be built. Analyzing an alternative to upgrade the CMR is a prudent measure and must be conducted in a new dSEIS.

A new formal business case must be executed.
Decisions made in 2004 EIS are outdated. The choice to build the Nuclear Facility is based on cost estimates made before it ballooned to ~$6B. In this dSEIS, cost is given as a factor to not upgrade the CMR, so cost must be a factor in going ahead with the Nuclear Facility. But vague references that upgrading the CMR would cost too much are not appropriate in this dSEIS. A formal business case must be executed. The passage below refers to reasons not to upgrade the CMR, but does not mention costs. We find it extremely doubtful that upgrade of the CMR would cost more than building a new Nuclear Facility.

204-17 cont'd

> However, after consideration of the various engineering and geological issues; the costs of implementing upgrades to an older structure and developing a new security infrastructure; the costs of maintaining the security infrastructure and safety basis (in addition to that for TA-55); the mission work disruptions associated with construction; operational constraints due to limited laboratory space; and programmatic and operational issues and risks from moving special nuclear material between TA-3 and TA-55, this action was not analyzed further as a reasonable alternative to meet NNSA's purpose and need for action in this (CMRR-NF SEIS, Pg. S-20)

What does "after consideration" mean? It must read, "After a careful examining of all the meticulously prepared costs…" Who did the considering? The above passage almost looks like the beginnings of a business case, but where are the numbers? For example, how much does "operational constraints due to limited laboratory space" cost? Are we to assume that the proposed budget total for the above passage exceeds the proposed cost of the Nuclear Facility? Is building the Nuclear Facility just easier to do and its cost is not a consideration?

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

As a matter of fact, this dSEIS does state that upgrading the CMR would likely be less than the cost of building a new NF:

> Costs for the Wing 9 geotechnical investigations, structural and security upgrades, and construction of new support buildings and utilities installations, would be substantial, although not likely to approach those associated with either of the construction options considered under the Modified CMRR-NF Alternative. (CMRR-NF SEIS, Pg. 2-27)

Earlier decisions that lead to the current dSEIS were based on the alternative that cost the least:

> Bases for Decisions – Overview - NNSA's decision locates the three major functional capabilities involving Category I/II quantities of SNM at three separate sites where these missions are currently performed. The selected alternative, which is a combination of the Distributed Centers of Excellence and Capability-Based Alternatives, has the least cost and lowest risk. (Complex Transformation Record Of Decision #1)

Cost is mentioned as a factor in the final decision of the false alternatives in this dSEIS, as in the below. New alternatives, based on cost, must be included and given in a new dSEIS.

204-17 cont'd

> DOD is developing an independent assessment of estimated cost range data for the CMRR-NF. Analyses and recommendations from these independent assessments, information in this CMRR-NF SEIS, and other programmatic considerations will be weighed as NNSA moves toward a final decision on the construction and operation of a CMRR-NF. (CMRR-NF SEIS, Pg. 1-19)

NNSA prepared detailed business case studies of the programmatic alternatives for the Complex Transformation SPEIS. These studies are available at *http://www.ComplexTransformation SPEIS.com*. They provide a cost comparison of the alternatives and include costs associated with construction, transition, operations, maintenance, security, decontamination and decommissioning, and other relevant factors. This is the example that shows what must be performed for this CMRR-NF dSEIS.

Costs of building a plutonium pit complex in a geologically unstable area are too high.
Weapons production at any cost is how we ended up with billions of dollars required for cleanup of LANL's Cold War legacy.

LANL is located between a rift valley (the Rio Grande in that area) and an extinct supervolcano (the Jemez Mountains) in a seismic fault zone (the Pajarito Plateau). An updated seismic hazards analysis was published in May 2007. It showed a potential huge increase in seismic ground motion and activity. In all likelihood, most of the over $3 billion in cost estimate increases since 2008 are due to efforts to address the increased seismic hazards. DOE must analyze whether $3 billion is too high of a premium in order to build a new Nuclear Facility at LANL.

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

At over $12,500 per square foot for the total delivered Nuclear Facility, it is clear that something is terribly wrong. The Nuclear Facility is all about the "laboratory" (we prefer to call it processing space) space. If only the 22,500 square feet of lab space is considered, the cost for special nuclear materials processing is $250,000 per square foot.

A new draft SEIS should examine CMRR compliance with DOE Order 413. We share the Senate Armed Services Committee's concern that NNSA should follow the DOE 413 order series on the proper management of the acquisition of capital assets. We argue that NNSA should make clear in a new dSEIS its compliance strategy with those orders. We further argue that starting construction, including the possibly huge "site preparation" mentioned above, before 90% design is complete and credible costs estimated is contrary to the intent of the DOE Order 413 series. However, DOE orders are not legally binding and are self-regulated with major loopholes.

The CMRR project is requesting concurrent approval of preliminary design (CD-2) and commencement of construction (CD-3). At the time of the submittal for approval the design contains significant uncertainty, significantly larger estimates of ESTIMATED COSTS, and very large contingency in account of the risk carried by the project. Again, we don't quarrel with the fact that LANL must retain some analytical chemistry and materials characterization capabilities, but do strenuously argue over how to best configure them after all factors are considered (including, but not limited to, cost tradeoffs and consistent national policy toward a nuclear weapons-free world). We certainly question the wisdom of approving a fast track approach for a project that caries such large uncertainty and risk and has already experienced significantly escalating costs. NNSA projects have a long and distinct history of exceeding budget, delayed completion, and difficulty in fulfilling objectives. Is it the best choice for the nuclear weapons complex to commit to an accelerated schedule for a project that displays the hallmarks of not meeting expectations? If the project request is granted, the funding allocated, and difficulties arise, what will happen to the overall effort? In times of severe budget constraints is it not possible that other critical components of stockpile stewardship will suffer just to put more concrete in the ground? *204-18*

Nuclear Watch suggests that rather then approve a fast track approach for this project now is the appropriate time to back track and revisit CD-1, approval of alternative analysis. Do we really know how much capability is required? Do we know if PF-4 and the CMR can accommodate the anticipated capability? Is there another site that will better suit the nation? Is LANS the appropriate contractor to manage construction of the facility?

The reasons to revisit the alternative analysis are many.

- The original analysis was performed prior to the restructuring of the contract to run LANL. Key assumptions on selection of the contractor and ties to the LANL mission have changed significantly.
- The alternative analysis was performed by a contractor that had a vested interest in the outcome and the lack of independence assured that locating the facility at LANL and managing the contract under the LANL contract was a given. This

204-18 NNSA notes the comment. The purpose of the SEIS is to address the environmental impacts for the proposed alternatives for the CMRR-NF project. Discussion of project execution or compliance with DOE Order 413, Program and Project Management for the Acquisition of Capital Assets, is not a requirement for NEPA analysis. However, the purpose of this Order is to provide DOE, including NNSA, with program and project management direction for the acquisition of capital assets with the goal of delivering projects within the original performance baseline, cost and schedule, and fully capable of meeting mission performance, safeguards and security, and environmental, safety, and health requirements. DOE Order 413.3, *Program and Project Management for the Acquisition of Capital Assets*, requires that NEPA documentation be completed prior to approval of Critical Decision 2 which is defined as the point at which a definitive scope, schedule and cost baselines have been developed for the project. At that time, NNSA would proceed with final design, commit funds for long lead procurement items, if required, submit the draft Preliminary Safety Analysis Report for approval, issue the DOE safety evaluation report, as appropriate, and conduct external and independent project reviews. The CMRR-NF project is currently approved through Critical Decision 1.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

influence continues today as the contractor is heavily influenced by the need to fund the large design staff and any answer that does not direct additional funds to LANS is not even considered.

- With estimated costs approaching $6B the CMRR project dwarfs all other projects at LANL. Nowhere in the LANL mission statement is there any indication that management of the construction of nuclear facilities is key to the laboratories mission. Including the construction effort within LANS portfolio is a distraction to management of the science that is the key to the LANL mission. The size of the project demands the majority of management cycle time. Just imagine attempting to request senior management support for hiring a new scientist when the calendars of senior management are full of meetings regarding how to respond to the increased estimated costs for CMRR. You will not stand a chance and the research that is key to the LANL mission is suffering as a result.
- When the estimated costs of the facility was ~$900M it was possible to come to the conclusion that collocation of the facility with the research conducted at LANL was the cost effective approach. Now with a estimated cost approaching $6B that is no longer the case. People and material are moved within the NNSA all the time, every day. Is continued collocation a benefit or a detraction?

204-18 cont'd

It is clear that the CMRR project is at a critical stage. A configuration that ensures analytical chemistry and materials characterization capabilities is critical to interim maintenance of the stockpile while we await global nuclear disarmament. But how much will it cost? Should the nation commit limited funding to the fast track of a project that carries significant risk or should it husband its resources and seek a lower cost solution?

We are concerned that the CMRR Project has avoided due process of DOE Order 413, and think that an alternatives analysis should be generated from an independent source. With both NNSA and LANS so vested in the status quo any answer provided from within the project is suspect. This alternatives analysis should flow from a baseline TA-55 capabilities study that we have argued for earlier, and a new CMRR-NF dSEIS flow form that.

Is NNSA backing away from previously made CMRR-NF safety commitments?

The Defense Nuclear Facilities Safety Board has expressed concern that NNSA may be going back on previously made CMRR-NF safety commitments that Congress required the Board to certify. This could continue to raise safety issues that could further escalate costs. According to one media report:

> Federal safety auditors this week questioned whether the federal government is backing away from nuclear safety commitments in an effort to reduce the cost of a multibillion dollar plutonium complex being built at Los Alamos National Laboratory…
>
> Among the changes being considered in the replacement building's design are elimination of some of the building's fire suppression systems and ventilation equipment intended to prevent plutonium from leaking in the event of an earthquake and fire.

204-19

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 29

204-19 Congress created DNFSB in 1998 as an independent oversight organization within the Executive Branch to provide advice and recommendations to the Secretary of Energy regarding protection of public health and safety at defense nuclear facilities. As such, DNFSB independently oversees activities affecting nuclear safety at defense nuclear facilities. DNFSB reviews safety issues and formally reports its findings and recommendations regarding the safety of nuclear weapons complex facilities to the highest levels of NNSA. DNFSB may conduct investigations, issue subpoenas, hold public hearings, gather information, conduct studies, and establish reporting requirements for NNSA. DNFSB is required to report to Congress each year about its oversight activities, its recommendations to NNSA, and improvements in safety at defense nuclear facilities resulting from its activities. Procedures are in place for NNSA to review and respond to DNFSB recommendations and to implement those recommendations at the sites as appropriate.

For many years NNSA has worked with DNFSB regarding identification and resolution of possible safety issues pertaining to the CMR Building, the CMRR Project, and other nuclear facilities at LANL. For example, DNFSB has reviewed DOE seismic hazard evaluations for LANL (see Section 2.6, Seismic and Geologic Concerns, of this CRD) and NNSA has worked with DNFSB to resolve questions about the design of safety class systems at the CMRR-NF (LANL 2009). In 2009, in accordance with the 2009 Defense Authorization Act, LANL received a certification of design closure from DNFSB pertaining to the CMRR Project, addressing seismic as well as engineering and design and safety control issues; the certification freed the release of allocated funding for continuation of the project (DNFSB 2009). The February 2011 letter from DNFSB to NNSA referenced in the comment pertained to DNFSB questions about modifications proposed by LANL to the design of the CMRR-NF since the 2009 certification. In its response to DNFSB, NNSA stated that at completion of its analysis of the LANL proposal, NNSA would share this information with DNFSB and solicit its input before reaching a conclusion about the LANL proposals (NNSA 2011).

Accident analyses for the *CMRR-NF SEIS* have been updated as applicable from those analyses performed for the 2003 *CMRR EIS* (see Appendix C of the *Final CMRR-NF SEIS*).

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

> The possibility of those changes has raised questions about whether federal officials are backing away from commitments they made when the building's design received preliminary safety certification in September 2009, according to a letter Tuesday from the head of the Defense Nuclear Facilities Safety Board to the National Nuclear Security Administration. "Clearly the Board's certification relied upon the future full implementation of these final design commitments by NNSA," Safety Board Chairman Peter Winokur wrote.
>
> Congress required the Safety Board's certification in order for Los Alamos to continue spending money on the project in 2009.[31]

All DNFSB risk analyses must be considered.
All Defense Nuclear Facilities Safety Board (DNFSB) reports and recommendations should be incorporated by reference into the new SEIS. DNFSB monitors the nuclear activities of LANL. The Board has made a number of critiques and suggestions over the years that should be incorporated into the new SEIS to improve future operational safety at LANL. The effects of LANL not following DNFSB recommendations in a timely fashion should be considered. We also ask that DOE recalculate the accident scenarios and consequences used in the 2003 CMRR EIS in a manner that addresses the concerns and comments expressed by the DNFSB in the past seven years.

204-19 cont'd

The Shallow Construction Option is not mature and must not be considered as an alternative until analysis of this option is complete.
It is inappropriate to consider the Shallow Construction Option in this dSEIS. All environmental impacts of the Shallow Option are based upon assumptions that are not defensible at this time. Any evaluation of the Shallow Construction Option at this time is just wishful thinking unsupported. As this dSEIS itself states:

> The Deep Excavation Option is more mature, having undergone technical review by NNSA, NNSA's contractors, and the Defense Nuclear Facilities Safety Board. At this time, there is more uncertainty with the Shallow Construction Option. The Shallow Construction Option needs to be subjected to the same level of technical review as the Deep Construction Option so the two options can be evaluated on the same basis. (CMRR-NF SEIS, Pg. 1-13)

Most of the environmental impacts proposed in this SEIS for the Shallow Option end up being the same or similar to the Deep Option impacts. This is only speculation at this time.

Even if analyses of the Shallow Option are completed and the results are included in the final SEIS, the public will have been denied the opportunity to comment on these analyses, which is contrary to the intent of NEPA. This is unacceptable.

204-20

[31] *Safety Changes Planned for LANL*, John Fleck, Albuquerque Journal, February 10, 2011, <http://www.abqjournal.com/cgi-bin/email_reporter.pl?staff=yes>

204-20 The concerns expressed by the commentor about the Shallow Excavation Option not being a mature alternative refer to statements in Chapter 1 and Chapter 2, Section 2.6.2.1, of the *Draft CMRR-NF SEIS* indicating that there is more uncertainty in the design of the Shallow Excavation Option because that design had not reached the same level of maturity as the Deep Excavation Option. The *CMRR-NF SEIS* has been revised. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option.

Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b). The human health and environmental impacts for both the Shallow and Deep Excavation Options have been analyzed to the same level in the *CMRR-NF SEIS.* As indicated in the *CMRR-NF SEIS* and reiterated in the *Final CMRR-NF SEIS*, the Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Deep and Shallow Options cannot be constructed with the same amount of electricity.
As further evidence that the Shallow Option has not been fully vetted, some construction options are listed with the same impacts, which cannot be the case. For instance the dSEIS states that electricity (megawatt-hours per year) for construction of both deep and shallow options is the same - 31,000 mWh/yr (CMRR-NF SEIS Table 2-1). This cannot possibly be correct since they are using electric batch plants for the Deep Option. **204-21**

The proposed alternatives must be clarified and added to.
NNSA proposed three alternatives for the CMRR-NF SEIS as published in its October 1, 2010 Federal Register Notice of Intent:

No Action Alternative: The No Action alternative would be the construction of the CMRR-NF and the ancillary and support activities as announced in the 2004 [CMRR] ROD.
CMR Alternative 1: Do not construct a replacement facility to house the capabilities planned for the CMRR-NF. Continue to perform analytical chemistry, material characterization, and actinide research and development activities in the CMR Building, with no facility upgrades, while performing routine maintenance at the level needed to sustain programmatic operations for as long as feasible.
CMR Alternative 2: Same as CMR Alternative 1 but includes making the extensive facility upgrades needed to sustain CMR programmatic operations for another 20 to 30 years. **204-7 cont'd**

A new dSEIS is needed that is completely free of predetermination.
This process must be completely unprejudiced by the fact that the RULOB facility has been built, that hundreds of millions of dollars have been spent on NF design, and that the 2003 CMRR EIS, 2008 LANL Site-Wide EIS, the Complex Transformation Supplemental Programmatic EIS and the April 2010 Nuclear Posture Review have all called for construction of the NF.

We applaud NNSA's decision to undertake a supplemental environmental impact statement (SEIS) for the CMRR Nuclear Facility. But this is clearly an unusual SEIS given that CMRR's phase one, the Radiological Utility, Laboratory Office Building (RULOB, or "Rad Lab") has already been built, and further that hundreds of millions of dollars have already been spent on NF design. NNSA has not demonstrated that this is an impartial and un-predetermined process that leads to an objective decision to build the CMRR-NF or not because it has not offered real alternatives. **204-22**

We are concerned that there is ample evidence of predetermination. For example, Brigadier General Garrett Harencak, NNSA Principal Assistant Deputy Administrator for Military Application, Office of Defense Programs, when "Asked if CMRR (at Los Alamos) and UPF (at Y-12) would continue on parallel tracks, he said, "Yeah, absolutely. We're committed, the administration is committed, the NNSA is absolutely 100 percent. We're committed to build at two sites. The NPR has said and come out and told us and the administration has told us we're going to complete the design, we're going to get into

204-21 The *Final CMRR-NF SEIS* has been revised to explain the difference in electricity requirements (for example, see Table 2–3). The annual estimated electricity requirement for both construction options was rounded to two significant figures. The estimate for the Deep Excavation Option is actually somewhat higher due to the larger electrical requirements associated with producing the additional concrete required under this option (about 2,900 megawatt-hours compared to 1,100 megawatt-hours). However, the additional 1,800 megawatt-hours of electricity for increased concrete requirements work out to approximately 200 megawatt-hours per year when averaged over the 9-year construction period.

204-22 As indicated in response to earlier comments (204-3 and 204-5), NNSA's purpose and need are to provide analytical chemistry and materials characterization operations at LANL in support of all its assigned missions and NNSA does not plan to revisit previous decisions made through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644) on level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions. Please refer to Section 2.2, NEPA Process, of this CRD for more information. Thus, as noted by the commentor, the CMRR-NF design is not intended to be a generic design.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

construction and complete it by 2020 and get to work in these buildings by 2022. We are 100 percent committed to both." [32]

That sounds like predetermination.

There should be no funding for an expanded security perimeter to accommodate the Nuclear Facility until a Record of Decision (ROD) is issued for the CMRR SEIS. Similarly, any procurement activities for the NF must cease until the ROD is issued, which the draft SEIS should make explicitly clear.

To continue funding the design of the NF gives the appearance of predetermination. Final design is scheduled to begin this FY 2011. There certainly has to be enough information now to complete this SEIS competently, given that probably around $200 million has already been spent on NF design. We also contend that the NF, as currently designed, is not a generic design that can be built anywhere. It would be over-designed to address seismic issues for some possible other locations. Please discuss other possible locations that the NF, as designed, could be located. If design continues, please state how much of the current estimate is to address seismic concerns at TA-55. Please explain the rationale for continuing to design the NF while this SEIS is in progress.

If the decision to locate the NF at LANL was based on cost, this location decision must be revisited. The current estimate of ~$4 billion dollars to construct the NF is reason enough to revisit earlier decisions.

Explain why this SEIS continues before the Secretary decides whether the NF is needed or not. Explain how the capabilities that NNSA claims it needs match those provided by the proposed NF. Explain how past justifications for the NF will not prejudice the outcome of this SEIS.

204-22 cont'd

No Action Alternative - All construction and program impacts must be reexamined.
Although construction of the CMRR-NF is now called the "No Action Alternative," all the construction and programmatic environmental impacts of this proposed facility must be reexamined. Very few, if any, of the construction impacts were adequately covered in the 2003 CMRR EIS, as it said, "The new building(s) proposed for the CMRR Facility are in the conceptual design stage and, as a result, are not described in great detail in the *CMRR EIS*." (CMRR EIS, Pg. S-27.)

In effect, all parameters of the NF have changed, because the facility analyzed in the 2003 EIS was "in the conceptual design stage" and now it is designed, so all aspects of the NF must now be reanalyzed in this SEIS.

Because the current design of the NF is more mature, analyzing the exact impacts of construction is now possible. The quantities and impacts of all materials to be used and removed in the proposed construction must be stated. For example:

204-23

[32] http://blogs.knoxnews.com/munger/2010/11/harencak_mum_on_nnsa_funding_p.html

204-23 As addressed in Section 2.2, NEPA Process, of this CRD, the *CMRR-NF SEIS* is being prepared to address the environmental impacts associated with the changes in the design of the CMRR-NF due to additional seismic information. The No Action Alternative is based on the CMRR-NF as it was decided in the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967), and the environmental impacts that could result from constructing and operating it.

As discussed in Chapter 1 and Chapter 2 of the *CMRR-NF SEIS*, the 2004 CMRR-NF would not satisfy current facility seismic and nuclear safety requirements, and, therefore, would not be able to safely function at a level sufficient to fully satisfy DOE and NNSA mission needs. The analytic chemistry and metallurgical characterization capabilities that would be required in the Modified CMRR-NF are described in Chapter 2, Section 2.3 and 2.4 *CMRR-NF SEIS.*

The Modified CMRR-NF Alternative was developed to represent what the 2004 CMRR-NF would require to meet current facility seismic and nuclear safety requirements. The changes in requirements for such materials as steel and concrete included in this alternative represent the updated requirements for the CMRR-NF. As discussed in Chapter 2, Section 2.6.2.1, of the *CMRR-NF SEIS*, the additional square footage required for the Modified CMRR-NF is related to additional requirements needed to satisfy current facility seismic and nuclear safety requirements. The ancillary and support requirements referred to by the comment associated with the CMRR-NF are described in Chapter 2, Section 2.6.2.1, of the *CMRR-NF SEIS* and include such requirements as parking lots and stormwater detention ponds. The environmental impacts associated with implementing these requirements are included in the projected environmental impacts discussed in Chapter 4, Section 4.3, of the *CMRR-NF SEIS.*

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

- The total cubic yards of concrete must be stated
- The total amount of steel must be stated
- The amount of dirt to be removed and the plans for its disposition must be stated
- How have seismic issues been incorporated into the design

Please describe in detail the "ancillary and support activities" that are included in this alternative. The environmental impacts of these "ancillary and support activities" must be analyzed.

The programmatic impacts must also be reexamined. List all the proposed activities and analyze their impacts separately. Please state how many plutonium pits will be built each year. What is the total number of AC samples that the proposed NF will be capable of analyzing annually? What is the total number of MC samples that the proposed NF will be capable of analyzing annually?

What is the mission contingency space currently planned for the NF?

The 2003 CMRR FEIS stated:

> 2.4.1 AC and MC Capabilities
> These capabilities include the facility space and equipment needed to support nuclear operations... Most of these capabilities are found at the CMR Building, although a subset of AC and MC capabilities reside in the TA-55 Plutonium Facility and other locations at LANL. (CMRR EIS, p. S-27.)

Describe AC MC capabilities at TA-55, CMR, and name the other sites and the capabilities.

Did the design engineers justify more and bigger? What is the reality of the calculations of required sq footage for the NF?

204-23 cont'd

CMR Alternative 1 – Questionable Alternative
Please define "feasible." A more refined timeframe must be stated. The current status of the CMR should be declared. How many wings are closed? What is the proposed square footage of the CMR that will be used? What is the proposed square footage of the CMR that will be used to support NF operations? Will current risk reduction activities continue under this alternative? If not, the impacts of not continuing these activities must be analyzed. Will the Lab still allow deferred maintenance to grow at the CMR under this alternative (as mentioned in National Nuclear Security Administration/Readiness in Technical Base and Facilities, FY 2011 Congressional Budget Pg. 160)?

Don't forget that the new, 200,000 square feet RULOB will be ready for operations in less than two years. Since continued use of CMR is now being considered any future work done there must be explained and analyzed.

CMR Alternative 2 – A Capability Study is Required

204-24

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 33

204-24 A description of the current status of the CMR Building and its wings, including operational and risk reduction status, is provided in Chapter 2, Section 2.2, of the *CMRR-NF SEIS*. As discussed in this section, Wings 2, 3, and 4 are currently shut down and Wings 5 and 7 are currently being operated at reduced levels due to safety and seismic concerns. Wing 9 continues to perform hot cell operations. Under the Continued Use of CMR Building Alternative, the existing CMR Building would continue to be used for SNM operations until it was no longer considered safe to do so. Risk reduction activities would continue to be taken in the CMR Building as necessary, and the CMR Building would continue to receive routine maintenance and limited component replacement. RLUOB operations are considered in the analysis of the Continued Use of CMR Building Alternative in this *CMRR-NF SEIS*, as described in Chapter 2 and analyzed in Chapter 4.

NNSA disagrees with the commentor's recommendation that the use of fire-rated safes should be considered as an upgrade to the 60-year old CMR Building. Appropriate protection of SNM is only one of many upgrades that would be required at the aging CMR Building. Continuing to use the CMR Building as a Hazard Category 3 facility would not meet NNSA's stated need for action and it would prolong the use of an aging facility that NNSA has determined to be located over a fault trace resulting in significant seismic concerns. Based on public comments, Chapter 2, Section 2.7, has been revised to provide more information about various alternatives considered but not analyzed in detail as reasonable alternatives. Refer to the responses to comments 204-7 and 204-8 for more information.

As stated in the response to Comment 204-17, the cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision. If the Modified CMRR-NF Alternative were chosen by NNSA and insufficient funding was available to start construction, NNSA would continue to operate the CMR Building as evaluated under the Continued Operation of CMR Building Alternative until the building can no longer be operated safely or until adequate funding was made available.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Because continuing use of CMR is proposed, a capabilities study is needed for all programs using the CMR and PF-4. For each program, include floor space required, projected life of program, and cost for upgrades.

Should the old CMR Building continued to be used for nuclear operations then installation of new stand-alone safes for Special Nuclear Materials (SNM) should be considered. From DNFSB Los Alamos Report for Week Ending October 1, 2010:

> Plutonium Facility – Fire Protection: Six fire-rated safes have been installed in the Plutonium Facility basement. These safes have been qualified to survive bounding Plutonium Facility accident scenarios and have been credited with a damage ratio of zero, meaning that material contained in these safes do not contribute to accident source terms.

Using safes such as these in the old CMR Building should be analyzed as an option.

Better yet, removing some special nuclear materials SNM from the old CMR Building and maintaining it as a Hazard Category 3 facility instead of a Hazard Category 2 facility must be considered. This would make seismic upgrades less burdensome and expensive.

The current status of the CMR should be declared. How many wings are currently closed? What is the proposed square footage of the CMR that will be used? Will current risk reduction activities continue under this alternative? If not, the impacts of not continuing these activities must be analyzed. Will the Lab still allow deferred maintenance to grow at the CMR under this alternative (as mentioned in National Nuclear Security Administration/Readiness in Technical Base and Facilities, FY 2011 Congressional Budget Pg. 160)?

204-24 cont'd

All the proposed "extensive facility upgrades" must be listed and the impacts of these upgrades must be analyzed. The CMR Hazard Reduction (as mentioned in the National Nuclear Security Administration/ Readiness in Technical Base and Facilities, FY 2011 Congressional Budget Pg. 161) activities must be listed and the impacts of these activities must be analyzed. The CMR Risk Mitigation and Consolidation (as mentioned in the National Nuclear Security Administration/ Readiness in Technical Base and Facilities, FY 2011 Congressional Budget Pg. 160) activities must be listed and the impacts of these activities must be analyzed.

The 2004 CMRR ROD states, "However, the actual implementation of these decisions is dependent on DOE funding levels and allocations of the DOE budget across competing priorities." Please analyze the impacts of insufficient funding on estimated costs of the three proposed alternatives.

Please analyze the impacts of all current and proposed projects to extend the life of the CMR, including roofing work, exhaust fans, HEPA filters, structural and safety systems, and elevator repairs.

Please list the history of investments made in the CMR.

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Don't forget that the new, 185,000 square foot; RULOB will be ready for operations in less than two years.

Because the CMR alternative is being considered, the proposed work to be done in CMR must be stated and analyzed. The proposed work in other facilities must be stated and analyzed as connected activities.

The use of new stand-alone safes for Special Nuclear Materials (SNM) must be considered. From DNFSB Los Alamos Report for Week Ending October 1, 2010:

> Plutonium Facility – Fire Protection: Six fire-rated safes have been installed in the Plutonium Facility basement. These safes have been qualified to survive bounding Plutonium Facility accident scenarios and have been credited with a damage ratio of zero, meaning that material contained in these safes do not contribute to accident source terms.

Using safes such as these must be analyzed as an alternative.

State what Hazard Category is planned for the CMR. From the 2003 CMRR FEIS P. 2-4:

> As noted previously, NNSA and UC at LANL have restricted CMR Building operations and have reduced SNM quantities allowed within the Building. As a result, the CMR Building is currently operated as a Hazard Category 3, Security Category III facility. A Hazard Category 3 facility is designated as a nuclear facility for which a hazard analysis estimates the potential for only significant localized consequences.

Keeping the CMR as a Hazard Category 3 facility must be considered. This would make the seismic upgrades less onerous.

Cost is a factor in these decisions. From the 2003 CMRR Final EIS Pg. S-20:

> S.2.2 Alternatives Considered but Not Analyzed in Detail Extensive Major Upgrade to the Existing CMR Building for Use Beyond 2010: The proposal to complete upgrades to the existing CMR Building's structural and safety systems necessary to meet current mission support requirements for the suite of capabilities that exist in the building today for another 20 to 30 years of operations was considered and evaluated by DOE and UC at LANL in the 1998 to 1999 timeframe. This approach to maintaining these mission critical nuclear support capabilities would require a capital investment in excess of several hundred million dollars for just two of the eight CMR Building's wings. The costs of upgrading the entire structure would equal or exceed construction costs for the proposed CMRR Facility.

Now it is time to analyze this option in detail. This current estimate for the NF is now ~$5 Billion. Would this cost more than upgrading the CMR? What is the cost of upgrading just two wings of the CMR? What is the cost of upgrading the entire CMR?

204-24 cont'd

MDA C, potential release sites and the CMRR-NF.

204-25

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 35

204-25 To construct the facilities analyzed in the *CMRR-NF SEIS*, acreage could be disturbed in several technical areas in addition to TA-55 as discussed in Chapters 2 and 4. Surveys have been conducted to identify potential release sites (PRSs), and no unidentified or unexpected soil contamination or buried media have been encountered. There are, however, known PRSs located within the affected technical areas (for example, Material Disposal Area C in TA-50), and the potential for contact with contaminated soil or other media would be appropriately considered throughout the construction process. For example, PRS-48-001 is being evaluated for potential impacts resulting from actions in the TA-48/55 laydown and concrete batch plant area. Proper precautions would be taken as needed to minimize the potential disturbance of this or other PRSs. As needed, actions such as appropriate documentation and contaminant removal would be taken by LANL Environmental Restoration staff in accordance with the 2005 Consent Order and other applicable requirements.

NNSA disagrees with the commentor's opinion about the need to stop preparation of the SEIS. "Suspected" contamination in the quoted statement in Comment 204-25 refers to soil that is either discolored or has a suspicious odor. In either instance, as stated, work would stop until further investigations could be performed. Sampling the site prior to excavation, records searches, and past sampling are used to determine areas of contamination at LANL. Information would be reviewed regarding all the activities locations that would be involved in the project, should NNSA decide to proceed.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

This draft SEIS should be withdrawn until:

- Soil and pore gas samples can be taken in affected areas for each of the alternatives considered where excavation and soil disturbances will take place.
- These samples are thoroughly analyzed and the results are posted, in the spirit of verification, to the publically available RACER database.
- The sampling locations where MCL exceeds standards are plotted on the SEIS "Affected Areas" map
- The effect on VOC plume migration of surfaces exposed during excavation is examined.

> This CMRR-NF SEIS evaluates the potential direct, indirect, and cumulative environmental impacts associated with the alternatives analyzed. (Pg. iv)
>
> 10.1 Provide information on any PRS by TA that may be encountered during construction and any plans for what steps will be taken in the event a PRS is encountered.
>
> MDA C (located east of CMRR Project areas) was investigated for potential impacts to planned and proposed actions in TA-55. No contamination from this PRS exists in the CMRR Project areas in TA-55 or nearby areas currently being considered under the planned and proposed actions. [33]

Not true! The RACER database shows VOCs in pore gas samples in TA-50. Is this where construction activity and relocation of the roadbed will take place as connected to the Modified CMRR-NF Alternative?

204-25 cont'd

The RACER database also reveals that there were no pore gas samples taken at the actual site of the excavation of the NF. For either excavation option the VOCs that are known to be in the pore gas of soil nearby (a few hundred yards) and can migrate relatively quickly, could currently be present at the proposed excavation site. Additionally the surfaces exposed during excavation could hasten the migration of the plume in that direction just as the canyon walls are known to do.
The dSEIS states;

> The 20-acre (8.1-hectare) site in TA-48/55 that would be required for the Modified CMRR-NF Alternative construction is mostly developed and previously disturbed land. There is a potential release site (PRS 48-001) that may affect a small portion of the TA-48 area proposed for use as a laydown area.
>
> During site development of the nearby area, if contamination is suspected, work would be stopped, characterization performed, and the necessary action and disposition completed. The extent of the potential release site is currently being evaluated; appropriate construction and operation measures would be

[33] CMRR-NF Project and Environmental Description Document Unclassified/Pre-decisional Information, p 26.

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

> employed to minimize potential disturbance of contaminated soils or other effects on the potential release site. P. 22.

What does "suspected" mean? Work on site prep should be stopped now until samples can be taken and thoroughly analyzed.

If the extent of the potential release sites is still being "evaluated" then the SEIS must be withdrawn until that evaluation is complete and the results publically posted.

> Construction Impacts – Deep Excavation and Shallow Excavation Options—Under either construction option, acreage would be disturbed in several technical areas in addition to TA-55. Surveys have been conducted to identify potential release sites (PRSs), and no unidentified or unexpected soil contamination or buried media have been encountered (LANL 2010c).

What sort of surveys and where? There is no record in the RACER database of samples being taken and analyzed from the excavation site. The reference document cited to support this statement concerns impacts to spotted owls, not soil and pore gas sampling.

> There are, however, known PRSs located within the affected technical areas (for example, Material Disposal Area [MDA] C in TA-50), and the potential for contact with contaminated soil or other media would be appropriately considered throughout the construction process. For example, PRS-48-001 is being evaluated for potential impacts resulting from actions in the TA-48/55 laydown and concrete batch plant area. dSEIS p. 4-6.

The SEIS must be withdrawn until the results of evaluating PRS-48-001 and ALL other sites in the affected area can be incorporated into the Statement.

> Proper precautions would be taken as needed to minimize the potential disturbance of this or other PRSs. As needed, actions such as appropriate documentation and contaminant removal would be taken by the LANL Environmental Restoration Program in accordance with the 2005 Consent Order7 and other applicable requirements. dSEIS, p. 4-56

How would removal of an as yet unknown quantity of material affect the budget and timeline of the project? Where would the material go? What additional impacts would result from this process? The SEIS must be withdrawn until these connected actions are known and documented.

204-25 cont'd

dSEIS must analyze the impacts of air quality of the CMRR-NF project on Bandelier.
LANL is adjacent to the PSD [Prevention of Significant Deterioration] Class I Bandelier National Monument. There is no mention of any impacts to this Class 1 area in the SEIS. The only mention of PSD is in the glossary. PSD is designed to preserve, protect, and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value.

204-26

204-26 As a result of public comments on the *Draft CMRR-NF SEIS*, the air quality sections of Chapter 4, Section 4.3.4 and 4.4.4, of the *CMRR-NF SEIS* have been updated to indicate that, based on the air quality modeling done in support of the *CMRR-NF SEIS*, none of the alternatives would have an adverse impact on air quality at Bandelier National Monument.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

Volcanic eruption impacts must be analyzed.
Reference *Preliminary Volcanic Hazards Evaluation for Los Alamos National Laboratory Facilities and Operations Current State of Knowledge and Proposed Path Forward, Issued: September 2010, LA-14426*, states, "The integration of available information on the volcanic history of the region surrounding Los Alamos National Laboratory (LANL or the Laboratory) indicates that the Laboratory is at risk from volcanic hazards." [34]

204-27

This dSEIS must be withdrawn and reissued when all known seismic hazards are addressed.
We have learned that new seismic analyses are being conducted at the Lab. This dSEIS is certainly premature until current seismic investigations are concluded. Even if current seismic investigations are completed and the results are included in the final dSEIS, the public will have been denied the opportunity to comment on the results. Pushing ahead with the CMRR-NF project without having the seismic risks in hand is what led to the need of this dSEIS. This is an on-going problem. A renewed decision to proceed with the Nuclear Facility at LANL was made in 2008 even though it was known that new seismic information would change the underlying assumptions of that decision as the Record of Decision states:

> New information about seismic risks at LANL (set forth in the report Update of the Probabilistic Seismic Hazard Analysis and Development of Seismic Design Ground Motions at the Los Alamos National Laboratory, 2007, LA–UR–07–3965) may change how hazardous materials are stored, operations are conducted, and facilities are constructed or renovated. NNSA is conducting a systematic review of LANL structures and operations in light of this information. This review, expected to be completed in about one year, will identify any necessary changes to address the new seismic information. NNSA will then implement the necessary changes to LANL facilities and operations based on the review's recommendations. (Record of Decision: Site-Wide Environmental Impact Statement for Continued Operation of Los Alamos National Laboratory, September 26, 2008)

DOE, NNSA, and LANS continue to roll the dice with the seismic risks at the CMRR-NF. If the seismic risks are understated, an earthquake could bring the Nuclear Facility down releasing its stock of plutonium into the environment. If the seismic risks are overstated, billions of dollars will be spent for no reason. Proceeding without knowing the exact seismic risks would represent a flagrant disregard of taxpayers' interests.

> Although project areas TA-3 and TA-55 have been mapped in detail for the presence of faults, areas showing no faulting on dSEIS Figure 3–5 do not necessarily represent an absence or lack of faulting. Large eastern and southern areas of LANL have not yet been mapped in detail for seismic hazards. Additionally, faults are only shown in areas where such faults are exposed or inferred. The end of a fault line on a map does not necessarily indicate

204-28

[34] Pg. vii, http://www.osti.gov/bridge/product.biblio.jsp?query_id=0&page=0&osti_id=991237&Row=0)

204-27 NNSA agrees that volcanic eruption impacts should be analyzed and has made revisions. In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapter 3 and 4 (Sections 3.5.1 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2011e).

204-28 NNSA notes the commentor's position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations as discussed in the response to Comment 204-5.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

> truncation of a fault, but may be indicative of the end of surface exposure or lack of evidence of a fault at that location. This scenario is common in urbanized areas or in areas where faults have been buried by younger sediments. Confirmation of the presence or absence of a fault at a particular site, that is, at the end of mapped fault lines, may require further site-specific detailed geologic investigations, even though mapping may already have occurred at that location. (Pg. 3-22)

It seems that the Lab infers liberally and maps when it is convenient. Steep topography on the Pajarito fault made field measurements difficult and the Rendija Canyon and Guaje Mountain faults have not been fully characterized or mapped. The Rendija and Guaje faults must be fully mapped. The inferred fault at TA-3 must be fully mapped. The original conclusions about the inferred fault under CMR were based on only 8 boreholes. Where is the trench across the inferred fault at CMR?

To address these increased seismic hazards, DOE now plans to excavate 250,000 cubic yards of earth under the proposed Nuclear Facility and fill the hole with concrete for the Deep Option. DOE must address the following questions: Is surrounding geology strong enough to support all that concrete? How much will the Nuclear Facility and all that concrete weigh? Has construction of a facility ever been done before on such an enormous concrete slab? If so, what were the results? Will a seismic event cause it to sink or shift? This dSEIS is analyzing the effects of this action, and this dSEIS should also examine the effects of removing it. Have these original design concerns been met?

> Design Concerns Arising from Ground Conditions - The existing properties of Qbt3L, coupled with its vertical proximity to the CMRR foundation grade and its lateral proximity to the slope of Two-Mile Canyon, have led to potentially significant issues for the design team and the PRT. The five design concerns are:
> · potential for static deflection (compression),
> · potential for hydro-collapse due to wetting,
> · potential for excessive movement of buttress due to dynamic slope instability,
> · inadequate resistance to dynamic sliding forces, and
> · seismic shaking and building response. (Kleinfelder 2010a, p. 2)

204-28 cont'd

This dSEIS must be withdrawn and not rereleased until all issues with the seismic modeling software used are addressed.
Basic assumptions concerning the safety and location of the Nuclear Facility were based upon seismic modeling software. It turns out that questions concerning the accuracy of one of these programs have arisen. The Defense Nuclear facilities Safety Board (DNFSB) stated:

> Seismic analysis and design of high-hazard Department of Energy (DOE) defense nuclear facilities requires evaluation of soil-structure interaction (SSI) effects between the building and its supporting soil. The computer program SASSI (A System for the Analysis of Soil-Structure Interaction) is used extensively for this purpose within the DOE complex, as well as in the commercial nuclear power industry. Recently, SASSI users have identified

204-29

requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The Kleinfelder report accounts for the weight of the building and demonstrates that the bearing capacity of the soil (20,000 pounds per square foot [97.600 kilograms per square meter]) is substantially greater than the pressure due to the building (4,850 pounds per square foot [23,700 kilograms per square meter]) for the Shallow Excavation Option (Kleinfelder 2007a). Under the Deep Excavation Option, the addition of 60 feet (18 meters) of low-slump concrete would increase the weight of the building by about 980 million pounds (440 million kilograms). The weight of the soil that would be removed for this deeper excavation is estimated to be about 740 million pounds (340 million kilograms). Under the Deep Excavation Option, the building would sit on rock and there are not similar concerns related to allowable bearing pressure of the soil under this option as opposed to the Shallow Excavation Option. A draft slope stability analysis has been prepared that indicated that global slope stability is not an issue for the Deep Excavation Option (LANL 2011a: LANL site, 028). If the Deep Excavation Option were selected, as part of the ongoing design and evaluation process, studies would be completed to verify that all geotechnical stability issues had been addressed. See the response to Comment 204-20 for additional information regarding the two excavation options under consideration for the Modified CMRR-NF.

204-29 For seismic analysis and design of high-hazard DOE nuclear facilities, the computer program SASSI [A System for the Analysis of Soil-Structure Interaction] has been used for evaluation of soil-structure interaction (SSI) effects between a building and its supporting soil. CMRR-NF engineers are aware of the issues that have been raised by the DNFSB with respect to the SASSI computer code. Engineers performing the soil structure interaction analysis of CMRR-NF originally identified the technical issues associated with SASSI's subtraction method of analysis. For the SSI analysis of CMRR-NF, a study has been performed utilizing a representative model of the Modified CMRR-NF and site that compares the SASSI direct solution, subtraction method and modified subtraction method. Results of the study validate that the modified subtraction method provides results consistent with the direct solution

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

> significant technical and software quality assurance issues with this software. In August 2010, the Los Alamos National Laboratory (LANL) published LA-UR-10-05302, Seismic Response of Embedded Facilities Using the SASSI Subtraction Method, identifying issues with the SASSI subtraction method, which is extensively used in DOE's design and construction projects. The Defense Nuclear Facilities Safety Board (Board) is concerned that these issues could lead to erroneous conclusions that affect safety-related structural and equipment design at DOE defense nuclear facilities. (April 8, 2011 Letter, DNFSB Chairman Peter S. Winokur to the Honorable Daniel B. Poneman, Deputy Secretary of Energy)

We know that SASSI was used for designing the NF because of this statement from the 2001 Probabilistic Seismic Hazards Analysis:

> For vertical motions, a site-specific 2D SASSI study for a CMRR layered profile performed by Costantino and Houston (2005) … (Probabilistic Seismic Hazards Analysis \ LOS ALAMOS-LANL\ UPDATED REPORT_FINAL.DOC\21-JUN-07\ Pg. 6-6)

The DNFSB is currently awaiting a DOE review of the quality of SASSI modeling results. Until the DOE review is complete and the DNFSB agrees with those results, this dSEIS must be put on hold.

204-29 cont'd

This draft dSEIS underestimates and misrepresents seismic hazards.
The draft statement used a value of 0.3 G as the peak ground acceleration value for the vertical plane, and not the value 0.6 G presented in the 2007 LANL Probabilistic Seismic Hazard Analysis. Design work has focused on 7.3 Richter scale earthquakes, but analogous earthquakes indicate that design should be increased to a minimum of 7.5. LANL scientists recommended further seismic studies in three key seismic reports written in 1995, 2007 and 2009. But those studies were not done. As a result, assumed values for six key parameters were inserted into computer programs to estimate the seismic hazard for the design of the proposed Nuclear Facility.

204-30

We incorporate by reference the report, *Public Comments of Robert H. Gilkeson, Registered Geologist, and Concerned Citizens for Nuclear Safety (CCNS) about the DOE 2011 draft Supplemental Environmental Impact Statement for the proposed Chemistry and Metallurgy Research Replacement Nuclear Facility (CMRR-NF) at the Los Alamos National Laboratory (LANL) Technical Area-55 (TA-55) Robert H. Gilkeson, Joni Arends, June 28, 2011.* A new dSEIS should reflect the voluminous information therein.

204-31

The shallow construction option is not mature and must not be considered as an alternative until analysis of this option is complete.
It is inappropriate to consider the Shallow Construction Option in this dSEIS. All environmental impacts of the Shallow Option are based upon assumptions that are not defensible at this time. Any evaluation of the Shallow Construction Option at this time is just wishful thinking unsupported. As this dSEIS itself states:

204-20 cont'd

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 40

results. Direct solution results are considered to be the benchmark solution. The modified subtraction method has been implemented for use on the CMRR-NF SASSI analysis. The DNFSB staff has evaluated the Seismic Design Plan and the Structural Design Plan in relation to DNFSB certification to Congress that its concerns regarding safety-class systems and seismic issued related to the CMRR-NF have been addressed. The DNFSB certified that relying on full implementation of commitments made by NNSA concerning safety-related processes, structures, systems, and components with regard to preliminary design, including design requirements and design processes, and final design, including development of design requirements into final design elements, that its concerns regarding the design of the CMRR were resolved (DNFSB 2009).

204-30 Based on an apparent typographical error in the 2007 PSHA Executive Summary (LANL 2007), the vertical peak ground acceleration for the CMRR-NF was incorrectly cited as 0.3 *g* instead of 0.6 *g* in the *Draft CMRR-NF SEIS*. This error has been corrected. This typographical error in the Executive Summary of the PSHA is not reflective of information presented elsewhere in the PSHA and was not used in the design of the proposed Modified CMRR-NF.

Design work has been performed in accordance with DOE Order 420.1B and its implementing standard, DOE Standard 1020-2002, with oversight and certification by DNFSB. (The 2009 DNFSB certification addressed seismic issues.) NNSA continues to work with DNFSB to ensure that the proposed CMRR-NF design meets with DNFSB expectations. Refer to the response to Comment 204-28 for more information related to seismic concerns.

204-31 The comments put forth in the referenced report have been responded to in this CRD. See responses to Comment letters 241 and 315.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

> The Deep Excavation Option is more mature, having undergone technical review by NNSA, NNSA's contractors, and the Defense Nuclear Facilities Safety Board. At this time, there is more uncertainty with the Shallow Construction Option. The Shallow Construction Option needs to be subjected to the same level of technical review as the Deep Construction Option so the two options can be evaluated on the same basis. (CMRR-NF SEIS, Pg. 1-13)

Most of the environmental impacts proposed in this SEIS for the Shallow Option end up being the same or similar to the Deep Option impacts. This is only speculation at this time.

Even if analyses of the Shallow Option are completed and the results are included in the final SEIS, the public will have been denied the opportunity to comment on these analyses, which is contrary to the intent of NEPA. This is unacceptable.

204-20 cont'd

Deep and shallow options could not be constructed with the same amount of electricity.
As further evidence that the Shallow Option has not been fully vetted, some construction options are listed with the same impacts, which cannot be the case. For instance the dSEIS states that electricity (megawatt-hours per year) for construction of both deep and shallow options is the same - 31,000 mWh/yr (CMRR-NF SEIS Table 2-1). This cannot possibly be correct since they are using electric batch plants for the Deep Option.

204-21 cont'd

Explain why LANL is still the best site for the Nuclear Facility.
The 2003 CMRR EIS was completed before the 2007 Probabilistic Seismic Hazard Analysis. One of the main requirements of DOE O 420.1b is to choose an appropriate site. It is not now clear that LANL is the appropriate site for the NF. Because of this, design overly-relies on the other requirements for defense in depth. Describe, in detail, how the design of the NF addresses the list of defense in depth requirements and the environmental impacts of these requirements. The specific DOE Order states:

> 3. REQUIREMENTS.
> b. Nuclear Facility Design.
> (1) Nuclear facility design objectives must include multiple layers of protection to prevent or mitigate the unintended release of radioactive materials to the environment, otherwise known as defense in depth. These multiple layers must include multiple physical barriers unless the basis for not including multiple physical barriers is documented in the DSA and approved by DOE.
> (2) Defense in depth must include all of the following—
> (a) choosing an appropriate site;
> (b) minimizing the quantity of material at risk;
> (c) applying conservative design margins and quality assurance;
> (d) using successive physical barriers for protection against radioactive releases;
> (e) using multiple means to ensure critical safety functions needed to—
> 1 control processes,
> 2 maintain processes in safe status, and

204-32

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 41

204-32 The decision to construct a replacement facility for the existing CMR Building at LANL was made through the 2003 *CMRR EIS* (DOE 2003b) and the 2008 *Complex Transformation SPEIS* (DOE 2008b). The Probabilistic Seismic Hazards Analysis referred to by the commentor was available at the time the *Complex Transformation SPEIS* was being completed. The 2003 *CMRR EIS* also addressed construction and location alternatives and options for the CMRR Facility within LANL. The CMRR-NF is being designed consistent with DOE requirements for nuclear safety, including those in DOE Order 420.1B. Safety-related considerations such as design, construction, and operating parameters are subject to independent oversight by DNFSB. NNSA believes that LANL is still the appropriate site for conducting plutonium work, and that TA-55 is the appropriate place to consolidate that work at LANL. The CMRR-NF is being designed with defense in depth at the forefront of the design effort. The changes in the CMRR-NF design between 2003 and the current time reflect NNSA's commitment to safety and its determination to design a facility that will be able to operate safely and protect workers and the public from the unintended release of radioactive materials.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

3 confine and mitigate the potential for accidents with radiological releases;
(f) using equipment and administrative controls that—
1 restrict deviation from normal operations,
2 monitor facility conditions during and after an event, and
3 provide for response to accidents to achieve a safe condition;
(g) providing means to monitor accident releases as required for emergency response; and
(h) establishing emergency plans for minimizing the effects of an accident.
(3) Hazard category 1, 2, and 3 nuclear facilities must be sited, designed, and constructed in a manner that ensures adequate protection of the health and safety of the public, workers, and the environment from the effects of accidents involving radioactive materials release. (DOE O 420.1B Attachment 2, 12-22-05, p. I-2.)

The Nuclear Facility was not sited with defense-in-depth in mind. As a matter of fact, the location is so dangerous that design and construction need to make up for the risks at the site. It is unclear if that can happen.

204-32 cont'd

References must be given with sufficient detail that they can be thoroughly checked.
When a statement within the draft SEIS is referenced to a supporting document a shortened name is used and no page number is cited. A reviewer must use the index to know the name of the document(s). Even then, the search for verification is complex without a detailed citation like any high-school student is expected to be capable of including in scholarly research.

For instance, the reference "LANL 2011" is used 46 times in the dSEIS. Looking at the online reference documents, one will find that the reference document labeled "LANL 2011" is actually 24 separate documents. In some cases a reference points to a photocopied supporting document numbering several hundred pages without citing a section or page number. Since the photocopied document cannot be word-searched the entire document would have to be visually scanned by the reviewer in order to check the reference. Page numbers for the references must be given so that they can be checked in a timely manner in order to complete the review within the short comment period. For this reason the SEIS must be withdrawn, rewritten, and re-released.

Reference documents must be correctly cited and publically available at the time of the release of the draft SEIS.
A statement in the Draft SEIS that is about Operations Impacts references (LANL 2010c), which is about Biological Assessment Summaries and is not the correct reference. Here's the quote:

> Operations Impacts—Projected annual waste generation rates for operations at the Modified CMRR-NF and RLUOB are summarized in Table 4–34 (LANL 2010c), "LANL 200b" is not referenced in the Draft SEIS but is included in the supporting documents. (CMRR-NF dSEIS Pg. 4-58)

The (LANL 2010c) reference mentioned above is about Biological Assessment Summaries and is not the correct reference. The word "waste" is not in that document.

204-33

204-33 It is not necessary to provide page numbers for reference documents. In the *Final CMRR-NF SEIS*, for the convenience of the reader, subsections within the reference "LANL 2011" are provided.

To the extent practicable, NNSA made references available on the Internet, except where limited by copyright or security concerns. As with other elements of the public comment process, this was consistent with past practices for other LANL NEPA documents. In addition, the comment period was extended by 15 days and all late comments were considered in developing the *Final CMRR-NF SEIS*. Problems with links to references that may have been experienced during the public comment period were corrected as soon as they were identified. In addition, the references were placed in five DOE Public Reading Rooms in the area surrounding LANL and one in Washington, D.C., as identified in Chapter 9 of the *CMRR-NF SEIS* and the Notice of Availability for the *Draft CMRR-NF SEIS* (76 FR 24018) published on April 29, 2011. Refer to Section 2.2, NEPA Process, of this CRD for additional information.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

Following the official release of the Draft SEIS the Reference Documents were not available in their entirety. It was more than a week later before all of the documents were made available. The comment period should not commence until all the supporting material is available to the public.

The Draft SEIS is so capriciously written and so shoddily documented that the reviewer questions the seriousness of the Agency's attempt to comply with NEPA in their haste to rush through a Record of Decision.

204-33 cont'd

Tribal notes must be included.
Tribal notes, similar to the *Greater Than Class C* EIS, must be included in this dSEIS. As the GTCC EIS states:

> DOE and Tribal Representatives have been working cooperatively over the last decade to improve consultation and communication related to decision making. This is an ongoing dialog, and DOE is committed to formal and meaningful consultation and interaction, at the earliest practical stages in the decision-making process, consistent with DOE's American Indian and Alaska Natives Tribal Government Policy (DOE Order 144.1). (Pg. 1-48)

These Tribal Nations participated in the GTCC EIS consultation activities**:**

- Acoma Pueblo, Acoma, NM
- Cochiti Pueblo, Cochiti, NM
- Jemez Pueblo, Jemez, NM
- Laguna Pueblo, Laguna, NM
- Nambe Pueblo, Santa Fe, NM
- Pojoaque Pueblo, Santa Fe, NM
- Santa Clara Pueblo, Española, NM
- San Ildefonso Pueblo, Santa Fe, NM

The tribal text is included in text boxes in throughout the GTCC EIS and full narrative texts are provided in an Appendix. This CMRR-NF dSEIS must be withdrawn and re-leased after Tribal Notes are included.

204-34

Describe the current status of plutonium shipping.
It is clear that LANL scientists must integrate closely with the work to be performed in the CMRR and this is used as a justification for co-location. The precedent of successfully working with SNL, LLNL, NTS, PTX, etc has already been set.

Please describe the current status of Pu shipments. Are Pu samples shipped to other DOE nuclear complex sites? Are any of these shipments because samples are being analyzed offsite? Is Pu shipped for experiments at other facilities? Any and all shipments must be analyzed in the SEIS. Is shipment of Pu a required capability for NNSA, independent of CMRR? If so, why must the CMRR be co-located with PF-4? Will the Lab have larger capacity with the NF as opposed to shipping the samples offsite? Will the NF be safer than shipping these samples? Will the NF cost more than shipping these samples?

204-35

All impacts of NF construction on the Consent Order must be analyzed.
Cleanup of the existing mess must be the priority – not the new Nuclear Facility.

204-36

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
***July 5, 2011 • Page** 43*

204-34 Additional information has been added to Chapter 5, Section 5.7, Consultations with Agencies and Federally Recognized American Indian Nations, of the *Final CMRR-NF SEIS*. Tribal notes are not a required part of NEPA documents; however, they are a desirable addition to any NEPA analysis.

204-35 Shipments of actinides and other radioactive materials to and from LANL would occur as part of performing a variety of stockpile stewardship and other activities at multiple LANL facilities. The 2008 *LANL SWEIS* (DOE 2008a) addresses impacts from transporting these materials.

204-36 As addressed in Section 2.5, Cleanup and Waste Management, of this CRD, funding decisions on major Federal programs and projects at LANL, such as environmental restoration activities, are made by Congress and the President, and are beyond the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. However, NNSA does not consider compliance with the Consent Order optional and is not linking Consent Order compliance with decisions about constructing and operating the proposed CMRR-NF. NNSA intends to continue conducting the environmental restoration program at LANL regardless of whether it decides to construct and operate the proposed CMRR-NF as analyzed in the *CMRR-NF SEIS*. Closure of Material Disposal Area C and Material Disposal Area G will take place consistent with the Consent Order process, in accordance with decisions reached by NMED. For information on the annual progress of LANL's ongoing environmental restoration program, refer to LANL environmental surveillance reports, which can be accessed at http://www.lanl.gov/environmental/all/docs/reports/.

A minor realignment of Pajarito Road would be carried out as part of construction of the Modified CMRR-NF as described in Chapter 2, Section 2.6.2.1. The impacts of this realignment are included as part of the overall analysis of impacts in the *CMRR-NF SEIS*.

The commentor refers to the planned construction of a new transuranic waste staging area along the Pajarito Corridor at TA-63, to characterize and certify transuranic waste for offsite disposal. The new facility was addressed in the 2008 *LANL SWEIS* (DOE 2008a) and will replace a number of buildings and fabric domes at TA-54. Design work for the facility is ongoing. NNSA expects that transuranic waste generated at the CMRR-NF would be packaged at the CMRR-NF and characterized and certified at the new transuranic waste staging area at TA-63. Characterization and certification of transuranic waste could also take place at the CMRR-NF or another LANL or offsite location.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

DOE made a commitment to cleanup the legacy waste sites at LANL when it signed the Consent Order with the New Mexico Environment Department on March 1, 2005. The Order requires cleanup of certain sites by December 31, 2015. Analyze the impacts of construction activities for NF on cleanup activities, including those at the nearby Material Disposal Area C (MDA C).

- DOE proposes to realign Pajarito Road in order to accommodate the new NF. Impacts of this realignment must be included in this SEIS
- Impacts on possible excavation of MDA C must be analyzed as a connected action to the realignment.
- The closure plans for MDA C and MDA G have not been decided. How can the impacts to the closure plans of these, or any site, be known until the closure plan itself is known?
- Impacts on proposed waste operations at TA-63 must be analyzed.
- Explain how it is known that that all Consent Order milestones will be met while $5 billion is being spent on construction of the NF.

We request that construction on the NF not start until all requirements of the Consent Order are met.

204-36 cont'd

Present waste processing and disposal facilities are failing and must be analyzed as connected actions.
DOE must analyze impacts to all other facilities that are required to support operations at the NF. Uncertainties surround the current support facilities. For example,

- DOE recently postponed a new Radioactive Liquid Waste Treatment Facility because the estimated costs increased from $100 million to $350 million;
- DOE's plans for a 63-acre expansion for low-level radioactive waste have been delayed for years; Area G will be closed in 2015 under the Consent Order; and
- DOE proposed a new Transuranic Waste Facility (TRUWF) to replace operations at Area G, but subsequently withdrew the proposal.

DOE must fully analyze all alternatives, including no construction of the NF, if these facilities are not available.

From the Final Complex Transformation SPEIS October 2008 Summary Pg. S-38:

> S.3.4.1.2.1 Los Alamos Upgrade Alternative
> Los Alamos could support pit production requirements using existing and/or new facilities at TA-55, which is the current site for the Plutonium Facility (PF-4). The planned CMRR Facility would be located in TA-55. In addition, LANL has several existing and planned facilities, all of which are included in the No Action Alternative, capable of supporting plutonium operations, including: the Radioactive Liquid Waste Treatment Facility, the solid waste characterization and disposal site (in TA-54), the Sigma Building (in TA-03), the Radiochemistry Facility (in TA-48), a new radiography facility (in TA-55), and a new solid-waste staging facility.

These facilities are examples of facilities that must be included in this SEIS. Upgrades to the electrical system are connected actions and must be analyzed!

204-37

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 44

204-37 As summarized in Section 2.5, Cleanup and Waste Management, of this CRD, the CMRR-NF and RLUOB would be designed, constructed, and operated to accommodate their projected waste volumes. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. The impacts associated with transportation of radioactive and nonradioactive wastes to offsite treatment or storage facilities have been estimated for all alternatives (see Chapter 4, Sections 4.2.13, 4.3.13, and 4.4.13). It is expected that waste transportation would occur using trucks, and standard and available types of containers (for example, drums, boxes) and shipping packages (for example, TRUPACT II).

Regarding the concerns expressed about LANL support facilities:

- DOE expects that RLWTF will be available to treat liquid wastes generated from various LANL facilities, using the existing capabilities of RLWTF or any future upgrades (DOE 2008a).
- Only a 63-acre portion of Area G containing Material Disposal Area G and other waste disposal and management capabilities would be closed consistent with remediation decisions reached by NMED for Material Disposal Area G pursuant to the 2005 Consent Order. Waste management operations would be transitioned to other LANL locations. For example, the transition of low-level radioactive waste disposal operations to Zone 4 within Area G was assessed in the 2008 *LANL SWEIS* (DOE 2008a). As noted in the *CMRR-NF SEIS*, low-level radioactive waste disposal may occur at Area G or at offsite DOE or commercial locations. (The *CMRR-NF SEIS* conservatively analyzes transportation impacts assuming all low-level radioactive waste is transported off site for disposal.)
- The CMRR-NF would be designed, constructed, and operated to accommodate the projected transuranic waste volumes for the facility. NNSA expects that required characterization and certification to meet transuranic waste disposal criteria would be performed at the planned new transuranic waste facility at TA-63. LANL began preliminary design of the new facility at TA-63 in October 2010, with completion targeted for the end of 2015. Impacts from transitioning transuranic waste support activities from TA-54 to TA-63 were addressed in the 2008 *LANL SWEIS* (DOE 2008a). Characterization and certification of transuranic waste could also take place at the CMRR-NF or another LANL or offsite location.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

Where will the wastes go?
To use DOE terminology: what is the "Path Forward?" Given the anticipated lack of disposal facilities for low-level radioactive, toxic, and hazardous waste at LANL, DOE must detail where that waste will be disposed, how it will be transported to an off-site facility, and the impacts to the communities along the route. Please describe the routes. DOE must specify how many shipments will occur by truck, train, or barge. Further, it must specify how many shipping containers will be needed, their costs, and whether they already exist or whether new containers will have to be developed and manufactured. WIPP closes in 2035. ***204-37 cont'd***

Any analysis must include DD&D of the existing CMR Building.
The 2004 Record of Decision (ROD) for the CMRR Project stated the existing CMR building would be DD&D'd in its entirety. However, the actual implementation of these decisions is dependent on DOE funding levels and allocations of the DOE budget across competing priorities, including construction of a new NF.

At the time it was built, the existing CMR was the largest building in New Mexico at 550,000 square feet. The 2004 ROD stated DOE would submit a work plan; but it does not specify to whom the work plan would be submitted. DOE must provide its DD&D work plan as part of its NEPA analysis. We will review the plan now in order to ensure that the DD&D activities will become part of the complete NEPA analysis. ***204-38***

Update impacts to endangered species.
Include impacts to the Mexican Spotted Owl. The effects on the spotted owl of the extremely high pore gas samples for many solvents in TA-50 core zone must be analyzed. ***204-39***

Update the status of compliance with all applicable federal, state and local statutes and regulations.
Include all international agreements, and required Federal and State environmental permits, consultations, and notifications.

- What portions of the NF will need to be RCRA permitted?

204-40

Intentional destructive acts must be independently evaluated.
Provide a reference to an analysis that substantiates that the probability of an airplane crash during overflight does not exceed 10-6/yr (i.e., one in a million) conservatively calculated.

There needs to be a rigorous independent review of this document by an independent professional organization in order to increase public confidence in the conclusions, which a new dSEIS should incorporate.

Provide an unclassified overview of the classified appendix, omitting details, but including at least answers to the following questions:
a. Does the appendix include consideration of attacks using aircraft?
b. In determining risks from terrorist attacks, does the appendix assume continued funding for government agencies other than NNSA, such as the Transportation Security Administration?
c. Does the appendix estimate the consequences of a successful terrorist attack? If so, ***204-41***

- As discussed in Chapters 2 and 4, adding to or modifying the existing electrical distribution infrastructure at LANL to support the requirements of the proposed CMRR-NF are analyzed in the CMRR-NF SEIS (for example, adding an electrical substation to TA-50).

204-38 To the extent known, impacts associated with DD&D of the existing CMR Building are analyzed in Chapter 4, Section 4.5.1, of the *CMRR-NF SEIS*. As indicated in the 2004 ROD associated with the *CMRR EIS* (69 FR 6967), the actual implementation of DOE's decision to DD&D the existing CMR Building would depend on DOE funding levels and allocations of the DOE budget across competing priorities. It should also be also noted that DOE is conducting a risk reduction effort at the existing CMR Building, which includes removal of some existing equipment and contamination. These efforts will reduce the levels of impacts from eventual DD&D of the CMR Building. As stated in Chapter 1, Section 1.7, of the *Draft CMRR-NF SEIS* in response to a similar scoping comment and as stated in the 2004 ROD, a work plan for DD&D would be prepared at the appropriate time; however, it is not required for NEPA analysis and is not available to be included as a part of this document. Detailed planning and analysis is not practical at this point because this work is potentially 10 or more years in the future.

204-39 Impacts on endangered species are evaluated in Chapter 4, Section 4.3.7.4, of the *CMRR-NF SEIS*. LANL is responsible for ensuring that all activities are reviewed for compliance with all applicable site plans that are found in LANL's *Threatened and Endangered Species Habitat Management Plan*, which was updated in April 2011 (LANL 2011b). The plan includes Areas of Environmental Interest for the Mexican spotted owl and the southwestern willow flycatcher. In addition to consultation with U.S. Fish and Wildlife Service (See Chapter 5, Section 5.7), owl surveys are done annually. No Mexican spotted owls have been observed in any potentially impacted areas where construction activities would occur, including in TA-50. In addition, the gas sampling referred to by the commentor is related to investigations associated with remediation of Material Disposal Area C in TA-50 and is not related to areas of TA-50 that would be effected by the proposed construction of the CMRR-NF at TA-55. Refer to Chapter 3, Section 3.7.4, of the *CMRR-NF SEIS*.

204-40 Chapter 5 of the *CMRR-NF SEIS* summarizes environmental requirements, agreements, and permits that relate to consolidation and relocation of mission-critical chemistry and metallurgy research capabilities at LANL. Compliance

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

have these potential consequences been brought to the attention of the President and Congress for consideration in decisions on nuclear weapons policy?

Provide a rigorous independent review of the classified appendix by an independent professional organization with appropriate clearances and include in the SEIS an unclassified summary of that assessment. Please include the identity of the organization and the amount budgeted for the review as an assurance that the review is independent and thorough.

What emergency response services are going to be available should a successful attack happen? What will be the impacts of an accident or attack during transportation? What emergency response services are going to be available should this happen?

204-41 cont'd

The JASON report on *"rare events" in the analysis of intentional destructive acts* must be considered.
Describe the Intentional Destructive Acts models used in this dSEIS. From the JASON Report:

> "Rare events" specifically refers to catastrophic terrorist events, including the use of a weapon of mass destruction or other high-profile attacks, where there is sparse (or no) historical record from which to develop predictive models based on past statistics…One problem is that rare events are rare. There will necessarily be little or no previous data from which to extrapolate future expectations in any quantitatively reliable sense, or to evaluate any model. In the extreme, how can the probability of an event that has never been seen or may never even have been imagined be predicted?... There is no credible approach that has been documented to date to accurately anticipate the existence and characterization of WMD-T threats…The combined urgency of the rare event threat, the difficulty of evaluating rare event models, and the complexity of social sciences problems has led some to advocate the suspension of normal standards of scientific hypothesis testing, in order to press models quickly into operational service. While appreciating the urgency, JASON believes such advice to be misguided… There is danger in premature model building and the use of such models, to the exclusion of careful data collection.

204-42

What was the probability of the rare event of Fukishima? What was the probability of the rare event of the Las Conchas Fire? Modeling for this type of event must be recognized for what it is, and not relied upon as the only way to assess risk.

204-43

All potential impacts from postulated accidents must be analyzed.
Recent Nuclear Facility procurement documents request equipment that can withstand 27,000 rem. The Request For Information projects a "Design Basis Accident Environmental Conditions" for "One (1) accident estimated at 27,000 rem over the 50-year life of the CMRR-NF facility." Describe this accident. All analyzed accidents must be described in detail.

- Impacts to tourism must be analyzed if there is an accident.

204-44

with applicable Federal and state environmental requirements is assessed in annual LANL site environmental reports, which may be accessed at http://www.lanl.gov/environmemntal/all/docs/reports/.

204-41 In response to similar comments, the text in the *Final CMRR-NF SEIS*, Appendix C, Section C.3.2, has been revised to more clearly reflect the consideration of an airplane crash into the CMRR-NF. The largest aircraft that is considered to have a conservative probability greater than 1 in 1 million per year of accidentally crashing into the CMRR-NF is a general aviation aircraft. References were added to support this conclusion, including the *DOE Standard: Accident Analysis for Aircraft Crash into Hazardous Facilities* (DOE 2006) and a site-specific technical evaluation of the potential for aircraft crashes (LANL 2011a).

As indicated in Chapter 4, Section 4.2.10.3 of the *CMRR-NF SEIS*, substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. NNSA considered a range of possible terrorist or intentional destructive acts and performed a detailed analysis of selected scenarios. Selected scenarios provide a reasonable range of events, including those with the largest expected impacts.

NNSA and DOE engage their own technically qualified staff and subject matter experts to prepare the SEIS along with qualified contractors. The analyses include the evaluation of accidents and intentional destructive act impact analyses. NNSA does not intend to pursue an independent external review of the analysis in the *CMRR-NF SEIS*.

NNSA has an extensive program related to preventing terrorist threats. This includes ongoing evaluations of facilities and security forces to prevent successful attacks. In evaluating intentional destructive acts, the probability of a given scenario occurring is not a factor in the analysis. Therefore, the programs and funding of other entities, such as the Transportation Security Administration is not a relevant factor. The intentional destructive acts appendix presents consequences projected to occur in the event of a successful attack. The results of these analyses will be reviewed and considered by NNSA in making its decision on the CMRR-NF and are shared, as appropriate, with senior Administration officials and Congress.

204-42 JASON is an independent scientific advisory group established in 1960 that provides consulting services to the U.S. government on matters of defense

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

- Impacts to property values must be analyzed.
- How would accidents at nearby facilities impact the Nuclear Facility and vice versa?

204-44 cont'd

Emissions from the utilities must be reexamined.
The NF is now twice the size than analyzed in the 2003 EIS. The environmental impacts of larger boilers must be analyzed. Are the boilers larger for the larger NF? Do we need a new RLUOB permit?

204-45

Analysis of the Pajarito Road re-alignment must be included in a new dSEIS.
This road re-alignment is currently a categorical exclusion. Instead, it should be analyzed in a new dSEIS as a "connected action."

204-46

This SEIS should be supplemented with annual updates.
Because the NF project may last over ten years, updates to this SEIS should be prepared annually, analogous to the LANL SWEIS yearbook. They should list the changes and/or accuracy of the estimates made in this SEIS, with public notification and the opportunity to request a paper copy.

204-47

Global climate change and drought.
Of course it is not just military threats that can deeply impact our national security, it can also be global climate change, with perhaps particular relevance for LANL at this very time. The Lab and the Los Alamos townsite have faced mandatory evacuation for the second time in two years due to wildfire. We comment on that threat later, but here speak on the question of the prioritization of national needs. Over the last five years the nation and world have faced an increasing number of natural disasters, including the Las Conchas Fire. While it's currently impossible to link one specific natural disaster to global climate change, there is increasing scientific thought that global warming is responsible for increasing the probability that such events occur.[35] If so, then global warming, in combination with a century plus of mistaken forestry management that suppressed all fires, threatens national security by threatening the Lab itself, and, in the extreme, public health could have been adversely affected had the Las Conchas Fire widely burned on LANL property.

In its Complex Transformation Record of Decision NNSA wrote in response to a public comment that the Supplemental Programmatic EIS had failed to address impacts on global warming:

> The SPEIS assesses the direct, indirect, and cumulative environmental impacts of the No Action Alternative and reasonable alternatives for the proposed action. The assessment of impacts includes, where appropriate, the direct and indirect contributions to the emission of greenhouse gases resulting from operation and transformation of the nuclear weapons complex. …

204-48

[35] See, for example, *Scientists: Extreme Weather Link 'Can No Longer Be Ignored'*, Steve Connor, The Independent UK, July 2, 2011 http://readersupportednews.org/news-section2/312-16/6469-scientists-extreme-weather-link-can-no-longer-be-ignored

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 47

science and technology. A 2009 JASON report responded to a request by the U.S. Department of Defense to conduct an evaluation of the Nation's ability to anticipate the risk of rare events, specifically catastrophic terrorist events, including the use of a weapon of mass destruction or other high-profile attacks, where there is sparse (or no) historical record from which to develop predictive models based on past statistics (JASON 2009). Substantive details of terrorist attack scenarios, security countermeasures, and potential impacts are not released to the public because disclosure of this information could be exploited by terrorists to plan attacks. Similarly, the details of the analysis of intentional destructive acts that was performed for the *CMRR-NF SEIS* cannot be disclosed.

204-43 Comment noted.

With respect to the Fukushima Daiichi Nuclear Power Plant accident, Section 2.8, Nuclear Accidents, of this CRD points out the large differences between the Fukushima Daiichi Nuclear Power Plant and the proposed CMRR-NF. The Fukushima Daiichi Nuclear Power Plant accident involved a very large earthquake followed by a tsunami, which affected the emergency cooling systems of a number of large boiling-water reactors at a nuclear power station. Neither the CMRR-NF nor the existing CMR Building contains nuclear reactors; the quantities of radioactive material that could be involved in a severe accident are orders of magnitude smaller than those at the Fukushima Daiichi Nuclear Power Plant reactors. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Appendix C of the *Final CMRR-NF SEIS*.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL and are historically common occurrences. The frequency of a large fire encroaching on LANL is estimated to be 1 in 10 years, as provided in the *2008 LANL SWEIS*, Appendix D (DOE 2008a). As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). NNSA does not consider the CMR Building to represent a significant risk due to wildfires because it is primarily constructed of noncombustible materials and is surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. The

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

> Overall, the release of greenhouse gases from the nuclear weapons complex constitutes a miniscule contribution to the release of these gases in the United States and the world. Overall U.S. greenhouse gas emissions in 2007 totaled about 7,282 million metric tons of CO 2 equivalents, including about 6,022 million metric tons of CO 2…
>
> NNSA considers the potential cumulative impact of climate change in making decisions regarding its activities, including decisions regarding continuing the transformation of the nuclear weapons complex. Many of these decisions are applicable to the broad array of NNSA's activities, and therefore are independent of decisions regarding complex transformation. NNSA considered its contributions to the cumulative impacts that may lead to climate change in making the programmatic decisions announced in this ROD. These decisions will allow NNSA to reduce its greenhouse gas emissions by consolidating operations, modernizing its heating, cooling and production equipment, and replacing old facilities with ones that are more energy efficient. Many of these actions would not be feasible if NNSA had selected the No Action Alternative, which would have required it to maintain the Complex's outdated infrastructure. Federal regulations and DOE Orders require the Department of Energy to follow energy-efficient and sustainable principles in its siting, design, construction, and operation of new facilities, and in major renovations of existing facilities. These principles, which will apply to construction and operation of a UPF at Y-12 and the CMRR-NF at LANL, as well as to other facilities, include features that conserve energy and reduce greenhouse gas emissions.[36]

204-48 cont'd

We take issue with NNSA's statement that "the release of greenhouse gases from the nuclear weapons complex constitutes a miniscule contribution to the release of these gases in the United States and the world." But we recognize that other things NNSA and DOE do to help mitigate greenhouse house emissions. But we can't help but note the irony that new nuclear weapons facilities will be LEEDS certified as green bomb-making plants.

As a reminder of what the underlying intent is that requires this review of the CMRR-Nuclear Facility:

> The purposes of this Act [the National Environmental Policy Act] are: To declare a national policy which will encourage productive and enjoyable harmony between man and his environment; to promote efforts which will

[36] Record of Decision for the Complex Transformation Supplemental Programmatic Environmental Impact Statement—Operations Involving Plutonium, Uranium, and the Assembly and Disassembly of Nuclear Weapons, NNSA, Federal Register / Vol. 73, No. 245 / Friday, December 19, 2008 / Notices, http://www.federalregister.gov/articles/2008/12/19/E8-30193/record-of-decision-for-the-complex-transformation-supplemental-programmatic-environmental-impact

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 48

CMRR-NF would be at least as resistant to the effects of wildfire as the existing CMR Building. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF.

204-44 Summaries of accident scenarios, accident consequences, and accident risks are presented for the *CMRR-NF SEIS* alternatives in Chapter 4, Sections 4.2.10.2, 4.3.10.2, and 4.4.10.2. Analysis details are presented in Appendix C. None of the accidents evaluated for the Modified CMRR-NF or the CMR Building would result in doses to the public at the level cited by the commentor. However, as indicated in Section 4.2.10.2, seismically induced accidents at the 2004 CMRR-NF would result in large doses to the public and is the reason that facility design has been modified. Appendix C of the *Final CMRR-NF SEIS* has been revised to sections on the potential land contamination that could result in the LANL area following a severe earthquake (Section C.6), and to show the combined impacts from such an earthquake on all of the nuclear facilities in TA-55 (Section C.7).

204-45 Air quality impacts from construction of the CMRR-NF and operation of the CMRR-NF and RLUOB are addressed in Chapters 4, Sections 4.2.4.1 and 4.3.4.1, of the *CMRR-NF SEIS*. Air quality impacts from continued operation of the CMR Building and operation of RLUOB are summarized in Section 4.4.4.1. Although the largest air quality impacts would potentially result from excavation and construction activities, rather than facility operations, criteria pollutant concentrations would not exceed the most stringent standards during construction activities and transport of materials to and from the site. The analysis for the Modified CMRR-NF is different from that presented for the 2004 CMRR-NF. The Modified CMRR-NF includes the use of seven emergency backup generators and these represent the largest potential source of air pollutants. As shown in Table 4–20, calculated concentrations for criteria pollutants would be far below regulatory standards. No additional impact analysis is necessary, nor is a new permit for RLUOB required.

204-46 See the response to Comment 204-36 regarding realignment of Pajarito Road.

204-47 NNSA notes the comment. The 2008 *LANL SWEIS* addresses activities at the existing CMR Building and NNSA's intent to replace it with new capabilities. Activities pertaining to construction and operation of existing facilities (for example, the CMR Building) and new facilities (for example, RLUOB, a new prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man…[37]

This will fall on deaf ears, but how we wish that the money invested into the Nuclear Facility were redirected into combating global climate change instead, which could circle back to contributing to the physical safety of the Lab itself. But even more important than the ~$6 billion put into CMRR construction will be LANL's long-term deeper entrenchment into nuclear weapons programs that the Nuclear Facility will catalyze. We believe this will harm LANL, and therefore the nation, in the long run through opportunities missed.

Last December University of Arizona scientists published a major study that concludes that the American West may be entering a prolonged drought.[38] At the same time the CMRR project requires 16 million gallons of water each year for its operation. This calls into question whether it's appropriate to use precious water resources to expand nuclear weapons production at the possible expense of regional communities and the environment. It further calls into question whether expanded nuclear weapons production at Los Alamos is feasible given a possible long–term drought and rising climate warming punctuated with catastrophic forest fires, given that LANL and the Los Alamos townsite have had to be hurriedly evacuated twice in eleven years. Given that the Nuclear Facility is slated to operate until 2075 a new dSEIS should analyze the effects that possible climate change and prolonged drought may have on its operations.

A New dSEIS should analyze what effects long-term drought and climate warming might have on CMRR-Nuclear Facility operations.

It's possible, but still not yet known, that the Las Conchas Fire and the 2000 Cerro Grande Fire, in combination with forestry thinning and other fire preventative measures at the Lab, have essentially fireproofed LANL for now (however, countervailing that is the apparent fact that the Las Conchas Fire burned through substantial portions of the Cerro Grande Fire scar). The CMRR-Nuclear Facility is slated to be operational until 2075. A new dSEIS should analyze the effects that long-term drought and climate warming might have on CMRR-Nuclear Facility operations.

The methodology used for studying wildfires should be included in this analysis. Of particular importance would be an examination of what conditions permitted some of the same areas near the Lab to burn twice in the last eleven years and how effective wildfire mitigation efforts are in this increasingly dry climate.

204-48 cont'd

How would the Nuclear Facility be secured in the event of an overwhelming wildfire?

204-49

Nuclear Watch New Mexico • Comments on the draft CMRR-NF SEIS
July 5, 2011 • Page 49

CMRR-NF, if constructed), the transition to new facilities, and the disposition of the existing CMR Building are being addressed within framework of the annual *LANL SWEIS* Yearbooks. The current yearbook can be accessed at http://www.lanl.gov/environment/nepa/sweis.shtml.

204-48 NNSA acknowledges the commentor's concerns that climate change may increase the frequency of wildfires and decrease the availability of water. In response to public comments, Chapter 3, Section 3.4.4, of the *Final CMRR-NF SEIS* has been revised to include a description of the types of environmental changes that could occur in the southwestern United States due to climate change. A discussion of potential impacts that could result at LANL from climate change and that addresses water usage has been added to Chapter 4, Section 4.1.

The CMR Building and the TA-55 Plutonium Facility were not included in the 2008 *LANL SWEIS* as facilities that present a significant risk due to wildfires because these facilities are largely constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. The CMRR-NF would be at least as resistant to the effects of wildfire as the existing CMR Building. Therefore, even if the frequency of wildfires is increased by global climate change, these facilities would not be directly affected. Chapter 4, Sections 4.2.4.2, 4.3.4.2, and 4.4.4.2 present the impact analyses associated with greenhouse gases. As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

204-49 The *CMRR-NF SEIS* includes analyses of potential accidents and their consequences involving the CMRR-NF or CMR Building, including the impacts of a large facility-wide fire that engulfs the entire facility. The results of the analysis are presented in Chapter 4 of the *CMRR-NF SEIS* and the details of the analyses, including assumptions about accident frequencies, are presented in Appendix C. As discussed in the response to Comment 204-43, wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. In accordance with DOE

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

The effects of a very large fire must be examined in a new dSEIS. The Las Conchas fire is reported to be the largest documented fire in New Mexico history. A new dSEIS must consider the possibility that another fire may occur burning Lab property. How would the Nuclear Facility be secured in the event of an overwhelming wildfire?

What are the consequences of power transmission lines or transformers going down or burning during a wildfire (or serious seismic event) resulting in loss of power to the CMRR-NF? How long will backup generators in the Central Utility Building run without being resupplied with fuel or maintained? Are these backup generators diesel engine powered? How long will the engine's air filters remain unclogged in the presence of particulates in smoke as experienced during the Las Conchas and Cero Grande Fires?

204-49 cont'd

Given the wildfires is Los Alamos the right location for the Nuclear Facility and expanded nuclear weapons operations?

At the time of this writing it is estimated that the direct cost to combat the Las Conchas Fire is over $20 million, and the fire is still burning. The long-term costs to remediate the area may top $1 billion. Is Los Alamos the right location for the Nuclear Facility and expanded nuclear weapons operations if at some point in the future the funds to protect such a facility from the consequences of catastrophic wildfires are no longer available?

requirements such as DOE Order 420.1b, the CMRR-NF would be designed, constructed, and operated using physical and administrative controls to prevent or mitigate the unintended release of radioactive materials to the environment. Design features would include such items as backup diesel-powered generators; heating, ventilation, and air conditioning systems with standard dust-type filters or specialty filters, including high efficiency particulate air filters; fire suppression systems and fire barriers; and other facility health, safety, and security equipment as required and appropriate. Safety-related issues pertaining to the CMRR-NF and other nuclear facilities at LANL are subject to oversight by DNFSB. A summary of emergency preparedness and security provisions at LANL is provided in Chapter 3, Section 3.11.6, of the *CMRR-NF SEIS*. Refer to the response to Comment 204-32 for more information.

Attachment 1

Excerpts from "THE ESSENTIALS OF NEPA" by Wildlaw.org

Under NEPA, an EA or EIS must include a review of the environmental impacts from all reasonable alternatives. It is the duty of the agency to develop and analyze the alternatives to the proposed action. The agency does not have to look at every conceivable alternative, only those reasonable ones that will meet the same goals and objectives of the proposed one. Also, the existence of a reasonable, but unexamined, alternative that is sufficiently similar to another alternative that the agency did analyze will not void the agency's NEPA analysis. However, the existence of only one reasonable alternative that the agency failed to look at will void the agency's decision…

"The alternative section is 'the heart of the environmental impact statement,' 40 C.F.R. 1502.14; hence, '[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate.' *Citizens for a Better Henderson v. Hodel*, 768 F. 2d 1051, 1057 (9th Cir. 1985). While the practicalities of the requirement are difficult to define, NEPA provides that all agencies of the Federal Government shall, to the fullest extent possible, '[s]tudy, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources.' 42 U.S.C. 4332(2)(E). Whether a particular EIS has met this demand can best be determined by its purpose, which is to 'ensure that federal agencies have sufficiently detailed information to decide whether to proceed with an action in light of potential environmental consequences, and [to] provide the public with information on the environmental impact of a proposed action and encourage public participation in the development of that information.' *Kunzman*, 817 F. 2d at 492; *see also Citizens for a Better Henderson*, 768 F. 2d at 1056.

"As a result an agency must look at every reasonable alternative, with the range dictated by the 'nature and scope of the proposed action,' *Block*, 690 F.2d at 761, and **'sufficient to permit a reasoned choice.'** *Methow Valley Citizens Council v. Regional Forester*, 833 F. 2d 810, 815 (9th Cir. 1987), *rev'd on other grounds sub nom. Robertson v. Methow Valley Citizens Council*, 490 U.S. 332 (1989)."

A particularly instructive case is *Friends of the Bitterroot, Inc. v. U.S. Forest Serv.*, No. CV-90-76-BU, 25 E.L.R. 21186 (D. Mt. 1994). There, even though the Forest Service identified and considered seven alternatives, the court held that the Forest Service failed to comply with NEPA because the agency failed to consider just one additional reasonable alternative, namely an alternative to protect roadless areas. The agency claimed that such an alternative would not further the purposes of the proposed action, but the court disagreed. The court held:
"In Count II of their complaint, as amended, plaintiffs contend the Trail Creek EIS fails to adequately analyze all reasonable alternatives, including a less environmentally damaging alternative that would exclude logging and road building activity in existing roadless areas within the Beaverhead National Forest. Plaintiffs maintain the EIS should have addressed an alternative exempting the Beaver Lakes roadless area from the timber sale in order to preserve that area's value as secure wildlife habitat. In response,

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

defendants assert the alternative would not have met the management goals, standards, and objectives of the Beaverhead National Forest Plan. Defendants further maintain the development of such an alternative would not have added any new information to the EIS.

"NEPA requires an EIS provide information in detail and consider every reasonable alternative to a proposed action. *Citizens for a Better Henderson*, *supra*, 768 F.2d at 1057; see 42 U.S.C. 4332(2)(c)(iii). An agency's range of alternatives is reviewed under a 'rule of reason' standard that 'requires an agency to set forth only those alternatives necessary to permit a reasoned choice.' *California v. Block*, 690 F.2d 753, 767 (9th Cir. 1982) ('The touchstone for [a court's] inquiry is whether an EIS' selection and discussion of alternatives fosters informed decisionmaking and informed public participation.'). Additionally, NEPA does not require a separate analysis of alternatives which are not significantly distinguishable from alternatives actually considered or which have substantially similar consequences. *Northern Plains Resource Council v. Lujan*, 874 F.2d 661, 666 (9th Cir. 1989). As a result, an agency's consideration of alternatives is sufficient if it examines an appropriate range of alternatives, even if it does not consider every available alternative. *Headwaters, Inc. v. Bureau of Land Management*, 914 F.2d 1174, 1181 (9th Cir. 1990).

"In the case sub judice, the Forest Service examined seven alternate courses of action with respect to the Trail Creek project: six 'action' alternatives (Alternatives B, C, D, E, F, and G) and one 'no action' alternative (Alternative A). The 'action' alternatives proposed timber harvesting in varying locations, amounts, and methods in the Trail Creek area. Moreover, the action alternatives all called for varying degrees of timber harvesting in the Beaver Lakes roadless area.

"Defendants maintain the plaintiffs' preferred alternative 'would not have met the management goals, standards, and objectives defined in the Beaverhead National Forest by the Beaverhead Forest Plan.' Specifically, defendants maintain that 'because the management decisions to harvest timber in those areas have already been made at the Forest Plan level it did not need to be revisited.'

"The fact the Beaverhead Forest Plan designates certain land as suitable for timber management does not, however, obligate the Forest Service to proceed with the timber harvesting, nor does it preclude the Forest Service from exercising its discretion to consider other courses of action. Accordingly, to the extent defendants maintain an alternative aimed at preserving the Beaver Lakes roadless area would be 'pointless,' based upon the goals of the Beaverhead Forest Plan, the court concludes defendants' summary judgment motion is not well taken. **Defendants' position is contrary to NEPA's underlying tenet, i.e., that agencies consider all reasonable alternatives so as to ensure an EIS fosters informed decision making.** See *Idaho Conservation League v. Mumma*, *supra*, 956 F.2d at 1519-20.

"The Forest Service cannot deny there is some benefit to be derived from considering an alternative that preserves the Beaver Lakes roadless area. Plaintiffs, as well as the Montana Department of Fish, Wildlife & Parks, whose considerable expertise in the area of wildlife management is undisputed, expressed concerns that preservation of the Beaver Lakes roadless area warranted full consideration in the Trail Creek NEPA

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

process given the area's high security value for wildlife. Moreover, plaintiffs have alleged the roadless areas provide wildlife corridors essential for maintaining the biological diversity in the Northern Rocky Mountains.

"Given the contentious and long-standing debate in the State of Montana regarding the preservation of roadless lands and wilderness designation, the court concurs with plaintiffs' assertion that the NEPA process would have been properly serviced by development of an action alternative that preserved roadless lands in the Trail Creek area. Such an alternative would have afforded the opportunity for scientific and public participation and debate regarding the delicate balance between preserving natural resources and timber management.

"Accordingly, the EIS' failure to address an alternative preserving existing roadless lands in the Trail Creek area renders compels this court to REMAND this matter for further administrative proceedings." – End of excerpt - http://www.wildlaw.org/Eco-Laws/nepa-txt.html

Bolded emphases added that form the skeleton of our argument (and case law) that NNSA has failed to provide a credible range of reasonable alternatives as required by NEPA.

Attachment 2

Additional Reasonable Alternatives that a new dSEIS should analyze

Nuclear Watch New Mexico's preferred alternative:
Alternative #4 (sequential from the three so-called alternatives that NNSA presented in the flawed dSEIS)

- Do not build the Nuclear Facility.
- Decontaminate and demolish the old CMR Building.
- Consolidate CMR missions in the Rad Lab and PF-4.

Alternative #5

- Do not construct a replacement facility to house the capabilities planned for the CMRR-NF.
- Do not continue to perform analytical chemistry, material characterization, and actinide research and development activities in the CMR Building.
- Install SNM safes
- Further consolidate operations into existing facilities, particularly the new 200,000 square feet Rad Lab and PF-4.

Alternative #6

- Do not construct a replacement facility to house the capabilities planned for the CMRR-NF.
- Do not continue to perform analytical chemistry, material characterization, and actinide research and development activities in the old CMR Building.
- Consolidate CMR missions at the Rad Lab and PF-4.
- Build an SNM vault at TA-55.
  - This vault would free up floor space at PF-4 and CMR.
  - This vault would help de-inventory CMR and PF-4.
  - It will provide for enhanced safe and secure storage of special nuclear materials.

Additional Alternative #7

- Do not construct a replacement facility to house the capabilities planned for the CMRR-NF.
- Continue to perform analytical chemistry, material characterization, and actinide research and development activities in the CMR Building, but make extensive facility upgrades needed to sustain CMR programmatic operations for another 20 to 30 years.
  - All the proposed "extensive facility upgrades" must be listed and the impacts of these upgrades must be analyzed.
  - The CMR Hazard Reduction (as mentioned in the National Nuclear Security Administration/ Readiness in Technical Base and Facilities, FY 2011 Congressional Budget, p. 161) activities must be listed and the impacts of these activities must be analyzed.

204-7 cont'd

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director Nuclear Watch New Mexico

- The CMR Risk Mitigation and Consolidation activities (as mentioned in the NNSA/ Readiness in Technical Base and Facilities, FY 2011 Congressional Budget, p. 160) must be listed and their impacts analyzed.
- Analyze the impacts of all current and proposed projects to extend the life of the CMR, including roofing work, exhaust fans, HEPA filters, structural and safety systems, and elevator repairs.

• Build an SNM vault at TA-55.
• Further consolidate operations into existing facilities, particularly the new 180,000 square feet Rad Lab and PF-4.

Attachment 3

Additional Background on the CMRR-Nuclear Facility and

Expanded Plutonium Pit Production

NNSA must justify why a ~$5 billion new Nuclear Facility is needed. We maintain that the Nuclear Facility has always been about directly supporting expanded pit production. For a current example, from NNSA's own FY11 Stockpile Stewardship and Management Plan (SSMP):

> **Existing Los Alamos plutonium facilities** are not sustainable and **do not provide an inherent manufacturing capacity sufficient for the range of possible future scenarios…**
> Path Forward…
> • Complete the design and begin construction of the Chemistry and Metallurgy Research Replacement **Nuclear Facility** at Los Alamos (a facility that conducts plutonium research and development and provides analytical chemistry and materials characterization to all plutonium programs such as surveillance, manufacturing, and plutonium disposition.) Plan and program to complete construction no later than 2020, and **ramp up to full operations in 2022**.
> • **Increase pit processing capacity and capability at the adjoining PF-4** (part of the main plutonium facility) at Los Alamos to demonstrate pit reuse by 2017 and manufacturing by 2018-2020. **Plan and program to ramp up to a manufacturing capability of up to 80 pits per year in 2022.** Complete required investment in PF-4 infrastructure and waste processing capabilities in time to support expected plutonium capability in 2022.[39]

Concerning whether LANL's plutonium facilities are sustainable, we agree that the old CMR Building is not, at least for operations with Hazard Category 2 special nuclear materials (SNM). However, not only is PF-4 clearly sustainable, but it has in fact already been retrofitted with additional glovebox lines and equipment to achieve expanded production capability of up to 80 plutonium pits per year, as evidenced by the following:

204-3 cont'd

> **LANL 08 Performance Evaluation Report**
> **Pit Manufacturing Equipment**
> **Measure 1.13 Build Six New W88 Pits & Install Equipment in FY 2008 to increase Pit Capacity to 80 Pits per Year by the Operational Date of a CMRR-Nuclear Facility (Incentive/Base)**
> **Expectation Statement:**
> Build six new W88 pits and install equipment in FY 2008 to increase pit capacity to 80 pits per year by the operational date of a CMRR-Nuclear facility.
> **Completion Assessment:**

[39] NNSA FY11 SSMP, p. 23-24, http://www.nukewatch.org/importantdocs/resources/Stockpile_Stewardship_and_Management_Plan_2010.pdf (parenthesis in the original, bolded emphasis added)

Response side of this page intentionally left blank.

Commentor No. 204 (cont'd): Jay Coghlan, Executive Director
Nuclear Watch New Mexico

> LANS [Los Alamos National Security, LLC] has submitted completion evidence for award of full fee. NNSA has validated appropriate and timely completion.[40]

All that is lacking for the desired "range of possible future scenarios," that is "to ramp up to a manufacturing capability of up to 80 pits per year in 2022," are the expanded SNM materials characterization and analytical chemistry capabilities needed to directly support expanded pit production. This is where the CMRR NF comes in. But while various high-level documents have blessed construction and operation of the CMRR NF, none have approved expanded plutonium pit production. The 1999 LANL Site-Wide Environmental Impact Statement set that level at 20 pits per year. Since that time, in one form or the other, the Modern Pit Facility EIS, the Complex 2030 Programmatic EIS, the 2008 LANL Site-Wide EIS, and the Complex Transformation Supplemental PEIS have all set out to formally expand plutonium pit production, but in each case failed to do so.

For there to be truly impartial NEPA review without predetermination there must be analysis of the fundamental need of the Nuclear Facility given that: 1) there has been no decision to expand beyond the currently approved production rate of 20 pits per year; and 2) there is no foreseeable decision to do so anytime soon. In effect, NNSA has predetermined that there will be expanded plutonium pit production (see SSMP above), which in turn predetermines that the Nuclear Facility is necessary. A new draft SEIS should specifically examine the likelihood that there will be a formal decision to expand pit production, and the need for the Nuclear Facility in the absence of such a decision.

204-11 cont'd

A capabilities study of LANL's plutonium infrastructure is required. Some programs currently performed in PF-4 are scheduled to last for only a few more years. The ARIES and the MOX programs, for instance, are due to be completed by 2015, thus freeing up some floor space. Given that plutonium pit production is not being expanded (nor is likely to be expanded), there should again be rigorous review of whether the Nuclear Facility is truly needed and analysis of the feasibility of relocating old CMR missions to PF-4 and the Rad Lab while not building the Nuclear Facility. An update is needed to a 1997 analysis of "Alternatives for Increasing the Nuclear Materials Processing Space at Los Alamos for Future Missions." Please update the tables that show the floor space requirements for each program and what facility could be used for which program and operation. Please update this report and include a revised table in a new dSEIS analogous to this 1997 table below.

[40] LANL 08 Performance Evaluation Report, NNSA, http://www.doeal.gov/laso/GeneralDocs/FY%202008%20Performance%20Evaluation%20Report%20Final.pdf (bolded emphases added)

Alternatives for Increasing the Nuclear Materials Processing Space at Los Alamos for Future Missions *Author(s):* Drew E. Kornreich & Nelson S. DeMuth, April 25, 1997, http://www.fas.org/sgp/othergov/doe/lanl/lib-www/la-pubs/00326510.pdf.

Updated needed mission floor space requirements must to take into account the fact that the Rad Lab is nearly complete for operations. The table below from the 1997 study indicates that the Rad Lab can indeed absorb much of the old CMR Building's operations.

Nuclear Watch New Mexico closes by again repeating that between the Rad Lab and the fact that SNM materials characterization has already been relocated to PF-4 that the CMRR-Nuclear Facility is not needed and should not be built. PF-4 can and should be reconfigured as other missions are terminated to accept the analytical chemistry mission as well. This would conserve taxpayers' money and is more consistent in progress toward a future nuclear weapons-free world.

RE: Comments on the Draft Supplemental Environmental Impact Statement (DSEIS) for the Nuclear Facility Portion of the Chemistry and Metallurgy Research Building Replacement Project at Los Alamos National Laboratory (CMRR-NF, DOE/EIS-0350-S1)

Dear Mr. Tegtmeier:

Southwest Research and Information Center (SRIC), a 40-year-old nonprofit organization with more than 35 years experience in working on nuclear issues, submits these comments in response to the Department of Energy (DOE) National Nuclear Security Administration (NNSA) Notice of Availability (NOA). 78 *Federal Register* 24018 (April 29, 2011). These comments are in addition to letters from SRIC and others during the comment period, and oral testimony provided at the Albuquerque hearing on May 23, 2011. DOE must respond to these comments and all of the previous ones, as well as all other comments from other organizations and individuals.

The CMRR-NF Draft Supplemental Environmental Impact Statement (DSEIS) is fatally flawed legally, as a matter of public policy, and technically. The DSEIS does not provide an adequate basis for a final EIS. Therefore, the SEIS process must stop, and NNSA must start over with a new EIS process.

1. The DSEIS is the wrong document. DOE/NNSA must instead begin a new EIS process. On February 3, 2004, then NNSA Administrator Linton Brooks issued the Record of Decision (ROD) for the CMRR Project, based on the Final EIS. The decision was to implement: ***205-1***

> "the construction and operation of a new CMRR facility within TA-55 at LANL. The new CMRR facility would include two buildings (one building for administrative and support functions, and one building for Hazard Category 2 SNM laboratory operations), both of which would be constructed at above ground locations (construction option 3). The existing CMR building would be decontaminated, decomissioned and demolished in its entirety (disposition option 3)." 69 *Federal Register* 6972 (February 12, 2004).

205-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that a supplement to the *CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

As described in Chapter 1, Section 1.1 of the *CMRR-NF SEIS*, five alternatives were analyzed in the November 2003 *CMRR EIS* (DOE/EIS 0350) (DOE 2003b): (1) Alternative 1 (the Preferred Alternative): Construct a new CMRR Facility at Technical Area 55 (TA-55); (2) Alternative 2 (Greenfield Site Alternative): Construct a new CMRR Facility at TA-6; (3) Alternative 3 (Hybrid Alternative at TA-55): Construct new Hazard Category 2 and 3 laboratory buildings (above or below ground) at TA-55 and continue use of the CMR Building; (4) Alternative 4 (Hybrid Alternative at TA-6): Construct new Hazard Category 2 and 3 laboratory buildings (above or below ground) at TA-6 and continue use of the CMR Building; and (5) No Action Alternative: Continue use of existing CMR Building – no new building construction. The Preferred Alternative (Alternative 1) was selected for implementation in a 2004 ROD (69 FR 6967) for the *CMRR EIS*. In addition, in the 2008 ROD for the *Complex Transformation SPEIS* (73 FR 77644) NNSA reaffirmed the decision to construct and operate the *CMRR-NF* at LANL.

In addition, Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, describes alternatives considered but dismissed from detailed analysis. These alternatives are: (1) alternative locations outside LANL; (2) extensive upgrades to the existing CMR Building; and (3) moving capabilities to other LANL facilities. For the reasons described in Section 2.7, these alternatives are not being revisited in the *CMRR-NF SEIS*; rather, the SEIS tiers from the previous decisions made in the ROD for the 2003 *CMRR EIS* and the 2008 *Complex Transformation SPEIS* and examines a more limited set of alternatives. Refer to Section 2.11, Alternatives considered, of this CRD for more information.

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

Over the past seven+ years, DOE/NNSA has:
1) implemented one part of the ROD – the administration/support building was constructed;
2) continued to operate the CMR building, while maintaining, but not implementing, the decision to decontaminate, decommission, and demolish the building some years in the future after its various functions are transferred to other locations or otherwise terminated; and
3) decided ***not*** to construct any of the Nuclear Facility alternatives described in the FEIS.

The DSEIS states:

> "Based on new information learned since 2004, the 2004 CMRR-NF would not meet the standards for a Performance Category 3 (PC-3) structure as required to safely conduct the full suite of NNSA AC and MC mission work. Therefore, the 2004 CMRR-NF would not be constructed." at 1-10.

Based on the requirements of the National Environmental Policy Act (NEPA), 42 U.S.C. § 4321, et seq. and its implementing regulations, DOE/NNSA must decide how to proceed. DOE/NNSA does not want to discard the November 2003 FEIS because it is the basis for the Radiological Laboratory/Utility/Building (RLUOB) that has been constructed and will soon begin operations. But DOE/NNSA also does not want to be bound by the Nuclear Facility reasonable alternatives of that FEIS.

Furthermore, since 2004, DOE/NNSA has advocated constructing the Nuclear Facility. Therefore, it also appears that DOE/NNSA wants to limit its examination of alternatives because it has a pre-determined outcome of constructing Nuclear Facility.

The most straightforward NEPA-compliant proposed action now would be to start a new EIS process with the purpose and need being how to operate the CMR building and/or its functions for the next decade or more. The reasonable alternatives would include:
- "no action" – maintain some functions in the CMR building;
- "reduced operations" – terminate some of the CMR functions;
- "transfer operations" – consider other facilities at LANL, including the RLUOB, TA 55 Plutonium Facility, as well as other NNSA sites for CMR functions; and
- "proposed action" – construct a Nuclear Facility, with two construction options, that would begin operations in approximately 2023 and operate for several decades.

The option DOE/NNSA has chosen instead is to try to supplement an admittedly inadequate FEIS regarding the CMRR-NF, so that all of those reasonable alternatives cannot be considered. Such an action is clearly contrary to the requirements of NEPA, and it must stop.

Council on Environmental Quality (CEQ) regulations under the National Environmental Policy Act (NEPA) clearly state that alternatives including the proposed action are:

> "the heart of the environmental impact statement. Based on the information and analysis presented in the sections on the Affected Environment (§1502.15) and the Environmental Consequences (§1502.16), it should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply

205-1 cont'd

Response side of this page intentionally left blank.

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. In this section agencies shall:
(a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.
(b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.
(c) Include reasonable alternatives not within the jurisdiction of the lead agency.
(d) Include the alternative of no action.
(e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference.
(f) Include appropriate mitigation measures not already included in the proposed action or alternatives." 40 CFR § 1502.14 (emphasis added).

The DSEIS totally fails to fulfill the requirement to "consider all reasonable alternatives." The DSEIS in reality has only one reasonable alternative, which is the proposed action: construct the Nuclear Facility of 407,600 gross square feet divided between four floors plus a partial roof level by excavating to a depth of 58 feet or excavating to a depth of 130 feet and backfilling with 250,000 cubic yards of low-slump concrete to a depth of about 60 feet.

The other two alternatives in the DSEIS are "No Action Alternative (2004 CMRR-NF)" but it will not be constructed and therefore is not a reasonable alternative, and "Continued Use of CMR Building Alternative." Regarding the latter alternative, the DSEIS states:

205-1 cont'd

> "This alternative does not completely satisfy NNSA's stated purpose and need to carry out AC and MC operations at a level to satisfy the entire range of DOE and NNSA mission support functions. However, this alternative is analyzed in this *CMRR-NF SEIS* as a prudent measure in light of possible future fiscal budgetary constraints." at 1-13.

Thus, the alternative of continuing use of the CMR building is not a reasonable alternative, but is effectively a "no action" alternative. The reasonable alternatives of reducing operations by downsizing the CMR building and its functions, or transferring some or all functions to other locations and terminating other functions are not considered.

2. The DSEIS is legally flawed because the alternatives fail NEPA's "hard look" test.
NEPA also directs that DOE take a "hard look" at the environmental impacts of its proposed action and compare them to alternative means of fulfilling the same purpose and need for agency action that may avoid or mitigate environmental harms or risks posed by that action. "What constitutes a „hard look' cannot be outlined with rule-like precision, but it at least encompasses a thorough investigation into the environmental impacts of an agency's action and a candid acknowledgement of the risks that those impacts entail." Nat'l Audubon Soc. v. Dept of the Navy, 422 F.3d 174, 185 (4th Cir. 2005).

Response side of this page intentionally left blank.

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

The DSEIS cannot take a "hard look" at all of the alternatives, because the document does not even include all of the reasonable alternatives. Nor does it technically provide a "thorough investigation" of the impacts of the proposed action, as will be discussed hereafter. **205-1 cont'd**

3. The DSEIS has insufficient policy options because the Nuclear Facility is only one size with the capacity to support manufacturing of 80 plutonium pits per year.
In its 1999 ROD on the LANL Site-Wide EIS, DOE/NNSA stated:

> "DOE will establish, over time, a pit production capability at LANL with a capacity of nominally 20 pits per year; this decision reflects an intent to establish a pit production capability at LANL within the existing floor space set aside for this operation (about 11,400 ft 2 [1060 m 2]). This will eliminate the need to transfer several Technical Area-55 plutonium operations (to „„make room'' for pit production activities in Technical Area-55) either to the CMR Building, or to newly constructed nuclear space, as contemplated in the Site-Wide Environmental Impact Statement. Thus, the Preferred Alternative for Pit Production can be implemented without an expansion of the plutonium operations floor space at LANL." 64 *Federal Register* 50803 (September 20, 1999).

In its December 2008 ROD on the Complex Transformation Supplemental Programmatic EIS, DOE/NNSA stated: **205-2**

> "NNSA does not foresee an imminent need to produce more than 20 pits per year to meet national security requirements." 73 *Federal Register* 77648 (December 19, 2008).

However, the Nuclear Facility would cost an estimated $6 billion or more and would support expansion of LANL's capability to manufacture up to 80 plutonium pits per year from the year 2023 onward. SRIC believes that a manufacturing capability of 20 plutonium pits per year is more than sufficient to maintain the U.S. nuclear arsenal. With the entry in force of the new START Treaty with Russia, the U.S. is limited to 1,550 warheads. The LANL capability of 20 pits per year has been sufficient to maintain a larger nuclear arsenal than the U.S. will have in the future. Thus, there is no apparent reason for the plutonium pit manufacturing capability to increase. There is certainly not a demonstrated need to have as the only action option a 407,600 gross square feet Nuclear Facility. At a minimum, decisionmakers and the public deserve a range of policy options, not just to leave things as they are or construct the huge, expensive Nuclear Facility. Such a range of options should be included in the new EIS process.

4. The DSEIS has insufficient policy options regarding commitment of resources.
CEQ regulations under NEPA require consideration of "any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented." 40 CFR § 1502.16. In addition to the NEPA requirements, decisionmakers and the public must understand the commitment of resources required by the Nuclear Facility, especially given present concerns regarding the national debt and deficit spending. **205-3**

4

205-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF.

205-3 Irreversible and irretrievable commitments of resources are addressed in Chapter 4, Section 4.8.3 of the *CMRR-NF SEIS*. The focus of the analysis is on commitment of materials, land, mineral, and energy resources. Financial resources are beyond the scope of the analysis.

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

205-4

The cost of constructing and operating the Nuclear Facility is unknown, but current estimates are up to approximately $6 billion for construction. Such a large expenditure is certainly a substantial commitment of resources. Decisionmakers and the public should have other, lesser cost options, which should be included in the new EIS process.

205-5

5. The DEIS is technically flawed because there are major impacts of the Nuclear Facility that are not accurately described and analyzed.

A. Nuclear Facility operations for 50 years or more will generate substantial amounts of radioactive and hazardous waste that must be stored at LANL, and the impacts are not analyzed in the DSEIS.

The DSEIS calculates that the Nuclear Facility and RLUOB annual waste generation rates are 88 cubic yards of transuranic (TRU) waste; 2,666 cubic yards of low-level waste (LLW) and mixed LLW; and 344,000 gallons of radioactive liquid. at 4-59. For 50 years, that would total 4,400 cubic yards of TRU; 133,300 cubic yards of LLW/MLLW; and 17,200,000 gallons of radioactive liquid.

The DSEIS states that the TRU waste would go to the Waste Isolation Pilot Plant (WIPP), the LLW/MLLW would go to the Nevada Test Site (NTS) or a commercial disposal site, and that the liquid waste would go to TA-50 for treatment. at 4-58 to 4-61.

However, WIPP is scheduled to end disposal operations by 2030, so for most or all of the Nuclear Facility's lifetime, WIPP will not be available for TRU waste disposal. DOE has no plans for another TRU disposal site. NTS and commercial disposal sites may or may not be available for all of the Nuclear Facility's lifetime. Thus, an adequate EIS would analyze the impacts of all of the TRU and LLW/MLLW staying at LANL, which the DSEIS does not even consider.

Moreover, the DSEIS does not accurately calculate the amount of waste that would result from the Nuclear Facility's operation. The CMRR-NF would be integral to the Plutonium Facility operations and is essential for production of 80 plutonium pits per year. Thus, the resulting increased waste generation from increased pit manufacturing would only occur if the NF is operational. The DSEIS does not include the data about the waste generation from the Plutonium Facility or any analysis of the impacts of the increased amounts of waste. An adequate EIS must consider the total and cumulative environmental impacts of the Nuclear Facility and interrelated plutonium operations.

205-6

B. Nuclear Facility operations would inhibit or prevent the cleanup missions of LANL, which is not described or analyzed in the DSEIS.

LANL is under a Consent Order with the New Mexico Environment Department, which, among other things, seeks to clean up waste sites, including at Area G. Disposal of LLW generated by the Nuclear Facility "could occur on site while Area G continues to accept waste." at 4-59. However, under the Consent Order, disposal at Area G must end years before the Nuclear Facility would begin operations in 2023. If the DSEIS is correct that LLW would go to Area G, the Nuclear Facility would delay closure of Area G and prevent the cleanup mission of that site.

5

205-4 The cost to build and operate the proposed CMRR-NF is not within the scope of the CMRR NF SEIS, but it will be one aspect that NNSA takes into consideration when making its decision.

205-5 As summarized in Section 2.5, Cleanup and Waste Management, of this CRD, the CMRR-NF and RLUOB would be designed, constructed, and operated to accommodate the projected waste volumes to be generated at the facilities. Sufficient capacity exists at LANL or at offsite facilities to manage all of the projected waste associated with any of the alternatives included in the *CMRR-NF SEIS*, as discussed in Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12. Section 2.5 of this CRD discusses the situation regarding the availability of WIPP for disposal of TRU waste. The possibility of offsite low-level radioactive waste disposal facilities not being available in the future is speculative and not appropriate for consideration in the SEIS. The impacts associated with transportation of radioactive and nonradioactive wastes to offsite waste management facilities have been estimated for all alternatives (see Chapter 4, Sections 4.2.13, 4.3.13, and 4.4.13, of the *CMRR-NF SEIS*).

DOE expects that RLWTF will be available to treat liquid wastes generated from various LANL facilities, using the existing capabilities of RLWTF or any future upgrades.

Only a 63 acre portion of Area G containing Material Disposal Area G and other waste disposal and management capabilities would be closed consistent with remediation decisions reached by NMED for Material Disposal Area G pursuant to the 2005 Consent Order. Waste management operations would be transitioned to other LANL locations. For example, the transition of low level radioactive waste disposal operations to Zone 4 within Area G has been assessed in the 2008 *LANL SWEIS* (DOE 2008a). As noted in the *CMRR-NF SEIS*, low level radioactive waste disposal may occur at Area G or at offsite DOE or commercial locations. (The *CMRR-NF SEIS* conservatively analyzes transportation impacts assuming all low level radioactive waste is transported off site for disposal.)

The commentor links the generation of waste from an assumed increase in pit production at TA-55 Plutonium Facility to the proposed CMRR-NF project. Please see the response to comment number 205-2.

Chapter 4, Section 4.6, of the *CMRR-NF SEIS* includes a cumulative impacts analysis of waste management requirements associated with projected future needs including both the proposed CMRR-NF and other LANL facilities

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

The DSEIS should commit that LANL operations will not delay closure of Area G and include that commitment in the EIS.

C. The Nuclear Facility would impact tribal concerns, which are not adequately described and analyzed in the DSEIS.

The DSEIS mentions some tribal issues, but notably ignores two major concerns - cleanup of the contamination at LANL and increased plutonium pit production. The Pueblos have supported cleanup because of their concerns about air and water pollution that affects their sacred lands and the health of their people. Tribal members also have expressed concerns about the impacts of increased pit production because of additional waste, contamination, and transportation that would occur.

The EIS must describe and analyze tribal concerns and explain how the alternatives and mitigation efforts address those concerns. **205-7**

6. <u>The DEIS is technically flawed because it does include analysis of decommissioning of the CMRR-NF.</u>

The total amount of waste generated and total cost of the Nuclear Facility include the decontamination, decomissioning, and demolition of the facility. The DSEIS provides no estimates on the amount of waste that would be generated by decontaminating, decomissioning and demolishing the Nuclear Facility. The DSEIS also provides no cost estimates for those activities.

SRIC understands that estimating waste amounts and costs 60 years or more in the future would be orders of magnitude estimates. But that fact should be acknowledged in an adequate EIS, and some estimates of the range of costs should be made based on actual historic practices. **205-8**

7. <u>The DSEIS public participation process has been grossly inadequate.</u>

SRIC has participated in dozens of EISs done by DOE, NNSA, and other federal agencies. The poor public participation process was among the worst that we have experienced and shows a marked lack of interest and/or significant lack of ability by DOE/NNSA.

Some of the many examples of a poor public participation process include the following.

A. Despite discussions with DOE/NNSA officials about the public process before the NOA was released, an inadequate 45-day public comment period and only three public hearings were noticed.
B. Time and resources that could have been used by SRIC and other organizations and individuals to promote turnout at the hearings and preparation of comments had to be diverted into additional efforts to secure an extension of the comment period and additional hearings in Albuquerque and Taos.
C. DOE/NNSA then granted only an inadequate 15-day extension of the comment period.
D. DOE/NNSA held only one additional hearing and that May 23 Albuquerque hearing was not adequately noticed 15 days in advance, as required by DOE's NEPA regulations at 10 CFR 1021.313(b). The *Federal Register* notice of the Albuquerque hearing was published on May 16. The postcard announcing the Albuquerque hearing was received by SRIC on May 19. **205-9**

6

including the TA-55 Plutonium Facility. Sufficient capacity is expected to be available on site or off site to treat and dispose of all of the projected amounts of radioactive waste. Refer to Section 2.5, Cleanup and Waste Management, of this CRD, for more information.

205-6 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

See the response to comment 205 5 for the status of Area G.

205-7 Regarding the potential impacts of an increase in the level of pit production, the commentor is again referred to the response to comment number 205-1. In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order.

Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low income populations surrounding LANL. The potential impacts on the general population from construction, operations, and transportation would be small as indicated in the impact analyses presented in Chapter 4, Sections 4.2, 4.3, and 4.4. As discussed in Section 4.3.8 and 4.4.8, there are not expected to be any significant impacts on cultural resources within LANL as a result of implementing these alternatives. As discussed in Sections 4.3.4, 4.3.6, 4.4.4, and 4.4.6, there are not expected to be any significant impacts on air or water quality as a result of implementing these alternatives. As discussed in Sections 4.3.13 and 4.4.13, there are not expected to be any significant impacts on transportation routes or traffic in the area surrounding LANL as a result of implementing this alternative. Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives, while waste management is addressed in Sections 4.2.12, 4.3.12, and 4.4.12. As indicated in Sections 4.2.11, 4.3.11,

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

E. At the Albuquerque hearing on May 23, SRIC's representative was rudely interrupted by the facilitator less than 5 minutes into his presentation. The facilitator had first announced that speakers would have 5 minutes, then decided to limit their time to 3 minutes. Based on the number of people registered to speak, there was adequate time for 5 minutes or more for each speaker. Facilitators at many other NEPA hearings have had much less rude and intrusive ways of having speakers wind up their comments.

F. DOE/NNSA later held a "meeting" in Taos, but did not provide for public comment on the DSEIS.

G. Despite announcing in the *Federal Register* and at the public hearings that comments could be emailed to NEPALASO@doeal.gov, that email address did not accept comments from more than 4,000 separate individuals around the nation. In addition, several people in New Mexico contacted SRIC during the public comment period to complain that their comments to the email address were not accepted.

Each of those examples could have easily been avoided or better handled by DOE/NNSA, as other agencies have done. SRIC and other representatives of citizen organizations discussed most of those matters with LASO officials before the NOA was issued and during the public comment period to try to avoid the problems. Thus, the reasonable conclusion is that DOE/NNSA were not interested in an adequate, effective public participation process or that they were not competent to carry out such a process.

205-9 cont'd

Conclusion

SRIC is aware that many other people are commenting on additional aspects of the DSEIS. SRIC's comments and those of all other persons must be fully considered. If DOE/NNSA adequately considers the comments, the DSEIS will be withdrawn and scoping for a new EIS will be carried out.

Sincerely,

Don Hancock

7

and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives. Also, impacts from a special pathways analysis have been included in Sections 4.3.11 and 4.4.11.

205-8 As discussed in Chapter 2, Section 2.10.2.2, DD&D of the new CMRR-NF would be considered at the end of its lifetime, designed to be 50 years. For either the 2004 CMRR-NF or the Modified CMRR-NF, impacts of DD&D of the CMRR-NF are expected to be comparable to those of DD&D of the CMR Building. Although activities involving radioactive materials that would be performed at the CMRR-NF are similar to those currently performed at the CMR Building, construction and operation of the CMRR-NF would reflect over 50 years of experience in facility design and operation and contamination control, with implementation of pollution prevention and waste minimization practices. An appropriate NEPA analysis would be conducted prior to commencing DD&D.

205-9 NNSA notes the commentor's concerns about the public outreach process. NNSA's implementation of public participation activities for review of the *Draft CMRR-NF SEIS* was consistent with past practices for other NEPA documents prepared for LANL. NNSA announced a 45 day comment period to provide sufficient time for interested parties to review the *Draft CMRR-NF SEIS*. In response to requests for additional review time, the comment period was extended by 15 days to a total review time of 60 days (76 FR 28222). All comments submitted to NNSA were considered in preparing the Final CMRR NF SEIS.

DOE regulations state that "DOE shall hold at least one public hearing on DOE draft EISs. Such public hearings shall be announced at least 15 days in advance. The announcement shall identify the subject of the draft EIS and include the location, date, and time of the public hearings" (10 CFR 1021.313(b)). NNSA published a Notice of Availability for the *Draft CMRR-NF SEIS* in the *Federal Register* on April 29, 2011 (76 FR 24018). That notice stated that the public review and comment period would continue until June 13, 2011 and announced public hearings to be held in Los Alamos, Española, and Santa Fe on May 24, 25, and 26, respectively. On May 6, 2011, NNSA published a Federal Register notice (78 FR 28222) to extend the comment period 15 days and to add a hearing in Albuquerque. While the Federal Register notice appeared a week before the Albuquerque public hearing, a notice of the Albuquerque public hearing

Commentor No. 205 (cont'd): Don Hancock
Southwest Research Information Center

was published in the Albuquerque Journal on May 8 and 19, 2011, meeting the requirement for 15 day advance notice.

The length of time given to commentors to speak at public hearings was predicated based on the number of anticipated commentors. Time was available to provide additional comments after all requested commentors spoke. In addition, other methods were available to provide public comments. Please refer to Section 2.2, NEPA Process, of this CRD for more information.

After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR-NF project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

Although many emails were received through the project email address, there were approximately 4,500 submittals that were attempted, but not successfully received by that method. Paper copies of these comments were later transmitted to NNSA and were fully considered in preparing the *Final CMRR-NF SEIS*. Responses to these comments can be found in Campaign AA.

Commentor No. 206: Geoffrey H. Fettus, Senior Project Attorney
Natural Resources Defense Council

June 28, 2011

Via Electronic Mail

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
Department of Energy – Los Alamos Site Office
3747 West Jemez Road
Los Alamos, New Mexico 87544

RE: NRDC Comments on the Draft Supplemental Environmental Impact Statement For The Nuclear Facility Portion Of The Chemistry And Metallurgy Research Building Replacement Project At Los Alamos National Laboratory, Los Alamos, New Mexico (CMRR-NF SEIS)

Dear Mr. Tegtmeier:

The Natural Resources Defense Council (NRDC) writes today to comment on the Department of Energy's National Nuclear Security Administration's (DOE/NNSA) *Draft Supplemental Environmental Impact Statement For The Nuclear Facility Portion Of The Chemistry And Metallurgy Research Building Replacement Project At Los Alamos National Laboratory, Los Alamos, New Mexico* (CMRR-NF SEIS), DOE-EIS-0350-S1. 76 Fed. Reg. 24018 (hereinafter "Draft SEIS"). The Draft SEIS issued by DOE/NNSA is the wrong document. Rather, DOE/NNSA should have commenced work on a new Environmental Impact Statement (EIS) process for the wholly new decision proposed by the Draft SEIS. *206-1*

NRDC Statement of Interest

NRDC is a national non-profit membership environmental organization with offices in Washington, D.C., New York City, San Francisco, Chicago, Los Angeles and Beijing. NRDC has a nationwide membership of over one million combined members and activists. NRDC's activities include maintaining and enhancing environmental quality and monitoring federal agency actions to ensure that federal statutes enacted to protect human health and the environment are fully and properly implemented. Since its inception in 1970, NRDC has sought to improve the environmental, health, and safety conditions at the nuclear facilities operated by DOE and the civil nuclear facilities licensed by the NRC and their predecessor agencies.

206-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS and that a full suite of alternatives should be re-evaluated. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

As described in Chapter 1, Section 1.1 of the *CMRR-NF SEIS*, five alternatives were analyzed in the November 2003 *CMRR EIS* (DOE/EIS-0350) (DOE 2003b): (1) Alternative 1 (the Preferred Alternative): Construct a new CMRR Facility at Technical Area 55 (TA-55); (2) Alternative 2 (Greenfield Site Alternative): Construct a new CMRR Facility at TA-6; (3) Alternative 3 (Hybrid Alternative at TA-55): Construct new Hazard Category 2 and 3 laboratory buildings (above or below ground) at TA-55 and continue use of the CMR Building; (4) Alternative 4 (Hybrid Alternative at TA-6): Construct new Hazard Category 2 and 3 laboratory buildings (above or below ground) at TA-6 and continue use of the CMR Building; and (5) No Action Alternative: Continue use of existing CMR Building – no new building construction. The Preferred Alternative (Alternative 1) was selected for implementation in a 2004 ROD (69 FR 6967) for the *CMRR EIS*. In addition, in the 2008 ROD for the *Complex Transformation SPEIS* (73 FR 77644) NNSA reaffirmed the decision to construct and operate the CMRR-NF at LANL. NNSA does not intend to revisit these decisions previously made in the *CMRR-NF SEIS*. The SEIS tiers from the previous decisions made in the RODs for the 2003 *CMRR EIS* and the 2008 *Complex Transformation SPEIS* and examines a more limited set of alternatives.

In addition, Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, describes alternatives considered but dismissed from detailed analysis. These alternatives include: (1) alternative locations outside LANL; (2) extensive upgrades to the existing CMR Building; and (3) moving capabilities to other LANL facilities. Based on public comments, Chapter 2, Section 2.7 was revised to include more information on alternatives considered but not evaluated in detail.

Page 2

A New EIS is Necessary.

On February 3, 2004, then-NNSA Administrator Linton Brooks issued the Record of Decision (ROD) for the CMRR Project, based on the Final EIS. 69 Fed. Reg. 6967 (February 12, 2004). This was the result of a multi-year process. The final agency action and decision implemented by the ROD was, quite simply:

> [Th]e construction and operation of a new CMRR facility within TA-55 at LANL. The new CMRR facility would include two buildings (one building for administrative and support functions, and one building for Hazard Category 2 SNM laboratory operations), both of which would be constructed at above ground location (construction option 3). The existing CMR building would be decontaminated, decomissioned and demolished in its entirety (disposition option 3).

Id. at 6972 (February 12, 2004).

Over the past seven years, DOE/NNSA has:

> 1) Implemented one element of the ROD by constructing the administration/support building;
>
> 2) Continued to operate the CMRR building. But importantly, the agency has not implemented any aspect of the decision to decontaminate, decommission, and demolish the building as, we suspect, there has been no progress on transferring to other locations or simply terminating the various functions. Rather, the building has been maintained; and
>
> 3) Decided not to construct any of the Nuclear Facility alternatives described in the Final EIS.

Now, in light of this work subsequent to its Final EIS and the 2004 ROD, the latest iteration states:

> Based on new information learned since 2004, the 2004 CMRR-NF would not meet the standards for a Performance Category 3 (PC-3) structure as required to safely conduct the full suite of NNSA AC and MC mission work. Therefore, the 2004 CMRR-NF would not be constructed.

Draft SEIS at 1-10.

The Department is well aware that it must comply with the National Environmental Policy Act (NEPA), 42 U.S.C. § 4321, et seq. and its implementing regulations. We agree that the current situation is somewhat unusual in that typically an agency proposes a major federal action, conducts the EIS process, including issuing a ROD, and ultimately implements a decision that

Page 3

reflects input received during the NEPA process. Or, as happens in the rare instance, the agency proposes a major federal action, conducts the EIS process, including issuing a ROD, and decides – or a court decides – to not carry out the proposed major federal action.

But in this instance, the major federal action was proposed, the NEPA process concluded, the ROD issued, and the agency itself determined that a significant aspect of the program was unsafe and not an action that federal government will perform to conclusion. But rather than discard a clearly inadequate 2003 FEIS and begin again, DOE/NNSA has attempted to shoehorn its NEPA compliance into the current supplemental process. We surmise two reasons for continued reliance on the 2003 FEIS: (1) it is the compliance basis for the Radiological Laboratory/Utility/Building (RLUOB) that has been constructed and will soon begin operations; (2) DOE/NNSA does not want to be bound by the Nuclear Facility reasonable alternatives presented in the 2003 FEIS and its subsequently issued ROD, so it issued the instant supplemental document with its even more limited, "tiered" set of alternatives in order to unlawfully constrain the agency's examination of alternatives examined; and (3) DOE/NNSA limits its examination of alternatives because it has a pre-determined outcome that it has advocated since 2004 – constructing the Nuclear Facility. Specifically, in the Draft SEIS, DOE/NNSA limits its examination of alternatives to avoid grappling with how to operate the CMR building and/or its functions for the next decade or more and moves ahead with intentions advocated since at least 2004, building the Nuclear Facility.
The proposed action gives the appearance of having a pre-determined outcome. NEPA does not allow for such pre-determination, and instead requires the agency to undertake a "hard look" at all reasonable alternatives.[1]

206-1 cont'd

A far more straightforward and NEPA-compliant proposed approach would be to commence a new EIS process—with a newly thought out statement of purpose and need that reflects the current administration's priorities – and a full examination of the following reasonable alternatives with all of their attendant environmental impacts (and associated opportunities to either mitigate or avoid those harms):

- "no action" – maintaining some functions in the CMR building;
- "reduced operations" – terminate some of the CMR functions;
- "transfer operations" – consider other facilities at LANL, including the RLUOB, TA 55 Plutonium Facility, as well as other NNSA sites for CMR functions; and
- "original proposed action" – constructing a Nuclear Facility, with two construction options, that would begin operations in approximately 2023 and operate for several decades.

The option DOE/NNSA has chosen is to try to supplement an admittedly inadequate FEIS regarding the CMR-NF, making transparent its effort to avoid examination of a host of reasonable alternatives and end up constructing the CMRR-NF. That option is contrary to the

[1] "What constitutes a 'hard look' cannot be outlined with rule-like precision, but it at least encompasses a thorough investigation into the environmental impacts of an agency's action and a candid acknowledgement of the risks that those impacts entail." Nat'l Audubon Soc. V. Dept of the Navy, 422 F.3d 174, 185 (4th Cir. 2005).

requirements of NEPA and must cease. DOE/NNSA should return the drawing board and issue a new Notice of Intent to Prepare an EIS for an entirely new process, with a new statement of purpose and need and a new, rigorous examination of alternatives. **206-1 cont'd**

If you have questions, please do not hesitate to contact me at (202) 289-6868. Thank you for considering our views on these important matters.

Commentor No. 207: Laura Watchempino

From: Laura Watchempino [5000wave@gmail.com]
Sent: Monday, June 27, 2011 3:29 PM
To: NEPALASO@doeal.gov
Subject: CMRR-NF SEIS

I am writing once again to state the need for a new EIS, rather than a Supplemental Environmental Impact Statement (SEIS) for a completely redesigned Chemical and Metallurgical Research Replacement Nuclear Facility (CMRR-NF) at Los Alamos National Laboratory (LANL) .

The orginal 2004 EIS for the new building is dated and requires a completely new assessment of environmental impacts based on a final new design for the CMRR-NF in a geologically unstable area that drains to the Rio Grande. The public health and safety risks of a new building for the processing of plutonium and nuclear materials to downwind and downstream communiities must be a paramount consideration. **207-1** LANL's historic discharges have disproportionately impacted Native and Hispanic New Mexicans along the Rio Grande **207-2**

LANL recently settled a Clean Water Act lawsuit by Amigos Bravos and other community groups of against LANL to stop polluted run-off to the Rio Grande from over 2,000 dumpsites on LANL property. LANL's track record of disregard for human health and safety must be questioned and is another reason why a new EIS for the new CMRR-NF is required. **207-3**

I also entered comments on the laptop computer provided at the public meeting in Albuquerque, NM on May 23, 2011.

207-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA has determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

207-2 Based on public comments, Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on minority and low-income populations surrounding LANL. The potential impacts on the general population from construction, operations, and transportation would be small as indicated in the impact analyses presented in Chapter 4, Sections 4.2, 4.3, and 4.4. As discussed in Section 4.3.8 and 4.4.8, there are not expected to be any significant impacts on cultural resources within LANL as a result of implementing these alternatives. As discussed in Sections 4.3.4, 4.3.6, 4.4.4, and 4.4.6, there are not expected to be any significant impacts on air or water quality as a result of implementing these alternatives. Sections 4.2.10, 4.3.10, and 4.4.10 of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

207-3 NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. There are established programs at LANL that address liquid discharges and cleanup of past contamination. Liquid discharges through permitted outfalls are sampled and analyzed to evaluate compliance with permit conditions; results are reported annually in the LANL environmental

Commentor No. 207 (cont'd): Laura Watchempino

surveillance report (copies are available at http://www.lanl.gov/environment/air/reports.shtml). A monitoring program is conducted at LANL (described in the 2008 *LANL SWEIS*, Chapter 4, Section 4.3.1.5) to detect contamination that has resulted from past practices. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL, and Section 2.5, Cleanup and Waste Management, of this CRD, for more information on cleanup of past contamination.

Commentor No. 208: Pat Walsh

From: Pat Walsh [walshpat@earthlink.net]
Sent: Monday, June 27, 2011 11:11 PM
To: NEPALASO@doeal.gov
Subject: Fukushima, NE and Fukushima, NM

I am writing to inform you of my deep concern with your plans at Los Alamos National Laboratory. I have summarized some of my concerns in my subject line.

Los Alamos National Laboratory sits on an earthquake-prone area between the Rio Grande rift and the volcanic Jemez Mountains. The original Environmental Impact Statement (2004) looked at a building designed to withstand only mild seismic events, but a 2007 study indicated a potential huge increase in ground motion activity, requiring major changes to the building design. ***208-1***

A new nuclear facility will detract from cleanup of the existing mess.

The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution. ***208-2***

And one last word: FIRE !!!!

Pat Walsh
Port Washinngton, WI

208-1 NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. But there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 208 (cont'd): Pat Walsh

208-2 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials, including vegetation, are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 209: Sheri Kotowski

June 27, 2011
Dear Mr. Tegtmeier,

I live in the Rio Embudo Watershed located about 35 miles directly down wind from Los Alamos National Laboratory (LANL). My village and the entire watershed are currently inundated with smoke, ash and unknown contamination from the Las Conchas Fire. I have many concerns about the CMRR-NF currently under construction, but foremost is the senseless terrorizing of communities by posing such a risk as a nuclear bomb factory and storage facility in a major wild fire hazard zone. This is the 4th major fire threatening LANL over a 15-year period and only the beginning of climate change induced drought. This Bomb Factory clearly poses an unjustified local and global risk disguised as "national security" to our communities and our lands.

As the Las Conchas Fire is raging around LANL at this very moment, I want to ask you if you were here during the Cerro Grande Fire, the Dome Fire or the San Miguel Fire? So many people from LANL that I meet these days were not. Unlike the Cerro Grande Fire the Las Conchas Fire is a very immediate and swift moving fire. This drought driven fire has in less that 24 hours ravaged over 43,000 acres, same amount as the Cerro Grande consumed in 21-days. Spurred by this climate change induced drought the fire is charging with little relief in sight. Areas threatened by fire now include High Explosive (HE) Open Burn and Open Detonation sites. These areas are highly contaminated with HE and depleted uranium. Area G, an open-air radioactive waste storage unit is also threatened as well as canyons contaminated with PCB's, HE and toxic and radioactive heavy metals. At this point we have heard nothing about what contamination may be present in the plume of this fire. **209-1**

I feel extremely threatened at the moment with this fire burning through legacy contamination still waiting to be cleaned up because of clean ups' low priority status all the while DOE continues to dump billions into the CMRR-NF, a facility designed to build more of something we do not need. **209-2** LANL has never taken the threat of wild fire seriously despite all the major fires that will continue to threaten LANL. For example, in the FEMA Emergency Management Exercise that took place in 2009, citizens and Non-Governmental Organizations repeatedly requested that the scenario reflect a substantial wild fire, i.e. Cerro Grande. This did not happen because LANL felt that it was an unreasonably exaggerated scenario that could not possibly happen. It did and now we have the Las Conchas which s beginning to make Cerro Grande look like a stroll in the park. ***209-1 cont'd***

DOE and NNSA must recognize the complete inadequacy of the Supplemental Environmental Impact Statement (SEIS) for the CMRR-NF project, halt construction activities and prepare a new Environmental Impact Statement. DOE/NNSA/LANL must return to the drawing table and do a complete EIS that addresses:

1. The 50% increase in scale and scope of the CMRR-NF. A SEIS by concept is meant to reflect only minor and inconsequential changes in a project, not changes that result in an over 10- fold increase in budget. **209-3**

1. A Nuclear Facility and plutonium storage located in a region where wildfire is the number one and most likely hazard in Northern New Mexico. ***209-1 cont'd***

209-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The waste storage domes in TA-54 are not the subject of the *CMRR-NF SEIS*. However, NNSA has taken actions to mitigate the risks of a wildfire on the domes. In 2000, the Cerro Grande fire burned a heavily forested canyon area to within about 0.75 miles (1.2 kilometers) of the waste storage domes, but none were burned and there were no radiological releases from the domes. The Las Conchas fire reached the southern border of LANL, but did not get within 2 miles (3.2 kilometers) of the domes. Additional fuel reduction has been conducted since the Cerro Grande fire, both to the vegetation surrounding TA-54 and within the domes themselves (for example, wooden pallets have been replaced with metal pallets), to further decrease the potential for a waste storage dome fire occurring as a result of a site wildfire. Furthermore, NNSA has an active program to remove the waste stored at Area G and ship it to WIPP for disposal.

Chapter 4, Section 4.3.1.7, of the 2008 *LANL SWEIS* summarizes a number of studies performed following the Cerro Grande fire to determine the impacts the fire had on the movement of contaminants (DOE 2008a). Preliminary monitoring data for the Las Conchas fire are available on the "Racer" website at http://racernm.com/. Additional monitoring data will be published in the LANL environmental surveillance reports typically published in the fall of each year for the previous year and available at "http://www.lanl.gov/environment/all/esr.shtml."

Commentor No. 209 (cont'd): Sheri Kotowski

2. All current and pending Seismic Reports indicating the possibility of a magnitude 8 earthquake. Current reports recognize that the fault line that the CMRR-NF sits on is capable of an earthquake of the same magnitude as the Fukushima earthquake in Japan earlier this year. **209-4**

3. Emergency Management and Preparedness (EM&R) both at the LANL site and regionally, in the event of a magnitude 8 earthquake. An earthquake of this magnitude is likely to spur wild fire. LANL has continually failed to adequately address countless and repetitive infractions in EM&R, to the point now that audits are no longer available for public inspection. **209-5**

4. The effects and impacts of climate change on the region in relationship to this facility, that includes fire risk and water consumption extending into the year 2025 **209-1 cont'd**

5. Negative socioeconomic and environmental impacts to agriculture that includes water usage and national security. One consideration would be, Northern New Mexico is on the verge of a farming renaissance. An example of the threatening use of "national security" would be taking water from farmland to keep making bombs. In 2010, LANL claimed that Open Burning in the hazardous waste permit was essential to "national security". **209-6**

6. Impact to Prime Farmland. Many People in Northern New Mexico make their living and/or feed their families by working the land. A bomb Factory not only would place a huge burden on water consumption it also risks contamination to the land.

7. And produce a cost effective cradle to grave analyses of this project, including damages that would be incurred by a magnitude 8 earthquake and a wild fire. This would include the true cost of producing a plutonium pit and storing 6 metric tons of weapons grade plutonium. **209-7**

The most outstanding issue is one of Local Security. I do not agree with the notion that bombs and weapons grade plutonium storage will provide security. Security is consistently having access to ample amounts of clean water, high quality food, good education and cultural integrity in a non-threatening environment. The CMRR-NF cannot provide any of this. **209-8**

Finally, I question the wisdom in risking the condemnation of future generations from a nuclear accident at this facility or the wisdom in squandering water and life to make money from something we have no use for.

Thank you for your consideration.

Sincerely,

Sheri Kotowski
PO Box 291
Dixon, New Mexico 87527
serit@cybermesa.com

NNSA acknowledges the commentor's concerns that climate change may increase the frequency and intensity of wildfires and decrease the availability of water. Based on public comments, Chapter 3, Section 3.4.4, of the *CMRR-NF SEIS* has been revised to include a description of the types of environmental changes that could occur in the southwestern United States due to climate change. A discussion of potential impacts that could result at LANL from climate change and that addresses water usage has been added to Chapter 4, Section 4.1.

As noted above, the CMR Building and the TA-55 Plutonium Facility were not included in the 2008 *LANL SWEIS* as facilities that present a significant risk due to wildfires because these facilities are largely constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum (DOE 2008a). The CMRR-NF would be at least as resistant to the effects of wildfire as the existing CMR Building. Therefore, even if the frequency of wildfires is increased by global climate change, these facilities would not be directly affected. As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

209-2 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

209-3 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Commentor No. 209 (cont'd): Sheri Kotowski

209-4 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 209 (cont'd): Sheri Kotowski

209-5 Chapter 4, Section 4.6.4, of the 2008 *LANL SWEIS* describes the LANL emergency management and response program. LANL personnel maintain the necessary apparatus, equipment, and Emergency Operations Center to respond effectively to virtually any type of emergency, not only on the LANL site, but throughout the local community as well. The program operates in accordance with applicable Federal requirements, including DOE Order 151.1C, *Comprehensive Emergency Management System*. Routine coordination between LANL staff and offsite agencies is primarily handled through the Los Alamos County Local Emergency Planning Committee, which meets monthly and is headed by the Los Alamos County Emergency Manager. LANL personnel provide training at no cost to a variety of county-associated response entities.

209-6 Information was added to Appendix C, Section C.6, of the *CMRR-NF SEIS*, that describes potential land contamination following a severe, beyond-design-basis earthquake and fire. The analysis presented in Section C.6 indicates that offsite contamination above levels that may require remediation could occur if this accident were to occur at the existing CMR Building or the 2004 CMRR-NF. If this accident were to occur at the Modified CMRR-NF, no land outside of TA-55 is projected to be contaminated above the screening level. Section C.6 also describes the potential impacts and costs of offsite contamination above screening levels.

As described in Chapter 5, Section 5.3, the Price-Anderson Act, which was signed into law in 1957, provides for payment of public liability claims in the event of a nuclear incident. See Section 5.3 for more information.

As described in Chapter 3, Section 3.5.7, no prime farmland soils have been designated in Los Alamos County. The closest areas of prime farmland are located approximately 7.5 miles (12 kilometers) east and 10 miles (16 kilometers) south of LANL, adjacent to the Rio Grande. With respect to water use, construction and operation of the Modified CMRR-NF would exceed that under the other alternatives. But as shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Commentor No. 209 (cont'd): Sheri Kotowski

209-7 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

209-8 Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Subject: Comment on Draft CMRR-Nuclear Facility SEIS -- This is no time to be expanding plutonium production at Los Alamos

To the US Department of Energy:

210-1

At the current time it is extremely irresponsible to even consider the expansion of plutonium pit production at Los Alamos as the current wildfire situation, which is part of a recurrent pattern for this area, makes clear that the Los Alamos plateau is not a safe place to be building plutonium-based armaments, storing plutonium-based products and creating plutonium-contaminated waste. As a person who lives downwind and downstream from Los Alamos, I believe that the continued expansion of plutonium-based weapons production at that site is a direct threat to my health and wellbeing and that of my family. You too easily forget that Los Alamos is upwind and upstream from some of the most densely populated metropolitan areas in New Mexico. It is once again proving itself not to be a safe place to build up plutonium contamination.

Even before this recurrent fire proved once again what a hazardous area the Los Alamos plateau is for dirty work with plutonium, research by credible nuclear watchdog organizations had demonstrated that the justification for expanding the CMRR Nuclear Facility as presented in the SEIS was flawed, in adequate and contradictory. The report from Nuclear Watch New Mexico, which appears below, is incorporated into my own testimony on this matter because it is well researched, cogent and clear. Given the questionable logic behind the expansion of nuclear weapons construction at this time, it is particularly egregious to place at risk the health and wellbeing of the people of New Mexico who bear the brunt of the risks associate with the CMRR Nuclear facility.

In their analysis, Nuclear Watch New Mexico stated:

The Draft CMRR-Nuclear Facility SEIS is deficient because:

210-2

Purpose and need is not reexamined. The Draft SEIS claims, "The purpose and need for NNSA action [to build the Nuclear Facility] has not changed since issuance of the 2003 CMRR EIS. NNSA needs to provide the physical means for accommodating the continuation of mission-critical AC [analytical chemistry] and MC [materials characterization] capabilities at LANL beyond the present time in a safe, secure, and environmentally sound manner." Summary page 8 (S-8). But the NNSA's own recently released FY 2011 Strategic Plan states, "Many things have

210-1 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4 CMR Mission, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

210-2 Responses to comments submitted by Nuclear Watch New Mexico can be found in letter 204. Issues raised by the commentor are addressed in Section 2.2, NEPA Process, Section 2.3, Programmatic Direction and Decisions, and Section 2.4, CMR Mission, of this CRD. As discussed in Chapter 1, Section 1.5, of the *CMRR-NF SEIS*, NNSA is not planning to revisit either the need for

Commentor No. 210 (cont'd): Dr. Rosemary Ann Blanchard

changed since the last National Nuclear Security Administration (NNSA) Strategic Plan was published in 2004," immediately pointing to President Obama's April 2009 Prague speech in which he called for a future world free of nuclear weapons. Thus, on a broad level the purpose and need of the Nuclear Facility, slated to operate as long as "toward the end of the twenty-first century" (S-16), should be examined in how it helps or obstructs to reach that lofty goal.

At the same time, Obama's Prague speech called for rigorous interim maintenance of the U.S. nuclear stockpile, and his April 2010 Nuclear Posture Review (NPR) specifically endorsed constructing and operating the CMRR-Nuclear Facility as one of "the following key investments [that] were required to sustain a safe, secure, and effective nuclear arsenal." However, one thing the NPR did not do was to raise LANL's level of plutonium pit production from the currently sanctioned level of up to 20 plutonium pits per year, despite repeated attempts by the NNSA to do so. Nevertheless, the Nuclear Facility is to be built with 22,500 sq. ft. of plutonium processing space, the size of which a 2007 NNSA-commissioned study explicitly linked to a future production rate of 50-80 plutonium pits per year. That same study also assumed that new design nuclear weapons, the so-called Reliable Replacement Warheads (RRWs), would be produced, requiring expanded plutonium pit production.

210-2 cont'd

NNSA's FY 2011 Strategic Plan further states (p. 10), "As requirements for new or expanded capabilities emerge, our reinvestment strategy will use accepted life cycle management standards to integrate maintenance and replacement schedules with needs for new facilities and capabilities."

So what are these needed new or expanded capabilities, if indeed we are seeking a future world free of nuclear weapons? If these needs exist, NNSA must explain why plutonium pit production must be expanded? If expanded production is not needed, then why is the CMRR-Nuclear Facility needed?

Current and proposed "Life Extension Programs" seek to extend the service lives of the W76 and W78 ballistic missile warheads and the B61 bomb. But these programs are scheduled for completion before the CMRR-NF's operational date of 2022, so the facility is of no use to them. Taxpayer money misdirected into the CMRR-Nuclear Facility would be better put into maintenance and upgrades of existing facilities and programs.

The Draft SEIS for the CMRR-NF fails to offer and analyze realistic alternatives.

After careful reevaluation of NNSA's contemporary purpose and need for plutonium pit production, a new document should be prepared that analyses a broader set of alternatives for meeting that purpose. Two of the Alternatives given in this April 2011 draft are unworkable, which automatically skews analysis in favor

210-3

the CMRR-NF or relocating the CMR capabilities at another site. NNSA has addressed the CMRR-NF in a series of NEPA documents since the 2004 ROD for the *CMRR EIS* that announced its decision to locate a two-building CMRR Facility at TA-55. The *Complex Transformation SPEIS* (DOE 2008b), which addressed transforming the nuclear weapons complex into a smaller, more efficient enterprise, also addressed the location for manufacturing and research and development involving plutonium. In the ROD for that document, NNSA announced its decision that that mission would remain at LANL and its decision to construct and operate the CMRR Facility at LANL. Based on these decisions and the authorization for the project and appropriation of funding, NNSA intends to proceed with the CMRR-NF planning process.

The CMR Building and the CMRR-NF provide capabilities as described above. As described in Chapter 1, Section 1.2, of the CMRR-NF SEIS, NNSA's ability to perform these capabilities has been curtailed because of safety restrictions at the existing CMR Building; some types of materials characterization work have been suspended because of these limitations.

Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

210-3 The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare a supplement when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the

Commentor No. 210 (cont'd): Dr. Rosemary Ann Blanchard

of the NNSA's preferred alternative. A reasonable alternative to consider is to not build the Nuclear Facility; continue to perform analytical chemistry, material characterization, and actinide research and development activities in the old CMR Building; and make facility upgrades to that building that are needed to sustain programmatic operations for another 20 to 30 years. Crucial to the validity of this alternative is an analysis of the impacts of all current and proposed projects to extend the life of the CMR, including roofing work, exhaust fans, HEPA filters, structural and safety systems, and elevator repairs.

The CMR upgrade alternative was included in NNSA's Notice of Intent to prepare the supplemental EIS, but was not considered in the draft. The cost of CMR upgrades was offered in the 2003 EIS as the reason why the CMR upgrade alternative would not be considered. But costs for the replacement Nuclear Facility have now skyrocketed such that it is now eminently reasonable to make a business case for upgrading the old CMR Building (which would also push back costs for decontaminating and demolishing it) and not build the Nuclear Facility.
Nuclear Watch NM's preferred alternative, which we have already proposed in our Scoping Comments on this SEIS, is to not build the Nuclear Facility; D&D the old CMR Building; and consolidate CMR missions in the new 185,000 square-feet Rad Lab and PF-4. In addition to arguing that this is the appropriate alternative for NNSA to follow we also that it meets the test of being a reasonable alternative such that NNSA must analyze it.

A possible option to our preferred alternative: The CMRR-NF is being designed with a vault for safe and secure storage of up to 6 metric tons of special nuclear materials (SNM). NNSA's claimed need for the Nuclear Facility should be de-linked from any possible need for a new SNM vault. NNSA should consider not building the Nuclear Facility while building a standalone vault. That vault could perhaps free up floor space at PF-4 (further obviating the need for the Nuclear Facility) and help de-inventory both it and the old CMR Building of materials at risk in a seismic event. Materials characterization and analytical chemistry could then be performed in PF-4 and the Rad Lab.

To be a credible analysis the NNSA must develop a greater spectrum of reasonable alternatives, which could include various combinations of the following:

- Do not construct the CMRR-NF.
- Continue to perform analytical chemistry, material characterization, and actinide research and development activities in the CMR Building, but making extensive facility upgrades needed to sustain CMR programmatic operations for another 20 to 30 years.
- Do not continue to use the old CMR.
- D&D the half of the CMR that was determined to be over a seismic fault.

210-3 cont'd

level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions, reached in 2008 and issued through the 2008 *Complex Transformation SPEIS* ROD (73 FR 77644). The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003. Another alternative addresses the alternative of continuing to use the CMR Building, although its continued use would not fully meet NNSA's stated purpose and need.

The alternative of distributing analytical chemistry and materials characterization capabilities among multiple facilities at LANL was considered, but not analyzed as a reasonable alternative. Because of the quantities of special nuclear material involved, to fully perform the analytical chemistry, materials characterization, and plutonium research capabilities, facilities would need to be classified as Hazard Category 2 and Security Category 1. RLUOB was not intended as a nuclear-qualified space to handle Hazard Category 2 or 3 levels of nuclear material. Thus, NNSA would not operate RLUOB as anything other than a radiological facility, which would significantly limit the total quantity of special nuclear materials that could be handled in the building. As a result, analytical chemistry and materials characterization operations requiring Hazard Category 2 and 3 work spaces could not be carried out in RLUOB. Using space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work. Use of other locations at LANL would introduce new hazards for which the facilities were not designed and would not conform to the objective of collocating plutonium operations near the TA-55 Plutonium Facility. Performing work at a location remote from the TA-55 Plutonium Facility would necessitate periodic road closures and heightened security to enable transport of materials between the facilities. In addition, other facilities would not have the available space, vaults, and engineered safety controls and requirements for this type of work. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

Commentor No. 210 (cont'd): Dr. Rosemary Ann Blanchard

210-3 cont'd

- Keep the nuclear materials inventory in the CMR low enough so that seismic requirements are less stringent. Operate it as a DOE Hazard Category 3 facility meaning that it has under 900 grams of plutonium-239 equivalent.
- Do not build the Nuclear Facility but do build a standalone SNM vault. This could help free up floor space at PF-4 and CMR and lower the amounts of "materials at risk" in the event of accidents or seismic events.
- Consider the most efficient use of the new 185,000 square-feet Rad Lab (which will be ready for operations in less than two years) and PF-4 for relocating old CMR activities

210-4

This draft SEIS should be withdrawn until the details of the Shallow Excavation Option are better understood. The cost-saving Shallow Option, in which the foundation would be constructed in a geologic layer above the poorly welded tuff layer, is not a mature concept, and it is not yet known if this option is safe. The draft SEIS fails to accurately analyze how impacts to the environment from this option may be different.

There are more new seismic investigations currently underway at the Lab. This draft SEIS must be withdrawn and rewritten after the results of these new investigations are known. Proceeding with design before seismic risks are better known will only repeat the process that led to the need for this Supplemental EIS.

210-5

Final Note: Although proponents of the CMRR-Nuclear Facility constantly point to the benefits of job creation, the SEIS itself states the socioeconomic impact of this new facility is minimal.

Concerning construction jobs, "Peak direct (790 workers) plus indirect (450 workers) employment would represent less than 1 percent of the regional workforce and would have little socioeconomic effect." (S-39, parentheses in the original.) The average number of construction jobs is 420 over nine years. (From Table2-1, Summary of CMRR-NF Construction Requirements, p. 2-15.)

Facility personnel would not change from existing levels, just their location, "Approximately 550 workers would be at the CMRR Facility (Modified CMRR-NF and RLUOB); they would come from the CMR Building and other facilities at LANL so the facility would not increase employment or change socioeconomic conditions in the region." (S-39, parentheses in the original)

Nuclear Watch NM argues that far more jobs could be created through other efforts, and not through a ~$6 billion dollar plutonium investment that will lock in Los Alamos' future to the hopefully shrinking business of nuclear weapons research and production.

210-4 The concerns expressed by the commentor about the Shallow Excavation Option not being a mature alternative appear to refer to statements in Chapter 1 and Chapter 2, Section 2.6.2.1, of the *Draft CMRR-NF SEIS* indicating that there was more uncertainty in the design of the Shallow Excavation Option because that design had not reached the same level of maturity as the Deep Excavation Option. In 2011, a review of the requirements for the design of the CMRR-NF identified an opportunity to reduce the amount of additional excavation and concrete fill required for the Deep Excavation Option by raising the bottom of the basemat to near the original design elevation. The overall building height would remain the same, but the top of the roof would be higher above ground than it was in the conceptual and preliminary design. At the current level of design maturity, this approach, known as the Shallow Excavation Option, appears to provide some reductions in construction impacts and cost without affecting other building design requirements. Both construction options require the same sets of safety controls and are expected to remain close in offsite environmental consequences as shown in the analyses contained in this SEIS. At this time, both construction options are being considered by NNSA. As the design studies continue and more details become available, one option or the other may be judged to have significant advantages in the time and/or cost expected for executing the excavation phase of construction that will facilitate NNSA's selection of a preferred construction option. Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials. Design considerations for this category are to limit facility damage as a result of design-basis natural phenomena events (for example, an earthquake) so that hazardous materials can be controlled and confined, occupants are protected, and the functioning of the facility is not interrupted (DOE 2002b). As indicated in the *CMRR-NF SEIS*, the Deep Excavation Option would have greater impacts from construction than the Shallow Excavation Option, but the operational impacts would be the same for either option.

210-5 NNSA is not considering the alternatives in the *CMRR-NF SEIS* to create jobs; rather, these alternatives are being considered to meet the purpose and need as stipulated in Chapter 1 of the SEIS.

Commentor No. 210 (cont'd): Dr. Rosemary Ann Blanchard

I hope that you will give serious consideration to the analysis by Nuclear Watch New Mexico and to the situation on the ground at Los Alamos which makes clear that this is an unsafe site for continued development of plutonium-based materials.

Sincerely,

Dr. Rosemary Ann Blanchard

Commentor No. 211: Tim Eisenbeis

From: Tim Eisenbeis [ateisen@gwtc.net]
Sent: Wednesday, June 29, 2011 1:17 AM
To: nepalaso@doeal.gov
Subject: I oppose the CMRR-NF

I am writing to inform you of my deep objection to this project on every count: environmental, cost, national security and moral. Nothing justifies this kind of spending when states and the federal governments are so near to shutting down for lack of funds. We, the American citizens do not need more plutonium pits nor shiny new nuclear weapons. They endanger us and can only serve to eventually blow up /incinerate the wonderful world we hope to hand off to our 2 teenage boys. ***211-1***

211-1 NNSA notes the commentor's opposition to pit production and nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 212: Patrick Brunmeier

From: patrick brunmeier [pbrunmeier@hotmail.com]
Sent: Tuesday, June 28, 2011 11:12 PM
To: nepalaso@doeal.gov
Subject: No new plutonium facility at Los Alamos National Laboratory

I write to urge you to disregard the proposition of a new plutonium facility at Los Alamos National for the following reasons (at least):

I believe that expanding the United States' nuclear weapons production capabilities is in contradiction to President Obama's stated goal of a world free of nuclear weapons.

The Department of Energy (DOE) is already struggling with prioritizing taxpayer funds intended for CLEANUP, not a new bomb plant that is dangerous, expensive, destabilizing and damaging to the environment. *212-1*

PS I write as two nuclear facilities are being threatened by flooding in the US; and another is being threatened by fire; and the meltdown continues in Japan; and three active facilities are threatened in the geologic Subduction Zone of the Pacific Northwest; and as other nations are stopping or curtailing their nuclear production. *212-2*

patrick brunmeier
200 Sheldon
mt shasta, CA 96067

212-1 NNSA acknowledges that there is substantial opposition to the development and testing of nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

212-2 NNSA acknowledges the commentor's concern about potential nuclear accidents at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 213: Beata Tsosie-Pena
Tewa Women United

June 14, 2011

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, NM. 87544

Dear Mr. Tegtmeier,

In regards to the Supplemental Environmental Impact Statement we, as members of downwind and downriver impacted communities, request that all construction and work on the new CMRR is halted until a new Environmental Impact Statement (EIS) is released, reviewed, and communicated to the impacted populations. As the surrounding communities health and well being is directly affected by the environmental consequences of such a facility, there needs to be a significant increase in the way that we are receiving information, opportunities for direct input, and direct involvement in decision making procedures. Additional scoping meetings need to be held in every community within a 100-mile radius of Los Alamos National Labs, Sandia National Labs, the WIPP sites, and in Uranium mining communities both in state and out of state. Public comment should be allowed as ongoing throughout the finalization of this process considering the changes in size, scope and cost of the proposed CMRR facility. We also request that more in-depth and comprehensive responses to all public comments are published alongside each other on the website and in the new EIS in order to facilitate understanding and to maintain transparency on the actual impact of these comments. **213-1**

It is vital that the state permits LANL will be applying for, and those they are exempt from, be included in the new EIS; with specific information therein regarding what will be released into the environment on a daily/regular basis. Information needs to be included that details the longevity of any radioactive or other toxins that will be released as a result of this new building. The lifespan of this facility (and the old one) must be taken into account in order to assess not only short term releases but also include the plan for decommissioning the building and/or improving it in 50 years, and what will be done with the waste generated in that time. **213-2** Financial assurance needs to be guaranteed so that our communities are guaranteed cleanup, containment, disposal and treatment of accidental and/or routine releases and exposures. **213-3** The adjacent pueblos and communities along waste transport routes do not have the capacity or emergency response training necessary to deal with an accident. We request a complete analysis of what support facilities, as well as their capacity and capabilities, will be needed for the proposed CMRR-NF, including the cost and any additional environmental impacts or changes as a result of the need for this increased support. Parallel to what happened to the communities adjacent to the Trinity Site (Tularosa Basin), where there was no plan in place to determine the impact of a nuclear explosion on local populations, and who now face cancer rates four times the national average. People in these communities have suffered and continue to suffer the irreparable harm resultant of the Trinity test with no help from the federal government. There needs to be solid information that ensures there will be zero harm on our well being as a result of this industry. **213-4**

The cost of the CMRR-NF is now 4.5 billion and rising. This is money that could be used for the benefit and prosperity of New Mexico citizens. Use it instead on health care, green energy, education, land conservation and preservation, public transportation and other endeavors that would stimulate lasting economic growth. Federal funds should be used to support and uplift our poorest communities rather than be filtered into the richest county in the nation, with concentrated dollars going to corporations profiting from unusable weapons. The jobs created by construction of this facility will end upon its completion, and does not contribute to a sustainable economy. **213-5**

We, as members of impacted communities, oppose the compartmentalization of public commentary. Of major concern is how comments are labeled as being "beyond the scope of the CMRR- EIS", because this does not leave room for our worldview and knowledge held by land-based people, regarding the holistic implications of what is being done to THEIR LAND. In addition to not holding equal value to the knowledge and contributions of local communities, the manner in which the technical material is presented, only serves to disenfranchise a population suffering from economic, social, educational and linguistic disparities. This is documented in the CMRR- EIS public comments that reference that more time is needed for comment, community education and outreach, and comprehensive, in-depth health studies. Another problematic factor is the methodology in which the public's comments were responded to. The comments were superficially abstracted, and the commenter's were instructed to refer back to the EIS document. This sort of response allowed for a one-dimensional understanding of what the commenter's were asking or stating. Much of the cultural commentary was disregarded and never addressed in this summarization. It trivialized their statements, concerns, and inquiries about the EIS by responding in a way that directed them back to the document. This serves to end dialogue rather than enhance it, and denies the public a meaningful response to their comments. It inappropriately patronizes the general population, and unfairly discredits the knowledge bases of our community experts on these matters. **213-6**

213-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

NNSA's implementation of public participation activities for review of the *Draft CMRR-NF SEIS* was conducted in compliance with applicable laws and regulations, and was consistent with past practices for other NEPA documents prepared for LANL. NNSA announced a 45-day comment period to provide sufficient time for interested parties to schedule their review of the *Draft CMRR-NF SEIS* around other commitments. In response to requests for additional review time, the comment period was extended by 15 days to a total review time of 60 days (76 FR 28222). All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

During the comment period, NNSA made the SEIS references available in five DOE Public Reading Rooms located in New Mexico and one in Washington, DC. To the extent practicable, NNSA made references available on the Internet, except where limited by copyright or security concerns.

As with previous LANL NEPA documents, the public hearings were held at regional venues near LANL (Los Alamos, Española, and Santa Fe). In response to requests for additional public hearings, NNSA also held a fourth public hearing in Albuquerque (76 FR 28222), and an informational meeting was held in Taos. Public hearings near uranium mining communities were not conducted because these facilities would not be impacted by construction and operation of the CMRR-NF. Public hearings near WIPP were not conducted because the volumes of transuranic waste to be disposed of at WIPP would be similar to those currently sent to WIPP due to operation of the existing CMR Building, and therefore, would not constitute an appreciable change in activity at WIPP.

For people who were unable to attend the hearings due to schedule conflicts or who could not travel to the hearing locations, NNSA provided a number of additional ways to comment on the draft SEIS. Comments on the draft SEIS could be submitted by U.S. mail, email, a toll-free telephone line, and a toll-free fax line. All comments submitted were considered in preparing the *Final CMRR-NF SEIS*. Responses to comments on the *Draft CMRR-NF SEIS* are included

Commentor No. 213 (cont'd): Beata Tsosie-Pena

Based on the findings in the Los Alamos Historical Document and Retrieval Assessment report (LAHDRA), which states that airborne plutonium releases in early production years at LANL exceed those of Hanford, Rocky Flats, and Savannah River combined, making us the most polluted nuclear site in the nation (LAHDRA, 2011). This fact warrants LANL's immediate action on legacy waste clean up before any new facility can be built that will only add to this contamination; in accordance with the 2005 New Mexico Environmental Departments consent order. We demand that detailed and widespread comprehensive health studies are carried out to determine the health impacts of the legacy waste already produced and released on all potentially impacted communities. We are in support of Concerned Citizens for Nuclear Safety and Nuclear Watch New Mexico's statement that, "The Department of Energy (DOE) must explain the impacts of diverting funds away from cleanup, renewable energy, and nonproliferation programs at LANL for a new manufacturing facility for plutonium pits or "triggers" for nuclear weapons called the CMRR." **213-7**

An EIS statement will only be relevant if the current standard of reference for determining safe levels of exposure to both workers and the general population is discontinued. This current standard is based on "reference man", a hypothetical male model which endangers the majority of the population in its' limitations. This standard does not protect women, children, the elderly, people of color, the unborn fetus, or any other demographic that falls outside of these narrow parameters from harm. If the agencies responsible for the EIS continue to use these inadequate ways of measuring contamination, then it endangers and threatens local populations. This model of reference is limited in its' focus on male human life. The new EIS report needs to factor in the impacts on the plant, insect, and animal communities with whom we share a delicate ecology. Our water, air and soil health are vital considerations that need to be included in any revised impact statements. **213-8**

In addition, the current EIS standards of measurement are unsatisfactory because it does not include impacts of multiple/cumulative exposures to radiological, toxic, and hazardous materials. The unique pathways of exposure that land-based people face as a result of growing and harvesting our own food, hunting, fishing, gathering wild plant-life, being outdoors for longer periods of time, livelihoods that include ranching, pottery, woodwork, natural pigments, the harvesting of forest materials, drinking, bathing, and irrigating with water, harvesting rainwater, breathing air, and ceremonial cultural practices within the pueblos all need to be analyzed, considered and respected. This needs to be done by creating meaningful dialogue and processes with local communities at a state and national level. All communities requesting a public hearing and informative sessions should be granted, and comments should be ongoing given the reasons we have stated and lack of public outreach. **213-9**

Updated seismic hazards analysis from 2007 have showed a dramatic increase in seismic motion and activity. In light of the recent nuclear catastrophe in Japan, it is apparent that even with extensive planning and state of the art facilities, far reaching long term damage to the planet and future generations cannot be ignored. **213-10** Los Alamos National Laboratories is the only facility of its kind that is in close proximity to residential areas. We reject the National Nuclear Security Administration, CMRR Federal Project Teams statement that "no other facility or site in the U.S. can fulfill its mission." We are here to say that we are not an expendable population and are no longer held to the fallacy that the southwest is a national sacrifice zone for the nuclear industry. **213-11**

We have stated reasons for the new EIS, but feel it is also necessary to express our opposition for the need for a new CMRR building in the first place. The cost is too high, it will use too much of our water that we need for agriculture and home use, historical impacts and legacy waste have yet to be addressed, and the region is unsuitable seismically, geographically, and culturally for the continuation of the nuclear industry in the Jemez Mountain Plateau. We hope and pray that LANL may shift its focus from an industry whose core is based on destructive values and a culture of violence to one that respects the sustainability of life.

As people who live in the shadow of this industry and who do not share its values, we ask that LANL's shift in mission begin with open dialogue and sincere consideration of our requests and concerns. Let this shift in mission begin with recognizing that this new facility is not needed or wanted here. We pray that our concerns are not trivialized and silenced as has been done in the past, and that we can continue living here, while healing from the damage that has already been enacted upon us. We look forward to furthering this discussion and to creative solutions to this issue that we are all affected by and involved in together. **213-12**

in the *Final CMRR-NF SEIS* and therefore, are posted on the *CMRR-NF SEIS* website at http://nnsa.energy.gov/nepa/cmrrseis.

The accident calculation methodology used in the SEIS estimates the total population dose (sum of the individual doses to all members of the affected population) within a 50-mile (80-kilometer) radius of LANL. As described in the 2008 *LANL SWEIS* (Volume 3, Book 1, Page 2-17), a 50-mile (80-kilometer) radius is commonly used in EISs because this distance has been shown to encompass the significant impacts on the public. Samples measured at varying distances from emissions sources show that the concentration of radionuclides decreases with the distance from the source. The 50-mile (80-kilometer) radius is accepted by regulatory agencies such as the U.S. Nuclear Regulatory Commission and DOE because, at this distance, the concentration of airborne radionuclides and toxic chemicals is very small.

The accident that would result in the largest population dose for a 50-mile (80-kilometer) radius region of influence, the TA-54 waste storage dome wildfire, also was analyzed using a 100-mile radius region of influence. The analysis shows that extending the region of influence out another 50 miles (80 kilometers) increases the affected population by 300 percent, while the population dose increases by only 13 percent. This shows that the radiation dose to individuals in the 50- to 100-mile range (which includes the city of Albuquerque) is very small relative to the dose to individuals within 50 miles of LANL (DOE 2008a).

213-2 Chapter 6 of the 2008 *LANL SWEIS* describes applicable environmental permits for facilities at LANL. NNSA cannot put a copy of permits in the SEIS because they have not been applied for yet. NNSA intends to comply with all applicable laws and regulations. NNSA will obtain all necessary permits as the project progresses if the decision is made to construct the CMRR-NF. Chapter 4 of the *CMRR-NF SEIS* describes the potential releases from the CMRR-NF and the environmental impacts of these releases on air quality, water resources, and human health. Annual impacts can be multiplied by 50 years to estimate total impacts from 50 years of operation. Decommissioning of the CMRR-NF is discussed in Chapter 4, Section 4.5, Facility Disposition.

213-3 As described in Chapter 5, Section 5.3, the Price-Anderson Act, which was signed into law in 1957, provides for payment of public liability claims in the event of a nuclear incident. See Chapter 5, Section 5.3, of the *CMRR-NF SEIS* for more information.

213-4 Transportation between offsite facilities and the CMRR-NF would be similar to that historically associated with the existing CMR Building. Therefore, changes to existing emergency response capabilities would not be needed. Support facilities are described in Chapter 2, Section 2.6.2. The environmental impacts associated with the support facilities and activities are included in those presented in Chapter 4. The results in Chapter 4 show minor impacts on humans and the environment. Impacts from historic above ground nuclear testing are outside the scope of the *CMRR-NF SEIS*.

213-5 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. See Section 2.7, Economic Impacts, of this CRD for information on the economic impacts as evaluated in the *CMRR-NF SEIS*.

213-6 All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*. Comments on activities outside the scope of the *CMRR-NF SEIS* are not applicable to the analysis presented in the SEIS. NNSA provided responses to all in-scope comments received on the *CMRR-NF SEIS*. Rather than duplicate information, these responses often refer the commentor to sections of the *CMRR-NF SEIS* where the answer to the question is located.

213-7 NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

As summarized in Chapter 3, Section 3.11.4, of the *CMRR-NF SEIS*, a number of health effects studies have been completed or are underway for LANL. Chapter 4, Section 4.6.1, of the 2008 *LANL SWEIS* provides additional detail on these studies. See the Centers for Disease Control and Prevention (CDC) website (http://www.cdc.gov/nceh/radiation/brochure/profile_los_alamos.htm) for more information on the status of the LAHDRA study.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

213-8 The DOE Office of Environmental and Policy Guidance recommended that DOE personnel and contractors use the risk factors recommended by the Interagency Steering Committee on Radiation Standards (ISCORS), stating that, for most purposes, the value for the general population (0.0006 fatal cancers per rem) could be used for both workers and members of the public in NEPA analyses (DOE 2003a).

Recent publications by both the Biological Effects of Ionizing Radiation Committee and the International Commission on Radiological Protection support the continued use of the ISCORS-recommended risk values. *Health Risks from Exposure to Low Levels of Ionizing Radiation: BEIR VII Phase 2* (National Research Council 2006) reported fatal cancer risk factors of 0.00048 per rem for males and 0.00066 per rem for females in a population with an age distribution similar to that of the entire U.S. population (average value of 0.00057 per rem for a population with equal numbers of males and females). ICRP Publication 103 (Valentin 2007) recommends nominal cancer risk coefficients of 0.00041 and 0.00055 per rem for adults and the general population, respectively, and estimates the risk from heritable effects to be about 3 to 4 percent of the nominal fatal cancer risk. Accordingly, a risk factor of 0.0006 LCFs per rem was used in the *CMRR-NF SEIS* to estimate risk due to radiation doses from normal operations and accidents.

The United Nations Scientific Committee on the Effects of Atomic Radiation, the International Atomic Energy Agency, and the International Commission on Radiological Protection all support the view that, "the standard of environmental control needed to protect man to the degree currently thought desirable will

Commentor No. 213 (cont'd): Beata Tsosie-Pena

ensure that other species are not put at risk," (IAEA 1997). Therefore, the analysis of human health impacts would be indicative of the potential impacts on plants and animals. Impacts on air, water, soil, and ecological resources are evaluated in Chapter 4 of the *CMRR-NF SEIS*.

213-9 Chapter 4, Section 4.6, of the *CMRR-NF SEIS* describes cumulative impacts for public and occupational health and safety. Chapter 5, Section 5.6, of the 2008 *LANL SWEIS* includes estimates of human health risks for specific receptors, including a Los Alamos County resident whose entire diet consists of locally produced foodstuffs, a user of outdoor recreational resources, and a special pathways receptor who relies heavily on fish and wildlife for subsistence. These estimates of human health risk are for operation of all LANL facilities (including the CMR Building) under the alternatives evaluated in the 2008 *LANL SWEIS* (DOE 2008a).

213-10 Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*). See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

213-11 NNSA does not consider any population expendable or any region of the country a national sacrifice zone. NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. This included options for moving the CMR capability to another location. In the 2008 ROD for the *Complex Transformation SPEIS* (73 FR 77644), NNSA reaffirmed the decision to construct

Commentor No. 213 (cont'd): Beata Tsosie-Pena

and operate the CMRR-NF at LANL. For the reasons described in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*, these alternatives are not being revisited.

213-12 NNSA acknowledges that there is substantial opposition to the nuclear weapons mission and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 214: Richard Johnson

Comments on the CMRR SEIS

This is insanity! As a citizen I am given the "opportunity" to comment on my governments plan to construct a huge facility for the design, manufacture and storage of nuclear bombs just 26 miles from my home and just 2/3 of a mile from a fault line. I am supposed to tell my government if this is or is not a good idea. In the interest of good governance this fact alone should be a deal breaker for the CMRR. Due to past volcanic activity in the proposed construction site the tuff layer of soil contains a high concentration of volcanic ash and therefore is unstable. The cost-saving so called Shallow Option is unproven. Seismic investigations are currently in process at the lab. Until these investigations can be completed no decision to go forward should be made. **214-1**

Besides the insanity of build this nuclear facility 2/3 of a mile from a known fault line, there is a total lack of need for a new generation of nuclear weapons. Our current arsenal of nuclear warheads is more then enough of a deterrent and is more than adequate to get the job done if the need should ever arise. Our nation has been getting along with creating approximately 20 needless pits per year. Why expand that production capacity by four times with this new NF when our nation is supposedly seeking a future world free from nuclear weapons? Expanding US capacity would certainly breed distrust and compromise our efforts for nuclear nonproliferation and nuclear arms reduction. **214-2**

Another reason not to go forward with this project is that our nation simply can't afford to rebuild a plutonium pit production complex at this time. In 2004 when LANL first proposed building the CMRR our country never perceived that we would be in the financial mess that we find ourselves in today. In 2004 the estimated cost to build this nuclear facility was estimated to be $600 million. With a current estimated price tag of $6 billion to upgrade the existing facility we need to put the brakes on. This investment will lock in Los Alamos' future to the hopefully shrinking business of nuclear weapons research and production. There are much more strategic uses of our nations scientific and creative resources. If we want to get serious about spending cuts defunding the CMRR would be a good place to start. **214-3**

As I am getting ready to submit these comments on this proposed CMRR Nuclear Facility, Los Alamos National Laboratory is once again threatened by a massive, out-of-control wildfire that already exceeds the Cerro Grande Fire of 11 years ago. Los Alamos today is under a state of emergency and mandatory evacuation. The Laboratory is surrounded by dense, steep and distressed Ponderosa forests. We know very well that these forests can easily propagate catastrophic crown fires that are very difficult to contain. Add in the likelihood of prolonged drought, low humidity and unpredictable winds and the risks of expanded plutonium pit production at LANL will only become more risky in the ensuing years. **214-4** Water in these mountains of the Southwest is always precious and often in short supply. This arguably unnecessary facility is slated to consume 16 million gallons of water per year. **214-5**

While the CMRR-SEIS considers the threat of a site-wide fire at the Lab, it only **214-4 cont'd**

214-1 NNSA notes the commentor's opposition to the CMRR-NF project and nuclear weapons. It should be noted that a plutonium pit is only one component of a nuclear weapon. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

A new seismic analysis is not under way at LANL, however, seismic studies are conducted on a continuing basis. Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements

Commentor No. 214 (cont'd): Richard Johnson

addresses fires that are seismically induced or that begin within the Nuclear Facility itself. The threat of wildfire like we are experiencing today is not comprehensively considered nor does this document address the Lab's ability to respond in the event of mass evacuations and the loss of the power grid. A complete analysis of this very real threat needs to be undertaken before there is another wildfire. ***214-4 cont'd***

Respectfully submitted,

Richard Johnson
968 Camino Oraibi
Santa Fe, NM 87505
rico@newmexico.com

for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

214-2 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

214-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

214-4 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 214 (cont'd): Richard Johnson

214-5 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information.

Commentor No. 215: Rose Ann Kaiser

From: rakaiserolvm@juno.com
Sent: Tuesday, June 28, 2011 12:51 PM
To: nepalaso@doeal.gov
Subject: CMRR

Dear Mr. John Tegtmeir
Los Alamos, NM
U.S. DOE/NNSA Los Alamos Site Office

I am writing to you with a heavy heart and a great deal of sadness about the proposed Chemistry and Metallurgy Research Replacement (CMRR) project in Los Alamos, NM. I'm trying to find words to describe my reaction to this new venture. Insane? Stupid? Wasteful? Hypocritical? I think all those words probably fit this proposal. Truly, I don't mean to be disrespectful to any of the people involved in this venture, I mean my criticism for the proposal itself, so please don't take this personally. I'm sure you are in this with the best of intentions, but I do so disagree with everything the proposal stands for.

We preach to other weaker nations that they dare not produce nuclear weapons, and here we are with a huge stockpile capable of destroying the entire planet, and now proposing to waste billions more on building more "triggers"?!?! This is a scandalous situation! One that our president and military giant of the past, Dwight Eisenhower, warned us against -- the dangers of the U.S. military industrial complex. What he warned against has all come true. We continue to spend enormous amounts of money on ways to destroy one another along with our planet, instead of ways to build the earth and its peoples. Is that insane or what??!! And surely no one still believes that lame old excuse that we need more and more nuclear development for our own safety and protection, do they!? That's nonsense. Instead, it's pushing us headlong into destroying ourselves as a nation and as a free people.

215-1

We wring our hands, moaning and groaning, over our out-of-contol monumental deficit, cutting corners and trying to balance budgets on the backs of the poor, middle class, and most vulnerable people in our country and our world, and at the same time we want to waste all this money on more "triggers" when, I understand, we already have more than enough stockpiled at the Pentax Facility in Texas. And even if in our madness we think we need more, our present Lab has the ability to continue producing more than we could ever possibly make use of..

215-1 NNSA acknowledges that there is substantial opposition to nuclear weapons. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 215 (cont'd): Rose Ann Kaiser

I apologize if the tone of my letter offends you. I don't mean any disrespect for you as a person. I only hope that all those responsible for this proposal and its implementation will reconsider this ill-advised waste of money.

Thank you for your consideration.

Rose Ann Kaiser

6/28/2011

With ever-increasing economic struggles at home, workers' rights being taken away and life in general going down the toilet, we DO NOT NEED more government funding of nuclear facilities. s a society, as humans on the brink of disaster, we must move from a stance of war and mass killing to a stance of peace and harmony. We don't need new pits for plutonium production, we need better schools. We don't need to be continuously prepared to kill all 6 billion people simultaneously, we need better health care. We don't need to be poised to strike like a cobra with deadly intensity, we need to take of the earth and nature for our generation and many generations to come. By expanding plutonium production we are basically assuring mutually assured destruction, whether it be a quick nuclear bomb to destroy an "enemy" or a slow painful sickening death that destroys American people through contamination of our soil, water or air. Either way, I want NO part of it! *216-1*

Nicole Rund
San Diego, CA 92115

216-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.   The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 217: Don Hyde

From: don hyde [hydedw@gmail.com]

To: NEPALASO@doeal.gov
Subject: CMRR-NF SEIS

Dear Mr. John Tegtmeier, CMRR-NF SEIS Document Manager:

Our federal government has been publicly stating for decades the need to reduce the number of nuclear warheads among the possessing nations, and rightfully so! Non-proliferation is and has been our policy.

Therefore, WE DO NOT NEED THIS EXPANSION OF THESE PLUTONIUM PITS ("pit-build, pit-surveillance, pit-certification," etc.)! **217-1**

WE DO NOT NEED THIS PROPOSED FOUR-FOLD EXPANSION OF PITS!

We, also, should not be wasting $6 billion for a new CMRR-NF! **217-2**

As previous radiological and other contamination at and unfortunately around Los Alamos has not been cleaned-up, AS USUAL BY NUCLEAR ACTIVITIES, no work on a new CMRR facility should commence.. **217-3**

Therefore, I respectfully request that this SEIS be scrapped and a new EIS be developed for a safe upgrade of the **217-1 cont'd**

CMR.

Thank you, Don Hyde
PO Box 3051
Gallup NM 87305

217-1 NNSA acknowledges that there is substantial opposition to nuclear weapons. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

217-2 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

217-3 NNSA intends to continue to implement actions necessary to clean up past contamination at LANL regardless of decisions made on the proposed construction of the CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 218: John Stratton

From: John Stratton [jstrat@ashland.edu]
Sent: Tuesday, June 28, 2011 11:28 AM
To: nepalaso@doeal.gov
Subject: Plutonium Pit Facility at Los Alamos

Expanding the United States' nuclear weapons production capabilities is wrong-headed. We continue to believe that we alone can build our own security. We should be, as the President and many others have said, working to create a world without nuclear weapons. *218-1*

Further, as I understnd the details of the current proposal, it puts the enviornment at signficant risk. Once again we appear to be willing to risk the health of minorities and indigenous peoples. *218-2*

I agree with others who say that one of the alternatives to be considered should be "taking no action," as all of the currently considered actions support building this facility which will endanger the enviornment and contriute to nuclear proliferation. *218-3*

John Stratton
213 Samaritan Ave.
Ashland, OH 44805

218-1 NNSA acknowledges that there is substantial opposition to nuclear weapons and their components and that President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

218-2 Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. These impacts would be minor. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority populations, including Native Americans and Hispanics, under any of the alternatives.

218-3 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

Commentor No. 219: Virginia J. Miller

Subject: Comments on the draft SEIS for proposed CMRR-NF at LANL

John Tegtmeier, CMRR-NF
SEIS Document Manager
NNSA Los Alamos Site Office
Los Alamos, New Mexico

I strongly oppose any further construction of the CMRR-NFat LANL. There is simply no reason to build a facility to manufacture 80 pits a year when a Jason study argues that existing pits in nuclear weapons will last 80 years or more, while our nation upholds U.S. nuclear treaty obligations and works for global nuclear abolition. Therein lies our greatest security. **219-1** A complete, new Environmental Impact Statement is needed, including a true "No Action" alternative of not building the CMRR-NF at all, especially in an earthquake zone. **219-2**

The costs of attempting to build a plutonium pit production facility in a geologically unstable area is just too great. It will take resources away from cleanup efforts of legacy wastes at LANL and just add to the radioactive contamination and health risks. Robin Collier, President of NGO Cultural Energy captured the views of technical experts willing to speak up about "the extreme dangers of a nuclear facility in an earthquake zone." Robert H. Gilkeson, registered geologist, stated after intensive research that the SEIS must be retracted by DOE because it does not provide accurate knowledge of the seismic hazard. It is incomplete and inadequate underestimating and misrepresenting the seismic hazard at the site of the proposed CMRR-NF.

Six key parameters must be investigated in order to characterize the seismic hazard needed for an effective building design: the fault locations, the fault geometry, the direction of the slip on the faults, the maximum magnitude of an earthquake, the rate at which earthquakes reoccur on the faults, and kappa, a key parameter for ground motions at specific LANL sites. Field studies are required to obtain this information. LANL scientists recommended these studies in 1995, 2007 and 2009, but the studies were not done. Gilkeson said "DOE must perform the field studies that are identified as important by the LANL scientists in order to calculate the seismic hazard." **219-3**

I support a true "No Action" alternative in a new EIS. Thank you for your careful attention. **219-2 cont'd**

Virginia J. Miller
125 Calle Don Jose
Santa Fe NM 87501

219-1 NNSA notes the commentor's opposition to the construction of the CMRR.NF. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

219-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967).

219-3 NNSA intends to continue to implement actions necessary to clean up past contamination at LANL regardless of decisions made on the proposed construction of the CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Commentor No. 219 (cont'd): Virginia J. Miller

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Responses to comments made by Robert H. Gilkeson and CCNS can be found in comment letters 241 and 315. The 2007 and 2009 probabilistic seismic hazard analyses represent the best knowledge to date on the seismic hazard at LANL, with the uncertainties appropriately incorporated. The results of these evaluations have been included in the design of the CMRR-NF and, as such, incorporated into the estimated cost of the facility.

Dozens of mapping studies of the Pajarito fault system have been conducted, including state-of-the-art, high-precision mapping in the vicinity of LANL, as discussed in response to comment 241-10. In addition, numerous paleoseismic trench investigations have been conducted at 17 sites over the past 20 years. Additional study of these areas would likely improve our understanding of the fault and could help reduce uncertainties in the inputs, but these studies are not a prerequisite to conducting a probabilistic seismic hazard analysis or determining design-basis ground motions at LANL. The uncertainties in regards to fault geometry, rupture behavior, and sense of slip on the Pajarito fault system were fully recognized and addressed in the range of inputs to the probabilistic seismic hazard analysis. Preferred maximum magnitudes for both simultaneous and synchronous ruptures were estimated using the same general approach, which has a sound technical basis, as discussed in the response to comment 241-15.

Subject: CMRR-NF SEIS Comments

6/28/2011

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, USDOE, NNSA, Los Alamos Site Office, 3747 West Jemez Rd., Los Alamos, NM 87544

How much more bad news about nukes gone awry can we take? Please do not license a new plutonium facility (not to mention that it's time for nuclear weapons to GO AWAY; they make the world less safe, not more so, as should be clear to everyone by now).

How sad (or possibly, from a cosmic view, funny) that human beings are so clever without, apparently, the capacity for forethought. We are not long on earth as a species, as our human-caused climate change intersects with our ongoing fascination with splitting the atom. *221-1*

I hope there is no major disaster this time around. PLease don't make things even worse than they already are.

Joanna Graham
Berkeley, CA 94702

221-1 Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 222: Virginia Trujillo

From: Virginia Trujillo [vatiav@aol.com]
Sent: Wednesday, June 29, 2011 12:03 AM
To: NEPALASO@doeal.gov
Subject: Are we listening?

I do believe that nature is weighing in on the question of whether Los Alamos laboratory should flex even more muscle in its capability to destroy human life. First there was Japan (Hiroshima and Nagasaki) more than half a century ago. Then Japan again in its futile attempt to withstand natural forces in its efforts to safely harness this destructive force. And to further punctuate the point...the fires that have erupted in N.M. over this weekednd. Sunday evening from my vacation home in Santa Fe, I could see the see the western horizon red rimmed... this could be seen as an eery preview of a different fiery eruption from Los Alamos Nuclear Laboratory if unrelenting seismic forces have their way with supposedly indestructible concrete vaults. I was able to board a plane the next day and escape from Santa Fe and head for California. But in a worst case scenario, escape? Who? Where? Why?

I wonder what the ultimate motive is for this leming-like drive to anhilate the planet. Perhaps if we understand the motive we can stop it at its roots. Maybe we should be listening more intently to nature.

222-1

Virginia Trujillo
3201 Pueblo San Lazaro
Santa Fe, New Mexico 87505

222-1 NNSA notes the commentor’s concern about the accident that occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant. But there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 224: Lisa Putkey

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico, 87544
E-mail: NEPALASO@doeal.gov

June 28, 2011

Dear NNSA,

My name is Lisa Putkey and for the past year I've been living in Chimayo, NM (downwind of LANL) and volunteering with a youth organization called Think Outside the Bomb. We are a national network that works to educate, train, and mobilize youth around environmental justice issues in their communities, focusing on the impacts of the nuclear-military-industrial complex.

224-1

I have been told that writing these comments is a waste of my time. That it won't make a difference. That you are already moving forward with the construction of the CMRR-NF, probably awarding Bechtel the billions. I've been to the "public comment" periods that you that you do a horrible job of community outreach for. Seen my community members spill out their hearts as you watch your stop watch ready to cut them off. We usually don't receive replies to our comments and they are mostly considered "not applicable." There is no dialogue and then the decision is made for us. The whole EIS process seems to be a façade for you to cross off "involved local communities" on your list before moving forth with a wasteful, unnecessary suck of resources, violating the earth and putting communities at risk to turn a profit. How can you expect downwind multilingual communities to digest two encyclopedia sized binders of EIS technical information in such a short period? Communities that also don't just happen to be low income with struggling education systems, drug abuse problems, high unemployment, and more than curious health complications. But we're not supposed talk about the interconnections between LANL, its projects, and the social ills of our communities. The fact that 10 years after the original EIS was completed, during which time the size and scope of the CMRR project changed, a telling seismic study of the site was released, and the cost of construction skyrocketed 1000%, you are doing only a SUPPLEMENTAL EIS and getting away with it is criminal. Please cease all construction on the CMRR until a new Environmental Impact Statement is completed; you yourselves don't even know how to construct it yet! The following are reasons why I and many others feel that the CMRR-NF should not be built. It may just bounce off your ears, but know that our voices are making ripples in the community.

224-2

Science is not infallible; unexpected mistakes, accidents, and natural disasters do happen. As I type this a fire rages at the border of Los Alamos and the entire city has been evacuated. The 2000 Cerro Grande Fire burned up parts of Area G at LANL and spread radioactive toxins in a thick black plume that went all the way to Taos. Afterwards, San Ildefonso Pueblo members were warned to not burn wood from trees on Pueblo land

224-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The proposed CMRR-NF is not being constructed at this time; there are several factors (such as environmental consequences and cost) that NNSA will take into consideration when making its decision. 40 CFR 1503.3, "Specificity of Comments," identifies the nature of comments to be received on an EIS. Comments on an EIS or on a proposed action shall be as specific as possible and may address either the adequacy of the EIS or the merits of the alternatives discussed or both. NNSA acknowledges the commentor's concern that public comments in hearings may be deemed "not applicable" to the NEPA comment process required in Section 1503.3. However, each comment is heard and/or read and responses to comments pertaining to the EIS are provided in this CRD.

In accordance with CEQ "Regulations for Implementing the Procedural Provisions of NEPA, Commenting, Inviting Comments" (40 CFR Part 1503.1), after preparing a draft EIS and before preparing a final EIS, the agency shall request comments from the public, affirmatively soliciting comments from those persons or organizations who may be interested or affected. Section 1503.4, Response to Comments, specifies that an agency preparing a final EIS shall assess and consider comments both individually and collectively, and shall respond to those comments.

In response to requests for additional review time, the comment period was extended by 15 days to a total review time of 60 days. NNSA believes this allows a sufficient period of time to provide comments on the *Draft CMRR-NF SEIS*. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

NNSA is aware of the issues that local communities struggle with, such as education and drug abuse. NNSA has an outreach program to interact with the communities near LANL and takes its social responsibilities seriously.

NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Commentor No. 224 (cont'd): Lisa Putkey

indoors because they had been contaminated with radioactive materials. The GTCC EIS Pueblo Views on Environmental Resource Areas states that "The Cerro Grande fire also increased post-fire storms' runoff flows in some drainages more than 1,000 times the pre-fire levels. These higher runoff flows increased erosion and moved radioactive and hazardous materials downstream towards the Pueblo people." Natural disasters do happen, and will only increase with global warming. There are many fires ablaze in the southwest right now thanks to the climate-change-induced drought we experienced this year. Severe weather conditions and natural disasters will only increase over the years to come as a result of Global Warming. In a time with the Fukishima nuclear power plant crisis, and the Nebraska plant threatened with flooding, we should not be expanding and entrenching nuclear weapons facilities. We should especially not be doing so at a site that resides on a layer of fragile volcanic ash over intersecting fault lines. A 2007 study showed that seismic activity is going to increase in this site that lies between a dormant volcano and a rift valley, with canyon fingers that flow to the Rio Grande. The only seismically safe option is to not build the CMRR-NF in Los Alamos. ***224-2 cont'd***

Scientific interest is driven increasingly by the interests of corporations and military and is taken for granted as the gap between the layman and technician grows, leaving science an undemocratic sphere controlled by a handful of experts and power holders. This is true at LANL where the priority over the next 15 years will be Bechtel's cash cow, the CMRR. I believe LANL should instead prioritize clean-up of legacy waste and sciences that are life-sustaining. Furthermore, Federal funding to Northern New Mexico would be better spent on education, healthcare, green jobs, and investment in the youth. ***224-3***

The nuclear legacy in the United States is one of racism and environmental injustice. From mining to power to weapons to waste, the nuclear chain has had extreme health and environmental consequences for the communities surrounding and working at the numerous nuclear sites across the U.S. The radioactive burden has been placed disproportionately on indigenous communities and communities of color. Los Alamos National (Nuclear Weapons) Laboratory is located on the seized native land of the San Ildefonso Pueblo, on top of mountains that are sacred to the surrounding indigenous Pueblos. The predominantly Native and Chicano Espanola Valley in which I live and work, lies down wind of Los Alamos. The land, air, and water have suffered due to both routine and accidental releases from the lab's activities. The communities understand that they have been impacted by the LANL operations; there are antidotal stories of cancers and strange illnesses. ***224-4*** Yet in the past 68 years there have been no government health studies conducted of residents in the Espanola Valley. ***224-5***

According to the Los Alamos Historical Document Retrieval and Assessment (LAHDRA) Project, a 13- year research effort by the Center for Disease Control and Prevention, radioactive plutonium releases into the community from LANL during a five-year period of time exceed all releases from the entire existence of Hanford, Savannah River, and Rocky Flats (which was closed due to contamination) facilities combined. To ask this historically poisened community to now bear the burden of a 6 metric ton vault for plutonium, which will triple their current holding capacity is an environmental injustice. ***224-6***

224-2 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1 of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Regarding the commentor's seismic concerns, the geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers

Commentor No. 224 (cont'd): Lisa Putkey

The CMRR-NF poses major environmental and health threats to communities in Northern New Mexico with more emissions, waste generated and water usage. LANL will create more toxic waste, when they have still failed to clean-up their routine and accidental contamination from the past. For example, Area G is one of the LANL sites where radioactive, toxic and hazardous waste lies buried in unlined trenches dug into the volcanic geologic formations. Area G is leaking and in need of intensive evacuation and clean-up. **224-7**

In my vision of social change the voices of downwinders are central to nuclear policy decisions and LANL should be accountable to Northern New Mexico, taking responsibility for clean-up and thorough public investigations on how the health of the Northern New Mexicans have been affected by their operations. I would like to see Northern New Mexican community members with access to the resources to do their own environmental monitoring. **224-8**

CMRR-NF will quadruple U.S. ability to produce new plutonium pits, the cores of nuclear weapons. A new facility that will "modernize" nuclear weapons actually means building *new* nuclear weapons, the opposite of disarmament. While President Obama's rhetoric calls for nuclear disarmament and international cooperation, the CMRR-NF sends a contradicting message to the international community and erodes US credibility. In this nuclear age, the United States has a legitimate need for security. The manner in which the United States seeks to secure itself through military supremacy, however, creates a self-perpetuating culture of violence that is unsustainable, negates the security of those it aims to protect, and encourages others to follow suit. The goal of security and freedom from fear is in reality undermined by the policies of nuclear deterrence and preemption, and US funding and effort would better be spent on disarmament, strengthening global cooperation, and programs of social uplift, which are cut as federal funding rolls to the war machine. **224-9**

Lastly I work with youth and being only 25 years old myself, we think about the future that the NNSA is leaving for us, and with your current escalation of nuclear weapons facilities, it is a grim future. Please, clean-up, don't build-up. We in the Espanola Valley need good green jobs, not Bechtel's crumbs. We want a healthy environment in which to raise our families, not a poisoned one continually at risk of nuclear catastrophe.

Sincerely,

Lisa Putkey

Organizer, Think Outside the Bomb

Mailing Address: 1940 Willow Way
San Bruno, Ca 94066

occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA acknowledges the commentor's concerns that climate change may increase the frequency of wildfires and decrease the availability of water. Based on public comments, Chapter 3 has been revised to include a description of the types of environmental changes that could occur near LANL due to global climate change.

224-3 The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on LANL legacy waste cleanup. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Regarding the commentor's concern about funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense, education, healthcare, and "green jobs") and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

224-4 Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

224-5 It is not within the scope of the *CMRR-NF SEIS* to perform a government health study of the residents in the Española Valley. However, Chapter 3, Section 3.11.4, shows the cancer rates for the counties surrounding LANL

Commentor No. 224 (cont'd): Lisa Putkey

and the Agency for Toxic Substances and Disease Registry issued a study of the health effects of LANL operations, in 2006, and concluded that, "Overall, cancer rates in the Los Alamos area are similar to cancer rates found in other communities. In some time periods, some cancers will occur more frequently and others less frequently than seen in reference populations. Often, the elevated rates are not statistically significant" (ASTDR 2006). Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives. See also response to comment 224-4.

224-6 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF.

224-7 In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Chapter 2, Section 2.2.6, of the 2008 *LANL SWEIS* summarized progress made in environmental restoration since 1999 (DOE 2008a) and more-recent progress is summarized in Section 2.5, Cleanup and Waste Management, of this CRD. For more information on LANL's ongoing environmental restoration program, please see the latest environmental surveillance report, which can be accessed at http://www.lanl.gov/environment/all/docs/reports/. Cleanup of Material Disposal Area G in TA-54 and the methods being used to bury low-level radioactive waste there are beyond the scope of the *CMRR-NF SEIS*.

Commentor No. 224 (cont'd): Lisa Putkey

224-8 NNSA has taken responsibility for cleanup of LANL, and has signed a Consent Order to accomplish this goal. Please see Section 2.5, Cleanup and Waste Management, of this CRD for more information regarding this agreement. NNSA publishes an annual report available to the public that summarizes the environmental surveillance activities at LANL, as noted in the previous response to comment 224-7. While NNSA does not provide monitoring equipment to the community, NNSA does work with the Northern New Mexico Citizens Advisory Board (NNMCAB). NNMCAB is a DOE-chartered site-specific advisory board whose purpose is to provide independent advice and recommendations to DOE regarding LANL's corrective action and waste management activities and associated environmental issues. It is composed of citizens representing the communities and pueblos of northern New Mexico. NNMCAB holds monthly public meetings and has chartered a number of subcommittees to address waste management, environmental surveillance, monitoring, and remediation. More information regarding NNMCAB can be found at http://www.nnmcab.energy.gov/.

224-9 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Regarding cleanup and funding priorities, refer to response to comment 224-3.

Commentor No. 225: Allen Ferguson

From: Allen Ferguson [arf2d@earthlink.net]
Sent: Tuesday, June 28, 2011 3:16 AM
To: NEPALASO@doeal.gov
Subject: LANL CMRR-NF SEIS

Mr. John Tegtmeier
Document Manager
U.S. Department of Energy
National Nuclear Security Administration

Dear Mr.Tegtmeier:

This is to provide you with my comments concerning the Supplemental Environmental Impact Statement (SEIS) concerning the proposed Chemestry and Metallurgy Research Replacement project (CMRR) at LANL.

My first comment is that although there is some mention in the draft SEIS of enahnced fire protection systems, it appears that insufficient inquiry and analysis has been done concerning the potential environmental and human health effects of a major wildfire on the proposed facility and associated operations and facilities. This issue of course is brought to the fore by the Las Conchas fire that is now raging near, and threatening, the Lab and the Los Alamos townsite. A similar wildfire threat occurred in the year 2000 (the Cerro Grande fire), and that should have provided the impetus for a thorough analysis of direct and indirect effects of wildfires on the proposed structure and associated structures and operations. Moreover, the possible conjunction of wildfire and other major disastrous or disruptive events, such as earthquakes or terrorist attacks, should be carefully analyzed and considered. & nbsp;For example, it would seem that a wildfire might provide good cover for a terrorist attack or an effort by some individual, organization or foreign government to seize critical nuclear materials or information. Likewise, the confluence of a major earhquake and a serious wildfire could unleash forces not yet contemplated or carefully analyzed, but that are possible and could prove disastrous. *225-1*

My second comment is that the draft SEIS makes it clear that new information since 2004 has resulted in design changes to better protect the prposed CMRR facility from the results of seismic events. This necessarily means that there is genuine concern on NNSA's part about the potential effects of seismic events on the proposed facility. While the plans to use more steel and concrete may help to mitigate the potential effects of earthquakes of a magnitude of up to 7, more intensive earhtquakes are possible. It would seem that the recent Fukujima earhquake experience in Japan teaches that earthquakes of unprecedented magnitude can and do occur. Also that one system failure resulting from such an *225-2*

225-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Chapter 4 of the *CMRR-NF SEIS* presents the potential human health impacts of the proposed alternatives. These impacts have been determined to be small under all of the proposed alternatives except in the event of a severe accident such as a severe earthquake. If such an earthquake were to occur, it would be expected to severely damage the 2004 CMRR-NF or the existing CMR Building under the No Action and Continued Use of CMR Building Alternatives as discussed in Chapter 4, Sections 4.2.11 and 4.4.11, of the *CMRR-NF SEIS* . Assuming this earthquake were to occur at the Modified CMRR-NF, as indicated in Section 4.3.11, the consequences would be much lower and the risk to the public would be small. The CMRR-NF SEIS addresses the potential for intentional

Commentor No. 225 (cont'd): Allen Ferguson

event can lead to others. If, as NNSA has found, there is a fault running beneath the current CMR facility, and the proposed CMRR facility is only about a mile away from the CMR, this is inherently a dangerous situation, and the p ossibility of an earthquake damaging the CMRR facility (if it is placed in TA-55 as proposed) cannot be eliminated. Even if the chance of such an event is very small, the magnitude of its potential adverse effects on the environment and human health are so great that such a plan should be abandoned. ***225-2 cont'd***

My third comment is that there seems to be a serious inconsistency in the draft SEIS report. Specifically, the continued use of the existing CMR building is consirdered a possible viable alternative to the construction of a new CMRR facility, particularly from a fiscal point of view (see p. S-19 of the draft Summary). However, the draft then entirely rejects as an alternative "extensive upgrades to the existing CMR Building" because the extensive improvements that had been proposed for the CMR facility "would be only marginally effective in providing the operational risk reduction and program capabilities required . . ." and needed seismic upgrades would be technically infeasabile. (p. S-20.) These two conclusions seem to imply that while the contined use of the existing CMR facility in its present condition (or with relatively minor improvements) would be a viable alternative (although it "would result in very limited AC and MC capabilities at LANL over the extended period"), continued use of the same facility with extensive upgrades would not be a viable alternative. This makes no sense. The conundrum it creates seems to be tailored to support a foregone conclusion, namely that the modified CMRR plan is the only way to go. That is, true alternatives were not seriously considered. ***225-3***

My fourth comment is to point out the extreme danger to public health and the environment posed by the the draft SEIS contemplating the continued use of the existing CMR facility for nuclear weapons and other nuclear work for several years into the future -- until a transition to the new facility is complete -- despite NNSA's conclusion that the CMR sits atop a seismic fault and was poorly constructed in the first place, by today's standards. In fact, the main presenter from NNSA at the informational meeting held in Taos a couple of weeks ago at one point referred to the existing CMR buliging as a "tinker toy" structure that would not withstand a seismic event. If this is the case, all nuclear material should be removed from that facility immediately and stored in some secure place or disposed of in the safest manner possible. ***225-2 cont'd***

My fifth comment is that the process for obtaining public comment on the draft SEIS was unfair and unreasonable in that no formal hearing was held in Taos, or anywhere in Taos County, even though Taos is a community nearby to Los Alamos and many of whose residents have a great interest in what goes on at LANL. ***225-4***

destructive acts in Chapter 4, Sections 4.2.10.3, 4.3.10.3, and 4.4.10.3, and Appendix C.

225-2 For seismic concerns, see response to comment 225-1.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. But there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

225-3 During the public comment period on the *CMRR-NF SEIS*, concerns were expressed regarding the alternatives considered in the *Draft CMRR-NF SEIS*, including the comment that the Continued Use of CMR Building Alternative could not really be considered a viable alternative for implementation. Chapter 2, Section 2.7, of the *Final CMRR-NF SEIS* has been expanded to include additional information on why it is not technically feasible to upgrade the existing CMR Building. This building is nearly 60 years old and parts of the building lie over a known fault trace. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

225-4 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR Project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number

Commentor No. 225 (cont'd): Allen Ferguson

Hearings were held in other affected and interested nearby communities, but not Taos, thereby leaving Taos citizens who wished to comment orally without an effective voice. This procedural defect should be cured by holding a public hearing in Taos. ***225-4 cont'd***

It seems at least a theoretical possibility, based on factors such as those stated above, that a thorough, balanced and well reasoned SEIS would come to the conclusion that all proposed alternatives result in unacceptable levels of risk to human health and the environment. It also seems that such a result should not be automatically precluded based on purely procedural considerations. What happens if the conclusion is that none of the proposed alternatives is viable in terms of adequately protecting the environment and human health? ***225-5***

I appreciate your taking my comments on this extremely important topic into consideration.

Allen Ferguson
arf2d@earthlink.net

of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

225-5 See the response to Comment 225-1.

There are several factors (such as environmental consequences of the alternatives and cost) that NNSA takes into consideration when making its decision. If it is determined that none of the alternatives are viable in terms protecting human health and the environment, then NNSA would need to reconsider the alternatives analyzed, with possible additional NEPA evaluations needing to be performed.

Commentor No. 226: Alice Ryan

Stamford, Connecticut 06907

226-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the commentor's concern about funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense, education, healthcare, and housing) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 227: Anonymous

June 25, 2011

Hello,

I'd like to leave a comment about the Metallurgy lab at Los Alamos. I am a concerned citizen, a long-time northern New Mexico resident, and I am definitely encouraging you to not build this facility. Okay?

It's time for us to move in a different direction in this country and on this planet. Six billion dollars is a lot of money and we could apply that money and help ourselves with renewable energy and not moving in a way of weapons and weapons research and plutonium pit manufacturing. Alright?

So it's time guys. Let's move our energy and our funds in a different direction. Please do not continue to poison the earth and its residence with plutonium pit factories that are unnecessary.

Thank you so much. Have a great day.

Anonymous

227-1

227-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort.

Commentor No. 228: Claire Lovelace

From: nepalasoClaire Lovelace [clairejlovelace@embarqmail.com]
Sent: Monday, June 27, 2011 12:28 PM
To: nepalaso@doeal.gov
Subject: Opposition to new plutonium pit facility

I am totally opposed to NNSA's proposal for a new plutonium pit facility at Los Alamos.

First, our country does not need 80 new plutonium pits annually. Without a nuclear arms race, the production limit implemented by DOE in 1999 should be more than adequate. ***228-1***

In addition, building the pit would be a threat to the health and safety of people who live downwind and downstream. Plutonium is a well known carcinogen. It is a vicious pollutant as well. ***228-2*** The impact on Native peoples and Hispanic New Mexicans at Los Alamos is already disproportionate.

The draft Supplemental Environmental Impact should be withdrawn; it is premature. ***228-3***

Claire Lovelace
113 Heritage Place Dirve
Jonesborough, TN 37659

228-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF.

228-2 The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. As discussed above, see Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* for more information on the potential human health impacts of the proposed alternatives.

228-3 The environmental impacts analysis in Chapter 4 of the *CMRR-NF SEIS* evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area. The potential impacts on environmental justice due to construction (except for the Continued Use of CMR Building Alternative) and operations are addressed in Sections 4.2.11, 4.3.11, and 4.4.11. These analyses show that the total minority, Native American, Hispanic, and low-income populations would not be subjected to disproportionately high and adverse impacts during implementation of any of the alternatives. There is no reason to withdraw the *CMRR-NF SEIS*.

Commentor No. 229: Carol Green

From: Carol E Green [cergreen@charter.net]
Sent: Tuesday, June 28, 2011 4:20 PM
To: NEPALASO@doeal.gov
Subject: Draft S-EIS for CMRR-NF: comment

Comment on the National Nuclear Security Administration's Draft Supplemental Environmental Impact Statement for the Chemistry and Metallurgy Research Replacement - Nuclear Facility at Los Alamos National Laboratory

As a United Methodist acting on our Social Principles regarding the universal elimination of nuclear weapons, I urge reconsideration of the construction of new bomb plants in the nuclear weapons complex of the United States.

The wildfires now threatening the vulnerable Los Alamos National Lab again, the current Fukushima, Japan revelation of the inadequacies of nuclear facilities, and the budget crisis of our nation beg the question: Why are new facilities being pursued? *229-1*

The independent review by the JASON assures the reliability of the current U.S stock of plutonium pits for the next 100 years. Going for the capacity to produce 80 warheads/year violates the 1970 Nuclear Nonproliferation Treaty Article VI (to build down at "an early date"), the 1996 International Court of Justice 1996 opinion to meet that obligation, and Article VI of the U.S. Constitution that makes international treaties binding. *229-2*

How can we demand that Iran, North Korea, or any other state (or non-state entity) not produce nuclear weapons when we ignore our nonproliferation promises?

How can we prepare to invest more than $10 Billion on an over-sized CMRR-NF when funds are desperately needed for environmental restoration of weapons communities, schools, housing, education, job training, and other programs that make our world better? *229-3*

A reasonable alternative is to asses upgrading facilities in place. This includes the Y-12 plant in Oak Ridge and the plans to construct a $6.5 Billion Uranium Processing Facility to go along with the CMRR-NF. Stockpile surveillance and facility maintenance can be enhanced by upgrades to meet environmental, health, and safety (seismic, wildfire, tornado, dirty bomb, bio/cyber attack) requirements in a cost-efficient manner. *229-4*

229-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

NNSA acknowledges the commentor's concern regarding the possibility of accidents at the proposed CMRR-NF (for example, could an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant happen at LANL). But there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 229 (cont'd): Carol Green

This S-EIS does not meet the NNSA's obligation to examine the full impact of these plans and ignores the calls to consider the reasonable alternative of upgrading in place in order to build down to zero. ***229-4 cont'd***

Carol Green
3215 Tuckaleechee Pike
Maryville, TN 37803
Member of the Peace with Justice Ministry Team of the Holston Conference of the United Methodist Church

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

229-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information. NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a).

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

229-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Regarding funding priorities of the U.S. Government, see response to comment 229-1.

Commentor No. 229 (cont'd): Carol Green

229-4 Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS* (see Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive and not technically feasible. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation SPEIS* (DOE 2008b) in 2008. NNSA announced its decisions, which were based on a number of considerations including cost, in two Records of Decision published in the *Federal Register* on December 19, 2008 (73 FR 77644 and 77656). The first ROD addresses operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and includes the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building. Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely.

Alternatives related to the Uranium Processing Facility at the Y-12 National Security Site in Tennessee are addressed in the *Site-Wide Environmental Impact Statement for the Y-12 National Security Complex* (DOE/EIS-0387) (DOE 2011a) and are beyond the scope of the *CMRR-NF SEIS*.

Subject: Prepare an EIS, Include an alternative for pursuit of deterrence via helping all the world's people

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager, NNSAQ Los Alamos Site Office,
3727 West Jeme Road, TA-3 Building 1410, Los Alamos, NM 87544
NEPALASO@doeal.gov

Dear Mr. Tegtmeier,

As I write this from north of Taos, the air outside is thick with smoke from fires burning in the Los Alamos area. With strong winds, that fire spread quickly, even at one point going close to the Los Alamos Lab. With climate change, the risk of fire endangering the lab--the climate here becoming hotter, drier, and more windy--will only increase. If a fire is hard to contain today, tomorrow it may be impossible to contain. This is only ONE of many reasons that a completely new environmental impact study, assessment, and EIS is needed, not a SEIS. Furthermore, I believe, to be a true assessment and a responsible study, the options and alternatives of closing down all nuclear weapon or pit construction must be included as well. *230-1*

Plutonium is a killing carcinogen. People working at the labs and downstream and living in the surrounding area are at risk from this and other products and byproducts of this production. Bombs, rather than protecting, also kill--that is their function. People all over the world are at risk from our nuclear weapon making, whether through deployment (accidental or intentional) or nuclear accident. The logic of building bombs to protect people's lives is faulty: it is the NOT building of bombs, particularly nuclear ones, which can protect people's lives. *230-2*

The ultimate deterrence program is the program whereby people are socially invested and active in the improvement of lives for everyone in the world. It is not by "protecting oneself from others" that one succeeds in self-protection. Rather it is the caring about others and acting on that care (rather than building capacity to harm others) that creates bonds of friendship and mutual caring that is ultimately the best path to safety for all. Please include assessments of social costs and resulting destabiliation, and missed opportunities to stabilize the world, in assessing the costs and harm to human environment and our global relationships in your new EIS. If we were to pursue a role of helper in the world rather than that of a nation powerfully capable of harming, we could usher in profound stability and warlessness. Please put this alternative in your EIS. I believe you will find it to *230-3*

230-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. The options and alternatives of closing down all nuclear weapon or pit construction are not within the scope of the SEIS.

230-2 The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

230-3 Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable

Commentor No. 230 (cont'd): Joanne Baek

be the best option, and one with infinate possiblity: wind turbine, solar, and other renewable energy research, could be new areas of specialty for the labs with great benefit everywhere in the world. And renewable energy sources is just one area of benefit to all that we could engage in for stabilizing our world and improving our safely and well-being. **230-3 cont'd**

Thank you for consideration of this perspective.

Sincerely,

Joanne Baek
PO Box 670
Arroyo Hondo, NM 87513

future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Funding decisions regarding major Federal programs (for example, defense and renewable energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 231: Patricia Whalen

From: annyaish@annya-ishtara-dance.com
Sent: Tuesday, June 28, 2011 4:29 PM
To: Mr. John Tegtmeier
Subject: Comment on the Draft CMRR-NF SEIS

To Mr. Tegtmeier:

231-1

I am writing in regard to the CMRR-NF SEIS. I am against putting such a facility in Los Alamos for a number of reasons, some of which I will discuss in this letter.

First, Los Alamos is in a geologic fault zone which has been scientifically shown to have an enormous potential for an increase in seismic activity. Think of what recently happened in Japan-what a huge human and environmental catastrophe that has been. We would not want a similar occurance here in the United States. Also the geologic complexity of the Los Alamos area would make it outrageously expensive to build the proposed facility to standards that could begin to meet any reasonable safety precautions. These two points plus the fact that Los Alamos is in a wildfire-prone area make it a completely unsuitable location for a hazardous facility such as the one proposed.

231-2

With these points in mind, the current EIS is out of date and inadequate. At the very least, a whole new EIS needs to be done. However, I believe that no manner of studies and safety precautions can adequately protect from the dangers of radioactivity associated with nuclear facilities. I worry about the health effects on people, animals, and plants downstream and downwind. This actually includes the whole planet. As we know, radioactivity levels all over the world have risen since the incident in Japan. This also occured after the Chernobyl incident. I realize we are not talking about the same kinds of facilities here, but radiation is radiation and lasts for hundreds of thousands of years, never truly disappearing, and leaving many devastating effects in its wake.

231-3

Lastly, the need for a nuclear facility such as the one proposed is moot. Nuclear weapons are obsolete. They do not make a country which possesses them safer. They do not prevent terrorist attacks. On the contrary, they and all facilities associated with them provide potential terrorist targets. Nuclear weapons do not feed or heal people or other creatures. They do not provide any tangible benefit whatsoever.

So for all the reasons above, and more, I ask you not to build the CMRR-NF in Los Alamos or, in fact, anywhere at all.

Respectfully,

Patricia Whalen

231-1 NNSA notes the commentor’s opposition to pit production and nuclear weapons, and concerns about seismic issues and wildfires.

Regarding seismic concerns, the geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

231-2 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The commentor's concern regarding the health effects of radiation affecting the entire planet is beyond the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. Chapter 4 of the *CMRR-NF SEIS* presents the potential human health impacts of the alternatives. These impacts have been determined to be small under all of the alternatives, except in the event of a severe accident such as a severe earthquake. If such an earthquake were to occur, it would be expected to severely damage the 2004 CMRR-NF or the existing CMR Building as discussed in Chapter 4, Section 4.2.11 and 4.4.11, of the *CMRR-NF SEIS* and result in unacceptable consequences for the public. Assuming this earthquake were to occur at the Modified CMRR-NF, as indicated in Section 4.3.11, the consequences would be much lower and the risk to the public would be small.

231-3 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. President Obama has stated a long-term goal of a world free of nuclear weapons. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain,

<u>*Commentor No. 231 (cont'd): Patricia Whalen*</u>

and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 232: Anne deBuys

From: Anne deBuys [anne.debuys@gmail.com]
Sent: Tuesday, June 28, 2011 8:54 AM
To: NEPALASO@doeal.gov
Subject: comments re CMRR

6/28/2011

To Whom it May Concern:

I would like to go on record in expressing the following comments regarding the proposed construction of the CMRR facility at Los Alamos National Laboratories.

232-1

A Complete, New Environmental Impact Statement is Needed, Not A Supplemental

Environmental Impact Statement. The original Environmental Impact Statement in 2004 assessed a building designed to withstand only mild seismic events. A 2007 updated seismic hazards analysis showed a potential huge increase in seismic ground motion and activity. I understand that even Lab scientists have expressed grave concerns regarding this matter. Only a full Environmental Impact Statement can adequately study the full consequences of increased possibility seismic events might have on the proposed bomb plant.

This draft SEIS should be withdrawn until the details of the Seismic Risks are better understood and no more funds used for planning at this time.

232-2

Valid Alternatives Must Be Considered in the Supplemental Environmental Impact Statement. DOE must develop and consider new alternatives, including a true "No Action" alternative--not building the Nuclear Facility and upgrading the existing plutonium production building.

232-3

The Costs to Build a Plutonium Pit Production Complex Are Just Too High. The total original estimate for constructing the new nuclear weapons complex at Los Alamos National Laboratory was approximately $600 million in 2004. The current estimate is $5.8 billion.

The US does not need 80 new plutonium pits per year. Just as new seismic information has forced a re-evaluation of the construction, new cost information must force a re-evaluation of the cost.

Thank you for your consideration of the foregoing comments.

Anne deBuys
1815 San Felipe Circle
Santa Fe, NM 87505
(xxx) xxx-xxxx

232-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

232–2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure,

Commentor No. 232 (cont'd): Anne deBuys

and environmentally sound manner (see Chapter 1, Section 1.3, of the CMRR-NF SEIS). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the 2003 CMRR EIS (69 FR 6967).

Chapter 2, Section 2.7, of the *CMRR-NF SEIS* addresses alternatives that were considered but dismissed from further analysis in the *CMRR-NF SEIS*. These include possible alternatives such as extensive upgrades to the existing CMR Building or distributing the functions assigned to the CMRR-NF among different LANL facilities. Regarding the former, NNSA has determined that extensive upgrades to the CMR Building would be only marginally effective in providing the operational risk reduction and program capabilities required to support NNSA mission assignments at LANL. Refer to Section 2.2, NEPA Process, and Section 2.11, Alternatives Considered, of this CRD for additional information.

232-3 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. See Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 233: Carole Gorecki

From: Carole Gorecki [caroleg1776@yahoo.com]
Sent: Wednesday, June 22, 2011 6:29 PM
To: nepalaso@doeal.gov
Subject: Comments on CMRR SEIS

The NNSA's plan to construct new plutonium pits at the Los Alamos Labs is a bad idea. I have listed a number of different reasons why this plan would be harmful and costly:

The costs to build a plutonium pit production complex are too high. the money can be better spent on productive things to help and not to destroy people and things. I am against nuclear weapons.

A new nuclear facility will detract from cleanup of the existing mess. The Department of Energy (DOE) made a commitment to clean up the legacy waste at Los Alamos Lab by 2015. Construction activities for a new Nuclear Facility will interfere with cleanup activities. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

233-1

Carole Gorecki
36500 North Pointe Dr.
n/a
New Baltimore, MI 48047

233-1 NNSA notes the commentor's opposition to construction of the CMRR-NF and nuclear weapons. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on LANL legacy waste cleanup. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 234: Dr. F.D.C Sinclair

From: Fiona Sinclair [rumgumption@yahoo.com]
Sent: Tuesday, June 28, 2011 3:39 PM
To: nepalaso@doeal.gov
Subject: STOP NNSA in Los Alamos

I am deeply concerned by the proposed next phase of building the NNSA facility in Los Alamos, NM. As the Current fire situation demonstrates this is NOT the place for such activity. As the birthplace of the nuclear weapons industry New Mexico is well positioned to advocate for unilateral decommissioning of ALL nuclear facilities rather than ramping up the arms race with more nuclear weapons development. The pollution and hazards associated with such development far outweigh the benefits of shaping a clean and peaceful world. *234-1*

Sincerely

Dr. F.D.C Sinclair

Fiona Sinclair
PO Box 422
Cleveland, NM 87715

234-1 NNSA notes the commentor's opposition to the CMRR-NF project and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1 of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The commentor's opinion on the cost-benefit of maintaining the Nation's nuclear weapon stockpile is noted.

Commentor No. 235: Sasha Pyle

Mr. John Tegtmeier, CMRR-NF SEIS Document Manager
USDOE/ NNSA
Los Alamos Site Office
3747 West Jemez Rd.
Los Alamos, NM 87544

I have lived in Northern New Mexico for most of my life. For nearly a quarter of a century I have been closely following the nuclear weapons complex and its production and waste agendas in my state. I have spent thousands of hours poring over environmental impact statements, maps, hydrologic and geologic studies; attending hearings and encouraging others to do so; testifying in Congress and meeting with elected and agency representatives in Washington, D.C.; reading, writing and editing reports, newsletters and fact sheets; and speaking publicly about the dangers posed to our fragile environment and our sinking economy by the wasteful and destructive programs of the Department of Energy and more recently its semi-autonomous National Nuclear Security Administration.

The United States has invested over six trillion dollars in the nuclear deterrent since World War II. We already have an enormous stockpile of weapons that can remain dependable for decades to come. If we continue to pour tax dollars into new weapons design and manufacture, what do we really get for this "investment"? The endlessly ballooning costs of each and every DOE program, the changes, alterations and scrapped designs, the buildings erected and then torn down, the warheads built, stored, maintained and then dismantled…these represent an appalling disregard for the public that foots the bill.

235-1

The proposed CMRR nuclear facility, in all its terrifying scale, represents the culmination of decades of wasteful and destructive practices by the weapons industry. The only purpose of this monstrosity is to enable a level of plutonium pit manufacturing that has nowhere been deemed necessary for national security. Enhancing our existing arsenal with new designs of warheads, or re-designed warheads boasting increased military capabilities, only serves to waste taxpayers' money, further pollute our land and water with dangerous chemicals and radioactive materials, and fly in the face of our nation's treaty obligations in a highly provocative and visible manifestation of the very proliferation we decry in other countries.

235-2

Is there a reason why the CMRR's environmental impact statement simply overlooks the option of scrapping this facility altogether? Why can the public not be provided this alternative to evaluate? When did this alternative get ruled out? And by whom?

It seems to me that the loss of a no-action alternative from the impact statement constitutes a flagrant violation of the National Environmental Policy Act, a piece of federal legislation that was designed to protect the public from the very real dangers that large-scale industrial facilities pose to health and natural resources.

235-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. In addition, the purpose and need for the CMRR-NF is not tied to the level of pit production.

Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

235-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967).

Commentor No. 235 (cont'd): Sasha Pyle

When DOE and NNSA hear "no" from the public and Congress on controversial facilities and programs, those facilities and programs continue to reappear under slightly different names and with expensive PR makeovers--over and over again, engendering the same tired theater of debate and bureaucratic wrangling that never seems to accomplish any meaningful policy decisions. **235-3**

As I write today, Los Alamos National Laboratory is once again threatened by a massive wildfire, one that already dwarfs the 2000 Cerro Grande Fire in growth rate and potential destruction. I question whether Los Alamos is a safe place to construct any new facilities that would house large quantities of dangerous nuclear materials.

I absolutely dispute the need for this multi-billion-dollar boondoggle bomb factory and decry its location in a seismic hazard zone and tinder-dry high mountain woodland that may continue to be swept by massive wildfires as the Southwest enters a cycle of heightened drought. **235-4**

Stop endlessly re-designing this unneeded facility and turn Los Alamos and the other national Labs toward work that actually needs to be done.

There is plenty to do in the realm of nuclear work, with on-going requirements to locate, track, isolate and stabilize existing weapons-grade nuclear materials, maintain our existing stockpile, and dismantle and dispose of excess weapons—which we possess in abundance if our international agreements are to be honored. **235-5**

Cleanup of the national nuclear weapons complex is habitually underfunded, resulting in missed targets and deadlines, and widening environmental impacts of inadvertently dispersed radioactive and chemical materials that continue to threaten human life, wildlife, and natural resources near every site, currently functioning or used in the past, for bomb production. The Labs should actively work on accelerating cleanup and environmental remediation of DOE sites across the U.S. **235-6**

There is also plenty of other work to do in this world, which would benefit greatly from the human intelligence and technically capable infrastructure that the Labs could provide. Water quality and harvesting; energy independence; improving, protecting and maintaining infrastructure; technologies that lead to more energy-efficient buildings and transportation modes; technologies for adapting to climate shifts; advances in medical technologies; breakthroughs in techniques for remediating environmental damages from the past—the list could be quite long.

If Northern New Mexico is so desperate for jobs that we would appear to welcome any program offering even meager employment, why can't the so-called brilliant minds at the Laboratory conceive of and launch beneficial programs and facilities offering said employment *without* the absurd waste of money and certain environmental damage posed by outdated and overblown ideas like this blundering CMRR facility? **235-1 cont'd**

235-3 NNSA considers all public input obtained during the public comment period. NNSA must carry out its mission as assigned by the President and Congress.

235-4 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

235-5 The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility.

Commentor No. 235 (cont'd): Sasha Pyle

If average Americans all over this nation were really aware of how much of their weekly paychecks went to weapons programs that are cloaked from scrutiny by the magic words "national security"—without offering any tangible benefits to our real national security—the voices of outrage would be deafening indeed. Unfortunately, most people are too busy trying to make a living and survive in this perilous economy to take hundreds or thousands of hours to educate themselves about what is really going on at their national laboratories.

People would like to believe that the "experts" and "authorities" know what they are doing. Sadly, the deep channels that a huge flow of money over many decades has carved to the Labs for the purpose of weapons manufacturing have resulted in a "culture" of mindless resource gobbling with no accountability and no standard of practicality. Nothing could embody this tragedy more than the currently proposed CMRR facility.

More weapons and more nuclear waste, more precious resources wasted forever…the real cost of this program can only be measured in the road not taken. What could the United States do to better the futures of Americans and all peoples of the world? Would we benefit from cleaning up the badly contaminated weapons complex? Or should we keep fouling our land, air and water, adding to a mess that has been decades in the making? What do you think most people would prefer?

Turn this boat around now. Stop the CMRR nuclear building and the poorly conceived programs it would house, endlessly transforming needed resources into dangerous trash. The citizens of this nation, and of the world, deserve better.

235-1 cont'd

Sasha Pyle
1672 Cerro Gordo Rd.
Santa Fe NM 87501
xxx-xxx-xxxx
sasha@visiblearts.com

235-6 The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on cleaning up (remediating) DOE sites across the country or LANL legacy waste cleanup. NNSA does not consider compliance with the Consent Order to be optional, and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 236: Debi L. Taylor

From: Debi Taylor [debitaylortaos@yahoo.com]

Subject: Los Alamos Lab EIS Statement needed

Mr. Tegtmeier and Whom It May Concern:

236-1 The current fire in Los Alamos further proves the need for a new, complete Environmental Impact Statement. It is unconscionable that with the current state of the World reflected by the threats to numerous nuclear plants around the World that further production is even being considered. Manufacturing plutonium pits is a dangerous and polluting threat to the health and safety of those living downwind or downstream (I reside in San Cristobal in Taos County). Federal Funds should be used to fulfill real human needs in New Mexico not spent on nuclear weapons that the World does not need and does nothing to support nuclear arms reduction. No place is safe for such manufacturing but certainly Los Alamos has proven to be an unsafe location. We may live in one of the poorest and unpopulated State of the United States but this in no way justifies sacrificing the well being of our people, our countryside and nation by building a plutonium pit complex in Los Alamos, a geologically unstable area, or anywhere!

Please help fight for a complete, new EIS and fight the building of a new nuclear facility. Let's focus our efforts on cleaning up the mess we already have.

Thank you for your efforts,

Debi Taylor

236-1 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

Regarding the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the

Commentor No. 236 (cont'd): Debi L. Taylor

scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

NNSA intends to continue implementing those actions necessary to clean up legacy waste sites at LANL regardless of decisions made on the proposed construction of the CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 237: Bud Ryan

June 28, 2011

To Whom it May Concern,

Since the moment my wife and I moved into our house southwest of Madrid I have been concerned about LANL. When the Cerro Grande fire happened the huge plume of smoke almost made it seem that the fire was just a little more than a stones throw away from our property. And of coarse the people of New Mexico (and surrounding States) dodged a bullet when the fire thankfully did not make it to the thousands and thousands of barrels of nuclear waste that the Lab had stored above ground. Did LANL learn its lesson from the Cerro Grande Fire? – NO! because here it is now some eleven years later and there is yet another fire threatening the Lab and the thousands of barrels of nuclear waste that are STILL STORED there above ground. Let us hope and Pray that we are again Blessed and the fire does not burn any areas or buildings that contain dangerous nuclear materials.

I write this in my comments about the Chemistry and Metallurgy Research Replacement building because I want to show that LANL and the people who run it often do not make the most intelligent decisions. To continue to store any barrels of nuclear waste above ground after getting away with it once, shows to me arrogance coupled with ignorance, and now you are asking to build the new CMRR building within a mile of a seismic fault line in the aftermath of the Fukushima catastrophe. How does that make any sense whatsoever? For a species that was able to put a man on the Moon I can't believe that some of us are capable of doing something that stupid! *237-1*

I would also like to know how any of the planned work that is to be done in this new building does not violate the Nuclear Non-Proliferation Treaty? And don't we already have over 10,000 "pits" stored at Pantex in Texas, so why do we need to build any more? *237-2*

I do not want to see the CMRR building constructed in Los Alamos or anywhere else in the United States. I do not want my taxes or the taxes of my fellow Citizens wasted on projects whose aim is to create weapons with the potential to kill millions of my fellow sisters and brothers on our beautiful planet. *237-3*

Sincerely,

Bud Ryan
POB 1594
Cedar Crest, NM 87008

237-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1 of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The waste storage domes in TA-54 are not the subject of the *CMRR-NF SEIS*. However, NNSA has taken actions to mitigate the risks of a wildfire on the domes. In 2000, the Cerro Grande fire burned a heavily forested canyon area to within about 0.75 miles (1.2 kilometers) of the waste storage domes, but none were burned and there were no radiological releases from the domes. The Las Conchas fire reached the southern border of LANL, but did not get within 2 miles (3.2 kilometers) of the domes. Additional fuel reduction has been conducted since the Cerro Grande fire, both to the vegetation surrounding TA-54 and within the domes themselves (for example, wooden pallets have been replaced with metal pallets), to further decrease the potential for a waste storage dome fire occurring as a result of a site wildfire. Furthermore, NNSA has an aggressive program to remove the stored transuranic waste from Area G and ship it to WIPP for disposal.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. But there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear

Commentor No. 237 (cont'd): Bud Ryan

reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

237-2 Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

237-3 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 238: Rebecca J. Anderson

June 28, 2011

Mr. John Tegtmeier, CMRR–NF
SEIS Document Manager
NNSA Los Alamos Site Office
3747 West Jemez Road,
TA–3 Building1410,
Los Alamos, New Mexico, 87544

Dear Mr. Tegtmeier,

I am writing to urge the National Nuclear Safety Administration to consider creating an entirely new Environmental Impact Statement to replace its current draft supplemental statement regarding the proposed Chemistry and Metallurgy Research Replacement (CMRR) Project. A new Environmental Impact Statement would be able to address many issues that the current supplemental statement is missing, such as up-to-date (and consequently, more complete) information on seismic risks as well as other alternatives, such as a "No Action" option to stop the production of a new nuclear facility altogether.

Creating a new Environmental Impact Statement would allow the National Nuclear Safety Administration to become more aware of the seismic risks in producing a new CMRR at the Los Alamos National Laboratory. The 2007 updated seismic hazards analysis showed that the seismic ground activity could possibly grow tremendously. As the Los Alamos National Laboratory sits in a seismic fault zone between the Rio Grande rift and the Jemez Mountains, this is something that should continue to be studied and considered when writing an Environmental Impact Statement. New seismic investigations are currently being conducted at the lab and the subsequent results should be included in any Environmental Impact Statement. If the NNSA continues with its current Supplemental Environmental Impact Statement, when the current investigations are finished, another statement will likely be needed. This process will continue to consume more time and money that could otherwise be focused on improving the safety of pre-existing nuclear facilities. By using these results along with any other updated information to create an entirely new Environmental Impact Statement, the NNSA will be able to present the most accurate and concise information possible to its stakeholders. **238-1**

Additionally, the Department of Energy should consider a "No Action" alternative in a new Environmental Impact Statement. This alternative would halt all plans to create a new nuclear facility. Since the design for this new CMRR is not yet completed, the DOE should reconsider some of its priorities regarding the Los Alamos National Laboratory. For instance, the DOE made a commitment to clean the legacy waste at LANL by 2015. The construction of a new facility will not only distract the DOE from reaching this goal, but it will also add more pollution to the lab. This CMRR will be very costly, as the price tag is rapidly increasing – the estimate of $500 million in 2004 is now up $5.8 billion. Additionally, the nuclear weapons produced at this proposed new CMRR at the Los Alamos National Laboratory would not contribute to the economy and generate revenue **238-2**

238-1 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. Section 2.6, Seismic and Geologic Concerns, of this CRD addresses the commentor's concerns about seismic risks.

238-2 Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure,

Commentor No. 238 (cont'd): Rebecca J. Anderson

the same way other publicly-funded programs such as education or health care could. Dedicating taxpayer dollars allocated to the DOE to improving the cleanup and safety along with upgrading existing facilities may be a much more feasible decision than following through on the plan to create a new CMRR at LANL. **238-2 cont'd**

Finally, the United States Government and subsequently the DOE should consider limiting the number of nuclear weapons produced. Nuclear weapons production only encourages nuclear proliferation domestically and internationally. Nuclear weapons cannot defend against terrorists, as their scope of destruction is much too great to counter attacks from international non-state actors. The larger the number of nuclear weapons, the greater the likelihood of these weapons falling into the hands of terrorists. By decreasing its own arsenal of nuclear weapons, the United States would be setting an example for the rest of the world that nuclear weapons should not be a condoned use of military technology. The 20 plutonium pits manufactured each year since 1999 (per the DOE's decision in 1999 to limit the number produced) have sufficed. The proposed plan for the new CMRR at LANL will allow at least 80 pits to be created. Instead of spending time and money to create this new facility, a study should be conducted to investigate whether existing facilities can meet the DOE's needs. **238-3**

Ultimately, the National Nuclear Safety Administration and the Department of Energy should consider foregoing a Supplementary Environmental Impact Statement in order to collect more data on the seismic risks involving in the proposed Chemistry and Metallurgy Research Replacement Project at Los Alamos National Laboratory. In this process, the possibility of stopping these plans and improving already existing facilities should also be considered. Agreeing to these two ideas could consequently improve the safety and environmental impact of existing facilities while promoting the cause of nuclear nonproliferation. **238-1 cont'd**

Best wishes,

Rebecca J. Anderson
Intern, Alliance for Nuclear Accountability
Student, American University

and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the *CMRR-NF SEIS* is based on the 2004 ROD for the 2003 *CMRR EIS* (69 FR 6967).

The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on LANL legacy waste cleanup. NNSA intends to continue implementing those actions necessary to clean up legacy waste sites at LANL regardless of decisions made on the proposed construction of the CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense, education, and health care) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

238-3 NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (75 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium

Commentor No. 238 (cont'd): Rebecca J. Anderson

mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

From: Greg Mello, Los Alamos Study Group (LASG)

Summary and Background

DOE and NNSA propose to construct a new building, the CMRR-NF[1], currently expected to cost $4.7 to $5.8 billion (B),[2] for the primary purpose of increasing the rate of manufacturing nuclear warhead cores ("pits") at Los Alamos National Laboratory (LANL) in New Mexico. **239-1**

[1] Comprehensive background on this facility is available at http://www.lasg.org/CMRR/open_page.htm.

2901 Summit Place NE • Albuquerque, NM 87106 • 505-265-1200 • www.lasg.org

239-1 The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium facility. The estimated cost of the CMRR-NF has increased since originally proposed, primarily because of the changes made in facility design to address seismic and safety requirements. These changes are the subject of this SEIS. The commentor's assertion that the amount of plutonium that would be handled and stored in the CMRR-NF has increased from 900 grams to 6,000 kilograms is incorrect. In the original *CMRR EIS*, Appendix C, Human Health Impacts from Facility Accidents, 6,000 kilograms of plutonium was used as the material at risk in the analysis of the potential impacts of accidents at the new CMRR Facility (see Section C.4.1 of that appendix) (DOE 2003b).

NNSA disagrees with the commentor's position that the CMRR-NF is not needed. The President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile. Continuing with the development of the CMRR Facility at LANL supports work needed to ensure that the U.S.'s nuclear weapons stockpile can continue to be managed safely. As noted above, the capabilities of the CMRR-NF support NNSA's plutonium mission.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

239-1 cont'd

The expected cost of this facility has increased more than tenfold since its conception.[3] The required plutonium storage and handling capacity in this facility has increased from 900 grams in 2000 and 2001 (denoting a Hazard Category III facility) to 6,000 kg today.[4]

Our organization has recently provided to Congress extensive background on why this facility is not necessary, and especially not necessary now.[5]

239-2

What was described as a relatively simple building in a 2003 environmental impact statement (EIS) written under the National Environmental Policy Act (NEPA) for the CMRR project[6] has subsequently become a very complex and expensive proposed project. It now has twice the original gross floor area, more than one hundred times the original quantity of concrete, a far longer construction and occupancy schedule (not ready for use until 2023), eight times the original electricity consumption (necessitating new or reworked transmission lines to Los Alamos County), and many other expansions.[7]

As a result of these unforeseen design complexities and expansions, the project currently lacks a final design concept. Two concepts are under consideration: a relatively shallowly-buried building, the foundation of which would be above a thick layer of unstable volcanic ash, and relatively deep one, founded below that unstable layer on welded tuff.

239-3

Of the $787 million (M) appropriated for the CMRR project as a whole over fiscal years (FYs) 2002 through 2011, $458 M has been for CMRR-NF.[8]

In the DSEIS and elsewhere, DOE and NNSA generally insist that the current CMRR-NF requirements, location, size, and timing cannot be changed. Very recently, however, NNSA Deputy Administrator for Defense Programs Don Cook recently warned that "As we go on, if the

[8] From DOE congressional budget requests.

2

239-2 Subsequent to the original proposal of the CMRR Facility and preparation of the *CMRR EIS*, the Final Report, *Update of the Probabilistic Seismic Hazard Analysis and Development of Seismic Design Ground Motions at the Los Alamos National Laboratory* (LANL 2007), was completed. The seismic hazard analysis for TA-55 was further updated in 2009 (LANL 2009). These reports provided a better understanding of ground motion and seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*). Whichever alternative or option is selected, the CMRR-NF must meet the design standards for a Performance Category 3 (PC-3) facility. PC-3 structures, systems, and components are those for which failure to perform their safety function could pose a potential hazard to public health, safety, and the environment from release of radioactive or toxic materials.

239-3 No response necessary.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

cost starts to get near the upper end [of the stated cost range], that will be a clear point for invitation to cut scope."[9]

The House Appropriations Committee (HAC) has recommended $100 million (M) less appropriation than the FY2012 request and no construction in FY2102, pending resolution of major seismic issues, revalidation of requirements, and a decision on whether the LANL management and operating (M&O) contractor is the appropriate entity to manage the project.

> *Project 04–D–125, Chemistry and Metallurgy Research Replacement (CMRR), Los Alamos National Laboratory.*—The Committee recommends $200,000,000, $100,000,000 below the budget request. The Committee fully supports the Administration's plans to modernize the infrastructure, but intends to closely review the funding requests for new investments to ensure those plans adhere to good project management practices. The latest funding profile provided to the Committee indicates that over half the funding requested for the Nuclear Facility would be used to start early construction activities. The recommendation will support the full request for design activities, but does not provide the additional funding to support early construction. The NNSA is not prepared to award that project milestone since it must first resolve major seismic issues with its design, complete its work to revalidate which capabilities are needed, and make a decision on its contracting and acquisition strategies.[10]

239-3 cont'd

This $100 million (M) cut is 90% of the Committee's proposed cuts in NNSA construction, meaning the HAC is almost uniquely targeting CMRR-NF for cuts among all proposed NNSA construction. NNSA had requested $270.1 M for CMRR-NF specifically, the balance of the requested $300 M CMRR budget line to be allocated to completing the first CMRR building, the Radiological Laboratory, Utility, and Office Building (RLUOB).

In its introduction to its markup of the NNSA budget the HAC wrote, in a passage especially germane to NEPA compliance and the DSEIS:

It is incumbent upon the experts at the NNSA to provide a range of options which would meet defense requirements and to ensure that a range of alternatives are considered, taking into account the DOE resource implications of each alternative.[11]

In his opening remarks Subcommittee Chairman Rodney Freylinghuysen (R-NJ) said the proposed bill would cut out from the Administration's request for nuclear warheads

> …hundreds of millions of dollars for construction projects that are not ready to move forward, capabilities that are secondary to the primary mission of keeping our stockpile ready, and yes, slush funds that the Administration has historically

used to address its needs. The recommendation before you eliminates these weaknesses and it is responsible.[12]

239-3 cont'd

In late April DOE and NNSA produced a Draft Supplement to the 2003 CMRR EIS (DSEIS), which is the subject of these comments. Despite all the above concerns, the DSEIS examines no alternatives to the CMRR-NF, which it has already decided to build. Despite extensive prior communication and comment from many parties, these two agencies incorrectly and we believe illegally relegate NEPA to a footnote in the engineering design process for a predetermined agency decision to construct a building of certain precise capabilities, size, and requirements, in a precise location, at a precise time (now).

DOE and NNSA's failure to conduct a full analysis of alternatives to the CMRR-NF project as NEPA requires risks not just billions of dollars in excess spending but also the effective management of NNSA's nuclear weapons programs, and the safety of the agency's workers.

239-4

Comments on the April 29, 2011 CMRR-NF DSEIS

1. Please incorporate by reference all of Plaintiff LASG's pleadings, evidence submitted, and both actual and prepared testimony in Case No. CIV10-760 JH/ACT, LASG v. Department of Energy (DOE), NNSA, Steven Chu, and Thomas D'Agostino, which bear centrally on the process and content of this DSEIS.[13] This includes sworn evidence and testimony regarding the need for, and alternatives to, the proposed CMRR-NF that were by submitted by me, Dr. Frank von Hippel, and Mr. Robert Peurifoy.[14] Please include all supporting references.

239-5

[12] Quoted by Todd Jacobsen, "Budget Battle Heating Up Over House Approps Cuts To Weapons Program," *Nuclear Weapons and Materials Monitor* of June 17, 2011.

[13] Available at http://www.lasg.org/CMRR/Litigation/CMRR-NF_litigation.html.

[14] For reasonable alternatives to CMRR-NF see Mello affidavit of January 14, 2011, paragraphs 83-91, http://www.lasg.org/CMRR/Litigation/Mello_aff3_14Jan2011.pdf, and Mello, "The Proposed Chemistry and Metallurgy Research Replacement Nuclear Facility (CMRR-NF): New Realities Call for New Thinking," http://www.lasg.org/CMRR/CMRR_alternatives.pdf. All reasonable alternatives center on usage of the pit production equipment in PF-4, with support functions conducted within PF-4 and at the CMRR Radiological, Utility, and Office Building (RLUOB), and *if desired* also elsewhere, either at LANL or at other sites. The entire "front end" of pit manufacturing, either up to metal production or including casting, could be done at another site, e.g. the planned Pit Disassembly and Conversion Facility (PDCF), as modified, at the Savannah River Site (SRS). Mark Hart, Warren Wood, and David Olivas, "Plutonium Pit Manufacturing Unit Process Separation Options for Rapid Reconstitution: A Joint Position Paper of Lawrence Livermore National Laboratory and Los Alamos National Laboratory," LLNL, LANL, September 6, 1996, cited in Mello affidavit of Jan. 14, 2011, op. cit, at p. 37.

Rationalization of programs, floor space, vault space, and equipment within the existing plutonium facility (Building PF-4) will provide adequate MC capability if it does not already do so. Frank von Hippel prepared testimony of April 27, 2011, http://www.lasg.org/CMRR/Litigation/vonHippel_27Apr2011.pdf. Mello affidavit of January 14, 2011, op. cit., at paragraph 10, citing Tim George, LANL Nuclear Materials Technology Division Director, "Can Los Alamos Meet Its Future Nuclear Challenges? Balancing the Need to Expand Capabilities While Reducing Capacity," *Actinide Research Quarterly*, 1st Quarter 2001 at http://arq.lanl.gov/source/orgs/nmt/nmtdo/AQarchive/01spring/editorial.html, and citing Secretary of Energy Advisory Board (SEAB) Nuclear Weapons Complex Infrastructure Task Force, "Recommendations for

the Nuclear Weapons Complex of the Future," July 13, 2005, p. H-6, at footnote 11 in

239-4 NNSA disagrees with the commentor's characterization of the SEIS NEPA process. NNSA has prepared the *CMRR-NF SEIS* in accordance with NEPA, the CEQ regulations that implement the procedural provisions of NEPA (40 CFR Parts 1500-1508), and DOE regulations implementing NEPA (10 CFR Part 1021). These regulations require the preparation of a supplement to an EIS when there are substantial changes to a proposal or when there or significant new circumstances or information relevant to environmental concerns. An agency may also supplement an EIS to further the purposes of NEPA. The CMRR-NF SEIS evaluates the environmental impacts of alternatives for satisfying the mission AC and MC requirements, currently provided by the CMR Building, over the next 60 years. Refer to Sections 2.3, Programmatic Direction and Decisions, and 2.11, Alternatives Considered, of this CRD for more information.

239-5 Los Alamos Study Group (LASG) submitted a comment requesting that NNSA incorporate by reference all of its pleadings, evidence submitted and both actual and prepared testimony in *Los Alamos Study Group v. Department of Energy*, Case No. 10-Civ-0760-JH-ACT. Much of this material involves legal contentions and does not comment on the draft CMRR SEIS. More important, LASG did not identify the specific issues in this mass of material to which it wanted NNSA to respond. Commentors are required to present their comments in a way that reasonably permits a reviewing agency to examine their contentions, and this comment by LASG does not do so.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

239-6

2. Please incorporate by reference my scoping comments on this DSEIS of November 20, 2010, including my August 14, 2002 comments on the scope of the 2003 CMRR EIS and all supporting references.[15]

239-7

3. Please incorporate by reference the LASG memorandum of May 23, 2011, with all supporting evidence provided, entitled "The [CMRR-NF at LANL] should not be built. Even if CMRR-NF were to be built eventually, it should be delayed now. Longer delay would bring greater net benefit – in dollars, program continuity, decreased management risk across the NNSA complex, and otherwise."[16]

239-8

4. As stated in the pleadings, evidence, and scoping comments above and particularly at sections E and F of my third affidavit (January 14, 2011)[17], the SEIS process is irredeemably flawed and could never serve as a valid SEIS under NEPA and its implementing regulations (at 40 CFR 1500 et. seq. and 10 CFR 1021 et. seq.), under guidance prepared by the Council on Environmental Quality (CEQ) and DOE, or under any common-sense, logical approach to making decisions in which analysis of choices and their costs, benefits, and impacts actually precedes the decision involved. In the case of the SEIS process, the supposed analysis comes after the decision to construct CMRR-NF. This is illogical as well as illegal and renders the entire exercise one of futility and waste from the management and appropriations perspective, and one of deception as regards NNSA's posture toward interested citizens, tribes, state and local governments, and other federal agencies.

As stated in sections E and F of my January 14, 2011 affidavit, after the SEIS scoping process had concluded but before the appearance of the DSEIS:

> NNSA has been increasing its commitment to CMRR-NF since making the decision in 2004 to construct and operate it. Nearly all of the activities currently underway specifically advance and entrench defendants' preferred alternative and no other. Thus, they are prejudicial action. These prejudicial actions include detailed design and the design, purchase, and installation at RLUOB of specialized equipment to support CMRR-NF. No objective EIS or SEIS could be written while project momentum continues and specific contractual commitments to it continue to be made, executed, and extended.
>
> The purpose of NEPA analysis is to foster better federal decisions, not to analyze the impacts of decisions already made (40 CFR 1500.1). NEPA analysis is supposed to be done very early in the design process (40 CFR 1501.2), prior to formal alternative selection at CD-1, *i.e.*, when alternatives to the project are still being weighed.[18] DOE guidance states that such interim commitments are normally not appropriate.[19] NNSA claims its SEIS will help the agency choose

5

239-6 LASG submitted comments to NNSA during the scoping process, prior to preparation of the *Draft CMRR-NF SEIS*. NNSA considered and collectively responded to all relevant scoping comments in the *Draft CMRR-NF SEIS*.

239-7 LASG has also requested that NNSA incorporate by reference a memorandum, with all supporting evidence, which was not submitted to NNSA as a comment document on this SEIS. LASG did not identify the specific issues to which it wanted NNSA to respond. As stated in response to Comment 239-5, commentors are required to present their comments in a way that reasonably permits a reviewing agency to examine their contentions, and this comment by LASG does not do so.

239-8 See the response to Comment 239-4.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

between design details, but the issue is a choice between primary alternatives. The proposed alternatives in the SEIS NOI do not involve choices between design details.

The SEIS is being written because *none* of the original alternatives are reasonable any more. The 2003 EIS only considered constructing a CMRR in neighboring technical areas. Now the scale and scope of the project have markedly changed, dramatically changing the environmental impact analysis. Relevant new environmental information has come to light. New circumstances and scientific knowledge, erosive to the original purpose and need, have appeared. The project itself has exploded in cost and lengthened in schedule as the true nature of the proposed site has become internalized. Without a comprehensive treatment, all reasonable alternatives and their impacts cannot be evaluated. An EIS must "[r]igorously explore and objectively evaluate all reasonable alternatives" (40 CFR Sec. 1502.14). "The information [in an EIS] must be of high quality." (40 CFR 1500.1). There is nothing left of the original EIS to "supplement," and the attempt to do cannot meet NEPA standards. The very word "supplemental" signals an unbroken commitment to the project. To write a "supplemental" analysis of a project's alternatives, when *one* alternative is the sole subject of such commitment, relegates the SEIS to *post-hoc* paperwork, contrary to NEPA's intention and requirements.

The purpose and need of the original project require reexamination today because of new scientific knowledge (existing pits will far outlast the factory to produce them), new technical data from the stockpile management program (stockpile can be kept safe, secure, and reliable without pit production indefinitely), new stockpile realities (post-2003 stockpile current and planned reductions), and new policies (NPR prejudiced against pit production; rejection of RRW). There is no significant pit production authorized or planned. NNSA is explicitly and fully committed to one alternative as they themselves and numerous senior officials have said. We read it on the front pages of our newspapers,[20] extensively in the trade press, on the White House web site,[21] and in the updated "Section 1251 Report."[22] The NOI and other materials provided so far contain too little factual material to provide any basis for informed comment. The scope of analysis presented in the October 1, 2010 Notice of Intent (NOI) was far too narrow and cursory. The current purpose and need were not examined. A very narrow suite of alternatives was offered, without any technical background to even indicate their possible feasibility. Two of the three alternatives are clearly infeasible and unsafe (build the rejected 2003 CMRR-NF; keep using CMR without upgrades).

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

No secondary alternatives were even mentioned. "Business case" or "capacity" analyses are needed to support a full suite of alternatives.

NNSA is conducting its NEPA process separately from other design, feasibility and impact analyses it is doing.

The notice methods used by NNSA for the SEIS were inadequate. Plaintiff, for example, did not receive any notice from NNSA or DOE, meaning that DOE did not use its mailing lists of regional organizations and individuals long involved in DOE affairs.[23] [Sic – see the preceding footnote.] Although CMRR-NF is clearly an issue of national importance, and DOE maintains national lists of parties categorized by interest, no evidence has been provided that any such list was used. The cognizant staff members at the New Mexico Environment Department (NMED) who had commented on the 2003 EIS told us they never saw any formal notice of this SEIS.

No hearings in other relevant NNSA locations, even though alternatives may involve facilities at other sites including the Savannah River Site (SRS), Lawrence Livermore National Laboratory (LLNL), and the Idaho National Laboratory (INL). LANL was chosen as a pit production site based on estimate of total costs a factor of ten lower than today's.[24] Given the huge cost increases, other sites which already have a plutonium infrastructure have clearly become reasonable alternatives, implying a need for proper notice and comment opportunities.

There were no actual scoping hearings. Providing computer terminals to type comments do not constitute a "hearing." Neither is an impromptu forum, provided without notice, where only informal notes are taken, a hearing.

An objective NEPA analysis of CMRR-NF and its alternatives is impossible without certain prior actions by defendants:

NNSA and DOE have publicly expressed their commitment to the single CMRR-NF alternative currently being pursued based on the 2004 ROD and their own critical decision process. A NEPA-compliant EIS or SEIS for CMRR-NF requires that they formally rescind these.

Defendants must rescind Critical Decision 1, "Selection of Alternatives."

Defendants must halt further investments in the CMRR-NF alternative currently being pursued, which only further entrench this alternative, reduce its schedule disadvantage to simpler alternatives, and prejudice any future decision. NEPA recognizes no post-decisional SEIS.

239-8 cont'd

[23] This issue was also pointedly raised in some detail by the Pajarito Group of the Sierra Club. Subsequent to this testimony we found the relevant notice letter.

[24] Richard Geddes, CMRR SEIS scoping comments, October 27, 2010.

7

Response side of this page intentionally left blank.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

Defendants must undertake a searching review of the project's purpose and need. A great deal has changed, from stockpile size (much smaller) to known minimum pit life (much longer), to confidence in stockpile maintenance without pit replacement (now complete). In 1997, DOE said CMRR was unreasonable. In 2001, CMRR-NF plans did not include a Hazard Category II structure. In 2003, CMRR-NF plans had some 120,000 sq. ft. of nuclear laboratory space. A few years later, CMRR-NF plans had about 38,500 sq. ft. of nuclear laboratory space. Clearly DOE and NNSA have held many different concepts of what is essential in the last 14 years.

As preparation for an EIS, defendants must conduct business case analyses of the cost and feasibility of all reasonable alternatives, considering the infrastructure of the entire weapons complex as appropriate. No objective EIS can be written without this.

A full national scoping process that takes the newly clarified purpose and need and new business case and feasibility analyses into account is then required.

239-8 cont'd

5. Additional fatal defects in the SEIS process became apparent with the publication of the DSEIS. Some examples:

   a. The decision to build the preferred alternative (the 2010/2011 version of CMRR-NF, of whatever design variation) is not actually being reexamined.

   Because NNSA decided in the 2004 ROD [Record of Decision] to build CMRR – as a necessary step in maintaining critical analytical chemistry [AC] and materials characterization [MC] capabilities at LANL – the SEIS is not intended to revisit that decision.[25]

   A SEIS is an EIS and must examine all reasonable alternatives to the proposed action, including primary alternatives, i.e. alternatives which do not build the project.

   Both the HAC and NNSA Deputy Administrator Don Cook apparently believe alternatives to the CMRR-NF project may exist, as noted above.

239-9

   b. The DSEIS lacks a No Action Alternative. First, a No Action Alternative means taking no action, including not building the CMRR-NF. No such alternative is envisioned. Further, NNSA admits it's bogus no action alternative "would not be constructed," and so is not an alternative of *any* kind.

   > **No Action Alternative (2004 CMRR-NF):**…Based on new information learned since 2004, the 2004 CMRR CMRR-NF would not meet the standards for a Performance Category 3 (PC-3) [footnote omitted] structure as required to safely conduct the full suite of NNSA AC and MC work. Therefore, the 2004 CMRR-NF would not be constructed.[26]

   And:

239-10

[25] DSEIS Summary at v. See also at 14 ("…NNSA is not planning to revisit either the need for the CMRR-NF or locating the facility at another site…NNSA intends to proceed with the CMRR-NF planning process.")

[26] Ibid at 8.

8

239-9 The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. Following issuance of the 2003 *CMRR EIS*, NNSA announced its decision to construct the two-building CMRR in TA-55. NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation Supplemental Programmatic Environmental Impact Statement* (DOE 2008c) in 2008. NNSA announced its decisions regarding operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and including the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building, which were based on a number of considerations including cost, in a ROD published in the *Federal Register* on December 19, 2008 (73 FR 77644). Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely. As stated by the commentor, NNSA is not planning to revisit that decision in the SEIS. The *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on additional seismic information and safety requirements. CEQ and DOE NEPA regulations and implementing procedures (40 CFR 1502.9(c) and 10 CFR 1021.341(a) – (b), respectively) require preparation of an SEIS if there are substantial changes in the proposed action that are relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns that bear on the proposed action or its impacts. The regulations state that an agency may also prepare a supplement when the agency determines that the purposes of NEPA will be furthered by doing so. NNSA determined that an SEIS to the CMRR EIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information.

239-10 Although many commentors expressed a preference for a No Action Alternative that would abandon the current CMR Building and not proceed with CMRR-NF, such an alternative does not meet NNSA's stated purpose and need (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). Thus, an alternative of ceasing CMR operations is not addressed in the CMRR-NF SEIS. The No Action Alternative in the *CMRR-NF SEIS* is based on the decision made following preparation of the original *CMRR EIS* in 2003.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

The remaining alternative, to construct the 2004 CMRR-NF as it was described and analyzed in the 2003 *CMRR EIS* [sic: it was not analyzed there] and its associated ROD, the 2008 *LANL SWEIS*, the *Complex Transformation SPEIS* [sic: it was not analyzed there] and its associated ROD, and in this CMRR-NF SEIS as the No Action Alternative, does not meet NNSA's purpose and need and thus, would not be implemented.[27]

239-10 cont'd

c. The DSEIS does not seriously consider any primary project alternative. This represents a step back from even the short suite of alternatives proposed during the scoping process, which included at least one colorably reasonable alternative (along with the "pre-rejected" ones offered at the time and formally rejected by NNSA in the DSEIS).

i. The CMR Upgrade alternative originally proposed in SEIS scoping – the sole potentially realistic alternative to CMRR-NF that was offered there – was abandoned in the DSEIS.

> …**Extensive Upgrades to the Existing CMR Building:** … this action was not analyzed further as a reasonable alternative to meet NNSA's purpose and need for action in this CMRR-NF SEIS.[28]

ii. The DSEIS considers however a patently unsafe alternative which would rely upon use of the existing CMR Building *without* major upgrades, and then (properly) rejects this same alternative.

> This CMRR-NF SEIS also considers an alternative that would continue to rely upon the restricted use of the CMR Building without constructing the CMRR-NF even though…this would not meet NNSA's purpose and need for taking action.[29]

This is certainly reasonable, since rejection of this alternative is the stated core justification for the CMRR-NF project.

iii. The DSEIS also rejects alternatives of building CMRR-NF at alternative sites at LANL, or at other locations.[30] It also rejects distributing the functions proposed for CMRR-NF to other LANL nuclear facilities.[31]

The rejection of any and all alternatives to CMRR-NF for detailed examination in the DSEIS is complete.

239-11

d. The rejection of all scoping comments that proposed alternatives to CMRR-NF bespeaks a defective SEIS *process*, as well as content. This is also another reason to suppose bad faith on the part of NNSA and its NEPA contractors in preparation of the DSEIS.

239-12

[28] Ibid at 20.
[29] Ibid at 14, 15.
[30] Ibid at 19.
[31] Ibid at 20.

9

239-11 Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original 2003 *CMRR EIS* and the current *CMRR-NF SEIS* (see Volume 1, Chapter 2, Section 2.7). The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building (specifically, there is a fault beneath TA-3/CMR Building). The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons as discussed in the previously referenced section of the *CMRR-NF SEIS*. Section 2.7 of the SEIS has been expanded to include additional information on why it is not technically feasible to upgrade the Existing CMR Building. Also see Section 2.11, Alternatives Considered, of this CRD for additional information.

239-12 As noted in the discussion of the scoping comments in Chapter 1, Section 1.7, Public Participation, of the *Draft CMRR-NF SEIS*, there were requests for changes in the type of document to be prepared, as well as suggestions for changes in the alternatives and for additional alternatives to be addressed in the SEIS. In addition, there were requests for the type of impact analyses to be performed for the SEIS, including for example, climate change and global warming. NNSA considered all scoping comments and summarized the comments and their responses in the Draft SEIS; however, not all suggestions were incorporated into changes to the SEIS.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

e. Having eliminated from considerations all project alternatives in its SEIS, NNSA incorrectly construes NEPA as an aspect of the *engineering design process* for a predetermined agency decision that would construct a project of certain precise capabilities, size, and requirements in a precise location at a precise time. **239-13**

f. The DSEIS identifies additional project parameters and environmental impacts, not previously disclosed, that so grossly exceed those identified in the 2003 CMRR EIS that a *de novo* EIS involving new alternatives is warranted. For example:

i. Electricity usage during construction and operation would be 492 and 8.34 times, respectively, that predicted in the 2003 EIS.

ii. Water usage during construction and operation would be 6.7 and 1.5 times, respectively, that predicted in the 2003 EIS.

In fact,

> When compared to the available site capacity, operation of the Modified CMRR-NF and RLUOB would require 12 percent of the available water, 27 percent of the available electricity…the peak electrical demand estimate of 26 megawatts [MW], when combined with the site-wide peak demand, would use all of the available capacity of the site.[32]

g. The DSEIS evinces an additional connected major federal action requiring its own NEPA analysis, namely how to supply all this proposed additional electricity.

> Regardless of the decisions to be made regarding the CMRR-NF [i.e. which of two functionally- and spatially-identical versions CMRR-NF to build], adding a third transmission line and/or re-conductoring the existing two transmission lines are being studied by LANL to increase transmission line capacities up to 240 megawatts to provide additional capacity across the site.[33]

This is far more electrical capacity than LANL (or the Los Alamos County electrical pool as a whole, including residential and commercial usage in Los Alamos), has ever needed, used, or previously analyzed under NEPA. Peak LANL demand was 70.9 MW in 2001 and 2003. The Expanded Operations Alternative in the LANL SWEIS projected peak loads of 124 MW for LANL and 144 MW for the Los Alamos power pool overall.[34] **239-14**

6. As a result of these fundamental defects of process and content, including the complete absence of detailed engineering feasibility studies which could support or reject reasonable alternatives as noted above and the transgressions of logic and law in which the DSEIS is offered, there is likely to be little value in offering detailed comments on this document. The DSEIS comes after NNSA's decision to construct CMRR-NF and until that order is reversed it cannot be viewed as a good-faith effort on NNSA's part. **239-15**

7. Nevertheless we aim to do so. For the last two days, however, which were to be devoted to this task, we have been substantially diverted by dozens of calls from citizen constituents and **239-16**

[32] Ibid at 25.

[33] Ibid.

[34] DOE, *Final Site-wide EIS for Continued Operation of Los Alamos National Laboratory* (DOE/EIS-0380), pp. 2-67 and 3-98, at http://www.doeal.gov/laso/NEPASWEIS.aspx.

10

239-13 As noted in the response to Comment 239-2, the *CMRR-NF SEIS* specifically addresses changes in the design of the CMRR-NF based on requirements related to additional seismic information. Three alternatives, including the No Action Alternative and an alternative with two options, are analyzed, as described in Chapter 2 of the SEIS. While the No Action Alternative reflects NNSA's previous decision made following preparation of the original *CMRR EIS* in 2003, NNSA has stated that this alternative would not be pursued.

239-14 NNSA agrees that both water and electrical usage would increase as addressed in the SEIS. Water usage estimates related to the proposed CMRR-NF are included in Chapter 4, Sections 4.2.3 and 4.3.3. As discussed in these sections, the proposed CMRR-NF is expected to use up to about 5 million gallons (19 million liters) of water per year to support construction of the CMRR-NF. If built, the CMRR-NF, combined with RLUOB, would use up to 16 million gallons (61 million liters) of water per year to support facility operations. When the CMRR-NF requirements are combined with other LANL site-wide projected water requirements, the projected requirements would remain within the LANL's water rights. Please refer to Section 2.10, Water Resources and Usage, of this CRD for more information. The CMRR project peak electrical demand estimate of 26 megawatts, when combined with the projected site wide peak demand, is estimated to use all of the available (surplus) capacity at the site. However, actual peak demand for LANL has been below projected levels in the past and well within site capacities.

239-15 Comment noted.

239-16 All comments received by NNSA, including late comments, were considered in developing the *Final CMRR-NF SEIS*.

Commentor No. 239 (cont'd): Greg Mello
Los Alamos Study Group

interviews with journalists seeking perspectives on the Las Conchas Fire. This fire has shut down LANL and the NNSA Los Alamos Site Office (LASO) for the past two days and has occasioned the evacuation of the Los Alamos townsite as a whole. We anticipate filing further comments later this week.

239-16 cont'd

These conclude our comments today. More will follow shortly, hopefully more or less concurrent with resumption of work on the SEIS as the fire abates.

I trust the present huge forest fire on the very borders of LANL will remind us all that significant natural hazards are present at this site, which was selected less for its suitability for manufacturing than for its remoteness and (former) beauty.

Sincerely,

Greg Mello, for the Los Alamos Study Group

Subject: OREPA comments on CMRR-NF S-EIS

Comments of the Oak Ridge Environmental Peace Alliance
on the National Nuclear Security Administration's
Supplement Environmental Impact Statement
for the Chemistry and Metallurgy Research Replacement – Nuclear Facility
at Los Alamos National Laboratory

27 June 2011

Since it was first proposed more than a decade ago, the momentum has built slowly and inexorably toward the construction of the Chemistry and Metallurgy Research Replacement-Nuclear Facility. In the intervening years, reality has rarely been allowed to intrude on the process, the CMRR has been built, and plans for the Nuclear Facility have entered the final stages before construction. Now, the insistence of the Defense Nuclear Facilities Safety Board that the National Nuclear Security Administration address concerns about the seismic stability of the CMRR-NF has created a speed-bump; the NNSA is compelled to prepare a Supplement to the original Environmental Impact Statement.

240-1

The CMRR-NF SEIS is an opportunity to examine not only the adequacy of the seismic design of the facility, but also to answer other questions that changing circumstances have posed since the 2003 CMRR-EIS. The original economic analysis supporting the CMRR is no longer valid as construction cost estimates have rocketed into the stratosphere and pressures on the US budget have forced draconian cuts in many programs; the "purpose and need" for the 80-warhead/year CMRR has been eclipsed by the START Treaty and the commitment of the president to pursue a world free of nuclear weapons; the disaster in Fukushima, Japan, compels a fundamental reassessment of the adequacy of current design assumptions; even the wildfires threatening Los Alamos National Lab at the moment (for the second time in little more than a decade) raise the most basic of questions—if the CMRR-NF is as crucial to national security as NNSA asserts, is it wise to build it in an area that faces evacuation and closure at the whim of nature?

240-2

The commitment of the United States to reduce its nuclear arsenal under the START Treaty, and the pursuit of further deep cuts, undermines the NNSA's assertion that the United States needs an 80-warhead/year production capacity for plutonium pits. An independent review by the JASON determines the current US stock of pits is reliable for at least 45 years, likely much longer. The only conceivable rationale for an 80-warhead/year capacity is a determination to

240-1 NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Regarding alternatives addressed in the *CMRR-NF SEIS*, as stated in Chapter 1, Section 1.5, NNSA does not intend to revisit decisions previously made on the level of operations at LANL, including the maintenance of CMR operational capabilities to support critical NNSA missions issued through the 2008 *Complex Transformation SPEIS* ROD. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 240 (cont'd): Ralph Hutchison, Coordinator Oak Ridge Environmental Peace Alliance

maintain full-scale capacity to produce new nuclear weapons. This would not only violate the spirit of the Nuclear Nonproliferation Treaty and send a perilously provocative message to the rest of the world, it would make a liar of our president and contradict the nuclear policy of the country. (It is not merely coincidence that the NNSA's proposed Uranium Processing Facility also has an 80-warhead/year throughput capacity.) **240-2 cont'd**

In the current economic climate, it defies reason to imagine the United States should invest more than $10 billion on an oversized CMRR-NF and UPF without a compelling case for the mission of the two facilities. A more reasonable alternative is to prepare a detailed assessment for upgrading current facilities in place—both at Los Alamos and Oak Ridge, the NNSA has the capacity to meet all mission requirements for stockpile surveillance and maintenance during the build-down to zero; existing facilities can be upgraded to meet environmental, safety and health requirements at a fraction of the cost of new facilities. **240-3**

The Supplemental EIS is not the appropriate vehicle for revisiting such fundamental questions—it requires a new EIS, one that takes as its starting point the reality of 2011 instead of the reality of 1998. Outside of the communities that stand to receive a direct financial benefit from the construction of the CMRR-NF and the UPF, no reasonable person believes the US can afford everything in 2011 it could in 1998; public support for the nuclear stockpile has also declined significantly; old war-horses and defense hawks—Henry Kissinger, George Shultz, William Perry and Sam Nunn have declared the US must take concrete steps toward the abolition of nuclear weapons; the disaster in Fukushima, now recognized as worse even than Chernobyl, has demonstrated the stakes are greater than we like to think—not only are the lives of workers and the public at risk, but the earth and the oceans are at risk—land around Fukushima is poisoned, no longer able to provide food and water to sustain life. **240-4**

How have the planners of the CMRR-NF accommodated this changing reality? They have pushed on as though nothing has changed, ignoring public comments that question the need for a new nuclear weapons production facility, maintaining the "need" for a grossly oversized facility, and bloating the budget with a straight face even as the public insists we can no longer act like teenagers who don't have to buy the gas that fuels their travels.

It is simply not true that there is no price to pay for this overreach. The CMRR-NF, underdesigned (like Fukushima) to withstand natural phenomena, may well fail. Its mere construction will undermine US efforts to constrain nuclear proliferation— **240-1 cont'd**

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

The CMR building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, including stockpile stewardship, maintenance, and production, but they are not tied to any specific pit production level. As indicated in Chapter 2, Section 2.4 of the CMRR-NF SEIS, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. But there are fundamental differences between the functioning of a nuclear reactor and activities at LANL. But, the type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 240 (cont'd): Ralph Hutchison, Coordinator Oak Ridge Environmental Peace Alliance

why should Iran listen to a word we say when we are brazenly ignoring our commitment under the 41 year-old nonproliferation treaty (reinforced by the 1996 opinion of the International Court of Justice that "there exists an obligation" on the part of nuclear weapons states to meet their 1970 NPT obligation)? Construction of the CMRR-NF will spend money that could be spent on environmental restoration of weapons communities, or new schools, housing, education, job training or a hundred other programs that are productive rather than destructive. ***240-2 cont'd*** ***240-5***

All this is to say the S-EIS fails to meet the NNSA's obligation to fully examine the impacts of its decision to proceed with a new bomb plant on "the whole of the human environment," and to consider all reasonable alternatives in developing its path forward. If the mission requirements of the Stockpile Stewardship program can be met at significantly less cost by upgrades to existing facilities, this alternative is not only reasonable, but should be compelling. ***240-4 cont'd***

Submitted by

Ralph Hutchison, coordinator
Oak Ridge Environmental Peace Alliance

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future.

240–2 A decision on the level of pit production is not within the scope of the CMRR-NF SEIS, as that decision (20 pits per year) was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

240-3 NNSA evaluated transforming the nuclear weapons complex into a smaller, more efficient enterprise in the *Final Complex Transformation Supplemental Programmatic Environmental Impact Statement* (DOE 2008b) in 2008. NNSA announced its decisions, which were based on a number of considerations including cost, in two Records of Decision published in the *Federal Register* on December 19, 2008 (73 FR 77644 and 77656). The first ROD addresses operations involving plutonium, uranium, and the assembly and disassembly of nuclear weapons, and includes the decision to construct and operate the CMRR-NF at LANL as a replacement for portions of the existing CMR Building. Continuing with the development of the CMRR Facility at LANL supports the analytical chemistry and materials characterization work needed to ensure that the United States' nuclear weapons stockpile can continue to be managed safely.

Upgrading existing facilities at LANL to accomplish the CMR mission was considered in the original *CMRR EIS* and the current *CMRR-NF SEIS*. The existing CMR Building operates at a reduced level because of seismic issues (for example, a fault trace underlies a portion of the existing CMR Building) and security concerns associated with the 60-year-old building. The renovations needed to upgrade the existing CMR Building would be extensive. This alternative was considered in the *CMRR-NF SEIS*, but was determined not to be a reasonable alternative for a number of technical and programmatic reasons.

Commentor No. 240 (cont'd): Ralph Hutchison, Coordinator Oak Ridge Environmental Peace Alliance

Chapter 2, Section 2.7 has been expanded to include additional information on why it is not technically feasible to upgrade the existing CMR Building.

240-4 NNSA has determined that the *CMRR-NF SEIS* meets NEPA's obligations to fully examine the impacts of the proposed action. Refer to Section 2.2, NEPA Process, of this CRD for more information.

240-5 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense, education, and housing) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Re: Insufficient, Incorrect and Misrepresented Seismic Information for Design Basis Earthquakes for Proposed CMRR-NF – Requirement for DOE to Retract DOE 2011 draft SEIS for CMRR-NF

ISSUE 1. There is a requirement for the Department of Energy (DOE) to retract the DOE 2011 draft Supplemental Environmental Impact Statement (DOE 2011 draft SEIS) for the proposed Chemistry and Metallurgy Research Replacement Nuclear Facility (CMRR-NF) at the Los Alamos National Laboratory (LANL) Technical Area-55 (TA-55) because of the inadequate and incomplete analysis provided based on the following facts: *241-1*

1.A. The DOE 2011 draft SEIS greatly underestimates the seismic hazard at the proposed CMRR-NF. This is because the LANL 2007 Probabilistic Seismic Hazard Analysis (PSHA) Report incorrectly calculated simultaneous earthquakes to produce a greater seismic hazard than multiple synchronous earthquakes. The greater ground motions from synchronous earthquakes produce a much greater seismic hazard than from simultaneous earthquakes. This issue is discussed beginning on page 22. *241-2*

1.B. The DOE 2011 draft SEIS misrepresents the LANL 2007 PSHA Report as "a comprehensive update to the LANL seismic hazards analysis." In reality, the LANL 2007 PSHA is inadequate and incomplete to provide the "design basis earthquakes" for the proposed CMRR-NF or for the assessment of the seismic hazard at the location of any existing or proposed critical facilities on the 40-square mile LANL Site. This issue is discussed throughout this report and specifically on page 26. *241-3*

- The DOE 2011 draft SEIS did not consider the increasing seismic hazard at the CMRR-NF that was described in the LANL 2007 PSHA Report and in Lewis et al., 2009 because the youthful Pajarito Fault System (PFS) is growing with an increase in danger for powerful ground-rupturing earthquakes at the location of the proposed CMRR- NF and at other critical locations at the LANL Site. This issue is discussed throughout this report and specifically in the section beginning on page 11 titled "Background for the neoseismic setting of the growing PFS." *241-4*

- The LANL 2007 PSHA did not have the necessary data to calculate the growing power of the neoseismic PFS. A comprehensive field investigation is necessary to acquire the data to evaluate the increasing seismic hazard (see Section 1 B beginning on page 26).

241-1 NNSA notes the commentor's concerns and technical comments regarding seismic issues related to the *Draft CMRR-NF SEIS*. In addition to all the following responses, refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information and to sections of the *Final CMRR-NF SEIS* where revisions were made to text in response to comments as noted in the specific response that follows each comment below.

As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazards analysis of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 preliminary seismic hazards analysis was not publicly available at the time the Draft CMRR-NF SEIS was prepared; however, it has subsequently been made available to the public and has been incorporated into the Final CMRR-NF SEIS.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*).

241-2 The PSHA (LANL 2007) included both simultaneous and synchronous earthquake rupture models in calculating design-basis ground motions for TA-55. Simultaneous ruptures were slightly favored in the model with a weight of 0.6 because this is the standard model used in PSHA practice, and displacement data for the Pajarito fault system suggest this type of rupture occurred in the past. However, synchronous ruptures were also included in the analysis with a weight of 0.4.

The PSHA did not calculate higher hazard for the simultaneous rupture, but the PSHA did estimate slightly higher maximum magnitudes for the simultaneous rupture model. Preferred maximum magnitudes for both simultaneous and synchronous ruptures were estimated using the same general approach, which has a sound technical basis, as discussed in the response to comment 241-15 (below).

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

- The DOE 2011 draft SEIS and the LANL 2007 PSHA do not provide the acquisition of site-specific data and subsequent analysis to ensure that ground motions for design basis earthquakes at the location of the proposed CMRR-NF are based on accurate scientific knowledge (see Issues 1.A and 1.B beginning on page 22).. **241-5**

- The DOE 2011 draft SEIS and the LANL 2007 PSHA do not provide a design for the proposed CMRR-NF that can be certified as safe for workers and the public, nor for the storage of six metric tons (13,228 pounds) of plutonium. **241-6**

- The DOE 2011 draft SEIS and the LANL 2007 PSHA incorrectly calculate simultaneous earthquakes to produce a greater seismic hazard than multiple surface-rupturing synchronous earthquakes. This important mistake is Issue 1.A on page 22. **241-2 cont'd**

- The DOE 2011 draft SEIS underestimate the seismic hazard at the proposed CMRR-NF because a low and incorrect value of 0.3g was used for the vertical peak ground acceleration (PGA). The value presented in the LANL 2007 PSHA for the vertical PGA was 100% greater at 0.6g. (see pages 32-33). **241-7**

- The DOE 2011 draft SEIS and the LANL 2007 PSHA do not provide the required knowledge of the seven key parameters (location, geometry, sense of slip, maximum magnitude, recurrence, and kappa) described in the LANL 2007 PSHA (see page 26). **241-8**

- The DOE 2011 draft SEIS and the LANL 2007 PSHA do not provide the "robust kinematic model" as described in the LANL report LA-UR-06-2158, entitled *"Fault interaction and along-strike variation in throw in the Pajarito fault system, Rio Grande rift, New Mexico"* in the June, 2009 issue of *Geosphere* by Lewis et al., 2009 (see page 28). **241-9**

1.C. The DOE 2011 draft SEIS misrepresents the lack of detailed field investigations for accurate knowledge of the distance from the proposed CMRR-NF to the Guaje Mountain Fault (GMF). The essential need for detailed field mapping for the southern boundary of the GMF is described in the LANL report by Lewis et al., 2009 (see page 33).

1.D. The LANL scientists disagree on the locations of active faults close to the proposed CMRR-NF. The DOE 2011 draft SEIS does not provide the evidence from field mapping of intense fractures in the Bandelier Tuff along Pajarito Road and in Mortandad Canyon in the LANL report LA-UR-04-8337 by Wohletz, 2004 that indicate active faults are located 800 ft west, 1600 ft north and 2500 ft east of the CMRR-NF (see page 34)..

ISSUE 2. There is a requirement to retract the DOE 2011 draft SEIS because of the following facts:

2.A. There was knowledge from 1992 of the weak layer of poorly welded volcanic tuff below the proposed CMRR-NF (LANL 1995 PSHA Report) and knowledge from outcrop mapping in 1990 (Vaniman and Wohletz,1990) that an active fault was located within 800 feet west of the location of the proposed CMRR-NF at LANL TA-55. The knowledge of the high seismic hazard because of the weak geologic layer and the close location of an active fault was not considered in the original design and cost estimates for the proposed CMRR-NF in the DOE 2003 Environmental Impact Statement. **241-10**

2.B. The DOE 2011 draft SEIS does not provide the final design and estimated cost of the proposed CMRR-NF at LANL TA-55. (see page 38). **241-11**

*Gilkeson and CCNS Comments about DOE 2011 draft SEIS for CMRR-NF * June 28, 2011 * Page 2*

It is somewhat counterintuitive that the slightly bigger simultaneous earthquake can result in a lower ground motion hazard, but the two synchronous earthquakes result in higher ground motions for nearby sites, particularly when the site is located between the rupturing fault segments, because energy is coming from two sources.

For both synchronous and simultaneous ruptures, maximum magnitudes were estimated in the PSHA based on surface rupture lengths and available displacement data, as appropriate to the particular rupture scenario. The main difference between the simultaneous and synchronous ruptures is that all of the moment (energy) is released in one event in the simultaneous model, versus the moment being split into two slightly smaller synchronous subevents on different segments of the Pajarito fault system, in the synchronous model. Thus, the slightly smaller magnitudes for the synchronous ruptures are a direct result of splitting the fault rupture into two portions for this model. In addition, the 10 percent difference in the total moment release between the two models primarily results from the different geometries used and the fact that displacements do not scale the same as surface rupture lengths in the empirical relations. Finally, as discussed in the response to comment 241-15 (below), maximum magnitudes for both synchronous and simultaneous ruptures were calculated correctly using techniques that meet SSHAC and DOE guidelines. The calculated results were checked and thoroughly peer reviewed.

As a result of comments received on the *Draft CMRR-NF SEIS*, Chapter 3, Section 3.5, Geology and Soils, of the *CMRR-NF SEIS* was revised to improve the discussion of faulting and seismic hazards at LANL. See the responses to comments 241-4 and 241-15 for more information on maximum magnitude earthquakes and seismic analogs.

241-3 Neither the LANL PSHA Peer Review Panel nor DNFSB found the 2007 and 2009 LANL PSHAs to be "inadequate and incomplete," as indicated in the comment. The purpose of the 2007 LANL PSHA update (LANL 2007), which was followed by another update in 2009 (LANL 2009), was to assess the earthquake ground-shaking hazard at LANL and based on that hazard, develop site-specific design-basis earthquake ground motions for several LANL sites, including the CMRR-NF. Both PSHAs were performed following the guidelines established by SSHAC (1997) for PSHAs, particularly with regard to the incorporation of uncertainty. DOE, NRC, and the Electric Power Research Institute (EPRI) sponsored the development of the SSHAC guidelines. The goal

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

2.C. The two designs being considered for the proposed CMRR-NF at LANL TA-55 are based on ground motions from simultaneous earthquakes and not on the larger ground motions from multiple ground-rupturing synchronous earthquakes, which have occurred. (see page 22). **241-2 cont'd**

2.D. The two designs being considered for the proposed CMRR-NF at LANL TA-55 do not consider that the GMF may extend south to a location close to the proposed facility. (see pages 33-34). **241-10 cont'd**

2.E. The DOE 2011 draft SEIS contains much incorrect information that misrepresents and downplays the large and poorly understood seismic hazard at the LANL location for the proposed CMRR-NF and at the location of other critical facilities at the LANL Site. This fact is presented throughout this report. **241-1 cont'd**

2.F. The DOE 2011 draft SEIS and the LANL 2007 PSHA place too much reliance on expert judgment couched in the "Poisson Assumption" instead of the acquisition of site-specific data and subsequent analysis to ensure that ground motions for design basis earthquakes are based on accurate scientific knowledge. The 2009 LANL report by Lewis et al., describes the need for a comprehensive kinematic study of the PFS in the geologic setting of LANL TA-55 and also over the entire region of the PFS. The knowledge of the kinematics of the entire fault system is necessary to assess the seismic hazard at the location of the proposed CMRR-NF and for other critical facilities at LANL TA-55 and at other LANL locations. This fact is presented throughout this report. **241-12**

ISSUE 3. We have not received written answers to the questions we presented to the DNFSB in April 2009 about the many deficiencies in the LANL 2007 PSHA Report. We have discovered many new deficiencies in our preparation of this report. The sparse data and conclusions based on the Poisson Assumption in the deficient LANL 2007 PSHA Report were used as the basis for the highly flawed and unacceptable seismic design of the proposed CMRR-NF at LANL TA-55. Our review of LANL and DOE reports show that the DOE 2011 draft SEIS and the LANL 2007 PSHA Report do not meet the DNFSB requirements described below on page 63 in the DNFSB TWENTY-FIRST ANNUAL REPORT TO CONGRESS: **241-3 cont'd**

> **4.10 Seismic Hazard Analysis**
> The Board pursued its ongoing review of DOE site characterization and seismic hazard studies across the DOE complex. The Board continues to stress to DOE the importance of adequate review, including independent peer review, of both the acquisition of site-specific data and subsequent analysis to ensure that ground motions for design basis earthquakes are based on accurate scientific knowledge.

There is a need for independent peer review of the data acquisition and subsequent analysis processes at LANL; especially because of the disagreement among LANL scientists on the locations of active faults at the proposed CMRR-NF.

Introduction. The DOE 2011 draft SEIS discusses the interaction with the Defense Nuclear Facilities Safety Board (DNFSB) for review of the two Options within the Modified Construction Alternative. They are the "Shallow" and "Deep" Options. The DNFSB is required by law to review the design and construction of defense nuclear facilities in order to ensure protection of workers and the general public. These facilities must be designed and constructed in a manner that supports safe and efficient

of any PSHA is to develop inputs that represent the composite distribution of the informed technical community. SSHAC recognizes that PSHA inputs can be subject to considerable uncertainties due to incomplete data and scientific understanding, as well as from process variability. In particular, when developing the inputs for PSHA, it is recognized that there is always incomplete knowledge because that is the nature of trying to characterize a complex natural process. However, by performing PSHAs in a manner consistent with the SSHAC guidelines, particularly with regards to the incorporation of the range of different interpretations and scientific uncertainties, the results should be robust and stable. Participatory peer review is also an essential element of a successful PSHA and in the case of the LANL PSHAs, an internationally recognized expert panel was engaged. In addition, DNFSB was involved in the 2007 and 2009 studies and provided commentary on the process.

241-4 In the 1995 PSHA, the peak horizontal ground acceleration (PGA) associated with an annual frequency of exceedance of 4×10^{-4} was reported to be about 0.33 *g* for TA-55. In the 2007 PSHA, the PGA at the same annual frequency of exceedance was reported to be 0.52 *g*. An increase in the slip rates on the Pajarito fault system, in addition to other factors, likely contributed to the increased seismic hazard. The 2007 and 2009 PSHAs represent the best knowledge to date on the seismic hazard at LANL, with the uncertainties appropriately incorporated. The results of this evaluation have been included in the design of the CMRR-NF and, as such, incorporated in the cost estimate.

The seismic hazard at LANL, defined as the likelihood of exceeding some level of ground motion in any given year, is considered static over the design lifetimes of critical facilities, including the planned CMRR Facility. What does change, however, is the estimate of the actual seismic hazard.

The change in seismic hazard at LANL is due in large part to new evidence in the activity of the Pajarito fault system, new ground motion prediction equations, and the consideration of temporal clustering in the Pajarito fault system. Considering this new evidence, the estimate of the horizontal PGA associated with an annual frequency of exceedance changed from about 0.33 *g* in 1995 to about 0.52 *g* in 2007. However, as new evidence becomes available, NNSA's estimate of the seismic hazard may change slightly, although the hazard estimates are expected to remain fairly stable. For example, the best estimate of the horizontal PGA associated with an annual frequency of exceedance of 4×10^{-4} decreased from

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

operations. These statutory requirements are described in the DNFSB Twenty-first Report to Congress as follows:

> **4. Nuclear Facilities Design and Infrastructure**
> The Board's strategic performance goal for this area is to ensure that new defense nuclear facilities and major modifications to existing facilities are designed and constructed in a manner providing adequate protection of the health and safety of the workers and the public. The Board is required by statute to review the design and construction of defense nuclear facilities, which must be designed and constructed in a manner that supports safe and efficient operations. The Board has made a concerted effort to ensure that its review of new design projects focuses on early recognition and resolution of safety issues, and that new DOE facilities are being constructed to acceptable industry codes and standards (p. 55).
>
> **4.6 Los Alamos National Laboratory Chemistry and Metallurgy Research Replacement Project.** The Board continued its review of the design of the Chemistry and Metallurgy Research Replacement Project. The Board continued to follow closely the seismic design of the project's nuclear facility. During the past year, the project has developed a detailed model to assess the complex structural behavior of this facility. The development of this model is a step forward that should ultimately lead to an adequate seismic design. The Board has worked with the project to ensure that seismic design inputs for this deeply embedded facility are properly defined [Emphasis Supplied]. The Board will review the seismic analysis calculations once they are complete (p.61).

241-3 cont'd

Discussion of Findings From Our Review. Our review of information presented in several reports by DOE and LANL has determined that DOE does not have the required knowledge of the seismic hazard at the location of the proposed CMRR-NF to meet the mission of the DNFSB *"to ensure that seismic design inputs for this deeply embedded facility are properly defined."* The information we present in this report shows that the DOE 2011 draft SEIS and the LANL 2007 PSHA Report have not acquired the site-specific data and subsequent analysis to ensure that ground motions for design basis earthquakes at the proposed CMRR-NF are based on accurate scientific knowledge.

The seismic hazard calculations that are being used for the design of the proposed CMRR-NF are not supported by accurate scientific knowledge on the seismic setting in the vicinity of the proposed nuclear facility. An important example is that Section 5 in the LANL 2007 PSHA Report incorrectly calculates that the seismic hazard is greater for simultaneous ruptures from a single earthquake than from multiple ruptures from synchronous earthquakes. However, Section 7 in the PSHA Report describes the reason the physical processes from synchronous surface-rupturing earthquakes produce a greater seismic hazard as follows on page 7-3:

> The hazard is higher for synchronous rupture because the ground motions will be larger from seismic slip involving two subevents versus more uniform slip in a single albeit larger simultaneous event.

In fact, Figure 7-53 in the LANL 2007 PSHA Report calculates that the Mean Peak Horizontal Acceleration Seismic Hazard at the proposed CMRR-NF is 75% higher for the synchronous ruptures of multiple earthquakes than for the simultaneous ruptures. The

241-2 cont'd

0.52 *g* in 2007 to 0.47 *g* in 2009 (LANL 2009). This change was in part due to the availability of a new and improved set of ground motion prediction equations.

241-5 The comment indicates that site-specific data on the geometry and sense of slip of the Pajarito fault system are inadequate because studies have not been conducted. Dozens of mapping studies of the Pajarito fault system have been conducted (for example, Gardner and House 1987; Wong et al. 1995; Carter and Gardner 1995; McCalpin 1997; Lavine et al. 2003), including state-of-the-art, high-precision mapping in the vicinity of LANL, as discussed in the responses to comments 241-10 and 241-17 (below). In addition, numerous paleoseismic trench investigations have been conducted at 17 sites over the past 20 years (for example, Gardner et al. 1990; Olig et al. 1996; Kelson et al. 1996; LANL 2007; McCalpin 1998, 1999, 2005). These studies clearly show that the Pajarito fault system is a series of normal slip faults that form the best studied fault system in the Rio Grande rift. Admittedly, some parts of the fault have not been as well studied as others; these tend to be those portions outside of LANL, especially where access issues are a problem (for example, the Santa Clara Canyon segment). Additional study of these areas would likely improve our understanding of the fault and could help reduce uncertainties in the inputs, but these studies are not a prerequisite to conducting a PSHA or determining design-basis ground motions at LANL. The uncertainties in regards to fault geometry, rupture behavior, and sense of slip on the Pajarito fault system were fully recognized and addressed in the range of inputs to the PSHA. A range of fault dips was used (±15°), a component of oblique slip was considered in calculating slip rates, and two rupture models and various rupture scenarios were included in the analysis to address remaining uncertainties in the geometry and sense of slip of the Pajarito fault system.

Finally, comments imply that there are critical data and analyses for the Pajarito fault system that were published in the Lewis et al. (2009) paper and were not included in the PSHA update (LANL 2007). Several of the coauthors of the Lewis et al. (2009) study, including the lead author, were also involved in developing the seismic source model of the Pajarito fault system for the 2007 PSHA update. All of the data and analyses for the Pajarito fault system published in the Lewis et al. (2009) study were included or considered in the PSHA update. The first draft of the Lewis et al. paper was written in 2007 and it took 2 years to get through the review and publication process.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

calculations in Figure 7-53 were for a return period of 2,500 years for multiple surface-rupturing earthquakes in the PFS. Figure 7-53 is on page 24 in this report.

Nevertheless, Section 5.1.2.4 in the LANL 2007 PSHA Report incorrectly estimated the maximum Magnitude **M** for earthquakes at the proposed CMRR NF to be approximately 10% smaller for synchronous earthquakes than for simultaneous earthquakes on page 5-18 as follows:

> We estimated maximum magnitudes for both subevents of the synchronous ruptures using the same approach and these are consistently slightly smaller than for the simultaneous ruptures (Table 5-11), but the sum of the moment for the two subevents is within 10% of the moment for the simultaneous rupture of the same rupture scenario.

- The incorrect low values for synchronous ruptures at the proposed CMRR-NF is a serious mistake that requires DOE to retract the DOE 2011 draft SEIS because the design basis earthquakes used for the design of the proposed CMRR-NF were not based on accurate knowledge of the seismic hazard.
- **An important fact is that the calculations of earthquake ground motions in the LANL 2007 PSHA Report and in the DOE 2011 draft SEIS are incorrect and can not ensure the proposed CMRR-NF will survive a design basis earthquake without significant structural damage with potential for release of the large inventory of six metric tons (13,228 pounds) of plutonium to be stored at the proposed nuclear facility.**

241-2 cont'd

The reports we reviewed show there is unacceptable poor knowledge of the locations of active faults close to the proposed CMRR-NF. We discovered that there is disagreement among the LANL scientists on the locations of the two key faults: 1). the Rendija Canyon Fault (RCF) and 2). the Guaje Mountain Fault (GMF). The ground based motions for the design of the proposed CMRR-NF were based on mapping of faults that show the RCF was located a lateral distance of 3000 feet west of the proposed CMRR-NF and an assumption that the termination of the GMF was 2 ½ miles north of the location of the proposed CMRR-NF.

However, a very important discovery in our review is that a LANL report (Lewis et al., 2009) shows that the LANL Seismic Hazards Geology Team have a concern that the southern boundary of the GMF may be close to the proposed CMRR-NF. The distant and probably incorrect location of the GMF used to assess the seismic hazard for the proposed CMRR-NF is displayed on Figure 5-4 in the LANL 2007 PSHA Report (Figure 1 below in this report) and on Figure 3-5 in the 2011 draft SEIS (Figure 2 below in this report). The pertinent excerpts from Lewis et al., 2009 follow:

> The southern extent and amount of displacement of the GMF are not well characterized (p. 257).
>
> **Conclusions. . .** The southern end of the GMF has not been mapped in detail, but its southern termination is likely to be similar to that of the Rendija Canyon fault (p. 268).

We discovered there is disagreement among the LANL scientists on the locations of active faults close to the proposed CMRR-NF. A 2004 LANL report by Kenneth H. Wohletz (LA-UR-04-8337) indicates that active faults are located 800 ft west, 1600 ft

241-10 cont'd

241-6 The draft SEIS and PSHA are not intended to be used as design-level documents. The PSHA represents the best knowledge to date on the seismic hazard at LANL, with the uncertainties appropriately incorporated. The results of the PSHA and site-specific geotechnical reports referenced in the geology discussions in Chapter 3, Section 3.5, and Chapter 4, Section 4.5 (Kleinfelder 2007a, 2007b, 2010a, 2010b), have been included in the preliminary design of the CMRR-NF, which, per DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets, will be finalized subsequent to completion of the SEIS.

241-7 Based on an apparent typographical error in the 2007 PSHA Executive Summary, the vertical peak ground acceleration for the CMRR-NF was incorrectly cited as 0.3 *g* instead of 0.6 *g* in the SEIS. This error has been corrected. This typographical error in the Executive Summary of the PSHA is not reflective of information presented elsewhere in the PSHA and was not used in the design of the proposed CMRR-NF; 0.6 *g* was used in the design.

241-8 While the PSHA study acknowledges that additional data in these areas would provide a more complete understanding of the seismic hazard at LANL, NNSA believes there was sufficient information to complete the study. The uncertainties associated with these areas have been adequately captured and bounded by the results of the study.

241-9 A kinematic fault interaction model for the Pajarito fault system, envisioned by Lewis et al. (2009), can be useful to test whether hypothetical linked rupture scenarios are physically plausible, and to understand possible coseismic static stress changes (normal and shear) to nearby fault segments, produced by slip on principal segments within the Pajarito fault system. The inputs to the kinematic fault interaction model require a significant number of assumptions, including the state of stress of all fault segments prior to the earthquake, and a model of the stress release of the earthquake. It is possible that, by incorporating the 2007 LANL PSHA fault scenarios and related uncertainties, insights could be developed on these fault interactions. This idea is a natural follow-on of the scenario model development of the LANL 2007 PSHA; however, none of the experts engaged in the LANL 2007 PSHA argued that that such a model would reduce uncertainties in the computed hazard. Additionally, the recommendations for future studies presented in Section 10 of the LANL 2007 PSHA do not specifically include development of a kinematic fault interaction model of the Pajarito fault system, although such a study could help refine seismic source

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

north and 2500 ft east of the proposed CMRR-NF based on zones of intense fractures in outcrops along Pajarito Road west and south of TA-55 and in Mortandad Canyon north of TA-55. The close location of active faults in Wohletz (2004) greatly increases the seismic hazard for the proposed CMRR-NF at LANL TA-55.

The fault locations that were used in the LANL 2007 PSHA Report and the DOE 2011 draft SEIS are displayed below on Figures 1 and 2. For comparison, the locations of the zones of intense fractures as evidence of active faults in the LANL report by Wohletz (2004) are displayed below on Figure 3. **241-10 cont'd**

The reports we reviewed describe an ongoing increase in the seismic activity in the network of many faults and associated folds in the very complex youthful PFS in the region of LANL. The reasons for the ongoing increase in seismic activity are described in an important report by scientists on the LANL Seismic Hazards Geology Team (Lewis et al., 2009). Our report includes much information from Lewis et al., 2009. The PFS may now cause powerful ground-rupturing earthquakes with a Richter magnitude possibly greater than 7.5. A much lower Richter magnitude of 7.27 was used to assess the seismic hazard at the proposed CMRR-NF. The potential for even more powerful ground-rupturing earthquakes will increase in the future along with a decrease in the time between the ground-rupturing earthquakes (LANL 2007 PSHA; Lewis et al., 2009). **241-13**

In Summary, the reports we reviewed show the assessment of the seismic hazard at the proposed CMRR-NF in the DOE 2011 draft SEIS and in the LANL 2007 PSHA is unacceptable because it does not meet the mandate of the DNFSB. In addition, the assessment does not recognize the large ground motions from synchronistic surface-ruptures of multiple earthquakes and is based on 1). incomplete knowledge of the locations of key faults, 2). incomplete knowledge of key parameters, 3). expert judgment of sparse data and assumed values for many key parameters instead of accurate scientific knowledge, and 4). the calculations of seismic hazard, as a result, are all incorrect and without technical basis.

parameters. It is nevertheless prudent to consider such interactive fault models (kinematic and dynamic) in the future for possible application to the Pajarito fault system.

See the response to comment 241-10 (below) with respect to location of nearest active faults.

241-10 Lewis et al. (2009) states that the southern extent and amount of displacement on the Guaje Mountain fault are not well constrained. Detailed geologic mapping of the area between the mapped southern termination of the Guaje Mountain fault and the northern side of Los Alamos Canyon has not yet been undertaken. That said, studies have completed detailed geologic mapping of LANL from Los Alamos Canyon to the north to Pajarito Canyon to the south, and from the Pajarito fault escarpment to the west to TA-46 to the east (for example, Gardner et al. 1999; Lavine et al. 2003). These studies carefully looked for the presence or absence of surface faulting associated with the Rendija Canyon and Guaje Mountain faults within LANL property. Geologic mapping at LANL to identify surface faulting is summarized by Animation 1 in Lewis et al. (2009).

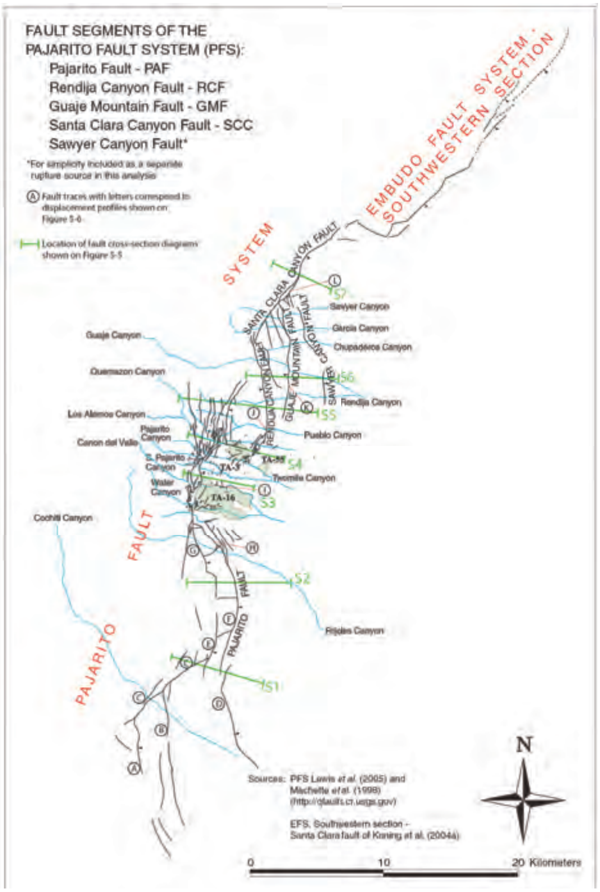
Lewis et al. (2009) shows that the Rendija Canyon fault trends southward to Los Alamos Canyon, then splays southwesterly into a broad zone of deformation in LANL's TA-3. Surface faulting from the Rendija Canyon fault was not identified due south of Los Alamos Canyon, including at TA-55. The surface expression of the Guaje Mountain fault is not visible south of Pueblo Canyon, including within LANL property.

Using the data presented in Lewis et al. (2009), as a comprehensive, peer-reviewed report and map of the Pajarito fault system, the following can be stated with respect to distances from the center of the proposed CMRR-NF:

- The nearest geologic structure with lateral continuity is associated with the Rendija Canyon fault, located approximately 3,300 feet (1,000 meters) west-northwest of the center of the proposed CMRR-NF. This geologic structure is located within the "horsetail" splay of the Rendija Canyon fault, in the western portion of TA-64, exhibits 3 feet (1 meter) of down-to-the-west displacement, and has a mapped length of approximately 100 feet (30 meters).
- The location at the north side of Los Alamos Canyon, where the Rendija Canyon fault changes its trend from southerly to southwesterly, is located

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Figure 1. Map of the Pajarito Fault System and Embudo Fault System – Southwestern Section in Northern New Mexico. **Source:** Figure 5-4 in LANL 2007 PSHA Report.



241-10 cont'd

approximately 6,250 feet (1,910 meters) north of the center of the proposed CMRR-NF.

- The mapped southern termination of the Guaje Mountain fault, north of Pueblo Canyon, within the Los Alamos townsite, is approximately 13,000 feet (4,000 meters) north-northeast of the center of the proposed CMRR-NF.

These data presented above, which are consistent with those provided in Chapter 3, Section 3.5, Geology and Soils, correspond to data used to calculate design-basis earthquake ground motions for the CMRR-NF.

It is important to note that precise locations of the strands of the Pajarito fault system, with respect to the CMRR-NF, are not needed for estimating the ground-shaking hazard at the site. The ground motion prediction models "flatten" out at short distances, less than a few kilometers for large magnitude earthquakes (magnitude > 6.5), so the hazard is not sensitive to uncertainties in faults locations of hundreds of meters. Precise fault locations are needed for assessing the hazard from surface fault rupture, but as further described below in the responses to comments 241-14 and 241-17, the potential for surface faulting at the CMRR-NF is considered very low.

The fault shown 800 feet (240 meters) west of the proposed CMRR-NF, by Vaniman and Wohletz (1990) and Wohletz (2004), is an inferred fault, meaning that the fault is interpreted to be present at some depth below the location at which it is mapped; however, no evidence for surface-rupturing faults was found along that mapped trace. The work of Vaniman and Wohletz helped spur the LANL Seismic Hazards Program to conduct detailed, site-specific studies around TA-55 (for example, Gardner et al. 1998, 1999, 2008) to determine the presence or absence of surface-rupturing faults, using detailed investigative methods. These methods included conventional geologic mapping at 1:1,200 scale, high-precision total station geologic mapping of Bandelier Tuff subunit contacts to identify faults, and large-scale trenching investigations at the site of the proposed CMRR-NF. Gardner et al. (1998, 1999) identified no faults or offsets along geologic contacts suggesting the presence of a fault at TA-55. Although Gardner et al. (2008) did observe some fractures and small faults confined within units of the tuff, they concluded that fractures and faults exposed at the proposed CMRR site formed very shortly after emplacement of the tuff, 1.26 million years ago, as a result of cooling and compaction, and the structures identified at the

241-10 cont'd

proposed CMRR-NF site pose no independent seismic surface rupture hazard. No evidence for active faulting was identified by Gardner et al. (1998, 1999, 2008) near the proposed CMRR-NF, as inferred by the early study of Vaniman and Wohletz (1990) and Wohletz (2004).

The work of Lewis et al. (2009) is a comprehensive, peer-reviewed report and map on the Pajarito fault system. Using data presented in Lewis et al. (2009), the nearest laterally continuous, surface-rupturing fault to the proposed CMRR-NF is located approximately 3,300 feet (1,000 meters) to the west-northwest, in the western portion of TA-64, with 3 feet (1 meter) of down-to-the-west displacement.

241-11 Per DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets, final or detailed design cannot be started until the NEPA document (Final SEIS in this case) has been completed, so as not to prejudice the outcome, or restrict or narrow the range of alternatives to be considered. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

241-12 The Poisson model or process that is used in the LANL 2007 PSHA report is a state-of-practice model for the recurrence of earthquakes in a PSHA (SSHAC 1997). As described by SSHAC (1997), this model is fundamental to earthquake hazard assessment and is found to correctly model the random occurrence of earthquakes, excluding dependent events such as foreshocks and aftershocks of large earthquakes. In some instances, time-dependent models may also be incorporated in a PSHA (SSHAC 997); however, the paleoseismic data (information on ancient seismic events) for the Pajarito fault system are not adequate at this time to develop a time-dependent model for the LANL PSHA. Future additional geologic investigations may reduce slip rate uncertainty, but are not likely to impact the application of the Poisson earthquake recurrence model.

241-13 There is no geologic or seismologic evidence that the rate of occurrence of surface-faulting earthquakes (magnitude > 6.5) is increasing along the Pajarito fault system. Paleoseismic investigations indicate that three large earthquakes ruptured along the Pajarito fault system during the Holocene period (past 11,000 years), suggesting that this recent activity may represent a temporal cluster in the long-term behavior of the fault (LANL 2007; Lewis et al. 2009). However, this possible pattern in the activity rate of the Pajarito fault system has

241-10 cont'd

been incorporated into the PSHA (LANL 2007). There is also no geologic or seismologic evidence that would suggest that the maximum potential earthquake along the Pajarito fault system is increasing in size. The maximum earthquake for the Pajarito fault system has been estimated for the PSHA based on observed fault displacements from past earthquakes and rupture dimensions of the potential fault rupture. Over the lifetime of the CMRR Facility and much longer, that is, thousands of years, the level of seismic hazard at the CMRR site is not expected to change because there are not expected to be changes in the maximum potential earthquake and activity rates of the Pajarito fault system. The general behavior of the Pajarito fault system is not expected to change over the time scale of the next century. Also see the response to Comment 241-15 (below) for more information on the maximum magnitude earthquake that could occur near LANL.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Background for the neoseismic setting of the growing PFS. LANL is located within the Rio Grande Rift, an intracontinental Neogene structural feature that dominates the seismotectonic setting of the LANL region. It is a continental rift system characterized by basin subsidence. A published paper by scientists on the LANL Seismic Hazards Geology Team (Lewis et al., 2009) describes the physical setting of the PFS as follows on page 252:

> The seismically active Pajarito fault system (PFS) of northern New Mexico, United States, is a complex zone of deformation made up of many laterally discontinuous faults and associated folds and fractures that interact in ways that have important implications for seismic hazards.
>
> The PFS [See Figures 1 and 2 on pages 7 and 8] is tectonically active, comprising the active bounding faults of the Española basin of the Rio Grande rift, and is the subject of ongoing paleoseismic investigations.
>
> Evidence for fault interaction, and the presence of prominent bends in the Pajarito fault system, imply structural control of paleoseismicity and neoseismicity and suggest the potential for stress concentrations and earthquake triggering in complex linking fault systems.
>
> Despite the importance of understanding the geometry of the fault system and potential linkage among faults for purposes of seismic hazard analysis, a robust kinematic model of the [Pajarito] fault system is lacking.

The above statement that "a robust kinematic model of the PFS is lacking" describes an important deficiency in the current knowledge of the seismic hazard at the location for the proposed CMRR-NF and at other critical facilities at the LANL Site. The need for a robust kinematic model of the PFS is described throughout this report. The LANL 2007 PSHA Report describes the lack of the data required for a kinematic model on page 28 in this report.

Figure 1 above on page 7 shows the network of fault segments in the PFS where the LANL Seismic Hazards Geology Team recommends a robust kinematic model. Our review shows that the knowledge required for a robust kinematic model does not exist. Accurate knowledge is necessary of 1), the locations of the discrete faults, 2). the geometry in the subsurface of the discrete faults, and 3). the potential linkage among the discrete faults for purposes of seismic hazard analysis at the location of the proposed CMRR-NF at LANL TA-55 and at other LANL critical facilities. The location of the proposed CMRR-NF is displayed above on Figure 2.

241-9 cont'd

Comparison of Figures 2 and 3 shows that there is disagreement between the LANL scientists on the location of active faults close to the proposed CMRR-NF at LANL TA-55. The fault locations of Figure 2 are based on mapping of fault displacements from field investigations by LANL scientists on the Seismic Hazards Geology Team. The fault locations on Figure 3 are based on mapping of intense zones of fracturing in field investigations by LANL scientist Kenneth H. Wohletz (Wohletz, 2004). Some of the intense zones of fracturing are associated with large displacement faults. However, faults are not identified in the upper part of the Bandelier Tuff for the intense zones of fracturing on Figure 3 that are located close to the proposed CMRR-NF. The issue of the zones of intense fracturing mapped by Wohletz is Issue 1.D on page 34.

241-14

241-14 Early seismic reflection studies by Dransfield and Gardner (1985) found evidence of the Rendija Canyon and Guaje Mountain faults below the ground surface, south of respective mapped surficial traces. This work prompted the creation of the LANL Seismic Hazards Program to investigate whether these deep faults were found at the ground surface. Geophysical studies using new investigative technologies have not been undertaken since the Dransfield and Gardner (1985) study. The fracture zones mapped by Vaniman and Wohletz (1990) and Wohletz (2004) triggered further detailed geologic studies in TA-55 to determine the presence or absence of surface-rupturing faults, using high-precision geologic mapping. No surface faults were found at TA-55, and the zones of higher-density fracturing were found not to correlate to regions of surface faulting (Reneau et al. 1995; Gardner et al. 1998, 1999, 2008). While Lewis et al. (2009) describe portions of the Pajarito fault system as buried faults, these descriptions refer to the trace of the main fault. Lewis et al. (2009) recognized that the main Pajarito fault is a discrete fault plane at depth, which manifests itself at the ground surface as a broad, diffuse zone of small faults. The surficial faults record paleoseismic activity on the Pajarito fault system, as described in several reports (for example, Reneau et al. 2002; Gardner et al. 2003; McCalpin 2005).

In the photograph of the fault scarp that formed during the 1954 Dixie Valley earthquake the vertical free face that offsets the alluvial fan surface is indeed a fresh surface rupture that occurred during the 1954 earthquake. The surface rupture occurred on a pre-existing late Quaternary fault (Caskey et al. 2004). This is not to say that new faults cannot form. However, they are much less likely than reactivation of pre-existing faults.

In addition, the comment asserts that fractures found in dacite in deep boreholes at the site of the proposed CMRR-NF "[are] an indication that active faults may be present in the dacite below the location of the proposed CMRR-NF." Deep geotechnical borings were drilled at TA-55 to characterize the complete geologic column down to the basement bedrock level. These borings were completed for geotechnical characterization of the subsurface and not for the purpose of identifying the presence or absence of deep faults. Three boring locations were initially identified; however, only two borings were deemed necessary to provide corroborative characterization of the deeper portions of the geologic column. The third boring was identified as an alternative and would have been drilled only if the currently planned site at TA-55 were deemed not viable. Borehole DSC-1B was drilled to a depth of 741 feet below ground surface (226 meters), while borehole DSC-2A reached a total depth of 550 feet below

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Comment by Gilkeson and Arends. *The zones of intense fractures mapped in Wohletz (2004) cannot be ignored. They may be evidence of active faults which are buried in the subsurface close to the location of the proposed CMRR-NF. The discussion in Lewis et al., 2009 is that active faults may be buried within the Bandelier Tuff and are propagating upward. The buried active faults may produce ground-surface ruptures during future earthquakes (see discussion on page 37 in this report).Also, see the discussion of the 1954 Dixie Valley – Fairview Peak Area Earthquakes on pages 15-16 and the picture of a fault scarp formed by the 1954 earthquake.*

The necessary field investigations to determine the presence of active faults buried in the Bandelier Tuff at the locations of the intense fractures close to the proposed location of the CMRR-NF have not been performed. Without the field investigations, DOE is required to assume that the locations of the intense fractures on Figure 3 identify the locations of active faults and calculate the seismic hazard at the proposed CMRR-NF accordingly.

241-14 cont'd

The youthful status of the PFS is because of the powerful volcanic activity in the vicinity of LANL beginning 16.5 million years ago to form the Jemez Mountains. The volcanic activity is described on page 3-20 in the DOE 2011 draft SEIS as follows:

> Volcanic activity began forming the Jemez Mountains approximately 16.5 million years ago and continued sporadically to the most recent eruptions that produced the El Cajete [Ash] Fall, about 50,000 to 60,000 years ago (Reneau et al. 1996). Future volcanic activity in the Jemez Mountains is likely, but recurrence intervals have not been firmly established (DOE 2003b). The unusually low amount of seismic activity in the Jemez Mountains has been reinterpreted to indicate that seismic signals of magma movement are partially absorbed deep in the subsurface, due to elevated temperatures and high heat flow (LANL 2004). The significance of this to LANL is that magma movement indicates that the Jemez Mountains continue to be a zone of potential volcanic activity.

The Pleistocene age Bandelier Tuff forms the near surface bedrock at LANL. The Bandelier Tuff consists of two members that were erupted as a series of ash flows during enormous caldera-forming volcanic events 1.61 million years ago (Otowi Member) and 1.25 million years ago (Tshirege Member). The volcanic eruptions that deposited the Bandelier Tuff are estimated at a total volume of rhyolitic ash flow tuffs of 650 cubic kilometers (dense rock equivalent) (*see* page 253 in Lewis et al., 2009). The large eruptions created the Pajarito Plateau. The young age and large areal extent of the Bandelier Tuff is an important factor for the youthful properties of the network of faults in the PFS.

Figure 4 below is cross-section D-E' on page 263 in Lewis et al., 2009 that illustrates the large number of faults in the PFS that have propagated upward through the Bandelier Tuff. The enlarged view of the western part of cross-section D-E' shows three parallel faults where two of the faults do not propogate upward through the Bandelier Tuff. The two faults have been inactive for the past 1.25 million years.

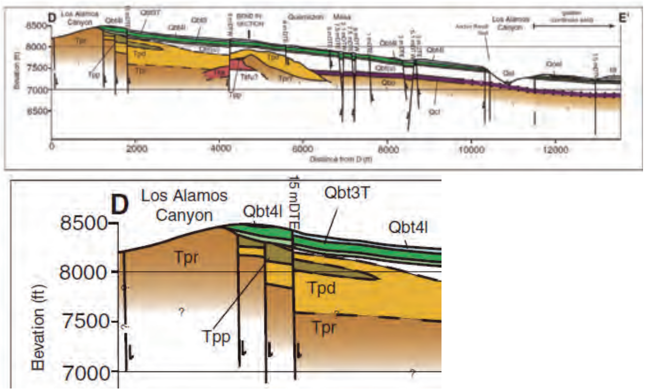
241-13 cont'd

ground surface (168 meters). The geologic formations that are most relevant to TA-55 are those that would influence seismic ground response and foundation performance. Seismic ground response, as determined by these two deep seismic characterization borings, is affected by the relatively high seismic wave velocity of the basement rocks, consisting of the Cerros del Rio basalt and Tschicoma Formation dacite (both of which are relatively hard volcanic rocks), and the much lower seismic wave velocities of the overlying, softer Bandelier Tuff. From data provided by Kleinfelder (2007a), DSC-1B was the only deep borehole to penetrate into the Tschicoma Formation dacite. In addition, the presence of the relatively soft Qbt3L between two stiffer units, Qbt3U and Qbt2, is important with respect to the seismic ground response of the site (Kleinfelder 2007a).

Kleinfelder (2007a) states that the sampled portion of the Cerros del Rio basalt and Tschicoma Formation dacite was highly fractured and vesicular. Fracturing and vesiculation are common features of chilled upper portions of relatively harder volcanic flows (Fink and Anderson 2000), and such features are expected in the upper 40 to 50 feet (12 to 15 meters) of a dacite flow that is hundreds of feet thick, such as the Tschicoma Formation dacite below the proposed CMRR-NF.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Figure 4. West to East Cross-Section D-E' on page 263 in Lewis et al., 2009.



Note. The vertical arrows show the side of the discrete faults where displacement is downward. 15mDTE means the vertical displacement is 15 meters (49 feet) downward to the east.

An additional important factor is that the youthful PFS is currently at a growth stage where the interaction between the primary Pajarito Fault (PF or PAF) and the subsidiary Rendija Canyon Fault (RCF) and Guaje Mountain Fault (GMF) often results in multiple ground-breaking ruptures from two of the three faults (Lewis et al., 2009). The powerful multiple surface-rupturing earthquakes are described on page 3-25 in the DOE 2011 draft SEIS as follows:

> New paleoseismic data argue for three Holocene (past 11,000 years) surface-rupturing earthquakes, including an earthquake on the Pajarito Fault, approximately 1,400 years ago; an earthquake on the Pajarito Fault approximately 5,000 to 6,000 years ago, which is consistent with an event during the same general time frame on the Guaje Mountain Fault; and a third earthquake on both the Pajarito and the Rendija Canyon Faults, approximately 9,000 years ago. This paleoseismic event chronology demonstrates that the Pajarito Fault often ruptures alone, but sometimes ruptures either with the Rendija Canyon Fault or Guaje Mountain Fault. When this occurs, the resultant seismic moment and, therefore, the earthquake magnitude are larger than when the main Pajarito Fault ruptures alone. Given the evidence for youthful movement on the Pajarito Fault system, future ruptures should be expected. <u>This fault system is capable of producing earthquakes up to Richter magnitude 6.5 to 7.0 (LANL 2007a; Lewis et al., 2009)</u> [Emphasis Supplied].

241-13 cont'd

Comment by Gilkeson and Arends. *The above statement in the DOE 2011 draft SEIS that* "This fault system is capable of producing earthquakes up to Richter magnitude 6.5 to 7.0 (LANL 2007a; Lewis et al., 2009)" *is incorrect because the historic earthquakes on*

241-15

241-15 NNSA has revised Chapter 3, Section 3.5, Geology and Soils, which incorrectly stated the maximum earthquake of the Pajarito fault system as Richter magnitude 6.5 to 7.0. These incorrect maximum earthquake magnitudes stated in the draft SEIS are not reflective of information presented in the PSHA and were not used in the design-basis earthquakes for the proposed CMRR-NF.

Richter magnitudes (M_L) can differ from moment magnitudes (M_w), especially at large magnitudes. Therefore, to make a direct "apples to apples" comparison, the magnitude values should be compared using the same scale. All magnitudes used in the LANL PSHA were in terms of M_w, not M_L, based on the latest geologic data, including those published in Lewis et al. (2009) and documented in the PSHA update (LANL 2007), expected maximum magnitudes for the various rupture scenarios of the Pajarito fault system range from M_w 6.5 to 7.3, and these were input as preferred values with a weight of 0.6 in the analysis. The expected magnitudes were calculated using well-established and widely accepted empirical relations (Wells and Coppersmith 1994). Results were checked and peer-reviewed by an internationally recognized Participatory Peer Review Panel during the PSHA update (LANL 2007). Additional uncertainties of ±0.3 moment magnitude (with a weight of 0.2 each) were included so that the M_w inputs into the PSHA were as large as 7.6, depending on the rupture scenario (LANL 2007). The estimated size of the 1959 Hebgen Lake earthquake is M_w 7.3, whereas the 1983 Borah Peak earthquake was smaller, at M_w 6.8 (Doser and Smith 1985). Thus, the range of maximum magnitudes used to calculate design-basis ground motions for the CMRR-NF incorporates the magnitudes of historic earthquakes that might be considered analogues for rupture of the Pajarito fault system.

The statement in the 1997 SSHAC guidelines "in cases where the maximum historical earthquake has not been assessed to be equivalent to the maximum possible earthquake, past practice has included adding an increment of one-half magnitude unit or one intensity unit to the maximum historical earthquake" is for area sources, not active faults. This statement also refers to "past practice." Current practice for estimating the maximum magnitude for an area source is based on evaluating the maximum earthquake in analogue seismotectonic regions. For an active fault, SSHAC (1997) describes two general approaches: constraints provided by historical seismicity and estimates of maximum rupture dimensions. Given the lack of significant historical seismicity on the Pajarito fault system, the latter approach has been used to estimate the maximum earthquake in addition to fault displacements from paleoseismic investigations.

fault analogs that are described in LANL 2007a (the LANL 2007 PSHA Report) and in Lewis et al., 2009 show that the PFS is now capable of producing ground-rupturing earthquakes up to Richter magnitude 7.5. The LANL 2007 PSHA Report and Lewis et al., 2009 describe the young and growing PFS may be capable of producing even more powerful ground-rupturing earthquakes during the operating life of the proposed CMRR-NF. The knowledge of the PFS that was presented in the LANL 2007 PSHA and in the DOE 2011 draft SEIS is not adequate to accurately calculate the Richter magnitude power of the PFS at this time or the increase in the Richter magnitude power that may occur over the operating life of the proposed CMRR-NF.

In fact, the historical information on earthquake analogs presented in Lewis et al., 2009 and in the LANL 2007 PSHA Report describe the 50-km (30 mile) long Pajarito Fault System (PFS) at LANL is now capable of producing ground-rupturing earthquakes up to a 7.5 Richter magnitude. The two reports cite analog examples for the PFS, including the 7.3 – 7.5 Richter magnitude 1959 Hebgen earthquake in Montana; the 7.3 Richter magnitude 1983 Borah Peak earthquake in Idaho; and the pair of 7.1 and 6.8 Richter magnitude earthquakes in the Dixie Valley – Fairview Peak Area of Nevada. We detail these 6.8 to 7.5 Richter magnitude earthquakes below:

1959 Hebgen Lake Earthquake 7.3 – 7.5 Richter Magnitude. The LANL 2007 PSHA Report on page 5-17 describes the collapsed Yellowstone caldera and the network of faults that are responsible for the 7.3 – 7.5 Richter magnitude Hebgen Lake earthquake as an analog for the Valles Caldera and PFS as follows:

241-15 cont'd

> Another example of a synchronous rupture that is a possible analog for the PFS is the **M** 7.3 1959 Hebgen Lake earthquake [Emphasis Supplied], which involved multiple discrete faults and two subevents: a mb 6.3 event followed 5 seconds later by a mb 7.0 event (Doser, 1985). This is a good possible analog for the PFS because 1) it occurred in a region adjacent to a Quaternary caldera, as does the PFS; 2) it clearly involved multiple overlapping but distinct faults (rupture segments) with complex geometries, including opposing dips like the PFS; 3) it was dominantly extensional; and, 4) it had large displacements [23 feet], as is suggested for the PFS [Emphasis Supplied].

The 7.3 – 7.5 Richter magnitude of the Hebgen Lake earthquake is described as follows in the U.S. Geological Survey Fact Sheet 2005-3024 issued in 2005:

> The Hebgen earthquake of August 17, 1959 occurred at 11:37 p.m. Mountain Standard Time. The earthquake had a Richter magnitude of 7.3 – 7.5.

The 23 ft maximum displacement on fault scarps from the 1959 Hebgen Lake earthquake was described in the U.S Geological Survey Earthquake Information Bulletin, Volume 6, Number 4, July - August, 1974, by Carl A. von Hake:

> Major new fault scarps were formed along existing normal faults northeast of Hebgen Lake. A maximum vertical displacement of 7 meters (23 feet) was observed near Red Canyon Creek.

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

1983 Borah Peak, Idaho Earthquake – 7.3 Richter Magnitude. The LANL 2009 report by Lewis et al., describes the 1983 Borah Peak earthquake in Idaho as an analog for the PFS at LANL as follows on page 267:

> A possible analog for the convex bend near St. Peter's Dome on the Pajarito Fault is the Borah Peak horst in Idaho, which is at the convex intersection of two normal fault segments, one of which (the Lost River fault) ruptured in the Borah Peak earthquake (Susong et al., 1990). The intersection zone at the Borah Peak horst is thought to have influenced earthquake nucleation and arrest for millions of years (Susong et al., 1990).

The 7.3 Richter magnitude of the Borah Peak earthquake was described in a paper in a refereed journal – *"The Borah Peak, Idaho Earthquake of October 28, 1983 – Summary"* by Lawrence D. Reavely, in *Earthquake Spectra* 2, pp. 1-9 (1985):

> The Borah Peak, Idaho earthquake of October 28, 1983 occurred at 8:07 a.m. Mountain Daylight Time. This earthquake which had a Richter magnitude of 7.3, was the largest earthquake to occur in recorded history (since 1872).

The 7.3 Richter magnitude of the Borah Peak earthquake was also described in a paper in the peer reviewed *Bulletin of the Seismological Society of America*; June 1987; v. 77; no. 3; p. 739-770 – *"Surface faulting accompanying the Borah Peak earthquake and segmentation of the lost river fault, central Idaho"* by Anthony J. Crone, Michael N. Machette, Manuel G. Bonilla, James J. Lienkaemper, Kenneth L. Pierce, William E. Scott and Robert C. Bucknam (Crone et al., 1987). The excerpt below is from the abstract of Crone et al., (1987);

> On the morning of 28 October 1983, the M_s 7.3 Borah Peak earthquake struck central Idaho and formed a Y-shaped zone of surface faults that is divided into a southern, a western, and a northern section. The total length of the surface faults is 36.4 ± 3.1 km, and the maximum net throw is 2.5 to 2.7 m. The near-surface net slip direction, determined from the rakes of striations in colluvium, averaged 0.17 m of sinistral slip for 1.00 m of dip slip.

1954 Dixie Valley - Fairview Peak Area, Nevada Earthquakes – 7.2 and 6.8 Richter Magnitude. The LANL 2007 PSHA Report on page 5-17 describes the two earthquakes in the Dixie Valley – Fairview Peak Area as follows:

> - We found it surprising that the 16 December 1954 Dixie-Valley Fairview Peak rupture was not a synchronous rupture because the two events (MS 7.2 and MS 6.8) were too far apart in time (four minutes) for strong ground motions to constructively interfere at local sites. So this sequence would be considered to have involved a triggered, but separate, second event.

The following description of the Dixie Valley – Fair View Peaks Earthquakes is abridged from *Seismicity of the United States, 1568-1989 (Revised)*, by Carl W. Stover and Jerry L. Coffman, U.S. Geological Survey Professional Paper 1527, 1993:

> - **Note:** Because damage from the two earthquakes cannot be separated, they are treated as one event. . . The population was sparse in the epicentral region of this earthquake, and few man-made structures existed. Damage to

241-15 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> structures, therefore, was minor despite the geologic and seismographic evidence of a major earthquake. . .The earthquake was accompanied by offsets along many faults in the four main zones of a north-trending belt 96 kilometers long by 32 kilometers wide (58 miles long by 19 miles wide). Minor geologic effects included changes in the flow of springs and wells, formation of craters and water fountains, landslips and landslides, mudflows, and rockfalls.
> - The fault displacements mainly were along normal faults in the following areas: (1) west of Dixie Valley, (2) southeast of Dixie Valley, (3) east of Fairview Peak, and (4) east of Stingaree Valley. The maximum strike-slip component was 3.6 meters (12 feet) of right-lateral movement at Fairview Peak, and the maximum vertical-slip component was 3.6 meters (12 feet) at Bell Flat.

241-15 cont'd

Below is a photograph of the fault scarp from the December 16, 1954 Dixie Valley earthquake. *Cover Photo* "Earthquakes in Nevada and How to Survive Them" – Nevada Bureau of Mines and Geology Special Publication E-16, Seventh Edition, January 2010

***Comment by Gilkeson and Arends.** The above photo shows a cabin sitting at an angle on the down-thrown side of the new fault scarp. The outhouse for the cabin is toppled over and is located west of the cabin on top of the fault scarp near the edge of the scarp. The man studying the fault scarp at a location between the outhouse and the cabin indicates the vertical displacement on the fault is approximately eight feet. The above photo provides evidence that this is a new fault scarp because it is common sense that the cabin was built on flat land and a previous fault scarp was not present between the path from the cabin to the outhouse. The above photo is evidence that earthquakes may produce new faults across landscapes where there is **no** evidence of historic fault scarps. The vertical fault scarp in the above picture shows that the bedrock is very hard and resistant to erosion. Therefore, there would have been a remnant of an earlier fault scarp on the landscape and between the cabin and outhouse but it is common sense that the outhouse was on a flat path from the cabin.*

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The maximum Richter Magnitude of 7.5 for the analogous 1959 Hebgen Lake Earthquake was not considered in the design basis earthquakes for the proposed CMRR-NF. The identification of historical earthquakes that are analogs to the PFS is important for knowledge of the potential magnitude of ground-rupturing earthquakes that may occur at LANL. The incorrect statement on page 3-25 in the DOE 2011 draft SEIS that "This fault system is capable of producing earthquakes up to Richter magnitude 6.5 to 7.0" is not a small matter. This is because the recent historical earthquakes on fault networks that are analogs to the PFS have produced powerful ground-rupturing earthquakes up to a Richter magnitude of 7.5.

An example of an historic earthquake that is an analog to the PFS is the discussion above on page 14 of the synchronous ruptures from the1959 7.5 Richter magnitude Hebgen Lake Earthquake. ***A 7.5 Richter magnitude earthquake is about 31 times more powerful than a 6.5 magnitude earthquake.*** The energy of earthquakes is explained in a 1989 United States Geological Survey Earthquake Hazards Program publication http://earthquake.usgs.gov/learn/topics/richter.php as follows:

> The Richter magnitude of an earthquake is determined from the logarithm of the amplitude of waves recorded by seismographs. Adjustments are included for the variation in the distance between the various seismographs and the epicenter of the earthquakes. On the Richter Scale, magnitude is expressed in whole numbers and decimal fractions. For example, a magnitude 5.3 might be computed for a moderate earthquake, and a strong earthquake might be rated as magnitude 6.3. Because of the logarithmic basis of the scale, each whole number increase in magnitude represents a tenfold increase in measured amplitude; as an estimate of energy, each whole number step in the magnitude scale corresponds to the release of about 31 times more energy than the amount associated with the preceding whole number value [Emphasis Supplied].
>
> Earthquakes with magnitude of about 2.0 or less are usually called microearthquakes; they are not commonly felt by people and are generally recorded only on local seismographs. Events with magnitudes of about 4.5 or greater - there are several thousand such shocks annually - are strong enough to be recorded by sensitive seismographs all over the world. Great earthquakes, such as the 1964 Good Friday earthquake in Alaska, have magnitudes of 8.0 or higher. On the average, one earthquake of such size occurs somewhere in the world each year. The Richter Scale has no upper limit. Recently, another scale called the moment magnitude scale has been devised for more precise study of great earthquakes.

241-15 cont'd

The 2007 LANL PSHA Report and the LANL report by Lewis et al., (2009) describe the growing power and increasing seismic hazard for the youthful PFS. The 2007 LANL PSHA Report describes an important comparison between the data presented in the 1995 and 2007 PSHA Reports as evidence of the large increase in the power of the youthful PFS and an increase in the seismic hazard from large ground-rupturing earthquakes is expected to continue during the operating life of the proposed CMRR-NF at LANL TA-55. From page 9-6 in the LANL 2007 PSHA Report:

> In the 1995 study, recurrence intervals were not used for most of the 26 rupture scenarios due to the lack of recurrence interval data. The weighted-mean recurrence interval was 32,000 years when they were used and the weighted-mean slip rate for most of the rupture scenarios was 0.182 mm/yr.

241-13 cont'd

Response side of this page intentionally left blank.

> In comparison, the weighted-mean recurrence for Rupture Model C, the strongly favored (weighted 0.85) model in this study is 8,400 years and the weighted-mean slip rate is 0.211 mm/yr (Figure 5-8). Sensitivity studies show that these higher rates have a significant impact on the hazard (Section 7.2.2) and so we know that increased rates on the PFS likely contributed measurably to the increase in hazard for this study, but we cannot specify exactly how much [Emphasis Supplied].

***Comment by Gilkeson and Arends**. The authors of the LANL 2007 PSHA Report acknowledge that the growing power of the PFS has caused an increase in the seismic hazard at LANL and the seismic hazard on the youthful PFS is continuing to increase into the future. Very importantly, the authors acknowledge they have not performed the field investigations to collect the data necessary to calculate the increase in the seismic hazard from the ongoing increase in slippage rates from the ongoing formation of unpredictable linkages between the discrete fault segments in the neoseismic PFS. The dynamics of the youthful and growing PFS are described as follows in the 2009 report by the LANL Seismic Hazards Geology Team (Lewis et al., 2009):*

> The seismically active Pajarito fault system (PFS) of northern New Mexico, United States, is a complex zone of deformation made up of many laterally discontinuous faults and associated folds and fractures that interact in ways that have important implications for seismic hazards (p. 252).
>
> Fault interaction has significant implications for seismic hazards. The probability of an earthquake rupture propagating from one fault to another increases with the degree of stress interaction between the faults (p. 265).
>
> Despite the importance of understanding the geometry of the fault system and potential linkage among faults for purposes of seismic hazard analysis, a robust kinematic model of the [Pajarito] fault system is lacking (p. 252).

***Comment by Gilkeson and Arends.** The DOE proposal to construct the $6 Billion CMRR-NF at LANL is unacceptable because the seismic hazard is not known but has been underestimated and incorrectly calculated at the present time. In addition, the LANL 2007 PSHA Report and Lewis et al., (2009) describe the PFS as increasing in power for higher magnitude earthquakes into the future at a rate that can not be calculated with current knowledge.*

Further, the design basis earthquakes for the proposed CMRR-NF is based on the incorrect calculations in the deficient 2007 PSHA; not for the increasing and accelerating seismic hazard in the future to 2073, the end of the operating life of the proposed CMRR-NF. DOE is required to retract the DOE 2011 draft SEIS and not submit a new draft SEIS until the comprehensive field investigations have been performed to provide accurate knowledge of the seismic hazard. After all, the DOE 2011 draft SEIS misrepresented the LANL 2007 PSHA Report as a "comprehensive update to the LANL seismic hazards analysis" (See discussion beginning on page 26 in this report).

From page 5-20 in the LANL 2007 PSHA Report:

> Interestingly, the scaling factor needed to adjust segment slip rates in order to achieve preferred target recurrence intervals is 2.11 (see footnote 6 of Table 5-14), which is essentially the same factor between the long term slip rate (0.1 mm/yr) and the weighted mean for the slip rate distribution derived from the RGR [Rio Grande Rift] analysis (cf., slip rate

241-13 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> branch for Rupture Model C on Figure 5-8). Thus, the moment balancing approach is implying that the late Quaternary rates are about twice as fast as the long-term Quaternary rates (and the Holocene rates are about 8 to 10 times faster than the Quaternary rates). We already knew this from the paleoseismic data, but it is reassuring to see that our moment-balanced rates for Rupture Model B are consistent with our slip rates assigned to Rupture Model C [Emphasis Supplied].

Comment by Gilkeson and Arends. *Multiple lines of evidence confirm that the slip rates on the youthful PFS are increasing by a large amount and this proves the ground-rupturing power of future earthquakes is increasing by a large amount. The acceleration in the slip rates is direct evidence of a large and continuing increase into the future in the danger of the PFS for large ground-rupturing earthquakes with a Richter magnitude greater than 7.5 as described below on page ES-4 in the LANL 2007 PSHA Report:*

241-13 cont'd

> The new [2007] PSHA shows that the horizontal surface PGA [peak ground acceleration] values are about 0.5 g at a return period of 2,500 years. The 1995 horizontal PGA values for a return period of 2,500 years are about 0.33 g. The estimated hazard has increased significantly (including other spectral values) from the 1995 study due to the increased ground motions from the site-specific stochastic attenuation relationships and increase in the activity rate of the PFS. The site response effects as modeled in this study with the newer site geotechnical data appears to amplify ground motions more than in the 1995 analysis [Emphasis Supplied]. Other factors could be the increased epistemic uncertainty incorporated into the empirical attenuation relationships and in the characterization of the PFS.

Comment by Gilkeson and Arends. *The increase in horizontal surface peak ground acceleration (PGA) values from 0.3g to 0.5g from the 1995 PSHA to the 2007 PSHA is an increase of greater than 50% for the active PFS at the location of LANL TA-55 over a short period of time. A very important issue is that the actual value of the horizontal PGA for the proposed CMRR-NF is much greater than 0.5g because the calculations in the 2007 PSHA Report are incorrect for the large ground motions from multiple ground-rupturing synchronous earthquakes. The design of the proposed CMRR-NF was based on the much smaller ground motions from simultaneous ruptures from a single earthquake.* ***This issue is discussed on page 22 in this report.***

241-2 cont'd

The poor knowledge of the seismic hazard in the DOE 2011 draft SEIS and in the LANL 2007 PSHA Report increases the risk for the storage of six metric tons (13,230 pounds) of plutonium at LANL in the proposed CMRR-NF at TA-55 and also increases risk for continuing operations with special nuclear materials at existing facilities at the LANL site.

From page 9-6 in the LANL 2007 PSHA Report:

> In Table 9-4 [Note: Table 9-4 is below], we compare the PGAs from this study with the values from the 1995 study (Wong *et al.*, 1995) for the return periods of 1000, 2500, and 10,000 years. As shown in the table, the estimated probabilistic hazard has increased significantly (including other spectral values). The percentage increase gets larger with return period due to differences in slope of the hazard curves (Figure 9-348). For example, at a 1,000-year return period, the increase from the 1995 PGA values to the current study is about 29%. At 10,000 years, the

241-4 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

increase is 84% (Table 9-4). This increase may be due to a number of factors including the increase in the activity rate of the PFS [Emphasis Supplied].

Table 9-4
Comparison of Probabilistic Peak Horizontal Accelerations in g's From 1995 and Current Studies

Return Period	1,000 Years		2500 Years		10,000 Years	
Source	1995	This Study	1995	This Study	1995	This Study
CMRR	—	0.27	—	0.52	—	1.03
TA-03	0.21	0.27	0.33	0.52	0.56	1.03
TA-16	0.21	0.25	0.32	0.47	0.53	0.93
TA-55	0.22	0.27	0.33	0.52	0.56	1.03

Another important issue is that the design of the proposed CMRR-NF was based on the Peak Horizontal Ground Acceleration (PGA) values for a return period of 2500 years. However, Table 9-4 shows a 98% increase of the PGA from 0.52g to 1.03g at the location of the proposed CMRR-NF for a return period of 10,000 years. A 10,000 year return period earthquake may occur during the operating life of the proposed CMRR-NF.

In addition, all of the PGA values in Table 9-4 are on "shaky ground" without technical basis because of the overall poor scientific knowledge of the seismic hazard at LANL. The PGA values in Table 9-4 are incorrect and too low for the synchronous multiple-segment ruptures of the PFS and also underestimate and cannot calculate the future increase in the PGAs as demonstrated by the following statement in the LANL 2007 PSHA on page 9-6 about the increased rates of slip over time for the PFS:

> Sensitivity studies show that these higher [slip and recurrence] rates have a significant impact on the hazard (Section 7.2.2) and so we know that increased [slip and recurrence] rates on the PFS likely contributed measurably to the increase in hazard for this study, but we cannot specify exactly how much.

241-4 cont'd

Comment by Gilkeson and Arends. *The above statement shows that the PGA values in the LANL 2007 PSHA Report are not accurate for the ongoing increase in slip rates. The poor knowledge of the increase in the slip rates that will occur into the future will increase the seismic hazard at the location of the proposed CMRR-NF by a large but unknown amount. Another important factor is the poor knowledge of the locations and geometry of faults that produce ground motions at the location of the proposed CMRR-NF. The uncertainty about the location of faults and the increasing slip rates was not considered in the escalating cost for the proposed CMRR-NF from an original estimate of $350 Million to a current estimate approaching $6 Billion. Constructing the proposed $6 Billion CMRR-NF without accurate knowledge of the seismic hazard at the present time nor over the 50-year life of the proposed nuclear facility is unacceptable.*

241-13 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The DOE used the Poisson Assumption to determine the seismic hazard at the proposed CMRR-NF at LANL TA-55 instead of performing the necessary field investigations to acquire accurate knowledge for assessment of the seismic hazard. Unfortunately, the great uncertainty in the assessment of the seismic hazard at the LANL Site is an accepted practice as shown by the following statement on page 2-1 in the 2007 LANL PSHA Report:

> **2.1 METHODOLOGY**
> The seismic hazard approach used in this study follows a methodology developed principally by Cornell (1968). The production of earthquakes by an identified fault or other seismic source zone is assumed to be a Poisson process. The Poisson assumption is widely used and is reasonable in regions where data are sparse and only provide an estimate of average recurrence rate (Cornell, 1968).

241-12 cont'd

The reliance on expert judgment to determine the seismic hazard at LANL because the applicable data were sparse is described on page 5-1 in the LANL 2007 PSHA Report as follows:

> <u>Specific earthquake parameters needed for the seismic source characterization are fault location, geometry, sense of slip, Mmax [maximum magnitude], and earthquake recurrence rate</u> [Emphasis Supplied]. Uncertainties in these seismic source parameters are sometimes large and include (1) those arising from lack of knowledge (epistemic uncertainties) and (2) those due to inherent variability in the earthquake process (aleatory uncertainties). The second type of uncertainty was handled by integration in the hazard calculations (Section 2); the first [i.e., the epistemic uncertainty], by use of a logic-tree approach. . . <u>In the current state of practice for PSHA, and as was done in this study, logic tree parameters are primarily assigned using expert judgment on the basis of applicable data, which are often sparse</u>. [Emphasis supplied].

241-3 cont'd

Comment by Gilkeson and Arends. *Our review of the LANL 2007 PSHA Report, Lewis et al., 2009, the 2007 geotechnical report by Kleinfelder (LANL Report LA-UR-10-08118) and the DOE 2011 draft SEIS, show an excessive and unacceptable use of expert judgment based on assumed values for key parameters in lieu of obtaining the specific earthquake parameters required for seismic source characterization.*

One example is that a robust kinematic model of the PFS is lacking (see excerpt from Lewis et al., 2009 above on page 18). A very important example is the lack of knowledge of the distance from the proposed CMRR-NF to the Guaje Mountain Fault (GMF) because the detailed field mapping has not been performed. The poor knowledge of the location of the GMF is a concern of the LANL Seismic Hazards Geology Team but is not disclosed in the DOE 2011 draft SEIS. This issue is discussed below in Issue 1.B beginning on page 26.

241-16

241-16 NNSA disagrees that the seismic hazard analysis relied on excessive and unacceptable use of expert judgement. SSHAC (1997) has developed the framework for incorporating the uncertainties associated with the range of interpretations for a set of observations and the uncertainties in specific parameters that would be encountered in any state-of-practice PSHA. SSHAC (1997) points out that differences of legitimate scientific interpretations occur on many if not all key inputs to a modern PSHA. The purpose of the SSHAC process is to capture the center, body, and range of expert interpretations (or more currently the defensible technical judgment) in a hazard assessment. Because the LANL 2007 PSHA followed the SSHAC (1997) process, it accommodated the interpretations of a large number of nationally and internationally known experts and reviewers who considered a large quantity of geological, seismological, geophysical, and geotechnical data and interpretations. Extensive use was made of logic trees to accommodate the range of interpretations and uncertainty in nearly all key parameters incorporated in the PSHA. As explained in the LANL 2007 PSHA, the logic trees represent uncertainty that can by definition always be reduced with additional data. DOE incorporates this uncertainty in facility design by requiring that the mean, rather than the median, hazard exceedance be used in design. Additional data collection and analysis could reduce the mean hazard for the CMRR site.

The use of logic trees also permits the exploration of hazard sensitivities to various key parameters and the LANL 2007 PSHA report illustrates many of those sensitivities (LANL 2007). A PSHA that makes limited use of logic trees, ignoring alternate interpretations of data and expert judgment, may have less overall hazard uncertainty, but would be criticized for failing to follow the SSHAC (1997) process.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Issue 1.A. The DOE 2011 draft SEIS greatly underestimates the seismic hazard at the proposed CMRR-NF. This is because the LANL 2007 PSHA Report incorrectly calculated simultaneous earthquakes to produce a greater seismic hazard at the proposed CMRR-NF than multiple surface-rupturing synchronous earthquakes. In this section, we describe the contradictory findings and conclusions in the LANL 2007 PSHA Report concerning the seismic hazard at the proposed CMRR-NF from multiple synchronous versus simultaneous surface-rupturing earthquakes of the PFS. The requirement for accurate knowledge of the size of ground motions from synchronous and simultaneous ruptures of the multiple-segment PFS is described in the LANL 2007 PSHA Report as follows:

> **5.1.2.3 Types of Multisegment Ruptures.** Large earthquakes involving multiple fault segments can rupture in multiple subevents (synchronous rupture) rather than in just a single large event (simultaneous rupture) as is typically assumed and modeled in standard PSHAs. <u>The type of multisegment rupture (synchronous versus simultaneous) can significantly impact ground-motion estimates, depending on the location of the site relative to the slipping fault segments</u> [Emphasis Supplied]. Several critical LANL facilities are located between segments of the PFS, and so we explicitly considered both simultaneous and synchronous types of multisegment ruptures for both rupture models of the PFS.

241-2 cont'd

The LANL report by Lewis et al., 2009 presents new paleoseismic data from field studies that argue for three Holocene surface-rupturing earthquakes with two of the Holocene earthquakes as multiple surface ruptures. The pertinent excerpt follows:

> One [surface-rupturing earthquake] ca. 1.4 thousand calendar years ago (1.4 cal ka) on the Pajarito fault, a second 6.5–5.2 ka ago on the Pajarito fault that is consistent with an event 6.5–4.2 ka ago on the Guaje Mountain fault, and a third ca. 9 ka ago on both the Pajarito and the Rendija Canyon faults. This paleoseismic event chronology demonstrates that the Pajarito fault often ruptures alone, but sometimes ruptures either with the Rendija Canyon or the Guaje Mountain fault. When this occurs, the resultant seismic moment and therefore the earthquake magnitude are larger than when the main Pajarito fault ruptures alone (p. 252).

The LANL 2007 PSHA Report recognized the potential for the future surface-rupturing earthquakes to include an increase in simultaneous and synchronous ruptures of the PFS with either the RCF or the GMF as follows:

> However, the paleoseismic record also strongly supports coseismic rupture of the PAF and RC and the PAF and GM during the Holocene, which indicates to us that this linkage, however new, will likely continue in future earthquake ruptures (p. 5-12).

Comment by Gilkeson and Arends. *The LANL 2007 PSHA Report and the report by Lewis et al., 2009 describe the importance for accurate knowledge of the location and distance of active faults from the proposed CMRR-NF. The closest distance is not known because the necessary detailed field investigations have not been performed. The DOE 2011 draft SEIS does not consider 1). the conclusion in the LANL report by Lewis et al., 2009 that detailed field mapping is needed to determine the distance separating the GMF from the proposed CMRR-NF nor 2). the detailed mapping of intense fractures in the LANL Report by Wohletz, (2004) that indicate active faults are located 800 ft west, 1600 ft north and 2500 ft east of the proposed CMRR-NF.*

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The LANL 2007 PSHA Report on page 5-17 describes the synchronous rupture Richter magnitude 7.2 Cedar Mountain, Nevada earthquake and the synchronous rupture Richter magnitude 7.3 – 7.5 Hebgen Lake earthquake in Montana as analogs to the PFS as follows:

> The MS 7.2 1932 Cedar Mountain earthquake included a **M** 6.8 subevent followed by a **M** 6.6 subevent, and it was likely a synchronous rupture. Another example of a synchronous rupture that is a possible analog for the PFS is the **M** 7.3 1959 Hebgen Lake earthquake, which involved multiple discrete faults and two subevents: a mb 6.3 event followed 5 seconds later by a mb 7.0 event (Doser, 1985). This is a good possible analog for the PFS because 1) it occurred in a region adjacent to a Quaternary caldera, as does the PFS; 2) it clearly involved multiple overlapping but distinct faults (rupture segments) with complex geometries, including opposing dips like the PFS; 3) it was dominantly extensional; and, 4) it had large displacements, as is suggested for the PFS. It should be noted however, that larger subevents do not always occur first and the subevents can be similar in size. Admittedly, our review here is not comprehensive. Nevertheless, the Hebgen Lake analog provides useful guidance in defining subevents for synchronous ruptures on the PFS [Emphasis Supplied].

241-2 cont'd

The LANL 2007 PSHA Report describes the much greater seismic hazard from synchronous ruptures than simultaneous ruptures on page 7-3 as follows:

> **7.2.2 Sensitivity to PFS Characterization. . .** The hazard at LANL is dominated by the PFS. To evaluate the sensitivity of the hazard to the selection of various source-characterization parameters, calculations were performed giving full weight to specific branches on the PFS logic tree. The hazard from synchronous versus simultaneous rupture (Section 5.1.1) is shown on Figure 7-53 [Figure 7-53 is on the next page]. The hazard is higher for synchronous rupture because the ground motions will be larger from seismic slip involving two subevents versus more uniform slip in a single albeit larger simultaneous event [Emphasis Supplied].

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Figure 7-53. Comparison of the larger seismic hazard from synchronous versus simultaneous surface-eruption earthquakes at the proposed CMRR-NF at LANL TA-55
Source. Figure 7-53 in LANL 2007 PSHA Report.

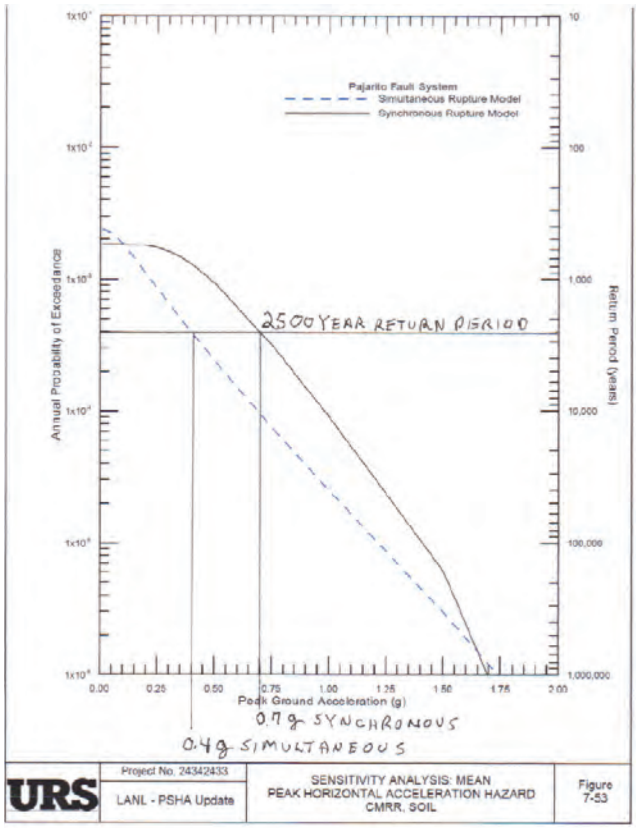

Figure 7-53 shows a much higher horizontal ground acceleration of 0.7g for synchronous ruptures of the PFS at the location of the proposed CMRR-NF compared to a lower value of 0.4g for simultaneous ruptures of the PFS.

241-2 cont'd

*Gilkeson and CCNS Comments about DOE 2011 draft SEIS for CMRR-NF * June 28, 2011 * Page 24*

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Figure 7-53 shows that the Mean Peak Horizontal Acceleration Seismic Hazard at the proposed CMRR-NF is 75% higher for the ground-surface ruptures from multiple synchronous earthquakes in the PFS for a return period of 2,500 years at 0.7g than for the simultaneous ruptures from a single earthquake for the same return period at a lower value of 0.4g.

A very serious issue is that Section 5 of the LANL 2007 PSHA Report calculated a smaller maximum Richter magnitude seismic hazard at the proposed CMRR-NF for the ruptures from multiple synchronous earthquakes than from the simultaneous ruptures from a single earthquake as follows:

> ***5.1.2.4 Maximum Magnitudes. . .*** We calculated preferred magnitudes for both simultaneous and synchronous ruptures. Weighted mean-maximum magnitudes range from **M** 6.94 (for RS-a) to **M** 7.27 (for ~~RS-g~~ ***sic*** RS-e) for simultaneous ruptures. . . We estimated maximum magnitudes for both subevents of the synchronous ruptures using the same approach and these are consistently slightly smaller than for the simultaneous ruptures (Table 5-11), but the sum of the moment for the two subevents is within 10% of the moment for the simultaneous rupture of the same rupture scenario.

Comment by Gilkeson and Arends. *The lower seismic hazard for simultaneous ruptures that was calculated in the LANL 2007 PSHA Report are incorrect and greatly underestimate the ground motions from multiple synchronous earthquakes at the proposed CMRR-NF as presented above in Table 7-53. The incorrect and low seismic hazard values in Section 5.1.2.4 for* ***Maximum Magnitudes*** *were used to underestimate by a large amount the seismic hazard at the proposed CMRR-NF.* ***The incorrect values for maximum magnitudes that were used to calculate the seismic hazard at the proposed CMRR-NF requires DOE to retract the DOE 2011 draft SEIS.***

The above statement in the LANL 2007 PSHA Report that the maximum moments for synchronous ruptures is less than but within 10% of the moment for the simultaneous ruptures misses the important fact that 1). the lower values calculated for the synchronous ruptures are ***proof*** *the calculations are incorrect and 2). a 10% change in Richter maximum moment is a large change in the seismic hazard because a 7.5 Richter magnitude earthquake is about 31 times more powerful than a 6.5 magnitude earthquake.*

The LANL 2007 PSHA Report described the multiple earthquake synchronous ruptures of the Richter maximum magnitude 7.5 1959 Hebgen Lake earthquake as an analog for synchronous ruptures of the PFS. However, the calculations in the LANL 2007 PSHA are not correct and underestimate the Maximum Magnitude for synchronous ruptures of the PFS for the proposed CMRR-NF and also for the existing or proposed critical facilities at other locations at the 40-square mile LANL Site. Indeed, the knowledge to calculate the seismic hazard at any existing or proposed LANL facility does not exist at the present time. The overall poor knowledge of the seismic hazard at LANL is described in our report with important discussion in the next section.

241-2 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Issue 1.B. The DOE 2011 draft SEIS misrepresents the LANL 2007 PSHA Report as "a comprehensive update to the LANL seismic hazards analysis" as follows on page 3-25:

> **Section 3.5.1.4 Seismicity**
> A comprehensive update to the LANL seismic hazards analysis was completed in June 2007 (LANL 2007a). The updated report used more-recent field study data, most notably from the proposed CMRR-NF site, and the application of the most current seismic analysis methods, in order to update the seismic source model, ground motion attenuation relationships, dynamic properties of the subsurface (primarily the Bandelier Tuff) beneath LANL, as well as the probabilistic seismic hazard, horizontal and vertical hazards, and design-basis earthquake for LANL. The methods used in the updated 2007 analysis follow the Senior Seismic Hazard Advisory Committee's guidelines for a Level 2 analysis in the most recent guidance from NRC, "Recommendations for Probabilistic Seismic Hazard Analysis – Guidance on Uncertainty and Use of Experts" (NRC 1997).

Comment by Gilkeson and Arends. *Our report presents many reasons the LANL 2007 PSHA Report is incomplete, incorrect and inadequate to provide "design basis earthquakes" for the proposed CMRR-NF or for the assessment of the seismic hazard at the location of any existing or proposed critical facilities on the 40-square mile LANL Site. We describe the overuse of the Poisson Assumption in lieu of accurate data in the LANL 2007 PSHA Report above on page 21.*

241-3 cont'd

Seven key parameters for assessment of the seismic hazard at the location of the proposed CMRR-NF and at other critical facilities at the LANL site are described in the LANL 2007 PSHA Report. Five of the key parameters are listed on page 5-1 in the LANL 2007 PSHA as follows:

> Specific earthquake parameters needed for the seismic source characterization are 1] fault location, 2] geometry, 3] sense of slip, 4] Mmax [maximum moment], and 5] earthquake recurrence rate.

The other two key parametes described in the LANL 2007 PSHA Report are 6] Kappa and 7] seismic properties of the dacite reference rock.

241-8 cont'd

1] Fault Locations. The distance of the GMF away from the location of the proposed CMRR-NF is not accurately known. The disagreement between LANL scientists on the distance from the proposed CMRR-NF and the RCF and GMF is described in Issue 1C. on page 33. Calculation of the seismic hazard at the proposed CMRR-NF requires accurate knowledge of the location of the GMF and its extensions (i.e., fault splays). This knowledge does not exist at the present time.

The need for detailed field mapping to determine the southern extent of the GMF is described in the LANL report by Lewis et al., 2009:

> The southern extent and amount of displacement of the GMF are not well characterized (p. 257).
>
> **Conclusions. . .** The southern end of the GMF has not been mapped in detail, but its southern termination is likely to be similar to that of the Rendija Canyon fault (p. 268).

241-10 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Figure 2 shows the numerous fault splays that are mapped at the southern end of the RCF. The above statement in Lewis et al., 2009 indicates that the LANL Seismic Hazards Geology Team have a concern that the GMF could extend south to a location close to the proposed CMRR-NF. Nevertheless, the necessary detailed field mapping for accurate knowledge of the southern extent of the GMF to determine proximity to the location of the proposed CMRR-NF has not been performed.

The LANL 2007 PSHA on page 5-17 describes the importance for accurate knowledge of fault locations to assess the seismic hazard at the proposed CMRR-NF:

> In our model of a simultaneous type of multisegment rupture for the PFS, ground motions are calculated the same as for a single segment source, with the closest distance to the source being a key factor [Emphasis Supplied].

The design of the proposed CMRR-NF was based on the locations of faults shown on Figure 2. Accordingly, the distance of the proposed CMRR-NF away from faults was described in the DOE 2011 draft SEIS as follows on page 3-25:

> Detailed geologic mapping in the vicinity of TA-55 indicates that the proposed CMRR-NF site lies approximately 3,000 feet (910 meters) to the east of the Rendija Canyon fault zone and 4,000 feet (1,200 meters) to the east of the Pajarito Fault (see Figure 3–4 [Figure 2 in this report]) and that no large faults exist at the site.

Comment by Gilkeson and Arends. *In fact, accurate knowledge of the distance from the proposed CMRR-NF to the active Guaje Mountain Fault (GMF) does not exist according to Lewis et al., 2009 and comparison of Figures 2 and 3 shows there is disagreement among the LANL scientists on the distance from the CMRR-NF to the active Rendija Canyon Fault (RCF) and to the GMF.*

Detailed mapping in trenches excavated at the proposed CMRR-NF has determined that no large faults are located at the top of the Bandelier Tuff in the foot print for the foundation of the NF. Nevertheless, the necessary detailed field mapping has not been performed to determine the distance from the proposed CMRR-NF to the GMF.

241-10 cont'd

The findings from the geologic mapping of fracture traces along Pajarito Road in 1990 (Vaniman and Wohletz, 1990) and in Mortandad Canyon north of the location of the proposed CMRR-NF (Wohletz, 2004) is that zones of intense fractures are located immediately west, 1600 ft north and 2500 ft east of the location of the proposed CMRR-NF, respectively. The importance of the intense zones of fracturing to the seismic hazard at the proposed CMRR-NF is an unresolved issue that requires field investigations.

241-17

2] Fault Geometry – Angle, Depth and Interaction. The components of fault geometry are the angle of dip of the discrete fault into the subsurface, the depth of the discrete fault into the subsurface and the stress interaction between the network of discrete faults. The LANL 2007 PSHA Report describes the lack of knowledge of the fault geometry as follows on page 5-12:

> Figure 5-7 shows views of our 3-D structural model for the PFS. These views were extracted from an interactive 3-D representation created by Claudia Lewis in Arcsine using digital elevation data to model the ground

241-5 cont'd

241-17 Numerous field investigations followed the work of Vaniman and Wohletz (1990) to investigate whether surface-rupturing faults related to the Rendija Canyon and Guaje Mountain faults extended into LANL property. These studies (including Gardner et al. 1998, 1999, 2008) used techniques of conventional geologic mapping at 1:1,200 scale, high-precision total station geologic mapping of Bandelier Tuff subunit contacts, and large-scale trenching investigations at the site of the proposed CMRR-NF, to identify the presence or absence of surface-rupturing faults at LANL, from TA-3 to TA-55. These careful field investigations to locate surface-rupturing faults overlap the fracture zones investigated by Vaniman and Wohletz (1990) and Wohletz (2004). Gardner et al. (1998, 1999) identified no faults or offsets along geologic contacts suggesting the presence of faults at TA-55. Although Gardner et al. (2008) did observe some fractures and small faults confined within units of the tuff, they concluded that fractures and faults exposed at the proposed CMRR site formed very shortly after emplacement of the tuff, 1.26 million years ago, as a result of cooling and compaction, and the structures identified at the proposed CMRR-NF site pose no independent seismic surface rupture hazard.

At TA-67 (south of TA-55), geologic mapping and paleoseismic trenching investigations for a proposed mixed waste disposal facility found small, complex faults at the site (Reneau et al. 1995). These faults were found to be older than 50 to 60 thousand years (the age of the El Cajete pumice fall), and the investigations found no correlation between increased fracture density and surficial faulting.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> surface, digital fault traces to accurately represent complex geometries, and ***assumed fault dips*** [Emphasis Supplied] (which are within the ranges used in our seismic source characterization for the PFS, Figure 5-8). **It is noteworthy that the fault dips are the most poorly constrained part of the model due to the lack of subsurface structural data** [Emphasis Supplied].

The subsurface structural data on fault geometry requires field studies with 1). trenching investigations, 2). surface geophysical methods, including seismic reflection and aeromagnetics and 3). drilling coreholes. Nevertheless, the field investigations have not been performed. The LANL report (Lewis et al., 2009) by the LANL Seismic Hazards Geology Team recognized an important deficiency in the LANL 2007 PSHA Report is the lack of knowledge of the fault geometry for the PFS as follows on page 252:

> Despite the importance of understanding the geometry of the fault system and potential linkage among faults for purposes of seismic hazard analysis, a robust kinematic model of the [Pajarito] fault system is lacking.

Comment by Gilkeson and Arends. *The above statement that "a robust kinematic model of the [Pajarito] fault system (PFS) is lacking" describes an important deficiency in the current knowledge of the seismic hazard for the proposed CMRR-NF at LANL TA-55 and knowledge of the seismic hazard at other critical facilities at the 40-square mile LANL Site. A robust kinematic model requires accurate knowledge from field studies for the seven key parameters listed in the LANL 2007 PSHA report.. Nevertheless, the discussion in the LANL 2007 PSHA Report provided here in our report demonstrates that accurate knowledge of the key parameters does not exist.*

241-5 cont'd

3] Sense of Slip. A robust kinematic model for the PFS requires accurate knowledge of the geometry of the discrete faults and the sense of slip on the discrete faults. However, the required data have not been acquired as explained on page 5-11 in the 2007 PSHA Report:

> Very few kinematic data regarding fault-slip direction are available for the PFS. Slip directions measured on the RC and GM indicate dominantly normal slip with rakes that are typically between 80° and 90°, but occasionally range as low as 70° (Karen Carter, personal communication 1994, cited in Wong *et al*., 1995, Table 7-1, footnote 9). Unfortunately, slip direction data are lacking on the PAF [Pajarito Area Fault], but with its similar northerly strike one would expect slip directions similar to the RC and GM. In contrast, the SCC [Santa Clara Canyon Fault] strikes northeast and could have a larger component of oblique slip, although data are lacking to check this hypothesis.

The omission of accurate knowledge of the slip direction for the discrete faults in the PFS is a serious issue because "sense of slip" is a key parameter for assessment of the seismic hazard as described on page 5-1 in the LANL 2007 PSHA:

> Specific earthquake parameters needed for the seismic source characterization are fault location, geometry, ***sense of slip*** [emphasis supplied], Mmax [maximum moment], and earthquake recurrence rate. Uncertainties in these seismic source parameters are sometimes large and include (1) those arising from lack of knowledge (epistemic uncertainties) and (2) those due to inherent variability in the earthquake process (aleatory uncertainties). The second type

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> of uncertainty was handled by integration in the hazard calculations (Section 2); the first [i.e., lack of knowledge], by use of a logic-tree approach. In the latter procedure, values of the source parameters are represented by the branches of logic trees with weights that define the distribution of [assumed] values.

Comment by Gilkeson and Arends. *The primary fault along the western boundary of LANL is the Pajarito Area Fault (PAF) [also named the Pajarito Fault (PF)]. The use of the logic tree approach to determine the important source parameters such as "sense of slip" for the primary PAF instead of the necessary field work to acquire accurate knowledge is an important reason for DOE to retract the DOE draft 2011 SEIS for the proposed CMRR-NF at LANL TA-55. The importance of accurate knowledge for the "sense of slip" on the primary PAF for the seismic hazard at LANL is described on page 5-15 in the LANL 2007 PSHA as follows:*

> On the basis of the structural and paleoseismic data, all of the rupture scenarios assumed that the PAF is the primary fault segment and always ruptures in larger surface-faulting events. In addition, we also assumed that if the PAF ruptures with the SCC [Santa Clara Canyon Fault], then either the RC, or GM, or both, must also rupture to transfer the strain between the PAF and SCC. As a result of these assumptions, our scenarios all have only one rupture source that always includes the PAF.

Accurate knowledge of the seismic hazard at LANL requires accurate knowledge of the "sense of slip" for the PAF and the difference in the "sense of slip" between the primary PAF and the subsidiary RCF and GMF. However, footnote 7 in Table 5-10 in the LANL 2007 PSHA Report shows that "sense of slip" for the PAF were average values determined from the RCF and GMF displacement probabilities as follows:

241-5 cont'd

> Footnote 7. As data are lacking on the EFS/SW [Embudo Fault System/South-West], SCC and PAF, displacements for RS-e [Simultaneous Rupture Model Event e] are based on displacement data from the Guaje Pines Cemetery site along the RC and sites along the GM. In this case, all values were considered averages and weights were determined by averaging the RC and GM displacement probabilities.

The methodology used in the LANL 2007 PSHA to calculate the key parameter "sense of slip" for the important primary PAF is not technically defensible and shows that the LANL 2007 PSHA Report did not acquire the site-specific data necessary for subsequent analyses. As a result, assumptions and averaging are used for the displacement data for the ground motions for design basis earthquakes at the proposed CMRR-NF, which are not based on accurate scientific knowledge. These are examples of why DOE must retract the DOE 2011 draft SEIS.

The important differences in the physical setting of the very deep primary PAF and the shallow depth for the antithetic RCF and GMF are described on page 265 in Lewis et al., 2009 as follows:

> The short lengths and antithetic dips of the RCF and GMF, and their location in the step over between the PF and the northern PF, suggest that they are subsidiary to the larger displacement east-dipping faults. The paleoseismic data corroborate this. . . As the principal bounding faults of the Española basin, the PF and northern PF are probably crustal-scale faults (dipping at high angle down to the base of the brittle crust;

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Baldridge et al., 1995), whereas the RCF and GMF are subsidiary but important, in that they bridge the gap, in the subsurface at least, between the main and northern strands of the Pajarito fault.

Fault interaction has significant implications for seismic hazards. The probability of an earthquake rupture propagating from one fault to another increases with the degree of stress interaction between the faults [Emphasis Supplied] (Scholz and Gupta, 2000). When the PF and the RCF rupture together, the seismic moment and therefore the magnitude should be substantially larger than when the PF ruptures alone.

Comment by Gilkeson and Arends. *The required knowledge of the stress interactions between the primary PAF and the subsidiary RCF and GMF does not exist because the necessary displacement data is lacking for the PAF and also for the SCC [Santa Clara Canyon Fault]. The important knowledge of the degree of stress interaction between the primary PAF and the subsidiary RCF and GMF and the SCC was not provided in the LANL 2007 PSHA Report because the field work to measure the degree of stress interaction has not been performed. The "expert judgment" that was used in the LANL 2007 PSHA Report to assess the stress interactions between the PAF and the subsidiary faults is obviously incorrect because the displacement data for the primary PAF were estimated from the median values for the displacement data from the subsidiary RCF and GMF.*

241-5 cont'd

4] Mmax [maximum moment] ***Seismic moment is a measure of the energy released in an earthquake determined by length of the fault and the area and amount of slip. The Richter earthquake magnitude scale is a presentation of seismic moment.*** The design of the proposed CMRR-NF was incorrectly based on earthquakes with a maximum moment magnitude for simultaneous ruptures from a single earthquake in the Richter range of 6.94 to 7.27 (see Table 5-10 in the LANL 2007 PSHA Report). Issue 1A. in this report describes the incorrect calculation of anomalously low maximum moments from ground-surface ruptures produced from multiple synchronous earthquakes.

Comment from Gilkeson and Arends. *The LANL 2007 PSHA Report recognizes the synchronous 1959 Hebgen Lake Earthquake as an analog to the PFS (see discussion above on page 23). The maximum earthquake in the synchronous pair of eruptions for the 1959 Hebgen Lake Earthquake was a Richter magnitude of 7.5. A 7.5 Richter magnitude earthquake is 31 times more powerful than a 6.5 magnitude earthquake (See USGS material above on page 17). Accordingly, it is important to use a higher maximum moment than 7.27 to calculate the seismic hazard for the proposed CMRR-NF because of the 7.5 Richter magnitude of the analog 1959 Hebgen Lake Earthquake and the obviously incorrect low values calculated for maximum moment from synchronous earthquakes in the LANL 2007 PSHA Report. Another concern is the increasing power of the PFS that may occur during the 50-year operational life of the CMRR-NF and the operational life of other critical facilities at LANL into the future. An additional important issue is that there is no technical basis for the values for maximum moment magnitude that are presented in Table 5-10 in the LANL 2007 PSHA Report. This issue is discussed beginning on page 22 in this report.*

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

5] Earthquake Recurrence Rate. The LANL 2007 PSHA Report recognized that there was insufficient knowledge of the earthquake recurrence rate and more field work with paleoseismic investigations were needed as follows:

> The PFS shows compelling evidence for repeated late Quaternary faulting, but individual rupture patterns are complex and the timing of some events remains ambiguous (e.g., Gardner et al., in review; McCalpin, 2005) (p.5-8).
>
> If the late Quaternary record is indeed incomplete, as we believe, then future paleoseismic investigations will, if anything, increase the number of surface-faulting events identified on the PFS. We have tried to consider the potentially incomplete record in developing and weighting rupture models and recurrence interval distributions for the PFS (p.5-15).

6] Insufficient knowledge or the key parameter kappa. The parameter kappa is important for site specific ground motions from earthquakes. The LANL 2007 PSHA Report recognized the need for improvements in the LANL seismograph network to improve measurement of kappa (see page 39 in this report). The 2007 PSHA used an assumed value of kappa because the LANL seismograph network did not provide usable data to calculate kappa.

7] Insufficient knowledge of the seismic properties of the reference rock dacite. The LANL 2007 PSHA Report used an assumed value for the shear velocity of the dacite below the proposed CMRR-NF because of the very low value that was measured in the only borehole that was drilled a short distance into the dacite. This issue is discussed on pages 36-37 in this report. The LANL 2007 PSHA Report recommended for LANL to do additional field work to measure the shear velocity of the dacite (see page 39).

Comment by Gilkeson and Arends. *In summary, the field investigations have not been performed to provide the necessary accurate knowledge of the seven key parameters that are essential to calculate the seismic hazard and design basis earthquakes for the proposed CMRR-NF at LANL TA-55. The omission of the required knowledge of the seven key parameters is a requirement of DOE to retract the DOE 2011 draft SEIS.*

241-8 cont'd

The necessary detailed field investigations have not been performed over large regions of the PFS. A major omission in the LANL 2007 PSHA Report is that there are large regions where there is poor knowledge of fault locations and fault geometry because the required detailed field investigations have not been performed. As described earlier on page 26 the LANL Seismic Hazards Geology Team recommend detailed field investigations to determine the distance from the GMF to the proposed CMRR-NF.

The LANL 2007 PSHA Report describes additional important data gaps north of LANL where there is a need for high precision mapping for a robust kinematic model of the PFS as follows:

> One key insight is that, although the PAF and SCC segments form the main western margin of the Espanola basin, there appears to be a large gap (about 5 km) between presently mapped traces of each segment

241-5 cont'd

Response side of this page intentionally left blank.

> (Figure 5-4). This gap is coincident with a major change in strike of the PFS from northerly to northeasterly. Additional high-precision mapping should be done at the southern end of the SCC to confirm this gap (p. 5-10).
>
> More displacement data and more detailed mapping are sorely needed to better define deformation patterns on the SCC, but landowner access restrictions have hampered study of the SCC to date (p. 5-11).

In addition, the DOE 2011 draft SEIS describes on page 3-22 that large areas of LANL have not yet been mapped in detail for seismic hazards as follows:

> Although project areas TA-3 and TA-55 have been mapped in detail for the presence of faults, areas showing no faulting on Figure 3–5 do not necessarily represent an absence or lack of faulting. Large eastern and southern areas of LANL have not yet been mapped in detail for seismic hazards. Additionally, faults are only shown in areas where such faults are exposed or inferred. The end of a fault line on a map does not necessarily indicate truncation of a fault, but may be indicative of the end of surface exposure or lack of evidence of a fault at that location. This scenario is common in urbanized areas or in areas where faults have been buried by younger sediments. Confirmation of the presence or absence of a fault at a particular site, that is, at the end of mapped fault lines, may require further site-specific detailed geologic investigations, even though mapping may already have occurred at that location.

Comment by Gilkeson and Arends. *The seismic hazard at the proposed CMRR-NF requires knowledge from a robust kinematic model for the PFS from accurate data in the immediate vicinity of the proposed CMRR-NF, in the region of the 40-square mile LANL SITE on Figure 2 and in the region of the PFS on Figure 1. The detailed field investigations for the required kinematic model of the PFS have not been performed.*

241-4 cont'd

Contradictory values for the vertical peak ground acceleration values in the LANL 2007 PSHA Report and the DOE 2011 draft SEIS. Our review of the LANL 2007 PSHA Report discovered that the DOE 2011 draft SEIS used a value for the vertical PGA of 0.3g for the recurrence interval of 2500 years when the value listed in the table in the LANL 2007 PSHA Report was 100% greater at 0.6g. From the LANL 2007 PSHA Report Table ES-1:

Table ES-1
LANL Mean PGA Values (g) From the UHRS

Return Period (years)	CMRR		TA-3		TA-16		TA-55		Site-Wide		Dacite	
	Horiz.	Vert.	Horiz.	Vert.	Horiz.	Vert.	Horiz.	Vert.	Horiz.	Vert.	Horiz.	Vert.

*Gilkeson and CCNS Comments about DOE 2011 draft SEIS for CMRR-NF * June 28, 2011 * Page 32*

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

However, the text of the DOE 2011 draft SEIS shows that the design of the proposed CMRR-NF at LANL TA-55 was based on the incorrect low value of 0.3g for the vertical PGA. The pertinent excerpt from pages 3-25 to 3-26 in the DOE 2011 draft SEIS follows:

> Probabilistic seismic hazard was calculated for the ground surface at the existing CMR site within TA-3 and the proposed CMRR-NF project site within TA-55. Anticipated horizontal surface peak ground acceleration values at both sites as a result of a large earthquake on the Pajarito Fault are about 0.52 *g* (percent of acceleration equal to gravity) at a return period of 2,500 years. <u>The vertical peak ground acceleration values are about 0.3 *g*, also at a return period of 2,500 years (LANL 2007a)</u> [Emphasis Supplied]. **Note.** LANL 2007a is the LANL 2007 Probabilistic Seismic Hazard Analysis (PSHA) Report.

The vertical PGA value in the LANL 2007 PSHA Report to be used for the design of the proposed CMRR-NF at TA-55 was 0.6g which is 100% larger than the low value of 0.3g that was incorrectly used for the design according to the above statement in the DOE draft 2011 SEIS. The use of an incorrect value for the vertical PGA to calculate design basis earthquakes for the proposed CMRR-NF requires DOE to retract the DOE 2011 draft SEIS.

241-7 cont'd

- **Issue 1.B. The insufficient knowledge of active faults located close to the proposed CMRR-NF.** The DOE 2011 draft SEIS misrepresents the omission of detailed field mapping north of TA-55 for knowledge of the locations of faults close to the location of the proposed CMRR-NF in LANL TA-55. From page 3-22 in the DOE 2011 draft SEIS:

> The Pajarito fault system has been mapped in detail in the northern and western portions of LANL property, as well as in the vicinity of LANL (see Figure 3-5 [Note. Figure 3-5 is Figure 2 in this report]). This detailed fault data includes fault mapping from a variety of projects that were performed using different methods, that is, conventional geologic mapping, surveying, drilling, and trenching; at different scales, ranging from 1:1,200 to 1:62,500; and at different times, from 1987 to 2004. Portions of the data include currently unpublished mapping performed by the LANL Seismic Hazards Geology Team. The fault mapping includes faults and related structures, such as folds, fissures, and fault zones.

In fact, detailed fault mapping data does not exist over a large region north of the location of the proposed CMRR-NF at LANL TA-55 to the southern boundary of the GMF displayed on Figures 1 and 2. The lack of detailed mapping is described as follows in Lewis et al., 2009:

> The southern extent and amount of displacement of the GMF are not well characterized (p. 257).
>
> **Conclusions. . .** The southern end of the GMF has not been mapped in detail, but its southern termination is likely to be similar to that of the Rendija Canyon fault (p. 268).

Figure 2 shows the numerous fault splays that are mapped at the southern end of the RCF. The above statement in Lewis et al., 2009 shows that the LANL Seismic Hazards

241-10 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Geology Team have a concern that the GMF could extend south to a location close to the proposed CMRR-NF. The intense fractures mapped north of the proposed CMRR-NF in Mortandad Canyon and west of the NF on Figure 3 (Wohletz, 2004) may be caused by faults that are buried in the Bandelier Tuff that are now propagating up through the Bandelier Tuff (see discussion on page 37 in this report}. Nevertheless, the necessary detailed field mapping for accurate knowledge of the southern extent of the GMF to determine proximity to the location of the proposed CMRR-NF has not been performed.

***Comment by Gilkeson and Arends**. The field studies in the area of the proposed CMRR-NF at TA-55 and especially to the north of the NF to determine the southward extension of the GMF have not been performed. The required field studies should be performed with the results reviewed by an independent team of experts. In addition all of the published and unpublished mapping performed by the LANL Seismic Hazards Geology Team should be reviewed by an independent expert team and made available to all reviewers of the DOE 2011 draft SEIS. For these reasons and others detailed in this report, therefore, DOE is required to retract the 2011 draft SEIS.*

- **Issue 1.C.** The 2011 draft SEIS does not provide the evidence from the field mapping of fractures along Pajarito Road (Vaniman and Wohletz, 1990) and in Mortandad Canyon (Wohletz, 2004) that indicate an active fault is located within 800 ft of the western side of the proposed CMRR-NF (shown as the RCF on Figure 3) and the active GMF is located approximately 2,500 feet east of the eastern side of the proposed CMRR-NF.

An important fact is the misrepresentation in the DOE 2011 draft SEIS that detailed field mapping has determined that there are no faults located close to the proposed CMRR-NF. The mapping of zones of intense fractures (Vaniman and Wohletz, 2000 and Wohletz 2004) and the statement above on page 33 from Lewis et al., 2009 shows that the necessary detailed field investigation for accurate knowledge of active faults west, north and east of the proposed CMRR-NF have not been performed. A very serious omission in both the LANL 2007 PSHA and the DOE 2011 draft SEIS is the need for detailed field investigations to provide accurate knowledge of active faults in the immediate vicinity of the proposed CMRR-NF. The LANL Seismic Hazards Geology Team (Lewis et al., 2009) have recommended detailed field mapping to determine the location of the GMF north of the proposed CMRR-NF.

The incorrect statement on page 3-25 in the DOE 2011 draft SEIS that there is no evidence of faults at or near the location of the proposed NF is as follows:

> In contrast to TA-3, TA-55 is located within an area of relatively simple structure, where no surficial fault deformation has been documented (see Figures 3–4 and 3–5 [Figures 1 and 2 in this report]). Detailed geologic mapping in the vicinity of TA-55 indicates that the proposed CMRR-NF site lies approximately 3,000 feet (910 meters) to the east of the Rendija Canyon fault zone and 4,000 feet (1,200 meters) to the east of the Pajarito Fault (see Figure 3–4 [Figure 2 in this report]) and that no large faults exist at the site. Local faults observed in an excavation at the CMRR-NF site originated from fumarolic activity and were created during cooling and compaction of the volcanic tuff, rather than as a result of movement along the Pajarito fault system.

241-10 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Comment by Gilkeson and Arends. *The above statement that there is no evidence of the PFS close to the location for the proposed CMRR-NF at LANL TA-55 is incorrect based on the results of 1). field mapping of fractures along Pajarito Road, 2). field mapping of fractures in Mortandad Canyon north of TA-55 and 3). field mapping of fractures in the trenches at the proposed location of the CMRR-NF at LANL TA-55. The findings from the field investigations are described in the May 25, 2007 Geotechnical Report by Kleinfelder that is referenced in the DOE 2011 draft SEIS. The pertinent excerpts from the 2007 Kleinfelder Geotechnical Report (LANL Report LA-UR-10-08118) follow.* From page 42 in the 2007 Kleinfelder Geotechnical Report

> Recent fracture mapping by LANL (Wohletz, 2004) in the north wall of Mortandad Canyon north of the CMRR site documented fracture clusters that were interpreted as southward extensions of the RCF and GMF, passing south-southwest along the west boundary of TA-55 and through TA-63 to the west and east of CMRR, respectively [Note. The locations of the RCF and GMF east and west of the proposed CMRR NF are shown on Figure 3]. This interpretation is consistent with studies by Vaniman and Wohletz, 1990, which found fracture clusters in Unit 3/Unit 4 along the TA-48/TA-55 boundary north and south of Pajarito Road. From these studies, <u>it appears that the structural disturbance manifested as dense fracturing, lying 800-1000 ft west of the west edge of CMRR, is the southern extension of the RCF zone with net vertical displacement (down drop to the east) of 11.3 meters (m) (37 ft)</u> [Emphasis Supplied].

Comment by Gilkeson and Arends. Detailed field mapping described in Lavine et al. (2005) determined that faults were not present in the zone of intense zone of fracturing 800-1000 ft west of the proposed CMRR-NF. Detailed field mapping in the zone of intense fracturing north of the proposed CMRR-NF in Mortandad Canyon also did not identify any faults but it is possible that small-vertical-displacement faults [<1 ft (30 cm) vertical displacement] may not have been recognized.

241-10 cont'd

From page 42-43 in the 2007 Kleinfelder Geotechnical Report:

> Mapping of fractures (Wohletz, 2004) in Unit 3 in Mortandad Canyon north and northeast of TA-55 documented two dominant, conjugate fracture sets with 1) mean strikes of N22W with steep dips to the south and 2) mean strikes of N82E with dips to mostly north and dips not as steep. The N82E set is the more prominent of the two. This conjugate fracture orientation suggests a principal horizontal stress in the N15E direction. A minor set striking N50W was also documented.

From page 43 in the 2007 Kleinfelder Geotechnical Report:

> As part of its site investigations, KA excavated test trenches within the CMRR site. Most of the trenches were excavated into fill or Qbt4; two were excavated into $Qbt3_U$. Fractures mapped in test trenches are plotted on Figures B-2 through B-7 in Appendix B of the GDR [Kleinfelder 2007 Geotechnical Data Report]. These figures show some clustering of very steep (81-90°) fractures dipping toward the northeast (Set A) and some lesser clustering of 71-80° fractures toward the northwest (Set B). Otherwise, fracture directions appear to be randomly distributed. These two sets do not match up with the conjugate clusters mapped by Wohletz, but

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> some of the other, apparently random fractures mapped in the CMRR studies could belong to the clusters identified by Wohletz [as evidence of faulting] [Emphasis Supplied].

Comment by Gilkeson and Arends. *The inclusion of the findings in the 2004 LANL report by Wohletz in the Kleinfelder 2007 Geotechnical Report but omitted in the DOE 2011 draft SEIS is a serious issue. The DOE 2011 draft SEIS did not mention the random fractures mapped in the CMRR-NF studies that were possibly from the PFS. Instead, the draft SEIS described the trenching studies at the CMRR-NF as follows on page 3-25:*

> Local faults observed in an excavation at the CMRR-NF site originated from fumarolic activity and were created during cooling and compaction of the volcanic tuff, rather than as a result of movement along the Pajarito fault system.

The findings of 1). a principal horizontal stress in the geologic setting north of the CMRR-NF, 2). zones of intense fractures possibly related to the PFS in outcrops along Pajarito Road south and west of TA-55, 3). zones of intense fractures possibly related to the PFS in Mortandad Canyon north and northeast of the CMRR-NF and 4). fractures possibly from the PFS in the trenching studies at the location of the CMRR-NF are all an indication that active faults may be close to the location for the proposed CMRR-NF.

241-10 cont'd

The misrepresentation in the DOE 2011 draft SEIS that detailed mapping determined there to be no active faults close to the location of the proposed CMRR-NF is a serious issue. There is an immediate need to do the detailed field mapping and drilling investigations in the large 2 ½ mile region on Figure 2 between the mapped southern end of the GMF and the location of the proposed CMRR-NF.

Detailed mapping for faults in trenches in the footprint of the proposed CMRR-NF is not sufficient to identify active faults at depth in the Bandelier Tuff. The Bandelier Tuff Tshirege Member was deposited 1.25 million years ago over a landscape where active faults in the PFS date from 16.5 million years ago. The mapping in trenches cut into the top of the Tshirege Member of the Bandelier Tuff is not sufficient to determine that active faults are not present in the subsurface close to and possibly below the location of the proposed CMRR-NF. One requirement is to investigate faulting in the dacite below the CMRR-NF and the propagation of faults upward from the dacite through the Bandelier Tuff The extensive fracturing that was discovered in the only borehole drilled into the dacite below the CMRR-NF is an indication that active faults may be present in the dacite below the location of the proposed CMRR-NF.

Borehole DSC-1B was the only borehole drilled into the dacite below the location of the proposed CMRR-NF. The Kleinfelder 2007 Geotechnical Report describes the dacite in borehole DSC-1B as follows:

> The basement rock of this site was encountered in boring DSC-1B at a depth of about 697.5 ft (El 6597.5) and consists of Tschicoma dacitic lava (dacite). At least three distinct flows were identified in the 43.5 ft of basement rock penetrated at the bottom of boring DSC-1B, but the total thickness is probably several hundred feet. The upper boundary is heavily fractured and vesicular, which reduces the overall rock mass stiffness.

241-14 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The Kleinfelder 2007 Geotechnical Report describes the video log in borehole DSC-1B as follows:

> Through the dacite the borehole wall was very blocky and irregular, retaining a cylindrical shape in only a few locations to 733 ft, where slough had backfilled the hole. The over break through the dacite appeared to be at least one borehole diameter beyond the borehole wall.

The low shear velocity (Vs) of 2,950 ft/sec measured in the upper 25 ft of dacite in borehole DSC-1B is also evidence the dacite below the proposed CMRR-NF is highly fractured possibly because of faulting.

The LANL report by Lewis et al., 2009 described locations where the active PF is buried below land surface. One example is the description of the Anchor Ranch Fault, which is part of the active portion of the PF, on pages 261 and 264 as follows:

> Maximum throw of 55 m down to the east occurs on the Anchor Ranch fault (the largely buried main fault in this sector) [Emphasis Supplied], but associated deformation extends into the footwall block 2000 m to the west of the Anchor Ranch fault and into the hanging-wall block 2000 m to the east (p. 261).
>
> As the Anchor Ranch fault propagated upward, breaking the surface between Water and Los Alamos Canyons, growth of the fold presumably ceased (p. 264).

Another example of the buried PF is on page 267 in Lewis et al., 2009:

> In the 1981 Gulf of Corinth [central Greece] earthquake series, warping of the surface between two normal faults resulted in strike-parallel extension and discontinuous surface fissures between the two main surface ruptures (e.g., Jackson, 1982; Vita-Finzi and King, 1985). As is the case with the PF and northern PF, the main Corinth fault failed to reach the surface across the bend, even though it may be a continuous structure in the subsurface [Emphasis Supplied].

The conceptual model of the LANL Seismic Hazards Geology Team is that the youthful PFS is continuing to propogate upward through the Bandelier Tuff to the present time as follows on page 265:

> Based on its probable interaction with the RCF and GMF, the PF may no longer propagate northward, although it may continue to propagate upward through the Bandelier Tuff. Rather, the PF, RCF and GMF are slowly accumulating displacement in the zone of overlap between the faults, and thus gradually filling in the local displacement deficit relative to the system as a whole (Fig. 5). This is a fault system of short segments that have just recently linked together; the near-surface displacement asymmetries have not yet evened out.

241-14 cont'd

Comment by Gilkeson and Arends. The DOE does not have accurate knowledge of the seismic hazard at the location for the proposed CMRR-NF

241-18

241-18 Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazards analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). The updated seismic hazard analyses (LANL 2007, 2009) provide a better understanding of the ground motion and seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF building site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. The revised design is reflected in the revised cost estimates. Per DOE Order 413.3, Program and Project Management for the Acquisition of Capital Assets, final or detailed design cannot be started until the NEPA document (Final SEIS in this case) has been completed, so as not to prejudice the outcome, or restrict or narrow the range of alternatives to be considered.

Site specific geotechnical investigations have been completed for the proposed CMRR-NF project site for both the Shallow Excavation Option and the Deep Excavation Option and recommendations issued related to the design of the CMRR-NF (Kleinfelder 2007a, 2007b, 2010a, 2010b). Such recommendations take into consideration potential sinking, including seismically induced and non-seismically induced settlement, and lateral shifting of the foundation. The *CMRR-NF SEIS* has been revised to include this information. Refer to Section 2.6, Seismic Concerns, of this CRD for more information.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

at LANL TA-55. The DOE 2011 draft SEIS increases the estimated cost for construction of the proposed CMRR-NF because of 1). the new knowledge about the weak layer of volcanic ash below TA-55 and 2). the large increase in the horizontal Peak Ground Acceleration (PGA) in the LANL 2007 PSHA Report. Because of these factors, the estimated cost of the proposed CMRR-NF has increased 20 times from $350 million to greater than $6 billion. The DOE 2011 draft SEIS does not provide a final estimated cost because there are two options for the design of the CMRR-NF and the final design and final estimated cost was not provided at the time the DOE 2011 draft SEIS was issued for public comment. From pages 2-14 and 2-15 of the DOE 2011 draft SEIS:

> Two options are being considered for construction of the Modified CMRR-NF. The Deep Excavation Option would involve excavating through a layer of poorly welded tuff, then partially backfilling the excavation with a low-slump concrete. The 10-foot-thick (3-meter-thick) concrete basemat on which the building foundation would rest would be constructed on top of the concrete backfill. The Shallow Excavation Option would avoid the poorly welded tuff layer by constructing the basemat well above that layer in the overlying stable geologic layer, which would act in a raft-like fashion to allow the building to "float" over the poorly welded tuff layer.
>
> The Deep Excavation Option design is more mature, having undergone technical review by NNSA, NNSA's contractors, and the Defense Nuclear Facilities Safety Board. At this time there is more uncertainty with the design for the Shallow Construction Option. The Shallow Construction Option design needs to reach the same level of design maturity and be subjected to the same level of technical review as the Deep Construction Option so the two options can be evaluated on the same basis; this process is currently ongoing.

241-18 cont'd

Comment by Gilkeson and Arends. *The DOE 2011 draft SEIS misrepresented and underestimated the seismic hazard at the location of the proposed CMRR-NF 1). because of the incorrect calculations in the LANL 2007 PSHA Report, 2). the inadequate and incomplete collection of data for the seven key parameters listed in Section 1.B, and 3). the insufficient knowledge of the location of active faults close to the proposed CMRR-NF and the lack of a robust kinematic model for the PFS. The required knowledge of the seismic hazard does not exist. However, the current knowledge of the seismic hazard is adequate for the decision that the shallow option "which would act in a raft-like fashion to allow the building to 'float' over the poorly welded tuff layer" is not a safe design.*

241-8 cont'd

In addition, the current knowledge of the poorly characterized seismic hazard is adequate for the decision that the LANL site is not acceptable for major operations in the DOE Program for modernization of nuclear weapons, for storage of six metric tons (13,228 pounds) of plutonium or for ongoing operations at the LANL site with special nuclear materials.

241-19

Section 10 in the LANL 2007 PSHA Report provides six recommendations for future studies to improve knowledge about the seismic risk. Section 10 is provided below with our Questions LANL 2007 PSHA A through LANL 2007 PSHA F about the current status of the studies. Please provide answers to our specific Questions LANL 2007 PSHA A

241-20

241-19 NNSA does not agree with the commentors conclusion about the safety of facilities at LANL that handle special nuclear materials. NNSA believes that sufficient geologic and seismic information is available to enable NNSA to design a CMRR-NF that can be safely operated. See the 2008 *LANL SWEIS* for more information on the operation of other facilities at LANL.

241-20 NNSA has considered the recommendations made in the 2007 PSHA and is addressing the recommendations in a prioritized manner, as resources are available. For example, NNSA has incorporated the Next Generation of Attenuation relationships in the seismic hazard for the CMRR-NF and TA-55, as documented in the 2009 update to the PSHA.

The goal of any PSHA is to develop inputs that represent the composite distribution of the informed technical community. SSHAC recognizes that PSHA inputs can be subject to considerable uncertainties due to incomplete data and scientific understanding, as well as from process variability. In particular, when developing the inputs for PSHA, it is recognized that there is always incomplete knowledge because that is the nature of trying to characterize a complex natural process. However, by performing PSHAs in a manner consistent with the SSHAC guidelines, particularly with regards to the incorporation of the range of different interpretations and scientific uncertainties, the results should be robust and stable. NNSA believes that sufficient geologic and seismic information is available to enable NNSA to design a CMRR-NF that can be safely operated.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

through LANL 2007 PSHA F in your Response to Comments for the DOE 2011 draft SEIS for the CMRR-NF about the progress to implement the six recommendations.

SECTION TEN Recommendations for Future Studies
Based on the studies completed to date, the following are recommendations for future investigations. The results of such studies will aid in refining specific seismic source and site parameters, which have been incorporated into the PSHA, and reduce their associated uncertainties.

- Recalculate the hazard using the NGA [Next Generation of Attenuation] ground motion attenuation relationships. Four relationships are now available for use and they display significant differences with the earlier generation of relationships, i.e., the ones used in the current study (Section 6.1). It would be prudent to evaluate the impact of these new relationships on the LANL hazard after they have had time to be fully vetted.

- *LANL 2007 PSHA A. What is the status on vetting the new NGA ground motion attenuation relationships?*

- Conduct additional detailed/high-precision mapping and displacement measurements along the SCC [Santa Clara Canyon] segment of the PFS [Pajarito Fault System], similar to what has been done on the PAF [Pajarito Area Fault] segment of the PFS. The purpose of this would be threefold: (1) better define fault trace geometry for the SCC and verify the gap between the PAF and SCC; (2) better define long-term displacements and slip rates for the SCC; and (3) identify potential paleoseismic trenching sites.

- *LANL 2007 PSHA B. What is the status of the performance of additional detailed high precision mapping and displacement measurements along the Santa Clara Canyon and the Pajarito Area Fault segment of the Pajarito Fault System?*

- Conduct paleoseismic trenching studies of the SCC to determine the timing and size of prehistoric surface-faulting earthquakes. This will help better define rupture models and scenarios for the PFS. It may also help better determine maximum magnitudes and recurrence intervals for rupture scenarios.

- *LANL 2007 PSHA C. What is the status of the performance of new paleoseismic trenching studies of the Santa Clara Canyon and also new paleoseismic trenching studies of the Pajarito Area Fault segment of the Pajarito Fault System?*

- Reevaluate the entire dataset for the RGR [Rio Grande Rift] fault slip rate analysis using only data for complete seismic cycles and more complete documentation of long-term data (both displacements and applicable time periods). This more robust analysis will likely reduce slip rate uncertainties and result in a more symmetric RGR slip rate distribution.

- *LANL 2007 PSHA D. What is the status of the reevaluation of the entire dataset for the Rio Grande Rift?*

- Conduct additional studies to better constrain kappa. Kappa is a key parameter in assessing the hazard at LANL (Section 6.2). Focused efforts should be made to evaluate kappa using data from the LANL seismographic network. Improvements in the network may be necessary to improve data quality [emphasis added].

- *LANL 2007 PSHA E. The 1995 Seismic Hazard Report described the failure of LANL to install and operate a seismographic network to provide data for the calculation of*

241-20 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

Kappa. The poor performance of LANL to install and operate the required seismographic network was also the finding of the 2007 PSHA Report. The 2007 PSHA Report and the DOE 2011 draft SEIS used an uncertain assumed value for Kappa. What is the current status for the LANL seismographic network to provide high quality data for the calculation of Kappa?

- Conduct VS measurements of dacite. There is no reliable VS data for the dacite (Section 4.2.3) and thus velocity data would confirm the value used in this study. Measuring the velocity of the dacite beneath the laboratory requires deep boreholes and so although not ideal, shallow velocity surveys where the rock outcrops is probably the only economical alternative.

- *LANL 2007 PSHA F. What is the status of LANL/DOE operations to measure the shear velocity of the "reference rock datum" in testholes at many locations site-wide and specifically at the location of the new CMRR Building? The complex change in the "reference rock datum" at LANL requires shear velocity measurements in many testholes drilled deep into the reference rock.*

241-20 cont'd

Below are Questions DOE 2011 draft SEIS A through DOE 2011 draft SEIS U based on our findings in this report. Again, please provide answers to our specific Questions DOE 2011 draft SEIS A through DOE 2011 draft SEIS U in your Response to Comments for the DOE 2011 draft SEIS for the CMRR-NF.

<u>There is insufficient acquisition of site-specific data and subsequent analysis of seven key parameters to ensure that ground motions for design-basis earthquakes at the proposed CMRR-NF are based on accurate scientific knowledge</u>. The seven key parameters required for seismic source characterization were identified in the LANL 2007 PSHA report. They are 1] fault location, 2] geometry, 3] sense of slip, 4] Mmax [maximum moment], 5] earthquake recurrence rate, 6] kappa, and 7] shear velocity of the dacite.

241-8 cont'd

1] Fault Locations. There is a need for detailed field mapping to determine the location relationship between the GMF and the proposed CMRR-NF. The concern of the LANL Seismic Hazards Geology Team follows as described in Lewis et al., (2009):

> The southern extent and amount of displacement of the GMF are not well characterized (p. 257).
>
> **Conclusions. . .** The southern end of the GMF has not been mapped in detail, but its southern termination is likely to be similar to that of the Rendija Canyon fault (p. 268).

DOE 2011 draft SEIS A. Should the necessary field investigations be performed to determine the southern extent and amount of displacement of the GMF as this knowledge is important for the design basis earthquakes for the proposed CMRR-NF?

241-10 cont'd

2] Fault Geometry – Dip Angle and Depth. The LANL 2007 PSHA Report describes the lack of knowledge of the fault geometry as follows on page 5-12:

> **<u>It is noteworthy that the fault dips are the most poorly constrained part of the model due to the lack of subsurface structural data</u>** [Emphasis Supplied].

241-5 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

DOE 2011 draft SEIS B. Should the necessary field investigations be performed to determine the fault geometry, including fault dip and depth, as this knowledge is important for the design basis earthquakes for the proposed CMRR-NF?

3] Sense of Slip. The required fault-slip direction data have not been acquired as explained on page 5-11 in the 2007 PSHA Report:

> Very few kinematic data regarding fault-slip direction are available for the PFS. … Unfortunately, slip direction data are lacking on the [primary] PAF [Pajarito Area Fault].

DOE 2011 draft SEIS C. Should the necessary field investigations be performed to determine the fault-slip directions for the primary PAF, and the subsidiary GMF, RCF and SCC (Santa Clara Canyon Fault) as this knowledge is important for the design basis earthquakes for the proposed CMRR-NF?

241-5 cont'd

4] Mmax [maximum moment] The LANL 2007 PSHA Report describes the larger maximum moment and greater seismic hazard from synchronous ruptures than simultaneous ruptures on page 7-3 as follows:

> The hazard is higher for synchronous rupture because the ground motions will be larger from seismic slip involving two subevents versus more uniform slip in a single albeit larger simultaneous event.

A very serious issue is that Section 5 of the LANL 2007 PSHA Report calculated a smaller maximum Richter magnitude seismic hazard at the proposed CMRR-NF for the ruptures from multiple synchronous earthquakes than from the simultaneous ruptures from a single earthquake as follows:

> ***5.1.2.4 Maximum Magnitudes. . .*** We calculated preferred magnitudes for both simultaneous and synchronous ruptures. Weighted mean-maximum magnitudes range from **M** 6.94 (for RS-a) to **M** 7.27 (for ~~RS-g~~ ***sic*** RS-e) for simultaneous ruptures. . . We estimated maximum magnitudes for both subevents of the synchronous ruptures using the same approach and these are consistently slightly smaller than for the simultaneous ruptures (Table 5-11), but the sum of the moment for the two subevents is within 10% of the moment for the simultaneous rupture of the same rupture scenario.

DOE 2011 draft SEIS D. Should the necessary field investigations be performed to correctly calculate the maximum moment for synchronous and simultaneous ruptures of the PFS, including the primary PAF and the subsidiary GMF and RCF, as this knowledge is important for the design basis earthquakes for the proposed CMRR-NF?

241-2 cont'd

5] Earthquake Recurrence Rate. The LANL 2007 PSHA Report recognized that there was insufficient knowledge of the earthquake recurrence rate and more field work with paleoseismic investigations were needed as follows:

> If the late Quaternary record is indeed incomplete, as we believe, then future paleoseismic investigations will, if anything, increase the number of surface-faulting events identified on the PFS. We have tried to consider

241-13 cont'd

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> the potentially incomplete record in developing and weighting rupture models and recurrence interval distributions for the PFS (p.5-15).

DOE 2011 draft SEIS E. Should the necessary paleoseismic investigations be performed to correctly understand the late Quaternary record of the earthquake recurrence rate as this knowledge is important for the design basis earthquakes for the proposed CMRR-NF?

241-13 cont'd

6] Insufficient knowledge or the key parameter kappa. Section 10 "Recommendations" of the LANL 2007 PSHA used an assumed value of kappa because the LANL seismograph network did not provide usable data to calculate kappa.

> Conduct additional studies to better constrain kappa. Kappa is a key parameter in assessing the hazard at LANL (Section 6.2). Focused efforts should be made to evaluate kappa using data from the LANL seismographic network. <u>Improvements in the network may be necessary to improve data quality</u> [Emphasis Supplied].

DOE 2011 draft SEIS F. What is the current status for the LANL seismographic network to provide high quality data for the calculation of kappa as this knowledge is important for the design basis earthquakes for the proposed CMRR-NF?

241-8 cont'd

7] Insufficient knowledge of the seismic properties of the reference rock dacite. The LANL 2007 PSHA Report used an assumed value for the shear velocity of the dacite below the proposed CMRR-NF because of the very low value that was measured in the only borehole that was drilled a short distance into the dacite. The LANL 2007 PSHA Report recommended for LANL to do additional field work to measure the shear velocity of the dacite (see page 39 of this report). The complex change in the "reference rock datum" at LANL requires shear velocity measurements in many testholes drilled deep into the reference rock.

DOE 2011 draft SEIS G. What is the status of LANL operations to measure the shear velocity of the "reference rock datum" in testholes at many locations site-wide and specifically at the location of the proposed CMRR-NF?

The LANL Seismic Hazards Geology Team recognized the need for a robust kinematic model for the PFS in Lewis et al., (2009) as follows:

> Despite the importance of understanding the geometry of the fault system and potential linkage among faults for purposes of seismic hazard analysis, a robust kinematic model of the [Pajarito] fault system is lacking (p. 252).

DOE 2011 draft SEIS H. Is a robust kinematic model necessary for knowledge important for the design basis earthquakes for the proposed CMRR-NF?

DOE 2011 draft SEIS I. If so, does development of the robust kinematic model require field investigations of the seven key parameters listed in Questions DOE 2011 draft SEIS A through DOE 2011 draft SEIS G above?

There is disagreement among the LANL scientists about the zones of intense fractures as evidence of active faults close to the proposed CMRR-NF location; 800 ft to the west, 1,600 ft to the north, and 2,500 ft to the east.

241-14 cont'd

*Gilkeson and CCNS Comments about DOE 2011 draft SEIS for CMRR-NF * June 28, 2011 * Page 42*

Response side of this page intentionally left blank.

Commentor No. 241 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

There is a need for independent peer review of the data acquisition and subsequent analysis processes at LANL; especially because of the disagreement among LANL scientists on the locations of active faults at the proposed CMRR-NF. The DNSFB addressed this issue on page 63 in the DNFSB TWENTY-FIRST ANNUAL REPORT TO CONGRESS:

> **4.10 Seismic Hazard Analysis**
> The Board continues to stress to DOE the importance of adequate review, including independent peer review, of both the acquisition of site-specific data and subsequent analysis to ensure that ground motions for design basis earthquakes are based on accurate scientific knowledge.

DOE 2011 draft SEIS J. Is the disagreement among the LANL scientists an issue that requires independent peer review of the data and subsequent analysis of Wohletz (2004) to ensure that design basis earthquakes for the proposed CMRR-NF are based on accurate scientific knowledge?

DOE 2011 draft SEIS K. If not, why?

DOE 2011 draft SEIS L. Should an independent peer review be done at the zones of intense fractures identified by Wohletz (2004) (Fig. 3 in this report)?

DOE 2011 draft SEIS M. If not, why?

241-3 cont'd

DOE 2011 draft SEIS N. Do the zones of intense fractures identify active faults close to the proposed CMRR-NF?

DOE 2011 draft SEIS O. If not, why?

DOE 2011 draft SEIS P. Should the zones of intense fractures be used as locations of active faults (Fig. 3 in this report) for design basis earthquakes for the proposed CMRR-NF?

DOE 2011 draft SEIS Q. If not, why?

241-10 cont'd

DOE 2011 draft SEIS R. Should the design work for the proposed CMRR-NF be halted because the accurate scientific knowledge of the seven key parameters listed above in Questions DOE 2011 draft SEIS A through DOE 2011 draft SEIS G are not provided to calculate the design basis earthquakes for the proposed CMRR-NF?

DOE 2011 draft SEIS S. If not, why?

241-8 cont'd

DOE 2011 draft SEIS T. Should the design work for the proposed CMRR-NF be halted because the necessary robust kinematic model is not provided for knowledge of the seismic hazard to calculate the design basis earthquakes for the proposed CMRR-NF?

DOE 2011 draft SEIS U. If not, why?

241-9 cont'd

We look forward to your responses.

Commentor No. 242: Mary Beth Moore

From: Mary Beth Moore [marybethmooresc@gmail.com]
Sent: Thursday, June 23, 2011 4:14 PM
To: nepalaso@doeal.gov
Subject: Chemistry and Metallugy Research Replacement

Dear Mr. Tiegtmeir,

I am deeply alarmed at the proposed Chemistry and Metallugy Reseacrch Replacement Project. The CMRR project should be canceled, a study of LANL's plutonium infrastructure should be required - including existing and future capability needs, and a realistic cost for maintaining and upgrading safety features at the existing CMR must be determined. We do not want a diseaster like the one Japan has just suffered. Let's opt for life. Think of your children and grand children. Cancell the project now. *242-1*

Sincerely Mary Beth Moore, SC

242-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Regarding a request for a plutonium infrastructure study, the proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 243: Terry Thompson

From: Terry Thompson (575) 751-4343 [terryt@taosnet.com]

Subject: Comments about the Draft CMRRNF SEIS

This email is for Mr. John Tegtmeier, CMRRNF SEIS Document Manager, NNSA Los Alamos Site Office, 3747 West Jemez Road, TA 3 Building 1410, Los Alamos, New Mexico, 87544; and any others accepting comments from residents of the affected area.

Recently I attended a meeting in Taos, NM, about the proposed project. It felt more like a "this is what we are doing" pitch than an opportunity for the residents of Taos to examine, debate, and register their concerns about this project. ***243-1***

My family and I are very concerned about the proposed plutonium pit production complex at Los Alamos. We feel that a complete, new EIS should be required ***243-2*** for this potentially very harmful expansion. The location is seismically active, and after the horrible environmental disaster affecting nuclear power plants in Japan, we know that our current scientific knowledge about the safety of such a project in a seismic zone is woefully inadequate. The proposed Supplemental EIS is not good enough to support building such a facility in a seismic zone that is not well understood. Furthermore, the building's design is not final, so any environmental studies should not be begun until the design is final. I can't imagine the government thinking it is a logical approach after 8 years has passed since the original EIS to not require a completely new EIS based on the extent of changes in design and pertinent known information available today. ***243-3***

We need to continue addressing the existing problems of clean-up at LANL, not begin new contamination and highly hazardous activities there. The American people are tired of living under the threat of nuclear warfare, terrorism, facility accidents, transport accidents, and economic downturns caused, in part, by the huge expense of waging several long-lasting wars in a number of countries overseas. We do not need more ramp-ups to war that cost billions of dollars and present unforeseen problems. We do not need 80 new plutonium pits (bomb triggers) a year. We need to respect our nonproliferation treaties and goals. ***243-4***

We do not need (and we strongly oppose) more environmental degradation caused by making war weapons, especially nuclear bombs. Los Alamos does not need an economic boost; but other parts of New Mexico do need environmentally friendly industries that aim to put this country and state back into prosperity--a peace-oriented prosperity. Let's stop the war machine and begin to address cleaning

243-1 After consideration of the request for a public hearing, NNSA decided to hold an informational meeting in Taos, New Mexico, rather than a public hearing. Taos is located over 50 miles (80 kilometers) from LANL and NNSA does not believe that the projected environmental impacts from the CMRR project would be likely to adversely affect the population residing in the area surrounding Taos. In making its decision, NNSA considered the cost of a fifth public hearing, the size of the population to be served by a public hearing in Taos, and the absence of a previous record of a NEPA meeting being held in Taos. In addition to a poster session similar to that associated with the hearing, NNSA made presentations describing the CMRR-NF project and SEIS. Meeting participants were invited to ask questions following the presentations and advised of ways to provide comments on the *Draft CMRR-NF SEIS*; comment forms were made available at the meeting. As discussed in Section 2.2, NEPA Process, of this CRD, a number of means of providing comments on the *Draft CMRR-NF SEIS* were available throughout the public comment period.

243-2 NNSA notes the commentor's position that a new environmental impact statement is needed rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

243-3 NNSA notes the commentor's request for a new EIS after the design is complete. NEPA documentation is typically performed while the design of a project is still underway. There is enough design information available to perform a NEPA analysis for the CMRR-NF project. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazard analyses of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able

Commentor No. 243 (cont'd): Terry Thompson

up the messes that we have and building self-sustaining energy industries such as wind power and solar power facilities. We live in a beautiful part of a beautiful state with a fascinating history and culture; let's not turn it into a wasteland unfit for life--just to keep our military machine expanding. Please listen and respect our point of view. Begin with a brand-new complete EIS that applies the most current knowledge to all of the proposed, final-design features of this project. ***243-4 cont'd***

Sincerely,

Terry Thompson
HCR 74 Box 22273
El Prado, NM 87529

to withstand a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*). See also Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The commentor's concerns that an accident (similar to the one that occurred in Japan at the Fukushima Daiichi Nuclear Power Plant) could happen at LANL is addressed in Section 2.8, Nuclear Accidents, of this CRD. There are fundamental differences between the functioning of a nuclear reactor (such as the Fukushima Daiichi Nuclear Power Plant or Chernobyl) and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems.

243-4 The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on LANL legacy waste cleanup. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

Commentor No. 243 (cont'd): Terry Thompson

Regarding cost and the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

Commentor No. 244: Laura Jolly

Subject: We cannot afford more nuclear development, healthwise

I just heard about the new plutonium facility at the Los Alamos National Laboratory. This cannot go forward.

It is time to focus on cleaning up what is already existing as th ewaste at Los Alamos Lab. DOE must devote taxpayer funds to cleanup, not a new bomb plant that would only add to the pollution.

244-1 We who live here in NM right under this fire at Los Alamos understand that humans are NOT expendable...

Yes, this is about “national security”...But we want to work with those issues from another perspective. More weapons, more bomb factories, more waste, more expansion of the military is NOT the way to go.

Thank you for listening to my humble opinion. We desparately need a new direction to move in.

laura jolly
1963 kiva
santa fe, NM 87505

244-1 NNSA notes the commentor’s opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Chapter 1, Section 1.5, identifies the decisions to be supported by the *CMRR-NF SEIS*. This does not include decisions on LANL legacy waste cleanup. However, NNSA intends to continue implementing those actions necessary to clean up legacy waste sites at LANL regardless of decisions made on the proposed construction of the CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

Commentor No. 245: Paki Wright

Subject: no plutonium bomb factory at Los Alamos!

Dear Sirs,

In view of the horrendous fire now burning all around Los Alamos, with no end in sight, it is the height of madness to envision putting a NEW plutonium bomb factory there, this is just bat s--t crazy to even contemplate. ***245-1***

Yours for a cancer-free future,

Paki Wright, Crestone, CO

245-1 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Regarding cost and the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

246-1 NNSA notes the commentor's opposition to the use of hazardous nuclear materials. As noted in Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD, NNSA must continue to operate nuclear facilities such as the existing CMR Building at LANL in order to meet its national security obligations.

Commentor No. 247: Lea Bradovich

From: Lea Bradovich [leab@cybermesa.com]
Sent: Friday, July 01, 2011 2:32 PM
To: NEPALASO@doeal.gov
Subject: Bomb Factory in Los Alamos

Dear Public Servants at the DOE,

As I write this from Santa Fe, NM, the air is smoky, visibility is low, all of the windows are closed and the air cleaner is humming. A monster forest fire is once again threatening LANL, creating a sense of dread in Northern New Mexico. Santa Feans are shaking their heads in dismay. 11 years after the last fire LANL is still storing plutonium contaminated wastes in tents. TENTS!

Nobody knows what is burning up there. The forests are stressed because of the drought, which is predicted to last 60 years.

Yet plans are being made to expand nuclear warhead (plutonium pit) production at LANL. The new plant will take vast amounts of our scarce water. It will be located in the remote, forested mountains of our beautiful state in an area prone to catastrophic forest fires.

This is also an area of seismic and volcanic activity.

It's a bad idea. Please re-think this poorly conceived plan.

247-1

Sincerely,

Lea Bradovich
Sant Fe, NM

247-1 NNSA notes the commentor's position that the CMRR-NF project should be stopped and re-evaluated. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources). The waste storage domes in TA-54 are not the subject of the *CMRR-NF SEIS*. However, NNSA has taken actions to mitigate the risks of a wildfire on the domes. In 2000, the Cerro Grande fire burned a heavily forested canyon area to within about 0.75 miles (1.2 kilometers) of the waste storage domes, but none were burned and there were no radiological releases from the domes. The Las Conchas fire reached the southern border of LANL, but did not get within 2 miles (3.2 kilometers) of the domes. Additional fuel reduction has been conducted since the Cerro Grande fire, both to the vegetation surrounding TA-54 and within the domes themselves (for example, wooden pallets have been replaced with metal pallets), to further decrease the potential for a waste storage dome fire occurring as a result of a site wildfire. Furthermore, NNSA has an active program to remove the waste stored at Area G and ship it to WIPP for disposal.

The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils sections of Chapters 3 and 4 (Sections 3.5.2 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). Based on the report, future planning will be performed to consider CMRR-NF structural requirements for ash-loading.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

LANL approaches sustainability on a site-wide basis, knowing that new facilities will require the use of limited resources. New projects such as the proposed CMRR-NF are constructed in a manner that improves the efficiency of energy and water use site wide. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 248: Jim Haber, Coordinator Nevada Desert Experience

Subject: Comments on CMRR-NF SEIS

Mr. John Tegtmeier
CMRR-NF SEIS Document Manager
Los Alamos Site Office
3747 West Jemez Road
TA-3 Building 1410
Los Alamos, New Mexico, 87544
By e-mail to NEPALASO@doeal.gov

248-1

The CMRR-NF has many problems, some of which are environmental, and others that have to do with geo-political nuclear issues. Nothing having to do with nuclear power or nuclear weapons can be good or worthwhile vis a vis the environment. There is no justification for building CMRR-NF, so any environmental issues aren't worth it.

It seems like a lot of work, so much that a full, new EIS should be made, not just updating the old one. The fires currently licking at Los Alamos further the need for a fuller review of any new work to be done there, and necessitating a review of proposed and existing EIS to see how it's good or not.

Respectfully,

Jim Haber, Coordinator
Nevada Desert Experience

248-1 NNSA notes the commentor's opposition to nuclear power, nuclear weapons, and the construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 249: Ryan Potoff

From: Ryan Potoff [rpotoff@gmail.com]
Sent: Tuesday, June 28, 2011 4:47 PM
To: NEPALASO@doeal.gov
Subject: Stop New Nuclear Weapons Plant, Earthquake Zone by 6/28

Dear Department of Energy,

Please consider my message as this is how I truly feel and know of many others who feel this way, as well. I am deeply concerned about the construction of the new CMRR plutonium reprocessing and storage facility in New Mexico. Plutonium is the most toxic substance on earth and this facility store six tons of it. Also, there are many other important causes, such as education and environmental protection, to spend the $6 billion dollars on, rather than weapons that kill people. Please reconsider the construction of this facility, which will pose a greater threat than it will ever reduce. *249-1*

Sincerely,

Ryan Potoff

Ryan Potoff
56 Pine Plain Rd.
Wellesley, MA 02481

249-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 250: Alfred Cavallo

To: NEPALASO@doeal.gov
Subject: Stop New Nuclear Weapons Plant, Earthquake Zone by 6/28

Dear Department of Energy,

I'm concerned about the construction of the CMRR plutonium reprocessing and storage facility in New Mexico. It will store six tons of the most highly toxic substance on Earth, plutonium, and will be able to produce 20-80 new nuclear weapons each year.

First of all, the costs have ballooned by 1000%, from $600 million to $6 billion. Most importantly, this facility can be used to negate President Obama's pledge to end nuclear weapons.

How can we criticize Iran and North Korea for their nuclear weapons programs when the US builds a new nuclear weapons factory? This is going one step forward, 3 steps backwards.

250-1

Sincerely,

alfred cavallo
princeton, NJ

250-1 NNSA notes the commentor's concern about the construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Dear Department of Energy,

I'm concerned about the construction of the CMRR plutonium reprocessing and storage facility in New Mexico. It will store six tons of the most highly toxic substance on Earth, plutonium, at the government's facility. Second, the costs have ballooned by 1000%, from $600 million to $6 billion.

Finally, this facility can be used to reverse the program, from President Obama's pledge to end nuclear weapons, to produce as many as 80 nukes each year. This is going one step forward, 3 steps back, with plutonium—the most deadly, toxic substance in the world.

251-1

Sincerely,

Joan Broadfield
2430 Lindsay St
Chester
Chester PA 19013, PA 19013

251-1 NNSA notes the commentor's concern about the construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

Commentor No. 252: Rachael Montag

From: Rachael Montag [mgminsurance@embarqmail.com]

Subject: Los Alamos Nuclear Expansion Opinion

To Whom It May Concern,

Our nation's resources should not in any way at this time be put to such wasteful use as to expand our nuclear weapons capabilities. This is absurd behavior in times where our own people are hungry, homeless and unemployed. What is the use in investing in facilities like these when they pose such and extreme risk to their surrounding population let alone the risk of major contamination to the nation? The current fire that is threatening this plant is prime example of this. Where are the safety measures that should be in place from the last fire?? It is unacceptable that the fire has reach the proximity that it already has to the nuclear lab. There are far better options to provide protection from foreign threats that are safer for our nations people. It is time we use our heads and thoroughly assess the situation before we cause any more harm to our nation. *252-1*

Sincerely,

Rachael Montag

252-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 253: Lily Jacobs

Comments on the CMRR SEIS

I feel very upset and afraid at the moment as I watch this terrible fire from my window burning around LANL.I just cannot understand why we need to make more weapons, and why this facility is so obviously unsafe , so near a large population! I dont understand how a new project can be started there, when clean up from the past has not even been completed! We have no idea what is being burned in the air as this fire blazes and we have no way to protect ourselves and are not even being told how to protect ourselves it is unacceptable! *253-1*

As a citizen I am given the "opportunity" to comment on my governments plan to construct a huge facility for the design, manufacture and storage of nuclear bombs just 26 miles from my home and just 2/3 of a mile from a fault line. I am supposed to tell my government if this is or is not a good idea. In the interest of good governance this fact alone should be a deal breaker for the CMRR. Due to past volcanic activity in the proposed construction site the tuff layer of soil contains a high concentration of volcanic ash and therefore is unstable. The cost-saving so called Shallow Option is unproven. Seismic investigations are currently in process at the lab. Until these investigations can be completed no decision to go forward should be made. *253-2*

Besides the insanity of build this nuclear facility 2/3 of a mile from a known fault line, there is a total lack of need for a new generation of nuclear weapons. Our current arsenal of nuclear warheads is more then enough of a deterrent and is more than adequate to get the job done if the need should ever arise. Our nation has been getting along with creating approximately 20 needless pits per year. Why expand that production capacity by four times with this new NF when our nation is supposedly seeking a future world free from nuclear weapons? Expanding US capacity would certainly breed distrust and compromise our efforts for nuclear nonproliferation and nuclear arms reduction. *253-3*

Another reason not to go forward with this project is that our nation simply can't afford to rebuild a plutonium pit production complex at this time. In 2004 when LANL first proposed building the CMRR our country never perceived that we would be in the financial mess that we find ourselves in today. In 2004 the estimated cost to build this nuclear facility was estimated to be $600 million. With a current estimated price tag of $6 billion to upgrade the existing facility we need to put the brakes on. This investment will lock in Los Alamos' future to the hopefully shrinking business of nuclear weapons research and production. There are much more strategic uses of our nations scientific and creative resources. If we want to get serious about spending cuts defunding the CMRR would be a good place to start. *253-4*

253-1 NNSA notes the commentor's opposition to nuclear weapons and the construction and operation of a new CMRR Facility at LANL. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

In regards to cleaning up past contamination at LANL, DOE established an environmental restoration project in 1989 to characterize and, if necessary, remediate over 2,100 potential release sites that were known to be or suspected of being contaminated from historical LANL operations. Remediation and cleanup efforts are regulated by and coordinated between NMED and DOE in accordance with a Consent Order. NNSA does not consider environmental restoration to be optional and progress on implementing environmental restoration activities is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

253-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis

Commentor No. 253 (cont'd): Lily Jacobs

As I am getting ready to submit these comments on this proposed CMRR Nuclear Facility, Los Alamos National Laboratory is once again threatened by a massive, out-of-control wildfire that already exceeds the Cerro Grande Fire of 11 years ago. Los Alamos today is under a state of emergency and mandatory evacuation. The Laboratory is surrounded by dense, steep and distressed Ponderosa forests. We know very well that these forests can easily propagate catastrophic crown fires that are very difficult to contain. Add in the likelihood of prolonged drought, low humidity and unpredictable winds and the risks of expanded plutonium pit production at LANL will only become more risky in the ensuing years. **253-5** Water in these mountains of the Southwest is always precious and often in short supply. This arguably unnecessary facility is slated to consume 16 million gallons of water per year. **253-6**

While the CMRR-SEIS considers the threat of a site-wide fire at the Lab, it only addresses fires that are seismically induced or that begin within the Nuclear Facility itself. The threat of wildfire like we are experiencing today is not comprehensively considered nor does this document address the Lab's ability to respond in the event of mass evacuations and the loss of the power grid. A complete analysis of this very real threat needs to be undertaken before there is another wildfire. **253-5 cont'd**

With Respect

Lily Jacobs
1704B Llano st #166
Santa Fe
NM 87505

earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The design of the CMRR-NF is still under way and will continue to evolve. There is no reason to withdraw the *CMRR-NF SEIS*, as building designs are rarely completed prior to the preparation of a NEPA document. See Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

253-3 A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information.

253-4 The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

253-5 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part

Commentor No. 253 (cont'd): Lily Jacobs

of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

253-6 As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. LANL approaches sustainability on a site-wide basis, knowing that new facilities will require the use of limited resources. New projects such as the proposed CMRR-NF are constructed in a manner that improves the efficiency of energy and water use site wide. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Commentor No. 254: Janet Greenwald, Co-coordinator, Citizens for Alternatives to Radioactive Dumping

Supplemental CMRR Comments

My daughter and her husband, my son and his wife and two young children live on our family farm in Dixon, directly downwind from Las Alamos. Yesterday, due to fire and smoke from a fire near the lab, my daughter-in-law and their children left for Albuquerque; my daughter and her husband stayed.

We do not know whether or not the ash that fell on both family's gardens is radioactive. We know that the trees that grow in the canyons where legacy waste was dumped carry some radioactivity; we also know that the clean up of the legacy waste has never been a priority for the labs. We keep reading articles that say all the waste at Los Alamos is safely contained but we know differently. We know that the transuranic waste at Area G is stored in tents; we have done our best to change this practice but it seems to be a matter of money; it would cost too much, according to officials, to build a bunker to store these thousands of barrels of mixed chemical and radioactive wastes safely. The fire is not contained, the labs and all who live downwind from them are not out of danger yet. ***254-1***

Though there is not money for cleanup or safe containment at the Labs, there is now a six billion dollar bomb-making building proposed for the labs, the CMRR building, to be built close to an earth quake fault. While we can not conceive of an enemy that could not be destroyed by the existing 1,000 plus nuclear bombs already in our country's possession, most of which are being stored in Albuquerque, we also know from the Jason Group report that those nuclear bombs will remain reliable for 100 years. (The Jason Group includes members of the prestigious National Academy of Sciences.). ***254-2***

It is difficult to believe in a government that would choose to put six billion dollars into an unneeded building while consistently refusing to do what needs to be done at the Labs to protect those of us who live close to the Labs. We remember that President Eisenhower warned us about the Military Industrial Complex, that it was powerful and could easily over influence government decisions. It seems to us that that is what has happened; the nuclear industry must go on, must expand because too many very powerful corporations depend on it, not because more nuclear bombs offer any defense advantage. ***254-3***

254-1 The EPA, NMED and LANL staffs have each obtained samples of ash from the Las Conchas fire and test results have not identified levels of radioactivity above background level expectations. This fire did not burn over areas of LANL where legacy waste resulted in soil contamination.

NNSA does not consider environmental restoration to be optional and progress on implementing those efforts is not linked to decisions on construction of the proposed CMRR-NF. Refer to Section 2.5, Cleanup and Waste Management, of this CRD for more information.

The waste storage domes in TA-54 are not the subject of the *CMRR-NF SEIS*. However, NNSA has taken actions to mitigate the risks of a wildfire on the domes. In 2000, the Cerro Grande fire burned a heavily forested canyon area to within about 0.75 miles (1.2 kilometers) of the waste storage domes, but none were burned and there were no radiological releases from the domes. The Las Conchas fire reached the southern border of LANL, but did not get within 2 miles (3.2 kilometers) of the domes. Additional fuel reduction has been conducted since the Cerro Grande fire, both to the vegetation surrounding TA-54 and within the domes themselves (for example, wooden pallets have been replaced with metal pallets), to further decrease the potential for a waste storage dome fire occurring as a result of a site wildfire.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 254 (cont'd): Janet Greenwald, Co-coordinator, Citizens for Alternatives to Radioactive Dumping

The CMRR building has become, for us who live close to the labs, a symbol of corruption in government. What we would like is some proof from you and all those who are in power that the good of the citizens of this country, not greed, is what is uppermost in your minds as you make your plans. ***254-1 cont'd***

Sincerely,

Janet Greenwald
Co-coordinator, Citizens for
Alternatives to Radioactive Dumping (CARD)
202 Harvard SE
Albuquerque, New Mexico 87106

254-2 NNSA reviewed pit lifetime studies and has concluded that degradation of plutonium in a majority of nuclear weapons will not affect warhead reliability for a minimum of 85 years. NNSA plans to continue studying plutonium aging through surveillance and scientific evaluation. NNSA will annually reassess the status of plutonium in nuclear weapons as the weapons laboratories continue to evaluate new data and observations (NNSA 2006a). Refer to Section 2.4, CMR Mission, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

254-3 Comment noted.

Commentor No. 255: Kathi Mottram

From: Kathi Mottram [lindlv@aol.com]
Sent: Tuesday, June 28, 2011 7:00 PM
To: nepalaso@doeal.gov
Subject: CMRR is not the answer

I was just recently told about your new plutonium facility at the Los Alamos National Laboratory. Here are several reasons I believe it is not in the interest of any U.S. citizen to have this facility built:

Cost

Earthquake vulnerability

Fires

Productions of known carcinogens

and most importantly,

the stockpiling of dangerous carcinogenic waste which has to be "stored" for an undetermined amount of time in a place immune to natural or manmade disaters. Is there such a place?

Is this how we want to proceed with the advancement of the US?

255-1

Kathi Mottram
40105 97th st west
leona Valley, CA 93551

255-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The CMRR-NF would be designed using information from the most recent studies and understanding of seismicity of the LANL region (LANL 2007, 2009); it would continue to function safely in the event of a design-basis earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 255 (cont'd): Kathi Mottram

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

Commentor No. 256: Scott Shuker

From: Scott S. [scottdas68@hotmail.com]
Sent: Friday, July 01, 2011 3:58 PM
To: nepalaso@doeal.gov
Subject: Plutonium weapons production at LANL

Congratulations. Your continued operations at LANL have created an even potentially deadlier health and environmental hazard with the Los Conchas fire. It appears that Mother Nature may do what decades of protest could not yet we will all pay a deadly price that may exist for millenia. *256-1*

I suggest an alternate use of that $6 billion: Jobs that would go to 12,000 individuals including from the distressed communities like Santa Clara, Cochiti and others; $50K a year for each individual for ten years—for forest restoration, watershed restoration and management, replenish our communities, and give people back their humanity. Sounded like an excellent plan to me, but instead, we're planning to use that money to build nuclear bombs to blow up the planet.

In 2008 Santa Clara Pueblo passed Tribal Resolution No. 08–16 in which the Pueblo opposes the expansion of plutonium pit production. This was in response to the Complex Transformation Supplemental Programmatic Environment Impact Statement. Along with the one–page resolution we also included 22–page comments from 256 community members, and some of which were included in congressional record.Your drive for more weapons production is an addiction and many of you need to go into rehab. It is heartbreaking that you disregard the sacred nature of land. You appear to want to make Los Alamos a permanent and perpetual nuclear bomb factory. It's the genocide of pueblo people. *256-2*

Scott Shuker
Santa Fe, NM

256-1 NNSA notes the commentor's opposition to continued operations at LANL. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. The existing safety conditions at LANL are addressed in Chapter 3 of the *CMRR-NF SEIS*, Section 3.11, Human Health, including radiation exposure and risk; the chemical environment; industrial safety; health effects studies; accident history; emergency preparedness and security; and the LANL Security Program. The environmental consequences or impacts on human health from normal operations, facility accidents, or intentional destructive acts are analyzed in Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the SEIS.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

256-2 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

NNSA notes the commentor's opposition to build a plutonium pit production complex at LANL. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are

Commentor No. 256 (cont'd): Scott Shuker

not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

Commentor No. 257: Alexis Brown

From: Alexis Brown [lamariposa@gmail.com]
Sent: Friday, July 01, 2011 3:58 PM
To: NEPALASO@doeal.gov
Subject: opposition to CMRR Nuclear Facility project

Because of the drought, the massive size of the Las Conchas fire, the fact that the state has burned nearly 2000 square miles this year alone, and the fact that LANL is located in a high risk fire zone, I am writing to voice my opposition to the CMRR Nuclear Facility project.

In addition to the fire danger and the risks associated with that, I am also opposing this project because the tax dollars can and should be used to HELP society, not destroy it. $6B can create jobs, help the environment, aid social service non-profits. I do NOT want my tax dollars paying for this project.

257-1

Alexis Brown
Santa Fe, New Mexico

257-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 258: Lauren Heartsill

From: Lauren heartsill [laurenheartsill@gmail.com]

To: NEPALASO@doeal.gov
Subject: Hi

Dear Sirs,

I would like to protest the proposed Plutonium Production Plant at Los Alamos...we do not need any more production of these horrible weapons...we have enough! *258-1*

Lauren Heartsill

258-1 NNSA notes the commentor's opposition to nuclear weapons and the construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

The proposal to construct a new facility to perform chemistry and metallurgy research involving plutonium and other actinides is the result of evaluations going back more than 10 years. In the 2008 *Complex Transformation SPEIS*, NNSA reviewed future plutonium-related requirements across the complex and concluded in the associated ROD that the CMRR-NF should be built at LANL (73 FR 77644). As indicated in Chapter 1, Section 1.3, of the *CMRR-NF SEIS*, NNSA has a continuing purpose and need to provide analytical chemistry and materials characterization in support of all DOE and NNSA nuclear mission work. NNSA has determined that the existing 60-year-old CMR Building cannot provide the necessary level of support over the next 50 years. Other alternatives for meeting the purpose and need have been considered and are discussed in Chapter 2, Section 2.7, of the *CMRR-NF SEIS*. See Section 2.3, Programmatic Direction and Decisions, Section 2.4, CMR Mission, and Section 2.11, Alternatives Considered, of this CRD for more information.

i , for one
want ouut of using nuclear energy.

is it 10% of our energy use??

i would easliy use that much less
as it is i am on very minimal solar

nuclear energy is DANGEROUS
as nature has been trying to tell us
poison for all living beings and the planet as well

i conclude that humans are greedy and insane.

please stop now.

annie degen

259-1

259-1 NNSA notes the commentor's opposition to nuclear energy. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 260: Michelle Victoria-Delon

From: michelle delon [smartlifeways@gmail.com]
Sent: Friday, July 01, 2011 4:28 PM
To: NEPALASO@doeal.gov
Subject: comments

I am writing as a concerned citizen and Santa Fe resident about the proposed project at LANL that will create a plutonium pit to build nuclear weapons. This plan is so dangerous for many reasons, one of which we are experiencing right now-a major fire. Already the fire came quite close to Los Alamos and it is only thanks to the wind direction that the lab has not faced the fire on its property, and the work of the fire fighters.

As temperatures increase it is becoming increasingly clear that more fires can be expected. This is one reason this project cannot be allowed to continue. *260-1*

In addition the lab sits on and near fault lines, which also increase the potential dangers of this site. I have also read that such a facility will use tremendous amounts of water and as the entire southwest faces droughts we need all the water just to sustain the existing communities...there is no extra water in this part of the country for such a project. *260-2*

The issue of whether or not we need additional nuclear weapons is also something to be considered. While encouraging the rest of the world to decrease nuclear arsenals it makes no sense for the US to be rebuilding theirs. This will only encourage other nations to do the same. *260-3*

Another factor is that in these times of economic crises how such expenditures can be justified is hard to imagine. Teachers are being fired, schools shut down, people are losing jobs and homes daily and our government wants to spend billions to build more dangerous weapons. It is time for our government to start paying more attention to community building and not bomb building. I recognize that these are policy issues and cannot be decided in such a forum, however they do need to be considered. *260-4*

260-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

260-2 The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 260 (cont'd): Michelle Victoria-Delon

But as far as this location for this sort of plant it is just far too dangerous. As we have narrowly escaped this time, at least so far, from the fires devastation at LANL we may not be so lucky next time.

I thank you for your deep consideration of these comments and those that come from other concerned citizens.

Kind regards,

Michelle Delon

SmartLifeways...it's easier than you think.

P Please consider the environment before printing this e-mail

As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. LANL approaches sustainability on a site-wide basis, knowing that new facilities will require the use of limited resources. New projects such as the proposed CMRR-NF are constructed in a manner that improve the efficiency of energy and water use site wide. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

260-3 President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

260-4 NNSA does not make decisions on the funding priorities of the U.S. Government. Funding decisions on Federal programs (for example, defense, education, healthcare, and renewable energy) and projects at LANL are made by Congress and the President, and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information. See Section 2.7, Economic Impacts, of this CRD for information on the economic impacts as evaluated in the *CMRR-NF SEIS*.

Sent: Friday, July 01, 2011 6:58 PM
To: NEPALASO@doeal.gov
Subject: CMRR Nuclear Facility Project

Please stop the funding and planning of building the above referenced nuclear facility-With New Mexico's water shortage, fires raging to Los Alamos and all over the state and a 60 year drought (possible) ahead, our country cannot afford this project in terms of human life and well being and social justice and the environment-Use this money to install solar panels, wind power, put people to work, not build more nuclear weapons-They just kill and I think we had done enough killing in our history-Please stop the madness and invest in our people and mother earth-Please don't build this plant-Thanks so much for your time and attention-Shari Korthuis *264-1*

264-1 NNSA notes the commentor's opposition to the funding and building of a new CMRR Facility at LANL. Funding decisions regarding major Federal programs (for example, health care and alternative sources of energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

The cost to build and operate the proposed CMRR-NF is not within the scope of the *CMRR-NF SEIS*, but it will be one aspect that NNSA takes into consideration when making its decision.

As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Subject: Future Plutonium Pits at LANL

Hello,

I am writing in opposition to the proposed new plutonium pits at LANL.

I am 37 years old, born and raised in New Mexico. Left for ten years and then came back.

This is my home, my families home and home to many people I love. I was pregnant with my daughter during the Cerro Grande fire. She is now ten and once again, we are breathing smoke from Los Alamos, wondering what toxic effects it may have on us. I am asking the person reading this to consider what better options, we as human beings, have for creating a safe world to live in. Is creating more weapons to kill others with, and in the process, creating more life threatening by products, really going to create a safe world for you to live in? *265-1*

I pray we can find a better way to live together and with our Earth.

Blessings and Love

Iscah Trujillo

265-1 NNSA notes the commentor's opposition to the CMRR-NF project. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the CMRR-NF SEIS, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Subject: plutonium pit facility - NAY

As a resident of New Mexico I would like to express my opposition to the proposed plutonium pit facility at LANL, particularly in the light of the Las Conchas fire and the presence of a fault line in the area. The explicit reasons are manifold and I'm sure others have expressed it more eloquently and succinctly than I am able to in this email.

I hope that you take all the concerns expressed from respondents into full consideration.

266-1

Sincerely,

Laure Liverman RN, MSN
125 Mesa Verde St.
Santa Fe, NM 87501

266-1 NNSA notes the commentor's remarks of opposition to the CMRR-NF project. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

To: NEPALASO@doeal.gov
Subject: Opposed to the proposed plutonium pit facility at LANL - please extend comment period due to massive wildfire burning at borders of LANL

As I sit watching the fires from my window here in Santa Fe, I am shocked and heartbroken to hear that there is a proposal for increased nuclear activity at LANL. Every day I put my suitcase in my car as I go to work, wondering if I'm going to have to leave my beloved home in order to protect my health. With the frequency of drought in this land, it is absolutely unconscionable that the nuclear activity increase here. There is more and more danger of fires just like this exteme fire before us now. We cannot allow this to happen. ***269-1***

Please extend the comment period so more of us who are sitting in shock, watching the fires edge closer and closer and crossing the border into LANL, can have time to be heard in this democracy. ***269-2***

Thank you,

Anna Molitor

--

"tell me, what is it you plan to do with your one wild and precious life?" ~mary oliver

269-1 NNSA notes the commentor's concern of the fires near LANL and the concerns of water resources and usage. Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS,* forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4–17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

269-2 NNSA notes the commentor's request to extend the public comment period. The CMRR Project was first analyzed in the 2003 *CMRR EIS* (DOE/EIS-0350). In response to the Las Conchas fire, which affected the Los Alamos community, NNSA extended the public comment period to July 5, 2011. All comments submitted to NNSA were considered in preparing the *Final CMRR-NF SEIS*.

To: NEPALASO@doeal.gov
Subject: Stop the weapons making at Los Alamos!

To whom it may concern:

One need not come from an Indigenous tribe to read the Sign Language that is abundantly expressing itself. I remember noticing what spiritual persons might regard as karmic blowback when after the U.S. launched a war of aggression against Iraq, on a case that was FIXED for war, that having eviscerated that region via The Gulf War, our very own Gulf of Mexico seemed targeted by Nature, Herself. No lesson was learned.

The B.P. oil disaster put human mistakes, and/or hubris on display for all the world to see, and for all the coastal residents to feel. Dead dolphins are but one of the trophies in this war on nature, or thoughtless ecocide.

The awful event comprised of both quake and tsunami that hit Japan in March, has left Fukushima as a gaping wound, emitting radiation that few authorities bother to measure, whilst few media sources dare to panic the public with facts. We know that most of the emissions have substantial half-lives and that many of these atomic particles are correlated to cancer.

270-1

Do you know that the spiritual teacher Yogananda gave a talk at the United Nations back in l949, seeking to explain that violence unleashed by human beings has its counterpart in disrupting invisible energy-based systems. These vibrations have much to do with holding the natural world together, i.e. stabilizing its systems. In spite of so much coming apart, and insurance companies no longer questioning climate change as the numbers are too strongly holding them to account for all the wild, unprecedented events that have spend up in frequency, intensity, and severity very rapidly... where has there been any scaling back in the way of violence?

Martin Luther King wisely stated that a nation that invests more in armaments than spiritual uplift for its people approaches spiritual death. And that is where the U.S., as a nation stands. That so much blood and treasure is wasted on nonsensical wars, those more likely about resource acquisition than any of the noble precepts used to "sell" them to The People, when it's needed at home to fund health care, affordable housing, public education, a stronger EPA, and programs that enrich and TRULY protect the citizenry is anything but the indication of National Security.

270-1 NNSA notes the commentor's opposition to nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 270 (cont'd): Susan Rose

First there is a knock on the proverbial door. If it's not opened (i.e. the message not received), eventually the door will be blown down. That is what we see with the fires that cannot BE contained surrounding Los Alamos. This is OBVIOUSLY a sign to cease and desist! Although there probably is no greater force of hubris than the U.S. military, incidentally the same machine that Eisenhower warned against in the speech given when he left office, there ARE higher powers. Nature is now showing her muscle.

The Native Americans who live downwind have suffered enough from the nuclear tests facilitated in the l940's. The uptick in natural disasters makes clear that few to no places are safe, especially when it comes to the storage of weapons so toxic that their radioactive emissions will be the "gifts" that keep on giving for many generations.

270-1 cont'd

Those who have devoted their careers to the agencies of death, and shown such a bankruptcy of conscience as to think this type of endeavor is protected by alleged patriotism know nothing about mercy, compassion, or Universal Law.

If letters from concerned citizens still mean anything, if this is indeed the democracy our defense department claims to be fighting to protect, then hear my voice and those of others! It is time to decommission these tools of death on a massive scale, and instead put the efforts of scientists and military personnel towards designing cities that can withstand the coming earth changes. It is time to GREEN the nation and use a variety of technologies that lessen our collective reliance on fossil fuels. If our thinkers got people to the moon, if they can store incredible amounts of data on a tiny computer chip, a Manhattan Project style incentive based on developing energy technologies that go more gentle on this great earth is overdue. Choose life!

270-2

Sincerely, Susan Rose

270-2 Project decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 271: Jennifer Davies, MD and William Davies, MD

To: NEPALASO@doeal.gov
Subject: CMRR Nuclear Facility project

To Whom It May Concern,

We are adamantly opposed to this new project to expand plutonium pit production at LANL. There are so many reasons that this is an inappropriate use of taxpayer money. We need to be investing in a sustainable future. The CMRR project only helps seal our fate as a dying species on this planet. ***271-1***

Sincerely,

Jennifer Davies, MD

William Davies, MD

271-1 NNSA notes the commentor's opposition to expanding plutonium pit production at LANL. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 272: Timothy Key Price

To: NEPALASO@doeal.gov
Subject: comments re draft CMRR-NF SEIS

Dear Mr. John Tegtmeier,

Thank you for this opportunity for input of the new building and future one.

I would like to see the lab take a leadership role in the nonproliferation of nuclear weapons and wastes. We do not need ANY new pits or weapons. We have plenty of old ones and high level intelligence can create ways of utilizing and revamping what we hare stockpiled already.

In short, (I know you have been reading lots):

Less is best. *273-1*

- new pits
- generating all sorts of waste
- re potential for contamination of environment, including and especially water.
- re weapons

Increasing responsibility, locally and globally manifested, are what is needed. Thoughts and actions.

Thank you for this opportunity for input and for sending a delegation to Taos for an interaction and opportunity for dialog.

Sincerely,

Mary J. Whiteman

273-1 NNSA notes the commentor's opposition to nuclear pits and nuclear weapons. A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information. The current CMR does support nonproliferation programs, as would the proposed CMRR-NF.

Decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

There are established programs at LANL that address radioactive discharges. LANL has established Pollution Plans that require the cleanup of any spills or leaks, monitoring of surface-water runoff, and implementation of best management practices. See Section 2.5, Cleanup and Waste Management, of this CRD for more information on cleanup of past contamination.

Commentor No. 274: Linda Trageser

From: Shakura [lshakura@aol.com]
Sent: Saturday, July 02, 2011 10:11 AM
To: NEPALASO@doeal.gov
Subject: oppose expanding plutonium projects at LANL that use our precious water

New Mexico, entering a 60 year drought, can not afford to give millions of gallons of ground water to research or bomb manufacturing.

What good are bombs to anyone if we don't have water to live? *274-1*

In addition, New Mexico is not safe from earthquakes or uncontrollable fires, the latter which will increase if the ground water is being used. *274-2*

Climate change and global warming is real. Put your energy into solving these serious problems before spending money to cause more problems. *274-3*

Thank you,

LInda Trageser
Santa Fe

274-1 NNSA notes the commentor's position on water resources. Based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

274-2 The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

274-3 NNSA notes the commentor's statement on funding of climate change and global warming problems. Funding decisions regarding Federal programs and activities (for example, global warming) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*.

Subject: We the PEOPLE oppose the CMRR Nuclear Facility Project .. are you crazy ??? Don't you love our planet and the people on it

277-1

Do you love anything but money ?? a Plutonium Bob Factory at Los Alamos... it does not get more insane than this.

We are American people who love this country, this land and its people, the air we breathe and mother nature.

Why would you think up an idea so dangerous it is symptomatic of a craziness that defies words.

This has not been thought through... Nature through LAS CONCHAS fires is trying to attempt to show us that this idea is so crazy given the propensity for fires in the area.. even if you did not have barrels of Poison in the canyons.

Who thought that this idea was a good one? Those are the people who should be institutionalized for being crazy so the rest of us can live. THere is no where else for us to go but this earth... why not take care of it and the rest of us when there are so many worthy alternatives to death and the use of plutonium. Just because you don't know what else to do with it.

That should have been thought through way before now... and not even a 2nd grader would think this was a good idea.

Why is the government pushing the CMRR Nuclear Facility project in such a hurried manner?

The supplemental EIS must be retracted and the public comment period must be extended.

The Las Conchas Fire has woken us up. We must now stop the maniacal plan to build the plutonium bomb factory at Los Alamos.

constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 278: Arifa Goodman

From: goodkaz@newmexico.com
Sent: Saturday, July 02, 2011 3:41 PM
To: NEPALASO@doeal.gov
Subject: Opposing the CMRR Nuclear Facility project

In the light of the devastating fires that continually threaten LANL; in the light of recent scientific evidence for greater seismic activity in the Los Alamos area than initially believed; in the light of continued drought for the area that makes the estimated 16 million gallons of water needed annually for this project untenable; in the light of the real needs of the planet for sustainable technologies aimed at bettering conditions on the planet, it is foolhardy at best but more accurately completely insane to build this plutonium enrichment facility at LANL whose only purpose is nuclear bomb production. Please put our tax dollars to beneficial use: like spearheading an energy revolution into sustainable, non-polluting technologies. This is what is needed now, not more weapons of mass destruction. ***278-1***

Thank you for your kind consideration of this comment.

Sincerely,
Arifa Goodman
PO Box 303
San Cristobal, NM 87564

278-1 NNSA notes the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD.

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission, (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that

Commentor No. 278 (cont'd): Arifa Goodman

are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Funding decisions regarding major Federal programs (for example, health care and energy) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*.

Commentor No. 279: Mary Saunders

To: NEPALASO@doeal.gov
Subject: Nuclear activity at Los Alamos

To NEPALASO:

I support reparations for the local tribes who have been affected by nuclear activity at the Lab.

Keeping these radioactive substances safe is impossible. Please move to lessen the risks. *279-1*

Thank you for your attention to this matter,

Mary Saunders
Oregon

279-1 NNSA notes the commentor's concerns regarding reparations; however, the commentor's concerns are not within the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. The analysis includes the potential impacts from severe accidents at the CMRR-NF, including possible fires.

Commentor No. 280: Sharyn Scull

From: Rodenham@aol.com
Sent: Saturday, July 02, 2011 4:18 PM
To: NEPALASO@doeal.gov
Subject: We oppose ther CMRR project at Los Alamos

The proposed Los Alamos CMRR project would cost taxpayers billions on an unsafe project, one that will require far too much water in an area experiencing deepening droughts, place more plutonium in an area beset by wildfires, and more. In addition, seismic risks need further assessment, as do construction methods in the ash layers of the area. *280-1*

Please do not let this project go forward.

Thanks for your attention to my comments,

Sharyn Scull
902 Birdie Way St Augustine, FL 32080

280-1 NNSA acknowledges the commentor's opposition to the construction and operation of a new CMRR Facility at LANL. Funding decisions regarding major Federal programs (for example, health care and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. The purpose of the *CMRR-NF -SEIS* is to evaluate the environmental impacts of alternatives related to the proposed CMRR-NF. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

In regards to the 'safety' of the project, NNSA must comply with laws and regulations pertaining to the protection of human health and the environment. In addition, DOE has its own orders and directives that must be implemented to protect human health and the environment. The potential impacts of the proposed project are presented in Chapter 4 of the SEIS.

As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the

Commentor No. 280 (cont'd): Sharyn Scull

proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Subject: Increased plutonium bomb manufacturing

Dear Sirs (As I know Men are the only ones who would have what they think is this brillant idea),

Thankfully it has come to my attention of your intention to increase plutonium bomb manufacturing at Las Alamos regardless of whether or not you destroy native sacred sites, native history, reside on a fault line or even bother to use a current and updated EIS. Seems you are hell bent on doing this regardless of the fire danger, regardless of the governments own reports that the fire department is unable to handle any type of fire at Las Alamos, regardless of areas in Las Alamos threatened by the current blazes, because I am writing to protest this ill thought of concept and demand it stops immediately.

You have no business decidng that my children's future isn't viable from the nuclear accident you will surely have-you are already demonstrating your lack of thoroughness and sloppiness by way you are trying to gain expansion of plutonium bomb manufacturing. I suppose Japan wasn't enough to make you stop and ask the question ...what if? We are assured time and again that this question is asked and well planned out; until a disaster occurs "that wasn't though of." We also have been shown time and again that companies who rush get burned-BP comes to mind.

284-1

The earth is taking back what she needs to take back and will continue to do so. She is already spitting up the toxic wastes you have buried within her. They burn her so she is giving them back and you are aware of this but don't care. At the same breath, you seriously ask me to help you (give you tax money) to destroy my planet? No, I won't do that and more importantly won't allow you to either. I am taking a stand and it is for my planet, for my human race, for my country.

Finally, I must ask the obvious question; how many plutonium bombs do you need to destroy the planet? You seriously don't have them stock piled yet? How many times are you planning on bombing once an area is gone? Are you going to go back to decimated area and bomb some more because you have to use them all?

I am unwilling to let you gamble my future, my children's futre, my grandchildren's future because you just need to make more bombs. How many programs that are proposed for cuts would be saved by diverting funds into them from this? I intend to ask my Colorado representatives the same question.

Sincerely,

Judith Niederquell

284-1 NNSA acknowledges the commentor's concerns about saving our planet and protecting the environment and our people.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Chapter 4 of the *CMRR-NF SEIS* provides the environmental impacts analysis, which evaluates potentially affected resource areas in a manner commensurate with the importance of the potential effects on each area. Resource areas evaluated include land use and visual resources, site infrastructure, air quality and noise, geology and soils, surface-water and groundwater quality, ecological resources, cultural and paleontological resources (including the potential impact to native sites), socioeconomics, human health, environmental justice, waste management and pollution prevention, and transportation and traffic.

During the public comment period on the *Draft CMRR-NF SEIS*, many commentors expressed the position that a new environmental impact statement is needed, rather than an SEIS. However, NNSA determined that an SEIS is the appropriate level of analysis, based on CEQ and DOE NEPA regulations. Refer to Section 2.2, NEPA Process, of this CRD for more information.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

Commentor No. 284 (cont'd): Judith Niederquell

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL is noted. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Regarding the commentor's concern about the funding priorities of the U.S. Government, funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

In summary, NNSA notes the commentor's opposition to pit production and the existence of nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

To: NEPALASO@doeal.gov
Subject: CMRR Project Comment

Hello,

I just read an article on this project to make plutonium weapons at LANL. I had not heard anything about this, why is this not in the news more?

My comment is that I think it is a very bad idea. I am absolutely totally 100% against this and Am hoping that NM representatives, governor, and lab employees and officials reconsider this idea. There are so many things your amazing brains could be used for. Destructive materials are a waste of your intelligence. Use your amazing resources there for GOOD, not evil! You could do so much to further clean, safe energy and technology---and THIS is what you decide on? This is what you want to use the brightest people in our country for? I don't feel there has been enough research into the seismic consequences of this either. LANL is near a volcano that is active underground at this time, and its on earthquake fault lines. Making things there stable for a 7.0 earthquake is inadequate and dangerous to everyone in the area, maybe even in the county. For God's sake, look at what is happening in Japan due to radioactive materials...and I figure we are not getting all the information on that either. Please re-consider your plan. It's a bad one. ***286-1***

Thank you for reading my comment,

Therese

A local resident

286-1 NNSA notes the commentor's opposition to pit production and the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Seismic issues are addressed in Section 2.6, Seismic and Geologic Concerns, of this CRD. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

In response to public comments on the possibility of volcano activity in the LANL region, Appendix C, Facility Accidents, and the Geology and Soils

Commentor No. 286 (cont'd): Therese

sections of Chapter 3 and 4 (Sections 3.5.1 and 4.3.5), of the *Final CMRR-NF SEIS* have been revised to include additional information regarding the potential volcanic hazards as described in the report, *Preliminary LANL Volcanic Hazards Evaluation* (LANL 2010c). A volcanic eruption during the life of the CMRR-NF is an unlikely event.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant require a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

288-1 NNSA notes the commentor's opposition the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1 of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 289: Mercedes Lackey

From: Mercedes Lackey [helloelsie@gmail.com]
Sent: Saturday, July 02, 2011 8:31 PM
To: NEPALASO@doeal.gov
Subject: I oppose the CMRR Nuclear Facility project

1) I oppose the construction of this facility on the grounds that the fires that have already closed the Los Alamos facility prove that it is unsafe to build this facility in fire country. The fires have already overrun many areas of the Los Alamos labs and closed them. It would be insane to build a plutonium-handling facility in fire country. ***289-1***

2) I oppose the construction of this facility on the grounds that this area is geologically unstable. No good assessment of earthquake potential has been done, yet the proposed site is right on top of a caldera. ***289-2***

3) I oppose the construction of this facility on the grounds that there is not enough water now for the population of the area, yet it is proposed that millions of gallons of water be virtually stolen from the existing population in order to meet the needs of this facility. Where is the population going to get its water from when it is stolen? Where is the water going to come from to serve existing agricultural and population needs? ***289-3***

5) I oppose the construction of this facility on the grounds that the existing stockpile of nuclear weapons is more than sufficient. No new nuclear weapons need to be created, when the stockpile that exists is sufficient to rend the entire planet uninhabitable three times over. ***289-4***

6) I oppose the construction of this facility on the grounds that, given the austerity measures being demanded, it is time to cut back on military spending. When people are dying of treatable illnesses, going hungry, going homeless, and all these is justified in the name of "austerity measures" it is more than time for the military to stop spending money like it was nothing. ***289-5***

Sincerely

Mercedes Lackey

289-1 NNSA notes the commentor's opposition the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

289-2 Section 2.6, Seismic and Geologic Concerns, of this CRD addresses the commentor's concerns about seismic hazard.

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

Subsequent to the original proposal of the CMRR Facility and preparation of the 2003 *CMRR EIS*, updated seismic hazard analyses of the LANL region were issued (LANL 2007, 2009) and site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). (The 2009 update to the 2007 probabilistic seismic

Commentor No. 289 (cont'd): Mercedes Lackey

hazard analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazard analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into the structural requirements necessary for constructing the proposed Modified CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage (see Chapter 2, Section 2.6.2, of the *CMRR-NF SEIS*).

289-3 As indicated in Chapter 2, Section 2.10.1, of the *CMRR-NF SEIS*, water use for construction and operation under the Modified CMRR-NF Alternative would exceed that of the other two alternatives. As shown in Chapter 4, Tables 4–15 through 4-17, and discussed in Section 4.3.3 of the *CMRR-NF SEIS*, based on current water use and the projected use under the Modified CMRR-NF Alternative, water use at LANL is expected to remain below its allotment of 542 million gallons (2,050 million liters) per year. See Section 2.10, Water Resources and Usage, of this CRD for more information on water resources at LANL.

289-4 A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Commentor No. 289 (cont'd): Mercedes Lackey

289-5 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense, education, healthcare, and housing) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Hello, I'd say buenas dias to you, but it is far from being good.

As to the proposed facility, CMRR Nuclear Facility, simply: NO! HALT!

LANL and subsequent sites should and must clean their sites before anything else is proceeded with - anything at all. If LANL and the government continues with anything other than cleaning up every and all places such as Acid Canyon, it is unpatriotic and defiles our human existence.

What the government has done to our land, air and water since the time of the origination of the Manhattan Project and it's on-going similar projects / sites is nothing short of genocide. Our people will no longer stand by while our government and it's factions poison us with little regard. We're neither stupid nor lemmings. Our earth, our home, has been desecrated for far too long at our expense and it must stop immediately. We do not want nuclear anything in New Mexico at all. *297-1*

Your LANL house is infested, walls crumble, there are fires hazards, your dishes are dirty, things are rotting in storage, and you haven't thrown the trash, much less wiped your arse.

Viva la revolucion!

Ronnie Ortiz

297-1 NNSA notes the commentor's opposition to the CMRR-NF project and nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 298: Marc Choyt

From: Marc Choyt [reflective@cybermesa.com]
Sent: Sunday, July 03, 2011 10:00 AM
To: NEPALASO@doeal.gov
Subject: Proposed storage facility

July 3, 2011

To Whom It May Concern:

I strongly oppose the building of a nuclear storage facility in Los Alamos. Given the current fire and the potential for earthquakes, the containment of plutonium in the new structure represents a threat to all surrounding communities. The recent events in Japan also demonstrate that there is no failsafe. *298-1*

Marc Choyt
912 Baca St.
Santa Fe, NM 87505

298-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Section 2.6, Seismic and Geologic Concerns, of this CRD addresses the commentor's concerns about the potential for earthquakes. The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake.

The danger of plutonium has been recognized since its first large-scale production in 1945. The awareness and knowledge of plutonium toxicity has resulted in DOE using special designs, operations, and procedural measures to protect workers and the public; such safety features and controls would be incorporated into the design and operation of the CMRR-NF. Chapter 4, Sections 4.2.10,

Commentor No. 298 (cont'd): Marc Choyt

4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives.

NNSA acknowledges the commentor's concern that an accident similar to that which occurred recently in Japan at the Fukushima Daiichi Nuclear Power Plant could happen at LANL. There are fundamental differences between the functioning of a nuclear reactor and activities at LANL. The type of radiological accident that occurred at the Fukushima Daiichi Nuclear Power Plant requires a large source of energy that is produced from the fissioning of nuclear fuel. The plutonium metal and oxide used at LANL cannot produce a sustained nuclear reaction by themselves and do not produce large amounts of decay heat that require the use of active cooling systems. For more information on this issue refer to Section 2.8, Nuclear Accidents, of this CRD.

Commentor No. 299: Dicron Meneshian

Subject: Please Do Not Build a Plutonium Factory in Fire Country

To whom it may concern,

Even though I am a resident of the state of Connecticut, I am urging you not to build a plutonium factory in fire country.

We live a on a very small planet. Everything we do on planet Earth is connected to everything we have share and enjoy on planet Earth. *299-1*

The repercussions of your actions have effects around the world.

yours,

Dicron Meneshian
Riverside, CT 06878

299-1 NNSA notes the commentor's opposition to the CMRR-NF project. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF, nor would plutonium production. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Subject: Los Alamos Lab CMMR final phase

I adamantly oppose the construction of a new radiological facility at Los Alamos Nuclear laboratory with the intent to increase plutonium production. The facility is already a liability, not an asset, to the American people and the global community. ***300-1***

The fires currently burning are proof that we cannot continue to promote nuclear technology and assume that human error and environmental influences will not endanger the health of the planet and its inhabitants forevermore. ***300-2***

Weapons and warfare are not keeping us safe. They are making us more vulnerable and creating more enemies. It is time that we are no longer dominated by those with an assault oriented strategy and we focus on restoring the health of our own nation. The assault oriented perspective has run rampant and unchecked for far too long and has endangered the United States and destabilized our relations globally. Enough.

Mary Ross

300-1 NNSA notes the commentor's opposition to the CMRR-NF project and nuclear weapons. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

A key purpose of the continued operation of LANL is to support NNSA's core missions as directed by Congress and the President, which includes ensuring a safe and reliable nuclear weapons stockpile. Work performed in the CMR Building and the proposed CMRR-NF supports this effort. This entails maintaining the existing stockpile, not adding more nuclear weapons. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not take place in the CMR Building and would not take place in the CMRR-NF, nor would plutonium production. Refer to Section 2.4, CMR Mission, of this CRD for more information.

300-2 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. 307-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the CMRR-NF SEIS, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Commentor No. 308: Barbara Larcom

From: Barbara Larcom [barbara.larcom@gmail.com]
Sent: Sunday, July 03, 2011 10:29 PM
To: NEPALASO@doeal.gov
Subject: Stop the Building of a Plutonium Bomb Factory in Fire Country

I am submitting my comments about the proposed plutonium bomb factory at the Los Alamos National Laboratory (LANL). I am TOTALLY and UTTERLY OPPOSED to this idea. It strikes me as nothing less than insane that it is even being considered.

The area has been described as "between a super volcano - Valles Caldera to the west and the Rio Grande River, our main water source to the east, on an active seismic zone, in a forested wildfire habitat." (Joni Arends, executive director of Concerned Citizens for Nuclear Safety) ***308-1***

You got lucky this time that the wildfire didn't reach the laboratory. What makes you think you'll always be so lucky, when it comes to future wildfires in the area? And what about seismic activity? Why would you even consider endangering the lives of the human beings and wildlife in the area? Why would you consider destroying an important water source, the Rio Grande River? ***308-2***

In addition, the proposal shows no respect for the desires of the Native Americans like the Pueblo who have lived in the area for many centuries. They have expressed their opposition to the proposed bomb factory. ***308-3***

Finally, why is a bomb factory being proposed at all? There are so many GOOD ways we could spend the $6 billion that this project would cost. Our country and its people need jobs, education, healthcare – and instead the proposal is to build a BOMB FACTORY for the purpose of DESTROYING THE EARTH? ***308-4***

Barbara Larcom
2743 Maryland Avenue
Baltimore, MD 21218

--

"A nation that continues year after year to spend more money on military defense than on programs of social uplift is approaching spiritual death."

"Darkness cannot drive out darkness; only light can do that. Hate cannot drive out hate; only love can do that....The chain reaction of evil--hate begetting hate, wars producing more wars--must be broken, or we shall be plunged into the dark abyss of annihilation."

Martin Luther King, Jr.

308-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, and Section 2.4, CMR Mission, of this CRD for more information.

308-2 Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the CMRR-NF SEIS, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

The geologic setting of LANL is described in Chapter 3, Section 3.5, of the *CMRR-NF SEIS*. The location of the proposed CMRR-NF is about 3,300 feet (1,000 meters) east of the closest mapped surface trace of faults associated with the Pajarito fault system. A trace of one of these faults underlies a portion of the existing CMR Building. Based on site-specific geotechnical investigations, no evidence of active surface-rupturing faults directly at the CMRR-NF building location were found (Gardner et al. 2009). At LANL, and for the CMRR Project specifically, facilities are designed to site-specific earthquake design criteria that are more conservative than those in the International Building Code so that the facilities remain safe in the event of a large earthquake. See Section 2.6, Seismic and Geologic Concerns, of this CRD for more information.

The impacts analysis in the SEIS indicates that there would be minimal impacts on humans and the environment from normal operations under any of the alternatives. The analysis indicates that the risk of environmental contamination is limited to extremely unlikely accident events. There would be essentially no impact on the Rio Grande; under all three alternatives, there would be no operational discharges dirctly to the environment. All radioactive liquids would

Commentor No. 308 (cont'd): Barbara Larcom

be transferred to RLWTF. At RLWTF, the liquids would be treated to meet discharge criteria and released through a permitted outfall or to a zero liquid discharge facility. Other liquids would be routed to the Sanitary Wastewater Systems Plant, where they would be treated prior to discharge through a permitted outfall.

308-3 Chapter 3, Section 3.10, of the *CMRR-NF SEIS* has been updated to include additional information on the minority and low-income populations surrounding LANL. Chapter 4, Sections 4.2.10, 4.3.10, and 4.4.10, of the *CMRR-NF SEIS* present the potential human health impacts of the proposed alternatives. As indicated in Chapter 4, Sections 4.2.11, 4.3.11, and 4.4.11, there would be no disproportionately high and adverse impacts on minority or low-income populations, including Native Americans and Hispanics, under any of the alternatives.

308-4 NNSA notes the commentor's concern regarding the funding priorities of the U.S. Government. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Hello. Due to the wildfires, more plutonium storage is suicidal. Please redirect the funds into something that can support the people of this beautiful state. *311-1*

Thank you.

311-1 NNSA notes the commentor's opposition to construction and operation of a new CMRR Facility at LANL. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Wildfires, such as the Las Conchas fire of June 2011 and the Cerro Grande fire of May 2000, are recognized hazards in the area around LANL. As indicated in Chapter 3, Section 3.7.1, of the *CMRR-NF SEIS*, forests are thinned as part of an ongoing Wildfire Hazard Reduction Program to reduce the fuel load available in the event of a fire. The risks and potential impacts of a wildfire on the entire LANL site were evaluated in the 2008 *LANL SWEIS*, Appendix D (DOE 2008a). The CMR Building and the TA-55 Plutonium Facility were not included as facilities that present a significant risk due to wildfires because these facilities are constructed of noncombustible materials and are surrounded by buffer areas in which combustible materials including vegetation are kept to a minimum. For the same reasons, wildfires are not expected to result in the release of radioactive materials from the proposed CMRR-NF. Appendix C of the *CMRR-NF SEIS* was revised to include a discussion of the potential effect of a wildfire on the proposed CMRR-NF, and information on the Las Conchas wildfire was included in Chapter 3, Sections 3.2 (Land Use), and 3.7 (Ecological Resources).

Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, of this CRD for more information.

Commentor No. 312: Dave McCoy, Director
Citizen Action

Comments on the National Nuclear Security Administration (NNSA)
Supplemental Environmental Impact Analysis (SEIS) for the
(CMRR)
Citizen Action New Mexico

I. The SEIS Fails to Consider Requirements of International Law.

312-1

By seeking to proceed with the construction of nuclear weapons at the LANL CMRR and the modernization of nuclear weapons, the United States is violating the Nuclear Nonproliferation Treaty (NPT). The US is acting contrary to the Advisory Opinion of July 8, 1996 of the International Court of Justice (ICJ) regarding the Legality of the Threat or Use of Nuclear Weapons. Both Article VI of the NPT and the Advisory Opinion contain an obligation to negotiate in good-faith for "general and complete nuclear disarmament."

The required cessation of the nuclear arms race applies to all nations, but especially to the United States, Britain, France, Russia, and China, the five nuclear powers acknowledged at the outset of the treaty.

The quadrupled production of nuclear bomb cores and the modernization of nuclear weapons at the LANL CMRR and other national laboratories violates the GOOD-FAITH NEGOTIATION requirement for disarmament. By continuing construction of the nuclear weapons infrastructure, the US is acting contrary to the principle of the long term durability of disarmament measures and disarmament that was approved by the NPT Review Conference in 2000. The code words for progams of nuclear weapons expansion have included: "advanced concepts" research, the "reliable replacement warhead," and "a more robust nuclear weapon."

The continued expansion of nuclear weapons development is evidenced by Sandia National Laboratories ongoing subcritical testing of nuclear weapons through the use of the Z-Machine.

The actions of the President, the Congress and the national laboratories is to build more weapons of mass destruction that will have long term planetary environmental consequences. Prouction or use of nuclear weapons is in opposition to humanitarian concerns expressed by the International Court of Justice. In consideration of the violations of the principles of humanitarian law, the Court stated some of the following:

> 36. [I]t is imperative for the Court to take account of the unique characteristics of nuclear weapons, and in particular their destructive capacity, their capacity to cause untold human suffering, and their ability to cause damage to generations to come.
>
> 42. The proportionality principle may thus not in itself exclude the use of nuclear weapons in self-defence in al1 circumstances. But at the same time, a use of force that is proportionate under the law of self-defence, must, in order to be lawful, also meet the requirements of the law applicable in armed conflict which comprise in particular the principles and rules of humanitarian law.
>
> 78. The cardinal principles contained in the texts constituting the fabric of humanitarian law are the following. The first is aimed at the protection

312-1 NNSA acknowledges the commentors' concerns about treaty compliance, international law, pit production, and the proliferation of nuclear weapons. Current operations at LANL do not violate the Treaty on the Non-Proliferation of Nuclear Weapons, the New Strategic Arms Reduction Treaty, or any other nonproliferation treaties to which the United States is a signatory, nor would the operations that would be performed in the proposed CMRR-NF. Refer to Section 2.9, Treaty Compliance, of this CRD for more information. Analysis of the environmental impacts associated with the use of nuclear weapons is beyond the scope of this SEIS.

As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. The CMR Building provides, and the proposed CMRR-NF would provide, capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

President Obama has stated a long-term goal of a world free of nuclear weapons. President Obama also stated that this goal would not be reached quickly. Since the 1940s, the President and Congress have directed DOE and its predecessor agencies to develop and produce the Nation's nuclear weapons and to ensure the safety and reliability of the nuclear weapons stockpile. Even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be an important element of national security policy for the foreseeable future. Refer to Section 2.1, Opposition to the CMRR-NF, Nuclear Weapons, and Nuclear Technology, of this CRD for more information.

Commentor No. 312 (cont'd): Dave McCoy, Director Citizen Action

of the civilian population and civilian objects and establishes the distinction between combatants and non-combatants; States must never make civilians the object of attack and must consequently never use weapons that are incapable of distinguishing between civilian and military targets. According to the second principle, it is prohibited to cause unnecessary suffering to combatants: it is accordingly prohibited to use weapons causing them such harm or uselessly aggravating their suffering.
In application of that second principle, States do not have unlimited freedom of choice of means in the weapons they use.
The Court would likewise refer, in relation to these principles, to the Martens Clause, which was first included in the Hague Convention II with Respect to the Laws and Customs of War on Land of 1899 and which has proved to be an effective means of addressing the rapid evolution of military technology. A modern version of that clause is to be found in Article 1, paragraph 2, of Additional Protocol 1 of 1977, which reads as follows:

> "In cases not covered by this Protocol or by other international agreements, civilians and combatants remain under the protection and authority of the principles of international law derived from established custom, from the principles of humanity and from the dictates of public conscience."

In conformity with the aforementioned principles, humanitarian law, at a very early stage, prohibited certain types of weapons either because of their indiscriminate effect on combatants and civilians or because of the unnecessary suffering caused to combatants, that is to Say, a harm greater than that unavoidable to achieve legitimate military objectives. If an envisaged use of weapons would not meet the requirements of humanitarian law, a threat to engage in such use would also be contrary to that law .
80. The Nuremberg International Military Tribunal had already found in 1945 that the humanitarian rules included in the Regulations annexed to the Hague Convention IV of 1907 "were recognized by al1 civilized nations and were regarded as being declaratory of the laws and customs of war" *(Trial of the Major War Criminals, 14 November 1945-1 October 1946*, Nuremberg, 1947, Vol. 1, p. 254).
86. … "In general, international humanitarian law bears on the threat or use of nuclear weapons as it does of other weapons."

Source: immoral://www.icj-cij.org/docket/files/95/7495.pdf?PHPSESSID=efe26ca87de1e6ed11fde11cc5e2fc65

The NNSA "legal justifications" for the continued production and modernization of the nuclear weapons complex at LANL reflect the mindset of a nation that espouses legal arguments for torture, used two nuclear weapons against civilian populations and invaded at least 18 other nations.

The dissenting opinion of ICJ Judge Weeramantry argues that the use of nuclear weapons produces factual consequences of such an inhumane nature as to clash with the basic principles of humanitarian law. He summarized the effects of the nuclear weapon:

312-1 cont'd

Response side of this page intentionally left blank.

Commentor No. 312 (cont'd): Dave McCoy, Director Citizen Action

(a) Damage to the environment and the ecosystem
(b) Damage to future generations
(c) Damage to civilian populations
(d) The nuclear winter
(e) Loss of life
(f) Medical effects of radiation
(g) Heat and blast
(h) Congenital deformities
(i) Transnational damage

The SEIS does not recognize that the CMRR project is designed for the construction of weapons of mass destruction. The above devastating environmental effects from the use of a nuclear weapon produced by LANL should be under consideration in the SEIS. To limit the environmental effects of Plutonium pit production only to workers or the surrounding communities near LANL is to remain blind to the full destructive potential of nuclear weapons on a worldwide scale.

312-1 cont'd

DOE has contaminated every national laboratory site and surrounding communities with hazardous waste and radioactivity. The US spends some $35 – 50 Billion dollars a year of taxpayer money to merely maintain the US nuclear weapons arsenal. This is a theft from every social program in the nation. Rather than funding the expansion of nuclear weapons programs and generating more waste, the 6 billion dollars that CMRR will cost should be spent on cleaning up the existing nuclear waste at LANL. 21,000,000 cu ft of nuclear and hazardous wastes are already buried at LANL in unlined pits, trenches and shaft wihtout liners.

312-2

The consequences of US actions internationally will encourage a competition of worldwide proliferation of nuclear weapons. This increases the reliance on nuclear weapons for state security policies with the increased risk of accidents and deliberate use. The US remains on hair-trigger alert status for the use of nuclear weapons against other nations. Building the CMRR will further exacerbate world tension.

President Obama's "vision" of a nuclear weapons free world is far from the reality of the actions and vast sums of money that are supporting the nuclear weapons industry.

312-1 cont'd

II. The SEIS does not meet legal requirements of the Council on Environmental Quality regulations to provide consideration of alternatives and for the resolution of siting, safety and waste issues. (10 CFR 1502).

No Safety Analysis Report for the LANL Plutonium Bomb Factory (CMRR) has yet been issued as is required to be performed at the earliest practicable point in conceptual or preliminary design.

312-3

3

312-2 NNSA notes the commentor's opinion regarding the funding priorities of the U.S. Government and concern about cleanup of wastes at LANL. NNSA does not consider compliance with the Consent Order to be optional and progress on implementing the Consent Order is not linked to decisions on construction of the proposed CMRR-NF. It should be noted that DOE and NNSA have limited authority in making decisions about how budgeted funds are spent. Funding decisions regarding major Federal programs (for example, defense and education) and projects at LANL are made by Congress and the President and are not within the scope of the *CMRR-NF SEIS*. Refer to Section 2.3, Programmatic Direction and Decisions, and Section 2.5, Cleanup and Waste Management, of this CRD for more information.

312-3 NNSA disagrees with the commentor's opinion that the SEIS does not comply with CEQ requirements. A Preliminary Documented Safety Analysis has been developed by the project and an approved Preliminary Safety Validation Report was issued documenting the NNSA Los Alamos Site Office review of the Preliminary Documented Safety Analysis. Both documents are the appropriate level of safety analysis required at this stage in the project lifecycle.

As discussed in Section 2.2, NEPA Process, of this CRD, the *CMRR-NF SEIS* was prepared in compliance with CEQ and DOE NEPA regulations. Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner (see Chapter 1, Section 1.3, of the *CMRR-NF SEIS*). The No Action Alternative included in the CMRR-NF SEIS is based on the 2004 ROD for the *2003 CMRR EIS* (69 FR 6967).

A decision on the level of pit production is not within the scope of the *CMRR-NF SEIS*, as that decision was made in the *Complex Transformation SPEIS* ROD in December 2008 (73 FR 77644). As indicated in Chapter 2, Section 2.4, of the *CMRR-NF SEIS*, pit production does not occur in the CMR Building and would not occur in the CMRR-NF. The CMR Building and the CMRR-NF provide capabilities for performing analytical chemistry, materials characterization, and plutonium research in support of the plutonium mission (including stockpile stewardship, maintenance, and pit production), but they are not tied specifically to LANL's pit production capability or to any particular pit production level

Commentor No. 312 (cont'd): Dave McCoy, Director Citizen Action

The "need" for the CMRR and the "no-build option" are not addressed by the SEIS. The stated reason is that the policy considerations of President Obama require that the nation continue modernization of the nuclear weapons complex. There is a contradiction between the Presidential vision for a nuclear weapons free world and the expansion of the nuclear weapons complex.

The justification for CMRR production of 80 additional plutonium pits is faulty, given that there are a total of approximately 40,000 plutonium pits in storage and on missiles under US control.

Approximately 5000 of those pits are deployable as nuclear weapons. The US constructed approximately 70,000 nuclear weapons and used two of the weapons over 50 years ago. Nuclear weapons are obsolete and serve no purpose for the taxpayer. None of the US invasions of at least 18 foreign nations including Iraq and Afghanistan have required the use of nuclear weapons.

312-3 cont'd

Alternatives to the proposed action Sec. 1502.14 (d) must include the no-action no-build alternative. NNSA is incorrect in its rationale for not presenting the no-build alternative for CMRR. The National Environmental Policy Act (NEPA 1969) 42 U.S.C.A. 4321 to 4370d and the Council on Environmental Quality regulations require detailed analysis of alternatives that are considered to be the "heart" of an EIS. (§ 4332(C)(iii) and (v) and CEQ § 1502.14). The "no-build" alternative is always included as a benchmark against which the impacts of other alternatives are to be compared. NNSA cannot eliminate the no-action/no-build alternative from discussion. The fact that the no-build alternative does not meet the purpose and need of the NNSA or the President does not allow dismissal of the statutory requirement.

The SEIS offers no assurance that the CMRR can be safely constructed to protect the public and the environment. The chosen site for the CMRR location is above soft volcanic ash and is a formula for seismic disaster. This is described in greater detail below. The alternative or mitigation measure has not been considered for placing the plutonium vault and the water for the fire suppression system at another location. Workers exposure in the event of an accident has not received consideration.

312-4

Waste disposal operations are not considered in the SEIS. The Liquid Radioactive Waste Facility, essential to CMRR operations, is at the end of its operational lifetime and is not designed to withstand the large seismic event that can occur. Deactivation, decommissioning, decontamination at end of life for the CMRR are not considered in the SEIS after the proposed 50 years of operation. The amounts of hazardous and radioactive waste that will be generated and the pathway for disposal are not presented.

312-5

There is no assurance that the CMRR and the related facilities necessary for operations can comply with the requirements of DOE Orders. DOE O 420.1 and DOE G-420.1-2 require that structures, systems, and components at DOE facilities be designed and constructed to withstand the effects of natural phenomena hazards using a graded approach.

DOE must comply with the federal requirements of Title 10 Part 835 *Occupational Radiation Protection Requirements*. The requirements of DOE Order 420.1 and Guides are to meet compliance with 10 CFR 835. DOE is not incompliance with (1) *DOE G 420.1-1, Nonreactor Nuclear Safety Design Criteria and Explosive Safety Criteria Guide*

312-6

4

of activity that would take place at the TA-55 Plutonium Facility. Refer to Section 2.4, CMR Mission, of this CRD for more information.

Although a number of commentors expressed the opinion that nuclear weapons are obsolete, the President and Congress have assigned NNSA the mission of ensuring the safety and reliability of the nuclear weapons stockpile.

312-4 This CMRR-NF SEIS presents the environmental impacts of alternatives for construction and operation of the CMRR-NF at LANL. NNSA believes that the analyses in this CMRR-NF SEIS demonstrate that the CMRR-NF can be safely constructed and operated.

Site-specific geotechnical investigations have been completed for both the Shallow Excavation Option and the Deep Excavation Option. A geotechnical report prepared for the Shallow Excavation Option provides a thorough analysis that focuses on, among other things, the foundation design and performance, taking into account the local seismic setting and the underlying stratigraphy, which includes an unconsolidated tuff layer approximately 15 feet (4.6 meters) below the depth of the proposed foundation (Kleinfelder 2007a, 2007b). The proposed CMRR-NF would be designed and constructed in accordance with geotechnical recommendations provided in the geotechnical report (Kleinfelder 2007a). Similarly, the Deep Excavation Option would be completed in accordance with recommendations resulting from the geotechnical reports (Kleinfelder 2010a, 2010b). This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The results of this evaluation have been included in the design of the CMRR-NF, which is still under way and will continue to evolve. See Section 2.6, Seismic Concerns, of this CRD for more information.

Chapter 2, Section 2.7, of the CMRR-NF SEIS has been revised to describe alternatives that were considered but dismissed as not meeting NNSA's purpose and need. The alternative of distributing AC and MC capabilities among multiple facilities at LANL was considered, but not analyzed as a reasonable alternative. Because of the quantities of special nuclear material involved, to fully perform the AC, MC and plutonium research capabilities, facilities would need to be classified as Hazard Category 2 and Security Category 1. RLUOB was not intended as a nuclear-qualified space to handle Hazard Category 2 or 3 levels of

Commentor No. 312 (cont'd): Dave McCoy, Director
Citizen Action

for use with DOE O 420.1 Facility Safety and (2) DOE G 420.1-2, *Guide for the Mitigation of Natural Phenomena Hazards for DOE Nuclear Facilities and NonNuclear Facilities*, along with additional requirements.

There is an established hierarchy in the set of documents that specify Natural Hazard Phenomena (NPH) requirements. In this hierarchy, 10 CFR Part 830 Nuclear Safety Management (for Nuclear Facilities only) has the highest authority followed by DOE Order 420.1 and the associated Guides DOE G 420.1-1 and DOE G 420.1-2. The four NPH standards (DOE-STDS-1020, 1021, 1022, 1023) are the last set of documents in this hierarchy.

No indication is given in the SEIS that the there is recognition or compliance with Defense Nuclear Facilities Recommendation 2004-2, *Active Confinement Systems* for radiological releases. The CMRR is a Hazard Category 2 nuclear facility that must comply with 2004-2. http://www.doeal.gov/SWEIS/OtherDocuments/591%20DNFSB%202004%20rec_2004_02.pdf Whether any such reliable confinement system could even be built to withstand the event of ground rupture at the CMRR site is not addressed in the SEIS.

312-6 cont'd

Hazard classification. The CMRR is misclassified as a Hazard Category 2 facility. A Hazard Category 2 facility is defined as a nuclear facility for which a hazard analysis shows the potential for significant onsite consequences. Hazard classifications are an "Evaluation of the consequences of unmitigated releases to classify facilities or operations into the following hazard categories." [DOE 5480.23]

The CMRR should be classified as Hazard Category 1 because of the potential for an accident affecting the surrounding communities. Maintaining 13,200 pounds of plutonium inside the facility given the seismic potential for ground rupture at the site could lead to significant offsite consequences in the event of a plutonium fire, explosion or other unforeseen natural disasters. No credit for the fire suppression system should be taken because it is located in the CMRR where the accident may occur.

• **Hazard Category 1:** Shows the potential for significant offsite consequences. DOE 5480.23 states:

> For facilities belonging to Hazard Category 1, for which very substantial limitation of potential risk must be achieved by safety design, management, and well-disciplined operation, *the Safety Analysis Review [SAR] must be particularly thorough and penetrating*. (Emphasis added).

312-7

LANL has not produced a thorough and penetrating Safety Analysis Review as demonstrated by failure to receive safety certification from the Defense Nuclear Facilities Safety Board (DNFSB).

The August 2009 Certification Report Resolution of Defense Nuclear Facilities Safety Board Concerns for the Chemistry and Metallurgy Research Replacement Project (CMRR-RPT-PM-1912, R1) shows that no safety analysis is complete for the CMRR (http://www.lanl.gov/orgs/cmrr/publicmeetings/documents/certification_laur09-06015.pdf p.3):

> "Between January 16 and March 30, 2009, the DNFSB formally transmitted five findings to NNSA in which they considered resolution a prerequisite to Congressional

312-6 cont'd

nuclear material. Thus, NNSA would not operate the building as anything other than a radiological facility, which would significantly limit the total quantity of special nuclear materials that could be handled in the building. As a result, AC and MC operations requiring Hazard Category 2 and 3 work spaces could not be carried out in RLUOB. Using space and capabilities in the TA-55 Plutonium Facility would interfere with performing work currently being conducted there and reduce the space available in the building that could be used to conduct future DOE and NNSA mission support work. Use of other locations at LANL would introduce new hazards for which the facilities were not designed and would not conform to the objective of collocating plutonium operations near the TA-55 Plutonium Facility. Performing work at a location remote from the TA-55 Plutonium Facility would necessitate periodic road closures and heightened security to enable transport of materials between the facilities. In addition, other facilities would not have the available space, vaults, and engineered safety controls and requirements for this type of work.

The accident analysis presented in Appendix C in the *CMRR-NF SEIS* considered impacts on workers and the public from a representative set of accidents, including natural phenomena such as earthquakes. See Chapter 4, Section 4.2.10.2, Facility Accidents, and Appendix C, Evaluation of Human Health Impacts from Facility Accidents, of the *CMRR-NF SEIS* for more information.

312-5 As summarized in Section 2.5, Cleanup and Waste Management, of this CRD, the CMRR-NF and RLUOB would be designed, constructed, and operated to accommodate the projected waste volumes to be generated at the facilities. Chapter 4, Sections 4.2.12, 4.3.12, and 4.4.12 provide estimates of and disposal pathways for all waste types expected to be generated by construction and operation of the CMRR-NF under each of the alternatives. The impacts associated with transportation of radioactive and nonradioactive wastes to offsite treatment or storage facilities have been estimated for all alternatives (see Chapter 4, Sections 4.2.13, 4.3.13, and 4.4.13, of the *CMRR-NF SEIS*). It is expected that waste transportation would occur using trucks using standard types of containers (for example, drums, boxes) and shipping packages (for example, TRUPACT II).

RLWTF currently receives liquid radioactive waste generated by the CMR Building and other LANL facilities, and would receive liquid radioactive waste generated by the proposed CMRR-NF. The planned replacement for the existing

Commentor No. 312 (cont'd): Dave McCoy, Director
Citizen Action

certification: (1) CMRR Seismic Design; (2) Seismic Design of Active Confinement Ventilation Systems and Support Systems; (3) Documenting and Maintaining Preliminary Documented Safety Analysis (PDSA) Safety-Related Functions and Requirements; (4) Inadequate Identification of Safety-related Controls, Functional Requirements, and Performance Criteria; and (5) System Design Descriptions Do Not Incorporate Preliminary Documented Safety Analysis Requirements Adequately."

The SEIS claim that a Modified CMRR will be able to withstand the design basis earthquake is without scientific basis. The relationship between the LANL fault structures and to regional techtonics is not well understood and *the design basis earthquake is unknown*. The NNSA will expose the public to Fukushima-sized risks by construction of the CMRR at the highly risky seismic location of LANL.

312-6 cont'd

The CMRR does not comply with DOE O 420.1A (5/20/02) for nuclear safety, which provides as follows:
4.1.1 Nuclear Safety
4.1.1.1 General Requirements
Detailed application of these requirements shall be guided by safety analyses that establish the identification and functions of safety (safety class and safety significant) Structures, Systems, and Components (SSCs) for a facility and establish the significance to safety of functions performed by those SSCs. **Safety analyses shall consider facility hazards, natural phenomena hazards, and external man-induced hazards. Factors such as proximity to nearby facilities such as airports, pipelines, and barge traffic peculiar to the site shall also be considered. A safety analysis shall be performed at the earliest practical point in conceptual or preliminary design, so that required functional attributes of safety SSCs can be specified in the detailed design. Safety analyses shall be performed in accordance with Safety Analysis Report (SAR) guidance for safety analysis, as described in DOE guidance documents.**

4.1.1.2 Design Requirements
Nuclear facilities shall be designed with the objective of providing multiple layers of protection to prevent or mitigate the unintended release of radioactive materials to the environment. **Defense in depth shall include: siting, minimization of material at risk, the use of conservative design margins and quality assurance; the use of successive physical barriers for protection against the release of radioactivity; the provision of multiple means to ensure critical safety functions (those basic safety functions needed to control the processes, maintain them in a safe state, and to continue and mitigate radioactivity associated with the potential for accidents with significant public radiological impact)**; the use of equipment and administrative controls which restrict deviations from normal operations and provide for recovery from accidents to achieve a safe condition; means to monitor accident releases required for emergency responses; and the provision of emergency plans for minimizing the effects of an accident. **Facilities shall be sited and designed in such a manner that gives adequate protection for the health and safety of the public and for workers, including those at adjacent facilities, from the effects of potential facility accidents involving the release of radioactive materials.**

Facilities shall be designed to facilitate safe deactivation, decommissioning, and decontamination at end of life.

Facilities shall be designed to facilitate inspections, testing, maintenance,

6

RLWTF, subject to the availability of construction funding, is anticipated to be complete in the same approximate timeframe as the proposed CMRR-NF. The new facility would be designed to withstand anticipated seismic events per the latest nuclear facility safety requirements. Until the replacement facility is available, RLWTF would continue to be maintained and operated under its NNSA-approved authorization basis.

As discussed in Chapter 2, Section 2.10.2.2, DD&D of the new CMRR-NF would be considered at the end of its lifetime, designed to be 50 years. For either the 2004 CMRR-NF or the Modified CMRR-NF, impacts of DD&D of the CMRR-NF are expected to be comparable to those of DD&D of the CMR Building. Although activities involving radioactive materials that would be performed at the CMRR-NF are similar to those currently performed at the CMR Building, construction and operation of the CMRR-NF would reflect over 50 years of experience in facility design and operation and contamination control, with implementation of pollution prevention and waste minimization practices. An appropriate NEPA analysis would be conducted prior to commencing DD&D.

312-6 NNSA takes exception to the commentor's assertion that the CMRR-NF and related facilities are not being designed and constructed in accordance with nuclear safety and design, occupational radiological safety, and natural phenomena hazards regulations and DOE orders; and that DNFSB safety concerns have not been resolved. DOE Order 420.1 and its associated guides are being implemented in the safety analysis and the design of the CMRR-NF. Based on the safety analysis, safety structures, systems, and components are being designed to the required rigor in DOE Order 420.1 and DOE-STD-1021, -1021, -1022, and -1023 considering appropriate natural phenomena hazards. In 2009, NNSA received a number of safety concerns from DNFSB regarding the CMRR Project. Some of these concerns questioned the project's ability to demonstrate compliance with DOE Order 420.1. After lengthy exchanges, DNSFB, as well as NNSA, certified to Congress the technical resolution of these cited concerns. The DOE Order 420.1 concerns and the DNFSB resolution can be found in the September 4, 2009, report to Congress.

Regulations at 10 CFR Part 835 are implemented as a safety management program at LANL. 10 CFR Part 835 is used as a design basis for occupational radiation protection requirements.

The project has been reviewed against DNFSB 2004-02 and was found to be in compliance. The DNFSB report to Congress dated June 15, 2011, confirms

Commentor No. 312 (cont'd): Dave McCoy, Director Citizen Action

repair and replacement of safety SSCs as part of an overall reliability, availability, and maintainability program. The objective is that the facility can be maintained in a safe state, including during these operations, and in keeping with the as low as reasonably achievable (ALARA) principle for occupational radiation exposure.

Facilities shall be designed to keep occupational radiation exposure within statutory limits and incorporate ALARA principles in design, including design provisions to facilitate decontamination during the operational period.

Facility process systems shall be designed to minimize the production of wastes and minimize the mixing of radioactive and non radioactive wastes. Safety SSCs, identified in accordance with this section shall, commensurate with the importance of the safety functions performed, be designed: (1) so that they can perform their safety functions when called upon to operate, and (2) under a quality assurance program that satisfies 10 CFR 830.120.

DOE is not meeting the requirements of DOE Order 5480.28 and the standards included therein to protect against natural phenomena hazards (NPH).

> It is the policy of the Department of Energy to design, construct, and operate DOE facilities so that workers, the general public, and the environment are protected from the impacts of **natural phenomena hazards** on DOE facilities. DOE NPH mitigation requirements are consistent with the safety policy and goals of DOE 5480.1B, DOE 5481.1B, the National Earthquake Hazards Reduction Program, and Executive Order 12699, for all its facilities. For nuclear facilities, DOE additionally requires that, the nuclear safety policy of DOE 5480.23 and Secretary of Energy Notice (SEN), SEN-35-91, NUCLEAR SAFETY POLICY, of 9-9-91, be met for NPH mitigation, and that cost effectiveness is considered. The goals of design, evaluation, and construction for NPH mitigation Include:
> (1) Providing for safe work places;
> (2) Protecting against property loss or damage;
> (3) Continued operation of essential facilities; and
> (4) Protecting public health, property, and the environment against exposure to hazardous materials.

LANL is not following the requirements of Executive Order 12699. EO 12699 requires that each Federal agency responsible for the design and construction of each new Federal building shall ensure that the building is designed and constructed in accord with appropriate seismic design and construction standards.

312-6 cont'd

LANL has done poor quality work in investigating the potential for seismic ground rupture at the CMRR site. No network of seismometers to gather seismic data is in place at LANL. Computer models are utilized without gathering actual hard data to make accuate models.

A. 1992. The SHB-1 borehole at TA-55 was drilled in 1992. The seismic profile from the borehole was published in Wong et al in 1995. Gardner et al LANL scientists knew from the velocity profile for Borehole SHB-1 at TA-55 that there were low shear velocities that greatly increased the seismic hazard at the TA-55 site for a plutonium processing facility. Rather than recognize the problem, LANL underestimated

312-8 cont'd

that no current open issues remain on the project's safety significant active confinement systems (DNFSB 2011b).

312-7 CMRR is appropriately categorized as a DOE Hazard Category 2 nuclear facility in accordance with DOE-STD-1027-92. The CMRR-NF hazard analysis as well as analyses in the *CMRR-NF SEIS* have verified that the facility does have the potential for significant onsite consequences but not the offsite consequences that would categorize it as a DOE Hazard Category 1 nuclear facility.

312-8 NNSA notes the commentor's concerns and technical comments regarding seismic issues related to the *Draft CMRR-NF SEIS*. In addition to the following responses, refer to Section 2.2, NEPA Process, and Section 2.6, Seismic and Geologic Concerns, of this CRD for more information. Chapter 3, Section 3.5, Geology and Soils, of the CMRR-NF SEIS has been revised to improve the discussion of faulting and seismic hazards at LANL.

The comment indicates that site-specific seismic data are inadequate because studies have not been conducted. Dozens of mapping studies of the Pajarito fault system have been conducted (for example, Gardner and House 1987; Wong et al. 1995; Carter and Gardner 1995; McCalpin 1997; Lavine et al. 2003), including state-of-the-art, high-precision mapping in the vicinity of LANL. In addition, numerous paleoseismic trench investigations have been conducted at 17 sites over the past 20 years (for example, Gardner et al. 1990; Olig et al. 1996; Kelson et al. 1996; McCalpin 1998, 1999, 2005; LANL 2007). These studies clearly show that the Pajarito fault system is a series of normal slip faults that form the best studied fault system in the Rio Grande rift. Admittedly, some parts of the fault have not been as well studied as others; these tend to be those portions outside of LANL, especially where access issues are a problem (for example, the Santa Clara Canyon segment). Additional study of these areas would likely improve our understanding of the fault and could help reduce uncertainties in the inputs, but these studies are not a prerequisite to conducting a PSHA or determining design ground motions at LANL. The uncertainties in regards to fault geometry, rupture behavior, and sense of slip on the Pajarito fault system were fully recognized and addressed in the range of inputs to the PSHA. A range of fault dips was used (±15°), a component of oblique slip was considered in calculating slip rates, and two rupture models and various rupture scenarios were included in the analysis to address remaining uncertainties in the geometry and sense of slip of the Pajarito fault system. All of the data and analyses for the

Wong, I., Kelson, K., Olig, S., Kolbe, T., Hemphill-Haley, M., Bott, J., Green, R., Kanakari, H., Sawyer, J., Silva, W., Stark, C., Haraden, C., Fenton, C., Unruh, J., Gardner, J., Reneau, S., and House, L., 1995, Seismic hazard evaluation of the Los Alamos National Laboratory: unpublished final report prepared for the Los Alamos National Laboratory and the U.S. Department of Energy, 3 volumes.

1995 Study. According to the 1995 SEISMIC MARGINS ASSESSMENT OF THE PLUTONIUM PROCESSING FACILITY LOS ALAMOS NATIONAL LABORATORY by Goen and Salmon (Los Alamos National Laboratory), increased seismic shaking would be present at TA-55. http://library.lanl.gov/cgi-bin/getfile?00818722.pdf , p.1 Abstract:

> DOE Order 5480.28 [1] requires that existing structures, systems and components (SSCs) be evaluated to determine their ability to withstand the effects of natural phenomena hazards. For existing SSCS, 5480.28 requires re-evaluation when changes in the understanding of a hazard results in greater loads. Los Alamos National Laboratory (LANL) has reevaluated its seismic hazard. Results of this study indicate that seismically induced loads will be significantly greater than those for which the SSC**S** for the Plutonium Processing Facility (PF-4) at Technical Area 55 (TA-55) were designed. (Emphasis supplied).

312-8 cont'd

The Goen study was based on an assumed ground acceleration value of 0.33 g. This PF-4 building is where the Pu pits will be manufactured. PF-4 does not comply with the specifications necessary for seismic safety requirements as per the DOE O 5480.28.

This 1995 report was made before the knowledge obtained in the May 2007 URS Probabilistic Seismic Hazard Analysis and Development of Seismic Design Ground Motions at the LANL that indicated an increased acceleration value of 0.52 g. Even the .52 g acceleration is questionable and may be an underestimate because the selection of the value for Kappa used compromised data. A minimum of three boreholes were supposed to have been drilled down to the reference rock. Only one borehole was drilled. The value of the reference rock for determination of kappa is unknown because the drilling of the one deep borehole did not extend more than 741 ft bgs.

D. The 2007 Probabilistic Seismic Hazard Analysis states: " The preferred range of maximum earthquakes is from moment magnitude (M) 6.5 to 7.3." There is no data from a sitewide network of seismometers to draw that conclusion.

Pajarito fault system published in the Lewis et al. (2009) study were included or considered in the PSHA update.

In addition, the comment asserts that information from deep boreholes at TA-55 indicates that the seismic hazards are greater than previously reported. Deep geotechnical borings were drilled at TA-55 to characterize the complete geologic column down to the basement bedrock level. Three boring locations were initially identified; however, only two borings were deemed necessary to provide corroborative characterization of the deeper portions of the geologic column. The third boring was identified as an alternative and would have been drilled only if the currently planned site at TA-55 were deemed not viable. Borehole DSC-1B was drilled to a depth of 741 feet (226 meters) below ground surface, while borehole DSC-2A reached a total depth of 550 feet (168 meters) below ground surface. The geologic formations that are most relevant to TA-55 are those that would influence seismic ground response and foundation performance. Seismic ground response, as determined by these two deep seismic characterization borings, is affected by the relatively high seismic wave velocity of the basement rocks, consisting of the Cerros del Rio basalt and Tschicoma Formation dacite (both of which are relatively hard volcanic rocks), and the much lower seismic wave velocities of the overlying, softer Bandelier Tuff. From data provided by Kleinfelder (2007a), DSC-1B was the only deep borehole to penetrate into the Tschicoma Formation dacite. In addition, the presence of the relatively soft Qbt3L between two stiffer units, Qbt3U and Qbt2, is important with respect to the seismic ground response of the site (Kleinfelder 2007a:29,61). Kleinfelder (2007a) states that the sampled portion of the Cerros del Rio basalt and Tschicoma Formation dacite was highly fractured and vesicular. Fracturing and vesiculation are common features of chilled upper portions of relatively harder volcanic flows (Fink and Anderson 2000), and such features would be expected in the upper 40 to 50 feet (12 to 15 meters) of a dacite flow that is hundreds of feet thick, such as the Tschicoma Formation dacite below the proposed CMRR-NF.

In the 1995 PSHA, the peak horizontal ground acceleration (PGA) associated with an annual frequency of exceedance of 4×10^{-4} was reported to be about 0.33 *g* for TA-55. In the 2007 PSHA, the PGA at the same annual frequency of exceedance was reported to be 0.52 *g*. An increase in the slip rates on the Pajarito fault system, in addition to other factors, likely contributed to the increased seismic hazard. The 2007 and 2009 PSHAs represent the best knowledge to date on the seismic hazard at LANL, with the uncertainties appropriately incorporated.

http://nnsa.energy.gov/sites/default/files/seis/Eval.%20of%20Faulting%20at%20the%20CMRR%20Site%202005%20LA-14170.pdf

EVALUATION OF FAULTING AT THE CHEMISTRY AND METALLURGY RESEARCH FACILITY REPLACEMENT (CMRR) SITE BASED ON EXAMINATION OF CORE FROM GEOTECHNICAL DRILLING STUDIES, TA-55, LOS ALAMOS NATIONAL LABORATORY by Alexis Lavine, Jamie Gardner, and Emily Schultz, January 2005

> Because Los Alamos National Laboratory (LANL) lies on the active western margin of the Rio Grande rift (Figure 1), seismic hazards, including the potential for seismic surface rupture, must be assessed before construction of any new facilities housing nuclear or other hazardous materials.

"Paleoseismic investigations indicate that there have been three Holocene seismic events of magnitude 6–7 on the Pajarito fault system."

The May 26, 2011 Report *Fault interaction and along-strike variation in throw in the Pajarito fault system, Rio Grande Rift, New Mexico,* Lewis, et al., describes fault interaction and rupturing with the Pajarito Fault (PF) and the Rendijas and Guaje Cyn faults. That led to PF rupture in 2 of 3 Holocene rupture with one of those faults.

312-8 cont'd

The above faults can rupture simultaneously or synchronously (in rapid sequence). Synchronous rupture can cause up to 75% more shaking than simultaneous rupture of the fault system. Although LANL has identified the possibility for synchronous rupture, LANL's analysis for the design basis earthquake is limited to consideration of the simultaneous rupture event.

DOE is not in compliance with Standard 1020-2002 because it is unable to demonstrate in the SEIS that the CMRR would be able to withstand the ground motions of the Maximum Considered Earthquake with either the shallow option or the deep excavation option.

The Department of Energy Standard 1020-2002

In 2002, DOE published a revision to its seismic siting standard, "Natural Phenomena Hazards Design and Evaluation Criteria for Department of Energy Facilities" It states:

> "This natural phenomena hazard standard...provides criteria for design of new SSCs (structures, systems and components) and for evaluation, modification, or upgrade of existing SSCs so that DOE facilities safely withstand the effects of natural phenomena hazards, such as earthquakes, extreme winds, and flooding."

312-9

Legal Issue: The original EIS plan for the CMRR has become impossible to construct because it cannot withstand a large seismic event. Can the CMRR SEIS be used as a supplement or substitute for an EIS that can no longer be implemented?

The 2011 Supplemental EIS is inadequate to offer a meaningful analysis of environmental consequences as a justification for continuance of the CMRR project. 10 CFR 1502.9 for Draft, final, and supplemental statements provides

The results of this evaluation have been included in the design of the CMRR-NF and, as such, incorporated in the cost estimate.

The change in seismic hazard at LANL is due in large part to new evidence in the activity of the Pajarito fault system, new ground motion prediction equations, and the consideration of temporal clustering in the Pajarito fault system. Considering this new evidence, the estimate of the PGA associated with an annual frequency of exceedance changed from about 0.33 *g* in 1995 to about 0.52 *g* in 2007. However, as new evidence becomes available, NNSA's estimate of the seismic hazard may change slightly, although the hazard estimates are expected to remain fairly stable. For example, the best estimate of the PGA associated with an annual frequency of exceedance of 4×10^{-4} decreased from 0.52 *g* in 2007 to 0.47 *g* in 2009 (LANL 2009). This change was in part due to the availability of a new and improved set of ground motion prediction equations.

Chapter 3, Section 3.5, Geology and Soils, incorrectly stated the maximum earthquake of the Pajarito fault system as Richter magnitude 6.5 to 7.0. This mistake has been corrected. These incorrect maximum earthquake magnitudes stated in the draft SEIS are not reflective of information presented in the PSHA and were not used in the design-basis earthquakes for the proposed CMRR-NF.

Based on the latest geologic data, including that published in Lewis et al. (2009) and documented in the PSHA update (LANL 2007), expected maximum magnitudes for the various rupture scenarios of the Pajarito fault system range from M_w 6.5 to 7.3, and these were input as preferred values with a weight of 0.6 in the analysis. The expected magnitudes were calculated using well-established and widely accepted empirical relations (Wells and Coppersmith 1994). Results were checked and peer-reviewed by an internationally recognized Participatory Peer Review Panel during the PSHA update (LANL 2007). Additional uncertainties of ±0.3 moment magnitude (with a weight of 0.2 each) were included so that the M_w inputs into the PSHA were as large as 7.6, depending on the rupture scenario (LANL 2007). The estimated size of the analogous 1959 Hebgen Lake earthquake is M_w 7.3, whereas the analogous 1983 Borah Peak earthquake was smaller at M_w 6.8 (Doser and Smith 1985). Thus, the range of maximum magnitudes used to calculate design ground motions for CMRR-NF incorporates the magnitudes of historic earthquakes that might be considered analogues for rupture of the Pajarito fault system.

Commentor No. 312 (cont'd): Dave McCoy, Director Citizen Action

(c) Agencies:
Shall prepare supplements to either draft or final environmental impact statements if:
(i) The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or
(ii) There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.

The finding of the 2011 SEIS is that the original CMRR described in the 2003 EIS cannot be built. Therefore, the findings of the 2004 EIS do not legally form the basis for the use of this SEIS. Although the basic purpose for building the CMRR remains from the original 2003 EIS and 2004 ROD, the CMRR cannot be built as was proposed due to deficiencies, lack of understanding and dangers inherent in the complex seismic setting at LANL.

The SEIS presents alternatives that are not alternatives at all. The alternative of building the CMRR as originally designed is not possible due to seismic dangers. Continuing use of the old CMR building is not possible according to the SEIS. The SEIS proclaims the only alternative left is to build the CMRR-NF. This is accomplished by ignoring: the no-build alternative, the need for the facility, and the possibility of using non-LANL locations for the CMRR construction.

312-9 cont'd

The SEIS then presents the shallow or the deep construction options for the CMRR as the only possible alternative to what was not viable in 2003.

- Neither option is based on a full understanding of the seismic setting at LANL.
- It is unknown whether either proposed construction option would withstand a powerful seismic event at LANL that could occur from a synchronous seismic event.
- Neither SEIS excavation option can provide the basis for a complete risk analysis of the consequences in the event of a severe seismic event that could result in rupture at the CMRR location.

Thus, neither construction option offers an improvement over the original 2003 EIS CMRR design. Since it lacks reliable seismic data and knowledge, the SEIS is incapable of providing a meaningful analysis for discussion of major points of view on the environmental impacts in relation to other alternatives, e.g., not building the CMRR at all or building it in a different location.

CONCLUSION

Without a thorough and complete analysis of all the factors related to the proposed construction of the CMRR, the public will only find out about the inherent dangers of the CMRR after some unpredicted catastrophic event. The CMRR SEIS must be retracted.

312-10

10

The PSHA (LANL 2007) included both simultaneous and synchronous earthquake rupture models in calculating design ground motions for TA-55. Simultaneous ruptures were slightly favored in the model with a weight of 0.6 because this is the standard model used in PSHA practice, and displacement data for the Pajarito fault system suggests this type of rupture occurred in the past. However, synchronous ruptures were also included in the analysis with a weight of 0.4. The PSHA estimated slightly higher maximum magnitudes for the simultaneous rupture model. Preferred maximum magnitudes for both simultaneous and synchronous ruptures were estimated using the same general approach. It is somewhat counterintuitive that the slightly bigger simultaneous earthquake can result in a lower ground motion hazard, but the two synchronous earthquakes result in higher ground motions for nearby sites, particularly when the site is located between the rupturing fault segments, because energy is coming from two sources. For both synchronous and simultaneous ruptures, maximum magnitudes were estimated in the PSHA based on surface rupture lengths and available displacement data, as appropriate to the particular rupture scenario. The main difference between the simultaneous and synchronous ruptures is that all of the moment (energy) is released in one event in the simultaneous model, versus the moment being split into two slightly smaller synchronous subevents on different segments of the Pajarito fault system, in the synchronous model. Thus, the slightly smaller magnitudes for the synchronous ruptures are a direct result of splitting the fault rupture into two portions for this model. In addition, the 10 percent difference in the total moment release between the two models results from the different geometries used and the fact that displacements do not scale the same as surface rupture lengths in the empirical relations. Finally, maximum magnitudes for both synchronous and simultaneous ruptures were performed using techniques that meet SSHAC (NRC 1997) and DOE guidelines, and were reviewed and accepted by an external review panel, DOE, and the Defense Nuclear Facility Safety Board.

Subsequent to the original proposal for the CMRR Facility and preparation of the 2003 CMRR EIS, updated seismic hazards analyses of the LANL region were issued in 2007 (LANL 2007) and 2009 (LANL 2009). These documents represent the best knowledge to date on the seismic hazard at LANL, with the uncertainties appropriately incorporated. In addition, site-specific geotechnical evaluations of the proposed CMRR-NF construction site were performed (Kleinfelder 2007a, 2007b, 2010a, 2010b). The Kleinfelder reports provide additional detailed information and structural evaluation of the proposed CMRR-

Commentor No. 312 (cont'd): Dave McCoy, Director Citizen Action

NF site. This information translated into design changes related to the structural requirements for the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. The results of this evaluation have been included in the design of the CMRR-NF, which is still under way and will continue to evolve.

While the PSHA study acknowledges that additional data would provide a more complete understanding of the seismic hazard at LANL, NNSA believes there was sufficient information to complete the study. The uncertainties associated with these areas have been adequately captured and bounded by the results of the study.

312-9 As discussed in Section 2.2, NEPA Process, of this CRD, NNSA determined that supplement to the *2003 CMRR EIS* is the appropriate level of analysis, based on CEQ and DOE NEPA regulations, to address the changes in construction of the CMRR-NF based on additional seismic information. Therefore, the alternatives reflect the different alternatives for construction of the facility. Although many commentors expressed a preference for an alternative of taking no action at all, that is, neither operating the existing CMR Building nor constructing a new CMRR-NF, such an alternative does not meet NNSA's stated purpose and need to continue to provide mission-critical analytical chemistry and materials characterization capabilities beyond the present time in a safe, secure, and environmentally sound manner. Refer to Section 2.11, Alternatives Considered, of this CRD for more information.

312-10 NNSA disagrees with the commentor's opinion that the *CMRR-NF SEIS* should be retracted because of concerns about an unpredicted catastrophic event. As described in Section 4.3.10.2 of the *CMRR-NF SEIS*, accident analyses for the CMRR-NF SEIS indicate that there would be no latent cancer fatalities resulting from postulated accidents. These scenarios assume that the CMRR-NF would survive a design-basis earthquake because of the design changes made to meet seismic requirements. See also Section 2.8, Nuclear Accidents, of this CRD for more information about how accidents that could occur at nuclear reactor facilities cannot occur at the CMRR and about other possible accidents and mitigating factors at CMRR-NF.

Re: **Insufficient, Incorrect and Misrepresented Seismic Information for Design Basis Earthquakes for Proposed CMRR-NF – Requirement for DOE to Retract DOE 2011 draft SEIS for CMRR-NF**

315-1 **Introduction:** There is a requirement for the Department of Energy (DOE) to retract the DOE 2011 draft Supplemental Environmental Impact Statement (DOE 2011 draft SEIS) for the proposed Chemistry and Metallurgy Research Replacement Nuclear Facility (CMRR-NF) at the Los Alamos National Laboratory (LANL) Technical Area-55 (TA-55) because it does not meet the basic purposes of the National Environmental Policy Act (NEPA). Further the DOE 2011 draft SEIS provides an inadequate and incomplete analysis as detailed below.

315-2 The DOE 2011 draft SEIS on page 3-25 misrepresents the methods used in the LANL 2007 Probabilistic Seismic Hazards Analysis (LANL 2007 PSHA Report) to follow the Senior Seismic Hazard Advisory Committee's Guidelines for a Level 2 analysis in the most recent guidance from the Nuclear Regulatory Commission (NRC), "Recommendations for Probabilistic Seismic Hazard Analysis – Guidance on Uncertainty and Use of Experts" (NRC 1997 SH Guidance Report). *Please note:* The NRC 1997 SH Guidance Report is not available in the electronic reference documents for the DOE 2011 draft CMRR-NF SEIS.

The NRC 1997 SH Guidance Report was a joint project of the NRC, DOE and Electric Power Research Institute. The Main Report was prepared by the Senior Seismic Hazard Analysis Committee (SSHAC) comprised of: R. J. Budnitz (Chairman), G. Apostolakis, D. M. Boore, L. S. Cluff, K. J. Coppersmith, C. A. Cornell, P. A. Morris, Lawrence Livermore National Laboratory.

One of the objectives of the NRC 1997 SH Guidance Report:

> Because PSHA results can be so important for both engineering design and public-policy decision-making, a goal of this project is that the PSHA methodology will ensure the stability of the numerical results for a

*Gilkeson and CCNS Additional Comments about DOE 2011 draft SEIS for CMRR-NF * July 5, 2011 * Page 1*

315-1 NNSA notes the commentor's concerns and technical comments regarding seismic issues related to the *Draft CMRR-NF SEIS*. In addition to all the following responses, refer to Section 2.6, Seismic and Geologic Concerns, of this CRD for more information and to sections of the *Final CMRR-NF SEIS* where revisions were made to text in response to comments as noted in the specific response that follows each comment below.

NNSA believes that the *CMRR-NF SEIS* meets the requirements of NEPA. Furthermore, NNSA does not believe it is necessary to retract the *Draft CMRR-NF SEIS* or reissue a revised draft SEIS. As discussed in Section 2.2, NEPA Process, of this CRD, based on CEQ and DOE NEPA regulations, NNSA determined that an SEIS is the appropriate level of analysis for the proposed action. In making this determination, NNSA was fully aware of the updated seismic hazards analysis of the LANL region (LANL 2007, 2009). (The 2009 update to the 2007 preliminary seismic hazards analysis was not publicly available at the time the *Draft CMRR-NF SEIS* was prepared; however, it has subsequently been made available to the public and has been incorporated into the *Final CMRR-NF SEIS*.) The updated seismic hazards analyses indicated an increase in the expected ground motion for a design-basis earthquake and provided a better understanding of the ground motion and probable seismic behavior of various geological material layers occurring at LANL. This information translated into design changes related to the structural requirements necessary for constructing the proposed CMRR-NF so that the building and equipment within the building would be able to withstand a design-basis earthquake without major damage. These changes are included in the Modified CMRR-NF Alternative (see Chapter 2, Section 2.6.2 of the *CMRR-NF SEIS*).

315-2 Neither the LANL PSHA Peer Review Panel nor DNFSB found the 2007 and 2009 LANL PSHAs to be "inadequate and incomplete." The purpose of the 2007 LANL PSHA update (LANL 2007), which was followed by another update in 2009 (LANL 2009), was to assess the earthquake ground-shaking hazard at LANL and based on that hazard, develop site-specific design-basis earthquake ground motions for several LANL sites, including CMRR-NF. Both PSHAs were performed following the guidelines established by SSHAC (SSHAC 1997) for PSHAs, particularly with regard to the incorporation of uncertainty. DOE, NRC, and the Electric Power Research Institute (EPRI) sponsored the development of the SSHAC guidelines. The goal of any PSHA is to develop inputs that represent the composite distribution of the informed technical community. SSHAC recognizes that PSHA inputs can be subject to considerable uncertainties

Commentor No. 315 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

> reasonable period of time (five to ten years) or until significant new technical information presents itself (Section 1.4, p. 4).

315-2 cont'd

The pertinent excerpt from page 3-25 is pasted below:

> The methods used in the updated 2007 analysis [LANL 2007 Probabilistic Seismic Hazard Analysis (PSHA)] follow the Senior Seismic Hazard Advisory Committee's guidelines for a Level 2 analysis in the most recent guidance from NRC, "Recommendations for Probabilistic Seismic Hazard Analysis – Guidance on Uncertainty and Use of Experts" (NRC 1997). Based on this analysis, the dominant contributor to seismic risk at LANL is the Pajarito Fault system, due to its proximity and level of seismic activity. The main element of the fault system is the Pajarito Fault. Secondary elements include the Santa Clara Canyon Fault, the Rendija Canyon Fault, the Guaje Mountain Fault, and the Sawyer Canyon Fault (DOE 2008a; LANL 2007a).

315-3

The locations of the above faults in the vicinity of LANL are shown on Figure 1. Figure 2 shows the locations of mapped faults in the LANL 2007 PSHA Report and in the DOE 2011 draft SEIS. Figure 3 is from a report by LANL scientist Kenneth H. Wohletz (Wohletz, 2004) which shows the disagreement among LANL scientists on the location of faults close to the proposed CMRR-NF. The inferred locations of faults on Figure 3 is determined from detailed field mapping of zones of intense fractures both west, north and east of the proposed CMRR-NF.

due to incomplete data and scientific understanding, as well as from process variability. In particular, when developing the inputs for PSHA, it is recognized that there is always incomplete knowledge because that is the nature of trying to characterize a complex natural process. However, by performing PSHAs in a manner consistent with the SSHAC guidelines, particularly with regards to the incorporation of the range of different interpretations and scientific uncertainties, the results should be robust and stable. Participatory peer review is also an essential element of a successful PSHA and in the case of the LANL PSHAs, an internationally recognized expert panel was engaged. In addition, DNFSB was involved in the 2007 and 2009 studies and provided commentary on the process.

As a result of comments received on the *Draft CMRR-NF SEIS*, Chapter 3, Section 3.5, Geology and Soils, of the *CMRR-NF SEIS* was revised to improve the description of faulting and seismic hazards at LANL.

315-3 The fault shown 800 feet (244 meters) west of the proposed CMRR-NF, by Vaniman and Wohletz (1990) and Wohletz (2004), is an inferred fault, meaning that the fault is interpreted to be present at some depth below the location at which it is mapped; however, no evidence for surface-rupturing faults was found along that mapped trace. The work of Vaniman and Wohletz helped spur the LANL Seismic Hazards Program to conduct detailed, site-specific studies around TA-55 (for example, Gardner et al. 1998, 1999, 2008) to determine the presence or absence of surface-rupturing faults, using detailed investigative methods. These methods included conventional geologic mapping at 1:1,200 scale, high-precision total station geologic mapping of Bandelier Tuff subunit contacts to identify faults, and large-scale trenching investigations at the site of the proposed CMRR-NF. Gardner et al. (1998, 1999) identified no faults or offsets along geologic contacts suggesting the presence of a fault at TA-55. Although Gardner et al. (2008) did observe some fractures and small faults confined within units of the tuff, they concluded that fractures and faults exposed at the proposed CMRR site formed very shortly after emplacement of the tuff, 1.26 million years ago, as a result of cooling and compaction, and the structures identified at the proposed CMRR-NF site pose no independent seismic surface rupture hazard. No evidence for active faulting was identified by Gardner et al. (1998, 1999, 2008) near the proposed CMRR-NF, as inferred by early studies of Vaniman and Wohletz (1990) and Wohletz (2004).

The work of Lewis et al. (2009) is a comprehensive, peer-reviewed report and map on the Pajarito fault system. Using data presented in Lewis et al. (2009), the

Figure 1. Map of the Pajarito Fault System and Embudo Fault System – Southwestern Section in Northern New Mexico. **Source:** Figure 5-4 in LANL 2007 PSHA Report.

315-3 cont'd

nearest laterally continuous, surface-rupturing fault to the proposed CMRR-NF is located approximately 3,300 feet (1,000 meters) to the west-northwest, in the western portion of TA-64, with 3 feet (1 meter) of down-to-the-west displacement.

Commentor No. 315 (cont'd): Robert H. Gilkeson and Concerned Citizens for Nuclear Safety (Joni Arends)

The LANL 2007 PSHA Report and the DOE 2011 draft SEIS did not use the demonstrated zones of intense fractures on Figure 3 to identify potential locations for buried active faults. The fault map in the LANL 2007 PSHA Report (see Figure 2) was limited to where field studies mapped displacements on faults. However, the NRC 1997 SH Guidance Report in Section 4 on page 54 describes the importance for knowledge of buried active faults close to the proposed CMRR-NF and for other critical LANL facilities in the following four issue areas:

NRC 1997 SH Guidance Report – Issue 1. Location of buried active faults close to the proposed CMRR-NF.

> At a minimum, the location of fault sources must be identified in map view. Usually a fault map depicts the line of intersection of faults with the ground surface. In the case of blind faults that do not intersect the surface, the location of the shallowest extent of the fault should be indicated on the fault maps. With the occurrence of the 1983 Coalinga earthquake and the 1994 Northridge earthquake has come an increasing recognition of the important contribution that blind or buried faults can make to seismic hazard.

A brief description of the buried 1983 Coalinga and 1994 Northridge earthquakes in California follows:

- Description of the 1983 Coalinga Earthquake in the URL listed below http://earthquake.usgs.gov/earthquakes/states/events/1983_05_02.php

> This damaging earthquake [Magnitude 6.4] was caused by an 0.5-meter uplift of Anticline Ridge northeast of Coalinga, but surface faulting was not observed. Ground and aerial searches immediately after the earthquake revealed ground cracks and fissures within about 10 kilometers of the instrumental epicenter, none of which appeared to represent movement on deeply rooted fault structures.

- Description of the 1994 Northridge Earthquake in the URL listed below http://nisee.berkeley.edu/northridge/

> At 4:31 A.M. local time, Monday, January 17, 1994 the Northridge earthquake struck the San Fernando Valley region of Southern California with a moment magnitude measured at 6.7 and focal depth of 19 km. The earthquake was centered 32 km west-northwest of Los Angeles along a south-dipping, blind thrust fault. Little if any surface faulting was produced. The earthquake resulted in 57 deaths, more than 5,000 injuries, and structural damage including instances of partial or complete structural collapse. Estimates of more than $20 billion in property damage make this earthquake the costliest seismic disaster in U.S. history.

315-4

***Comment by Gilkeson and Arends.** The NRC 1997 SH Guidance Report requires DOE to have accurate knowledge of the presence of buried active faults close to the proposed CMRR-NF. The zones of intense fractures on Figure 3 may indicate buried active faults close to the location of the proposed CMRR-NF. DOE has not performed the necessary field investigations with detailed field mapping, drilling of coreholes and surface geophysics (seismic and aeromagnetics) to determine the presence of buried*
